

Housing Conditions of Persons with Disabilities

INTRODUCTION

Some 3.8 million Canadians, or nearly 14% of the population aged 15 or older, reported having a disability¹ in 2012; their likelihood of being in core housing need was more than 60% higher than that of persons without disabilities. This Research Insight examines the housing conditions of persons with disabilities using data from the 2012 Canadian Survey on Disability (CSD)².

FINDINGS

- In 2012, 549,500 persons with disabilities (or 15.3%) were living in households in core housing need compared to 2,082,700 persons without disabilities (or 9.2%) (see figure 1). Prince Edward Island had the lowest incidence of core housing need for persons with disabilities (11.0%); Nunavut had the highest (41.9%).
- The incidence of core housing need for persons with disabilities living in owner households (7.5%) was much lower than for those living in renter households (34.2%). A similar pattern was true for persons without disabilities, but the difference in the incidences was less pronounced (5.2% and 21.9% respectively).
- Of persons with disabilities living in subsidized housing, 42.3% were in core housing need compared to 34.1% of persons without disabilities living in the same type of housing. Notable provincial differences in incidences of core housing need in various tenure existed (see figure 2).
- Disabilities related to pain, flexibility and mobility were the most common; this was true regardless of the core housing need status. For all types of disabilities except hearing, the prevalence of a particular disability type was higher among persons living in core housing need than those not in core housing need (see figure 3).
- Thirty per cent of persons with disabilities in households in core housing need were classified as having a very severe disability; another 26.9% were classified as having a severe disability. The incidence of having a very severe and a severe disability was lower among persons not in core housing need (24.7% and 21.9%, respectively).
- Persons with disabilities aged from 35 to 44 had the highest incidence of living in households in core housing need (26.6%) followed by an incidence of 19.0% for persons with disabilities aged from 15 to 24. This compared to 9.6% and 11.7% for persons without disabilities of the same age groups respectively. The lowest incidence of living in core housing need (10.8%) was seen among persons with disabilities who were 65 to 74 years old. Differences in the incidence of core housing need among persons with and without disabilities in various age groups were more pronounced among renters than owners (see figure 4).
- Women with a disability had a higher likelihood of living in a household in core housing need than men with a disability. Some 16.9% of females with disabilities lived in households in core housing need compared to 13.2% of males with disabilities. A similar pattern was true for females without disabilities (10.5% and 8.0% respectively).
- Persons with disabilities living in female lone-parent households experienced a higher incidence of core housing need (34.7%) than those in any other type of living arrangement. For persons without disabilities in female lone-parent households the incidence of core housing need was 26.4% (see figure 5).

¹ Persons are considered to have a disability if they report a difficulty or impairment due to a long-term condition or health problem and they report that they are limited in their daily activities as a result of their condition. For further details, see Statistics Canada's publication "[Canadian Survey on Disability, 2012: Concepts and Methods Guide](#)."

² The survey population comprised all Canadians aged 15 or older as of May 10, 2011, who were living in private dwellings in the ten provinces and three territories. Persons living on a First Nation Indian reserve, as well as those living in collective dwellings were not included in the survey. Findings presented in this Research Insight are based on the population living in households assessed for core housing need.

Persons with disabilities are more likely to live in households in core housing need than persons without disabilities.

Figure 1: Number and percentage of persons living in households in core housing need, by disability status and province and territory, 2012

	Persons With Disabilities		Persons Without Disabilities	
	#	%	#	%
Canada	549,500	15.3%	2,082,700	9.2%
Newfoundland and Labrador	8,400	14.4%	23,400	6.6%
Prince Edward Island	2,000	11.0%	5,600	5.9%
Nova Scotia	24,900	17.9%	46,250	7.7%
New Brunswick	12,100	12.5%	29,800	6.1%
Quebec	73,600	12.3%	428,700	7.7%
Ontario	239,250	15.2%	900,600	10.4%
Manitoba	17,400	12.5%	55,950	7.6%
Saskatchewan	19,850	18.2%	51,800	8.7%
Alberta	51,450	14.8%	183,800	7.6%
British Columbia	98,750	19.3%	341,550	11.5%
Yukon	700	18.4%	2,450	10.7%
Northwest Territories	450	17.3%	4,000	13.4%
Nunavut	650	41.9%	8,700	41.9%

KEY TERMS

A household is in **core housing need** if its housing is below one or more of the adequacy, suitability and affordability standards, and it would have to spend 30% or more of its before-tax household income to access local housing that meets all three standards.

Adequate housing does not require any major repairs, according to residents.

Suitable housing has enough bedrooms for the size and makeup of resident households, according to National Occupancy Standard (NOS) requirements.

Affordable housing costs less than 30% of before-tax household income.

Households assessed for core housing need comprise private, non-farm, non-band, non-reserve households with incomes greater than zero and shelter cost-to-income ratios (STIRs) less than 100%.
