

# HOUSING MARKET ASSESSMENT

Edmonton CMA

Date Released: Second Quarter 2018

## Highlights

- The HMA framework continued to detect a moderate degree of vulnerability in the Edmonton housing market, unchanged from the previous quarter<sup>1</sup>.
- There was low evidence of overvaluation, overheating and price acceleration.
- The inventory of completed but unsold units remained near its threshold level indicating overbuilding, while the apartment vacancy rate was above its threshold level.

## HMA Overview<sup>2</sup>

As Canada's authority on housing, CMHC contributes to market stability by providing information on potential imbalances that could affect housing markets. With the HMA, CMHC offers information and analysis that can help Canadians make more informed decisions.

The HMA combines the results from a technical framework with insights gained through CMHC's Market Analysts' knowledge of local market conditions. These insights position CMHC to provide additional context and interpretation to the results of the HMA framework.

The HMA framework detects degrees of vulnerability in local housing markets by identifying imbalances. An example would be the detection of overbuilding, a situation in which the inventory of unsold new homes accumulates due to supply outpacing

demand. Such an imbalance could be resolved by an adjustment in house prices. As an example, lower prices would help resolving an excess supply imbalance by supporting stronger demand and/or reducing supply. However, other unexpected developments that do not originate from the housing market could accentuate or reduce an imbalance.

Colour codes indicate the degrees of market vulnerability. The HMA is a comprehensive framework that considers the intensity of signals of imbalances (that is, how far the indicator is from its historical average), and the persistence over time. Generally, low intensity and persistence are associated with potentially low degree of vulnerability. As the number of intense and persistent signals increases, the associated degree of vulnerability increases.

## In Detail

### Overheating

The Housing Market Assessment (HMA) framework detected low evidence of overheating in the Edmonton housing market. The sales-to-new listings ratio (SNLR) remained well below its threshold, indicating that demand has not been outpacing supply. The seasonally adjusted SNLR averaged 54% in the fourth quarter of 2017, up from 47% in the third quarter of 2017, and well below the framework's threshold of 85% that would be consistent with overheating. Sales activity in the existing home market increased in the last quarter of 2017 while the number of new listings remained elevated.

Access CMHC's Market Analysis Centre publications quickly and conveniently on the Order Desk at [www.cmhc.ca/housingmarketinformation](http://www.cmhc.ca/housingmarketinformation). View, print, download or subscribe to get market information e-mailed to you on the day it is released. CMHC's electronic suite of national standardized products is available for free.

<sup>1</sup> Results are based on data as of the end of December 2017 and local market intelligence up to end of March 2018. CMHC continuously monitors market developments and will issue HMA updates on a quarterly basis.

<sup>2</sup> A detailed description of the framework is available in the appendix of the [National edition](#).

## Price Acceleration

The Edmonton housing market continued to show low evidence of price acceleration. The New House Price Index continued to indicate an absence of price growth in the Edmonton market while the 2017 fourth quarter Teranet-National Bank House Price Index™ increased by only 0.4% year-over-year. Although the MLS® average price in the fourth quarter of 2017 was up 2.5% compared to the same period of 2016, much of the increase is due to a changed sales composition. With existing home market conditions continuing to favour the buyer, prices are expected to remain stable.

## Overvaluation

Low evidence of overvaluation continued to be detected in the Edmonton housing market as the average overvaluation estimate remained below its threshold level as determined by economic and demographic fundamentals. Demographic fundamentals eased in the fourth quarter of 2017 compared to the prior quarter as the growth rate in the young adult population continued to slow. Conversely,

employment continued to move higher for a fourth consecutive quarter thereby boosting economic fundamentals, while slightly higher mortgage rates negatively impacted affordability.

### Overbuilding

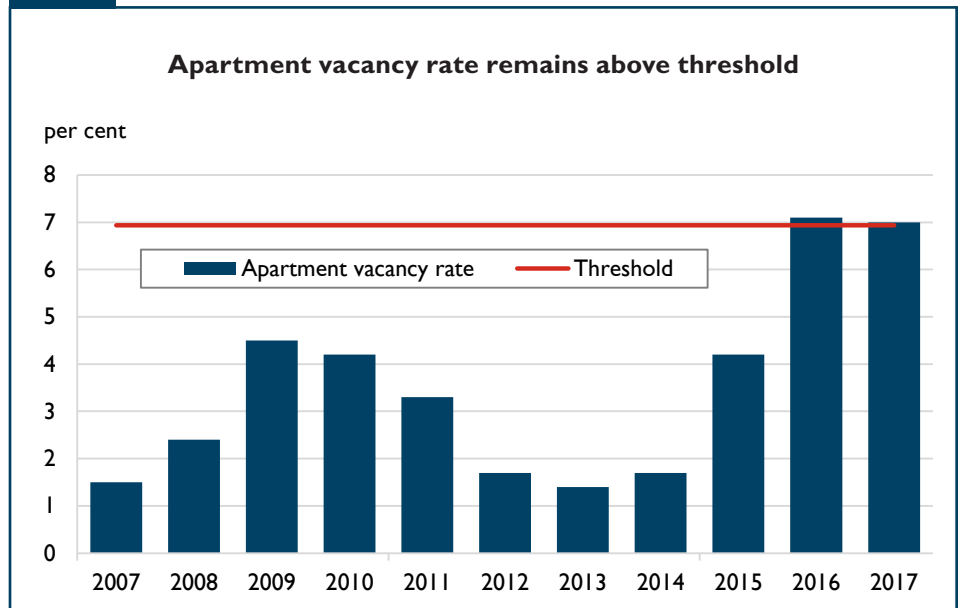

Evidence of overbuilding remained high in the Edmonton housing market as imbalances in both the ownership and rental markets were detected. The inventory of completed but unsold units remained near its threshold level for overbuilding due to a large inventory of condominium apartment units. The October 2017 rental apartment vacancy rate of 7.0% was above its threshold level indicating oversupply in the rental market.

Figure 3

Sources: CREA, Statistics Canada, Teranet and National Bank of Canada, and calculations by CMHC. Note: The average estimate of overvaluation is the average gap between actual house prices and price levels estimated from a group of selected models. These include demand, supply, hybrid, and affordability models, each of which is estimated using four measures of house prices to generate sixteen unique estimates of overvaluation. The selection of models is conducted with a set of cointegration tests, and the selected models are estimated with Dynamic Ordinary Least Squares (DOLS). The maximum overvaluation gap is obtained from the model that has the largest gap between the actual price and the estimated price. The threshold is fixed at a critical value of 1.29 for a confidence level of 80%. Overvaluation is signaled when overvaluation estimates lie above the threshold. Last data point: 2017Q4

## Overview of the Housing Market Assessment analytical framework

To obtain an accurate picture of the overall state of the housing market, it is important to consider multiple data points and lines of evidence rather than relying on just one measure or indicator.

The Housing Market Assessment (HMA) analytical framework provides a comprehensive and integrated view that relies on a combination of signals from several indicators to detect imbalances in housing markets.

Specifically, the framework considers four main factors that may provide an early indication of vulnerability in the housing market: (1) overheating (when demand outpaces supply); (2) sustained acceleration in house prices; (3) overvaluation of house prices in comparison to levels that can be supported by housing market

fundamentals (listed below); and, (4) overbuilding (when the inventory of available housing units is elevated).

For each factor, the framework tests for: (1) the incidence of signs of vulnerability, but also considers; (2) the intensity of the signals, i.e. how their magnitude compares with their historical average or how consistent they are with known or suspected house price bubbles, such as for Toronto in the late 1980s and early 1990s; and, (3) the persistence of signals over time.

Generally, a situation in which we detect few signals with low intensity or lack of persistence is associated with a low degree of vulnerability. Conversely, as the intensity, number, and/or persistence of the signals increases, so does the evidence of imbalances in the housing market.

The framework takes into account demographic, economic, and financial determinants of the housing market such as population, personal disposable income, and interest rates to detect vulnerability. The framework also takes into account developments in both resale and residential construction markets.

The framework was developed on the basis of its ability to detect vulnerable housing market conditions in historical data, such as the house price bubble Toronto experienced in the late 1980s and early 1990s. The ability of the HMA to detect vulnerabilities relies on the assumption that historical relationships between prices and fundamental drivers of housing markets have not changed.

## Housing Market Assessment Factors

### Overheating

Overheating is caused by demand significantly and persistently outpacing the supply of housing. The sales-to-new listings ratio is used as an indicator to assess possible overheating conditions in the existing home market. To identify signs of overheating, the framework compares the sales-to-new listings ratio to thresholds. When demand is strong relative to supply, house prices typically grow at a faster rate. Sustained overheating on the existing home market may lead to acceleration in house prices for existing and new homes. However, as supply and demand begin to balance out, indicators of overheating (and acceleration) would begin to soften and house prices would gradually moderate.

### Acceleration in House Prices

Under balanced market conditions, house prices are expected to increase over time, in line with increases in households' cost of

living. House price acceleration occurs when the growth in house prices strengthens over time on a persistent basis. Acceleration in house prices over an extended period can cause their pace of increase to depart from the overall price inflation and eventually lead to overvaluation.

To assess acceleration in house prices, the HMA framework uses a statistical test\* that was developed to identify periods of accelerating asset prices.

### Overvaluation

Overvaluation is detected when house prices remain significantly above the levels warranted by fundamental drivers of housing markets such as income, population, and actual and expected financing costs.

The HMA framework uses combinations of different house price measures and models to estimate house price levels warranted by fundamental drivers.

The difference between observed house prices and their estimated levels consistent with housing market fundamentals allows for an estimation of the degree of over- and undervaluation. The use of different price measures and models improves the reliability of results.

### Overbuilding

Overbuilding is detected when the supply of readily available housing units significantly exceeds demand. In such a context, downward pressure on house prices would occur until the excess supply is eventually absorbed. To assess signs of overbuilding in the housing market, the HMA framework uses two indicators that relate to the supply of readily available housing units: the rental vacancy rate, and the inventory of completed and unsold housing units per 10,000 population. The HMA framework compares the current level and recent trends in these indicators with thresholds.

**Note 1:** Colour codes indicate the degree of market vulnerability. The HMA reflects a comprehensive framework that not only tests for the presence or incidence of signals of imbalances (that is, how far the indicator is from its historical average), but also considers the intensity and the persistence of these signals over time. Generally, low intensity and persistence are associated with a lower vulnerability. As the number of persistent signals increases, the evidence of an imbalance increases.

**Note 2:** Results at the CMA level are not segmented by housing type or neighbourhood. They represent an assessment of the entire CMA. However, specific CMA reports provide further detailed analysis of these markets.

**Note 3:** The colour scale extends to red only for those factors that have multiple indicators that can identify imbalances. As a result, only overvaluation and overbuilding can receive a red rating, since they are assessed using more than one indicator.

**Note 4:** To ensure the framework is as current as possible, on a regular basis, we undertake a model selection process whereby our house price models for overvaluation are tested for statistical significance at the national and CMA level. The result of this process may change the number of indicators showing vulnerability from the previous assessment.

## Housing Observer Online

Featuring quick reads and videos on...

- Analysis and data
- Timely insights
- Updates to housing conditions and trends & *much more!*

All links can be shared in social media friendly formats!

The screenshot displays the Housing Observer Online website. At the top, there's a navigation bar with the title 'HOUSING MARKET INFORMATION PORTAL'. Below it, several article cards are visible, each with a date and a brief description. For example, one card dated 'JUNE 23, 2015' says 'The HMI Portal provides reliable and impartial housing market reports, data and analysis.' Another card dated 'AUGUST 04, 2015' is titled 'An alternative water ready home — what's the plan?'. A third card dated 'AUGUST 20, 2015' says 'We have to learn to be flexible... and so does our housing'. A fourth card dated 'JULY 04, 2015' asks 'What is a condo?' and lists options: a) An apartment, b) A single family home, c) A townhome, d) All of the above. At the bottom of the screenshot, there's a red banner with the text 'Subscribe today to stay in the know!' and the URL 'www.cmhc.ca/observer'. Below the banner, there are more article cards, including one dated 'MAY 2015' about 'CMHC 2015 Mortgage Consumer Survey' and another dated 'JUNE 2015' about 'Own Their Future: Learn more about Millennials in the Housing Market'.
