THE SYSTEM OF NATIONAL ACCOUNTS

In Canada, the National Accounts have been developed since the close of the Second World War in a series of publications relating to their constituent parts. These have now reached a stage of evolution where they can be termed a "System of National Accounts". For purposes of identification, all publications (containing tables of statistics, descriptions of conceptual frameworks, and descriptions of sources and methods) which make up this System will now carry the term "System of National Accounts" as a general title.

The System of National Accounts in Canada consists of several parts. The annual and quarterly Income and Expenditure Accounts (included with Catalogue Nos. carrying the prefix 13) were, historically speaking, the first set of statistics to be referred to with the title "National Accounts" (National Accounts, Income and Expenditure). The Balance of International Payments data, (Catalogue Nos. with prefix 67), in their more summary form, are also part of the System of National Accounts and they, in fact, pre-date the Income and Expenditure Accounts.

Greatly expanded structural detail on industries and on goods and services is portrayed in the Input-Output Tables of the System (Catalogue Nos. with prefix 15). The Indexes of Real Domestic Product by Industry (included with Catalogue Nos. carrying the prefix 61) provide "constant dollar" measures of the contribution of each industry to gross domestic product at factor cost. Inputs and outputs are related in Productivity Studies (Catalogue Nos. with prefix 14).

Both the Input-Output Tables and Indexes of Real Domestic Product by Industry use the establishment as the primary unit of industrial production. Measures of financial transactions are provided by

the Financial Flow Accounts (Catalogue Nos. with prefix 13). Types of lenders and financial instruments are the primary detail in these statistics, and the legal entity is the main unit of classification of transactors. Also, provision is made in the System for incorporation of balance sheet (wealth) estimates when such data are sufficiently developed.

The System of National Accounts provides an overall conceptually integrated framework in which the various parts can be considered as interrelated sub-systems. At present, direct comparisons amongst those parts which use the establishment as the basic unit and those which use the legal entity can be carried out only at highly aggregated levels of data. However, the Dominion Bureau of Statistics is continuing research on enterprise-company-establishment relationships; it may eventually be feasible to reclassify the data which are on one basis (say the establishment basis) to correspond to the units employed on another (the company or the enterprise basis).

In its broad outline, the Canadian System of National Accounts bears a close relationship to the international standard as described in the United Nations publication, "A System of National Accounts" (Studies in Methods, Series F., No. 2, Rev. 3, Statistical Office, Department of Economic and Social Affairs, United Nations, New York, 1968). In the future, a document on the conceptual framework of the Canadian System of National Accounts will be prepared for publication by the Dominion Bureau of Statistics. This document will furnish the broad theoretical outline of the System. The finer conceptual details, the statistical tables, and the descriptions of sources and methods as they pertain to the individual parts of the System, will appear in the various regular and occasional publications relating to those parts.

SYMBOLS

The following standard symbols are used in Dominion Bureau of Statistics publications:

- .. figures not available.
- ... figures not appropriate or not applicable.
- nil or zero.
- amount too small to be expressed.
- p preliminary figures.
- r revised figures.

A FINANCIAL COMMENTARY

Second Quarter 1970

General Economic Conditions

The second quarter of 1970 showed further declines in both economic growth rate and inflationary pressures. An essentially flat GNP performance was not really unexpected in the light of wide ranging and persistent efforts to stabilize the economy. The success of these measures was remarkable when compared to statistics from the United States, where the rate of economic slow-down and also price increases exceeded the Canadian experience. Growing unemployment, however, tempered these successes. An increase of 0.5 per cent in the price deflator was a significant achievement as it represents only half of the rate of increase in the first quarter and less than one third of that in the fourth quarter of 1969. Conclusive evidence that inflation is on the retreat is perhaps still not available. A change in the composition of demand may affect the growth rate of the implicit GNP deflator, without basic changes in price patterns; however, its falling trend over three quarters and some recent easing in consumer prices are undeniably hopeful signs.

Among the components of demand, a decline in investment spending was the factor most responsible for the economic slow-down. The moderation in investment spread to all forms of capital formation and involved construction activities as well as machinery and equipment. The growth in the export balance on external transactions was more modest than in the first quarter of the year and combined with increased consumer and government spending did not offset the impact of lower levels of capital formation.

The two major components of income, labor income and corporate profits reflected the general climate. The growth in personal income hardly exceeded 0.5 per cent and after-tax disposable income actually fell about 1 per cent. Corporate profits also indicate declines on a seasonally adjusted basis and appears to have dropped below their fourth quarter 1969 levels.

There were several significant developments in the financial economy. The accelerating influx of foreign exchange resulting from favourable Canadian export performances and also the relaxation of United States credit conditions constrained our government's freedom of pursuing its economic policy. The freeing of the Canadian dollar exchange rate was mainly designed to relieve the pressure on the depleted government cash balances (which shifted into the hands of the general public) and also to help moderate prices by making imports cheaper and exports more expensive. It may very well be that the lag factor inherent in this development together with the normally delayed impact of the contraction of personal disposable income will further

moderate price increases in the latter part of the year. The direction of costs will be an all important factor in the determination of price movements.

The combination of corporate liquidity requirements – associated with a flurry in the commercial paper market resulting from the Penn-Central bankruptcy – and the manifest sluggishness of the economy motivated an easing trend in the money supply and the injection of \$100 million by the federal government in the housing market.

To interpret the general direction of monetary policy by analysing money supply is a delicate task. The expansion of money supply is but one indicator and its growth rate is relevant only within the parameters defined by certain other variables. The actual rate of price increases affects real balances and some analysts discount the nominal expansion of money stock by the price changes to measure the real rate of growth and the stimulus such expansion imparts to the economy.

Currency outside banks and deposit liabilities of the chartered banks (M_2) held by the general public increased by \$1.2 billion in the second quarter (on a seasonally adjusted basis). The figure for the corresponding 1969 quarter was a decline of \$0.1 billion. While it would appear that, GNP and price performances taken in account, the posture of monetary policy has indeed changed; much of this effect is due to the shift of government cash balances into the hands of the general public.

The trend towards lower interest rates in the first quarter of the year, particularly in short-term instruments, continued at a reduced pace in the second quarter. Long-term rates resisted, however, the declining trend of interest rates very strongly, and the McLeod, Young, Weir 10 industrial bond rate stood at 9.24 per cent at the end of June which was exactly the point it reached by the end of March. Treasury Bill rates responded most to a more relaxed atmosphere and dropped 106 basis points in the second quarter. This compares with a drop of only 58 basis points in finance paper, undoubtedly reflecting a temporary shock the market suffered when Penn-Central a very large debtor so suddenly declared bankruptcy.

Interest rate developments, particularly in the medium and long-term structure, were influenced by factors other than the general credit conditions. The decline of the stock market, which reached its trough in the second quarter, caused some institutional and private

funds to flow back into fixed income instruments after a period of disillusionment with this type of investment. The pent-up demand for funds by corporations, however, absorbed the available long-term money very swiftly, preventing interest rates from responding to an easier trend. An eventual reaction to slowing demand pressure would likely reduce bond yields to rates where they compensate for lower levels of expected price increases.

There were two bank rate reductions within three weeks signalling the monetary authorities' desire to achieve generally lower levels in the Canadian interest rate structure. The 1 per cent drop in the bank rate in May and June was inspired by the foreign exchange developments.

It is significant to note that both lending and borrowing by the non-financial sectors have declined by close to \$800 million respectively in the second quarter in comparison with the second quarter 1969 period. Although credit started to become very tight in the spring of 1969, it took some time for the tightening measures to filter through the entire economy and the financial markets as a whole. The trend shown by these figures demonstrates that while fund flows shift easily between institutional deposits and direct lending the overall total is constrained by the state of the economy. In other words the competitiveness of the financial markets and interest rate developments may influence the relative proportions of intermediation but the size and volume of total financial activity is primarily influenced by consumption and investment.

² See Tables 3-1 and 3-2, Category 1500.

³ See Tables 3-1 and 3-2, Category 2100.

Non-financial private corporations. — A significant feature in the second quarter of this year was the reduced rate of gross-fixed capital formation in comparison with that of the corresponding 1969 quarter. Investment in new physical capital of \$1,880 million was approximately \$240 million less than the corresponding 1969 amount. Capital spending is frequently regarded as the most important demand variable in economic growth. Some observers of the economic scene view with alarm when capital investment becomes sluggish because of its impact on employment and future growth. A concern with the inflationary effects of capital shortage is also often expressed. However, studies of business cycles indicate that capital formation bottoms out after the trough in economic activity and turns up normally only after recovery is well under way. In addition to this lag factor, attention is drawn to the

very high ratio of capital spending in the latter half of the sixties. This produced a fairly substantial pool of productive facilities which was also accompanied by an accelerating rate of inflation. Thus attempts to maintain a very high growth rate of capital investment may also create inflationary dangers.

Statement 1 illustrates the dramatic increase in capital formation by the non-financial private corporations until quite recently.

In 1969 the sector spent 50 percent more on productive facilities than in 1965 while the whole economy increased its investment by only 30 per cent. The sector's capital formation in relationship to total investment of the economy shows an upward trend, while the contribution of total investment to GNP moves in the opposite direction. This suggests that non-

financial private corporations, the mainstay of the goods producing economy have expanded their productive capability in absolute terms as well as maintained their high level of capital investment much more than other sectors of the economy. Furthermore, the downward

trend since 1966 of investment relative to total spending (GNE) seems to support the view that, at least in the medium term, the maintenance of a certain relative level of investment does not decisively influence economic growth.

STATEMENT 1. Capital Formation and Long-term Financing Pattern of the Non-financial Private Corporations (Sector III)

Year and quarter	Fixed capital formation of Sector III 1	Total fixed capital formation 2	Long-term financing of Sector III ¹ 3	Total long-term financing ² 4	GNP at market prices 5	Share of Sector III to total		
						%	%	%

II	1,881	4,091	236	1,335	20,744	46.0	17.7	19.7

¹ Long-term financing of Sector III is defined as net increase in equity (3512 + 3520 - 2512 - 2520), mortgages (3410) and bonds (3424).

² Total long-term financing is defined as financing through bonds, mortgages, stocks and corporate claims for all sectors except "Rest of the world" sector.

Source: Tables 3-1 to 3-4, Financial Flow Matrices (See *Financial Flow Accounts*, DBS Catalogue Nos. 13-002 for the years 1967-70 and 13-530 for the years 1962-66), and Tables 7-29, 7-34 and 7-40 (category tables), DBS *National Income and Expenditure Accounts 1926-1968* and DBS Catalogue No. 13-001.

The second quarter is normally a period when the sector as a whole shows increased activity. Inventories grow more slowly with compensating heavier investment in trade credit. Liquidity instruments, most of all cash balances, are increasingly relied upon to finance current operations. The concept of net trade credit (receivable minus payables) has many loopholes when applied on an aggregate basis; however, it may have some usefulness as an indicator of sector liquidity. There appears to be no alarming change in the rate of growth in the funds tied up in trade credit. To wit:

II Q. 68 II Q. 69 II Q. 70
millions of dollars

Net trade credit
changes	408	310
		458

In spite of the fact that the second quarter of 1970 was, in a relative sense, less buoyant than those of the preceding years, the increase in trade credit does not

seem to be unduly large. The first quarter amount of net trade credit is much more substantial, resulting in a considerably higher half-yearly figure compared with the first two quarters of 1969. Only examination of levels rather than flows can reveal whether or not the cumulative effect has had a substantial impact on the sector's liquidity.

On the financing side the upsurge in bond financing, although remarkable, is in line with the bond market trend emerging recently. More unusual is that both bonds and commercial papers moved in the same direction. The increase of about \$280 million in bond financing in combination with an over \$160 million short-term paper financing might be interpreted as a substitute for the badly sagging equity capital inflow. It has been more usual in the past to use short-term paper for bridge financing until the long-term debt capital has been arranged. Commercial paper also plays a role in complementing bank lines of credit. The use

of commercial paper to replace equity capital is, however, an unconventional role for this instrument and it may indicate the adaptiveness of users of capital, as not only the instruments and institutions, but the application of the instruments change.

The growth in bank loans has been much less spectacular than in the tight credit squeeze of the second quarter of 1969. The less than \$250 million flow of bank loans was likely used in their more conventional role of financing receivables rather than as it happened a year ago, when the \$500 million growth in bank accommodation was a substitute for extremely scarce long-term debt capital.

Chartered banks. — Earlier references to the modest increase in money supply that took place in the second quarter of this year, and its relationship to the economic conditions are best analysed in the context of the banking sector. This sector generally reflects the influence of the prevailing economic climate fairly closely. The atmosphere was perhaps a bit more expansionary in this quarter than in any of the preceding year. Signs of substantial change in the rate of economic growth show up first in the financial markets, on both the downward and the upward swing of the cycle. The goods and services producing economy responds to the financial economy with some delay. Even then, the reaction is not uniform throughout the economy. Those areas of spending affected first by monetary restraints such as consumer and government spending are also ordinarily the first to expand again when monetary restraint is relaxed.

The banks' deposit liabilities increased by more than \$650 million in the second quarter. This amount should not be compared with the second quarter of 1969, the period when the screw was really tightened. A comparison with the corresponding period of 1968, however, indicates that the banks' ability to participate in the credit expansion has been, at least partially, restored. It may be in line with the general pattern, outlined above, that one of the first areas to benefit was consumer credit. The more than \$160 million increase in consumer loans comes after three quarters of drastic reductions. In this perspective, it is a turning point of considerable significance, although the amount itself has not yet rebounded to the previous levels of activity.

The \$310 million decline in bank loans seems to support the view that much of the ease generated was the product more of slack demand than of increased supply. This condition allowed the banks to replenish their liquidity by increasing their treasury bill and government of Canada bond holdings by almost \$440 million and \$230 million respectively.

When considering the trend in chartered bank asset growth and its reflection of monetary policy, one fact stands out quite conspicuously. The relatively easier tone mentioned above is really the result of

changes in the more broadly defined money supply (M_2). Currency and demand deposit (M_1) grew very little in this period. In addition, much of the growth in other types of deposits was caused by the depletion of government cash balances. One could perhaps conclude that, in this period, the trend of the narrow concept of money supply describes better the real stance of monetary policy.

Sales finance and consumer loan companies. — After the dramatic contraction of consumer credit in the first quarter of this year, the considerable increase of almost \$80 million in consumer financing in the second quarter may be a sign of easier monetary conditions. The share of the market serviced by the industry dropped, however, in comparison with the second quarter of 1969. In the current period, approximately 3.5 per cent of expenditures on durable and semi-durable goods was financed by the sector, whereas this ratio was almost 7 per cent in the corresponding 1969 period. The share of banks in this market fell too, although to a somewhat lesser extent, from roughly 10.8 per cent to 6 per cent. As these two sectors are the main suppliers for consumer credit, it may be concluded that consumer spending was affected less than credit, and personal savings were depleted to provide the necessary funds.

The second largest asset item on the sector's balance sheet is the "other loan" category. A large part of this constitutes wholesale financing (floor-plan financing) and is a sensitive barometer with which to measure business conditions in general, and as they apply to the sales finance industry in particular. At times when monetary conditions are easy and competition very keen, large amounts are invested in this asset in order to acquire new accounts or protect existing ones by financing dealers at favourable terms. On the other hand, during tight monetary conditions, sales finance companies invest their available resources in the much more profitable consumer credit and withdraw funds from dealers. The little over \$50 million increase in this other loan category compares with a \$14 million decrease in the second quarter of 1969 and a \$100 million increase in the corresponding 1968 period. Its trend appears to reflect the prevailing monetary conditions indeed. The increase in this quarter coming on the heels of a fairly substantial investment, more than \$120 million in the first quarter, suggests that the sales finance industry is beginning to follow a moderately expansive policy and competition is becoming keener again.

The financing of the sector raises interesting points. Fund requirements were satisfied mostly by equity type capital (much of it by non-arm's length loans) and long-term debt funds. Almost \$100 million was secured through these means, while no recourse was made to bank lines of credit and more than \$30 million of short-term paper was retired. The Penn-Central bankruptcy may be part of the explanation.

One would have expected this industry to play the short-end of the market (including bank loans) at a time, when a downward adjustment in long-term rates was becoming a more realistic anticipation than it has been for some considerable time.

Trust and mortgage loan companies. — Trust companies reported a slower rate of growth in both profits and assets in the second quarter of 1970. This was in line with some of the earlier predictions of trust company executives. The business handled by the different enterprises varies a great deal and consequently interest rate developments have varying impacts on these companies. The industry on the whole stands to benefit from an apparent end to the interest rate spiral. Its lending policy is likely to be geared towards investing as much as possible in mortgages while rates are still high. With a more rapid turn-over of its liabilities than of its mortgage portfolio the industry's profit performance will be improved when the rate structure eventually eases.

If one views the asset side of the sector's balance sheet, the flows of the second quarter do not seem to entirely validate the above logic. An almost \$130 million investment in mortgages represents approximately the same magnitude as the second quarter 1969 amount, and exceeds by more than \$40 million the investment of two years ago. This item on the balance sheet is fairly well in line with expectations, however, the high investment in cash and foreign currency, close to \$90 million, may suggest borrower resistance to prevailing interest rates, creating some marketing problems for the industry. Reductions of little over \$90 million in holdings of government bonds and foreign investments by trust companies, may be indicative of a desire to take advantage as much as possible of higher yield potentials offered by the mortgage market. An increase of more than \$20 million in corporate bonds is not only a sign of returning confidence in fixed income securities, but also supports the view that resources were directed towards the two instruments (mortgages and corporate bonds), which yielded least to the downward pressures on interest rates.

The sources of funds used by the sector came, overwhelmingly from deposits. The more than \$180 million increase in the sector's deposit liabilities, although a sharp drop from the abnormally high \$310 million in the first quarter, nevertheless represents a good average growth rate. The sector's ability to attract funds from its depositors is due to a combination of factors. Interest rates play an important role, but flexibility of term is of growing significance as well. The once standard five-year term on certificates of deposits was step by step reduced during the recent interest rate spiral, and according to some estimates the average term has lately been less than two years. This favoured the depositor while he expected increases in rates and allayed his fears of being locked in for a long time in "low" rates. It may however, turn in favour of the industry by allowing a roll over at the reduced rates in the near future.

In the mortgage loan sector an almost \$70 million increase in the mortgage portfolio appears to be in line with the second quarter 1969 performance, but (as in the trust company sector) outstrips very considerably the amount of two years ago. It is in fact more than double that of the corresponding 1968 period. Borrower resistance does not seem to be much of a problem for the mortgage loan companies, as more than \$20 million of cash holdings were liquidated for investment in mortgages. Borrower resistance may vary perhaps with regional and other special circumstances, as even in the trust company sector some companies did not experience it at all, while others appear to have been affected.

The size of the sources of funds used to finance the sector's activities are of considerable interest. The more than \$120 million in deposits is a record for the sector. It is roughly twice the size of the corresponding 1969 amount, or of most of the higher quarterly figures in recent years. The magnitude of this increase is dramatic indeed and not likely to be explainable by rate considerations only. The reduction of almost \$40 million in other loans may be related to this increase in deposits and it might represent a change in classification of loans to deposits by some of the respondents.

Mutual funds. — The second quarter performance of the stock markets offers an explanation for changes in the sector's balance sheet. The self-accelerating forces of a declining market affect both the holder and the would-be-holder of shares in a similar way. Those who own shares are inclined to sell and protect themselves from suffering even heavier losses, and those who want to buy delay in the hope that the future may offer still better opportunities. This, while accelerating the decline of the markets, also leads to heavy mutual fund share redemptions. Stock market indices by themselves do not offer a full explanation for the pattern in fund share sales. The almost \$40 million decline in the second quarter of 1970 as compared to the flow of funds in earlier periods is influenced by a number of intangible factors in addition to actual swings in stock prices. The first quarter 1970 Financial Flow Accounts review noted that retirement saving fund sales, with their tax saving implications may have boosted fund sales of that quarter substantially, whereas this stimulus was absent in the second quarter.

The very heavy cash position, more than \$100 million increase in liquidity was derived mainly from disposing of \$110 million in foreign investments and short-term paper holdings. The flow of funds into Canadian stocks increased somewhat, although domestic stock prices were not much better than foreign prices. The question whether or not the disenchantment with foreign stocks was due only to the poorer performance of the U.S. economy or also to the anticipated impact of the proposed tax legislation, is difficult to answer now. A stabilizing economy with improved stock prices in both countries may, when it comes, give an answer to this question.

The reductions of close to \$20 million in bonds, — government, provincial and corporate — is but one more unexplained phenomenon on the financial scene. Under the existing circumstances an increased commitment in these relatively high-yielding instruments might have been expected. This would be particularly true in the case of retirement funds, whose income is tax sheltered. As is often the case after a market shake out, when conditions start to improve the investors are very cautious and conservative. Interest in blue chips and high quality bonds may increase to the point where venture capital becomes practically unavailable. The so-called glamour funds, while suffering most heavily in the recent bear market contributed, however, to pooling and supplying funds to the rapid development of certain segments of our economy.

Governments. — One of the dominating features of the second quarter was the acceleration in the inflow of foreign currency and the resulting unpegging of the Canadian dollar. These factors were also major influences on the federal government's asset and debt management. The weight of the problem created can be best illustrated by the fact that the government had to commit almost a billion dollars between the beginning of April and the end of May — to hold down the exchange value of our currency. This amount includes forward commitments as well as spot purchases. An additional development was an increased transfer payment commitment to the provinces of almost \$300 million agreed upon at the federal-provincial conference in Winnipeg. The increases in government security issues are not evident from the published figures. Attention is drawn to the fact that the \$330 million decline in the government's bond liability does not reflect a more than \$520 million new bond issue delivered on July 2nd but sold in June. There were substantial reductions, more than \$110 million, in the government's holding of its own bonds. Much of this was caused by the depletion of Unemployment Insurance Commission funds due to the rising unemployment benefit claims. The \$410 million increase in treasury bill issues is an unusually high figure for any quarter or even for a full year. Since 1962 there has been no period in which issues came even close to this amount. It includes a special issue of \$250 million designed to provide funds for the government to finance the Exchange Fund Accounts' foreign currency purchases. Most of this issue was taken up by the banking system whose resultant increase in liquidity was counterbalanced by correspondingly increased secondary reserve requirements.

The largest flow on the asset side of the federal government's balance sheet is the billion dollar claim figure. More than \$720 million of this amount went to the Exchange Fund Account and approximately \$130 million was injected in the mortgage market through Central Mortgage Housing Corporation.

The savings of provincial and municipal governments are much less affected by the federally directed monetary and fiscal policies than that of the govern-

ment of Canada. The developing pattern of surpluses rather than deficits for these lower levels of governments, have continued in the second quarter and showed further increases. There was a slight increase in capital formation and a \$70 million in net saving. The second quarter net lending position increased to almost \$190 million, approximately 40 per cent over that of the 1969 second quarter.

The cash position of these levels of governments has shown further growth amounting to more than \$150 million. This was in contrast to the 1969 second quarter, when cash held by the sector decreased by \$70 million. It would probably be incorrect to attribute general economic significance to this movement. The change in the direction of the movement and its magnitude was largely influenced by changes occurring in two provinces.

It is perhaps of greater import that advances to government enterprises and mortgages lent by provincial housing corporations have slowed down considerably. A comparison between the corresponding 1969 and 1970 second quarter shows that the total increase of these two categories dropped to less than half, from almost \$240 million to somewhat over \$90 million. In addition to the mortgage loans, advances to government enterprises are also used mainly for capital formation and their restrained growth is associated with the sluggishness in construction activities in general.

Investment in provincial and municipal debt securities by the sector is one way to finance local projects by higher levels of governments in addition to satisfying sinking fund requirements of the various debt obligations. This latter use of funds is relatively stable and most of the drop from more than \$100 million in the second quarter of 1969 to about \$50 million in the current period, is due to a corresponding change in the pace of these activities. Even more conspicuous is the change in the holdings of "other Canadian bonds" which were virtually unchanged in contrast to a more than \$70 million increase in the second quarter of 1969. Much of this investment represents funds provided to universities and is also related to construction activities.

The bond market maintained its dominant role in supplying funds for the sector's needs. Out of a net increase of almost \$340 million provincial bonds (gross amount was close to \$410 million) nearly \$90 million was supplied by the U.S. and Eurobond markets. The average borrowing rate was 8.6 per cent with fluctuations between 8 per cent, represented by the Canada Pension Plan funds and 9.6 per cent which was the average contract rate of Eurodollars.

The following schedule offers an interesting insight in bond market behaviour. It shows how the inflationary pressures adversely affected fixed income securities and also indicates a rebounding attraction of these instruments commensurate with the success of the anti-inflationary measures.

Rest of the world. — In the second quarter of 1970 the very large inflow of foreign currency dominate the picture in the "Rest of the world" sector. The impact of these events had the effect of changing the composition of the capital account. Net foreign investment in Canadian securities with the exception of short-term paper has dropped from the levels of the first quarter of this year and also from those of the second quarter of last year. The largest drop, almost \$410 million occurred in federal government bonds largely affected by special retirements but investment in corporate stocks also fell by almost \$80 million. Fund flows into corporate and provincial government bonds moderated very substantially, although the less than \$20 million investment in provincial government bonds does not include some issues, which are reported internationally as loans and are incorporated in the "other financial asset" category.

With a dramatic change in Canada's trade position and the not unrelated decline of foreign investment in our security markets, it is of some significance that an active inflow of funds from foreign parents to their Canadian subsidiaries persisted in the quarter. The more than \$220 million in this form is very close to the amounts obtained in the corresponding periods of 1968 and 1969 and seems to indicate, that the economic slowdown has had little effect on the amount of non-arm's length financing these affiliates have been using. As the foreign parent is often a residual source of funds, the size of the fund flow reflects the unsatisfied capital needs of the Canadian subsidiary and also the state of the domestic capital markets.

Much of the upward pressure on the Canadian dollar was due to more muted growth of addition to the high demand for our goods. A slight shift in the composition of exports in favour of raw materials added to the slackening import demand which developed primarily as a result of the more muted growth rate of the Canadian economy.

Supply of and Demand for Funds

The progressively increasing pressures in the nation's financial markets, which persisted for the past year and culminated probably in the first quarter showed slight indications of moderation in the second quarter.

Good news, such as the first hopeful signs of consumer price moderation, was mixed with the unwelcome but perhaps unavoidable news of slackening production and employment. The distressing plunge of the equity markets was short lived but even after a quick recovery the overall performance of the stock market has been displaying at best a distinct lack of exuberance. Credit markets demonstrated great resiliency by withstanding the added pressures resulting from the reverses suffered by equities and short-term paper. The impact of these factors was quite dissimilar. Equity capital on the one hand had to be replaced by other types of instruments as stock prices did not attract investors. In the case of short-term paper on the other hand, the after effect of the Penn-Central bankruptcy was felt mostly in a disruption of the downward trend in short-term rates.

Issuers of prime commercial paper can, as a rule, borrow money at rates not exceeding $\frac{3}{4}$ percentage point above treasury bill rates. Shocks, like the Atlantic Acceptance collapse, precipitated wider spreads. In the case of the Canadian finance company's debacle this reached 2 percentage points. It is perhaps typical of our times, that the financial collapse of this American railroad company, which aroused much less of a furor in Canada, than Atlantic Acceptance did five years ago, nevertheless caused an even wider spread amounting to $2\frac{1}{4}$ percentage points.

When financing patterns of the second quarters of 1969 and 1970 are compared it should be borne in mind that, while this comparison minimizes seasonal factors, it involves two periods which are quite dissimilar from a cyclical point of view. The second quarter of 1969 was the beginning of the big credit squeeze, but the second quarter of 1970 may be recognized as the beginning of the thaw. In view of this it is perhaps more meaningful to parallel developments of the first two quarters of this year. Because of the presence of strong seasonal influences, however, only basic features will be dealt with.

One of the major changes that have taken place is in consumer credit. The unusually large contraction of the first quarter is contrasted with a more normal increase in the second quarter, representing almost 6 per

cent of total fund demand. It is noteworthy that currency and deposits of all deposit taking institutions, the broadest definition of money supply (M_3), increased its share to more than 27 per cent from 3 per cent in the first quarter and 17 per cent of the second quarter last year. A decline in equity capital from both the first quarter of this and the second of last year is not an unexpected development. The share of equity capital declined from 27 per cent in the first quarter to a negative ratio of 1 per cent in the second quarter.

The changes in the sectors supplying these funds are characteristic. Chartered banks have begun to re-enter the financial markets as the growth of money supply and the abating trend of disintermediation permitted them a return to more active participation in the supply of credit. Their share among the sectors grew to over 14 per cent from a decline of more than 5 per cent in the first quarter. As a corollary, the role of near-banks dropped to 26 per cent from almost 33 per cent, although in absolute amounts, credit supplied by non-bank financial institutions increased substantially and at \$1,550 million came close to the second quarter 1969 amount.

The roles of the various securities in supplying the economy with its needed funds are undergoing a certain change. Investment analysts have tended to focus mostly on income statements in the last decade. This was a

period of very fast economic growth with strong inflationary overtones in its second half. It resulted in depleted liquidity, high interest rates and even a few shocks such as those mentioned earlier. It may very well be that in the years ahead, analysts will scrutinize balance sheets just as carefully as they have the income statements in the past. Poorer corporate risks may find it much harder to go to the debt markets and may have to lean more heavily on equity financing. The beating many investors took in the recent bear market may force a better balance between growth and underlying security.

Credit markets supplied, to an essentially stationary economy, nearly 6 billion dollars. This represented a very considerable (almost 10 per cent) increase over the second quarter of 1969. The shifts in instruments suggest a tendency towards a return to normal. The relative proportions do not yet show settled conditions, but a returning vigour in the equity markets might assist this process. The disturbed proportions among the various sectors supplying the economy's credit needs show a similar trend of re-orientation. The time may be approaching when the production of goods and services is financed by customarily and appropriate instruments and the suppliers of funds channel their investment in a fashion which allows the pooling of capital and the sharing of risks in a most productive way, devoid of the dislocations caused by spiraling inflation.

SOURCE: Tables 3-1 to 3-4, Financial Flow Matrices.

TECHNICAL NOTES

(a) The tables reflect a measure of conceptual inconsistency in the presentation of data due to divergence in data sources. In the non-financial private corporation sector certain specific amounts owing to foreign parents by Canadian subsidiaries are shown as "corporate claims", while the rest of the world sector include these in the "other assets" category. In addition, trade transactions with foreign parents are shown gross in the non-financial business corporation sector, whereas, the rest of the world sector net these out.

(b) Category 1800, Net Purchase of Existing Assets in Sector III, "Non-financial Private Corporations"

represents the difference between the residual of National Income and Expenditure Accounts' Gross Fixed Capital Formation as applied in this sector, i.e. total business capital formation less capital formation of Sectors II, and IV to IX and increments in fixed assets as indicated by the sector balance sheet flows.

(c) In previous publications the method used in Sector III (see note (b)) for category 1800 was applied in Subsectors IV.1 and IV.2. This has been discontinued and starting with the third quarter publication a new method will be applied to determine a more accurate estimate of purchases and sales.

MORTGAGE FINANCING AND STABILIZATION POLICIES

The purpose of this note is to examine the behavioural patterns of mortgage financing, broad policy measures in the fiscal and monetary fields and their impact on the volume of housing financing.

In the view of some economists, construction activities are expected to portray a contracyclical pattern. Because of the wide-ranging effect of construction on employment directly and on other industries, in a less direct way, housing is often used by government authorities to reflate the economy in downturns in combination with their pursuits of social objectives. The momentum thus generated carries over into other sectors of economic activity, such as consumer durables, and stimulates demand. As inflationary tendencies develop, cutbacks in construction might in turn become necessary. These economic activities are reinforced by the Government's influence on the mortgage markets.

This note will examine the three-year period between mid-1967 and the second quarter of 1970. This

is generally recognized as a period when the progressively increasing inflationary pressures were attacked and perhaps also checked by stabilization measures. The forces producing expansion in this period and the means by which restrictive policies affected it should, however, not be considered to have general applicability. Under different social and economic conditions the intent of policy measures may attempt to achieve different objectives.

Factors other than the cost and availability of credit account for a part of construction in general and residential construction in particular. The growth in the physical need for shelter is obviously a very basic determinant. The number of new family formations and the relative affluence of the population are also major factors. The relationship of the cost of housing to general price trends may be an important consideration as well.

	Family formation ¹	Per capita disposable income ²	Housing cost ³ (1961 = 100)	Consumer price index ³ (1961 = 100)
No.	\$			
1967	118,600	2,073	119.9	117.5

³ *Prices and Price Indexes*, (DBS Catalogue No. 62-002).

Some of the selected factors provided conditions fertile for a growing trend in residential construction. The period dealt with in this note was, all in all, one of considerable prosperity. Per capita personal disposable income has been growing, until recently, at a rapid pace and so has employment. On the other side of the ledger the rate of growth in family formation eased and the cost of housing grew much faster than the overall price levels. More recently the slowing growth rate of employment was accompanied by accelerating unemployment.

On the financial side the first two years of this period can be described as a time of relatively easy monetary and credit conditions, although with rising trends in interest rates.

The severe credit stringency of the third year is well known. Mortgage interest rates have responded sharply to the upward pushing forces. Controls exercised over National Housing Act mortgage rates have been gradually removed so as to permit the free flow of funds into this sector of the economy. The New Bank Act introduced certain institutional changes affecting the mortgage markets directly and the chartered banks became major suppliers of mortgage loans.

On the following pages attention will be focused on:

- (a) The role of mortgage financing in our financial markets.
- (b) The determinants for the supply of mortgage funds by financial institutions.
- (c) The impact of stabilization policies on mortgage financing.

(a) The Role of Mortgage Financing in Our Financial Markets

It has often been said about financial institutions that without them one main element of economic growth, deficit financing, would be difficult if at all possible. Their role of pooling and redistributing funds, risk and yields is carried out by different types of instruments. One of those instruments is the mortgage loan. Its direct claim on the underlying security and the normally easily assessable value of such security has rendered it for centuries the major vehicle for financing the acquisition of real property.

As a source of funds for borrowers, the mortgage market is larger than the provincial, municipal and corporate bond markets and most of the time even the federal bond market. It is larger than the stock or short-term money markets. Because of its size and the sources from which it draws funds mortgage financing plays a significant role in the formulation of the interest rate structure. The most important private lenders, such as trust companies, mortgage loan companies and life insurance companies put a very high proportion of their available funds into mortgages. This assures a relatively large and dependable flow of funds from this source. These institutions provide more than 50 per cent of the mortgage flows and as mentioned above (and shown by chart) they traditionally invest comparatively little in other types of instruments. Changes in credit conditions affecting the lending ability of these sectors will be directly transmitted to the housing market. On the other hand, mortgage lending by the chartered banks, as important as it may be for the mortgage markets, represents a relatively small portion of the total credit supplied by the banks and as a result is less sensitive to monetary conditions.

Statement 3 reveals the changes and trends within the various sectors participating in mortgage financing. In addition to legislative changes affecting NHA rates and the banks, it seems likely that developments in the capital markets from mid-1965 onwards had run their course by mid-1967. Institutional lenders had completed

the necessary adjustments in their investment commitments and portfolios and renewed active participation in the mortgage markets. Trust companies, for example, after having reduced their mortgage loan commitments most sharply in 1966 accounted for a significant part of the 1967 increase. Mortgage interest rates increased during most of the year, which in all likelihood acted as a stimulant for institutional investment decisions. The rationing used by many investors in the preceding year had been replaced by market forces. Support of the mortgage market came from additional sources as well. Caisses populaires, credit unions and individuals became more active in providing funds for housing as the rising interest rates seemed to attract these lenders.

In 1968, the chartered banks and trust companies both of which enjoyed large asset growth, expanded substantially their mortgage lendings. The relatively easy monetary policy during certain periods of the year, allowed the banks a considerable increase in their assets, and trust companies were bidding very aggressively for savings. Life insurance companies increased their holdings of mortgages, though proportionately perhaps less than other sectors mentioned. The growth of life companies' assets was much more restrained than that of the other financial sectors. Most of the gain in mortgage investment came from the slightly increased proportion of funds allotted to this instrument compared to the acquisition of other securities.

Mortgage lending as a whole did not increase much in 1968, and in fact decreased in the second half of the year over the corresponding 1967 period. Higher institutional lending was accompanied by a sharp drop of \$260 million in public financing. As public mortgage financing is of a residual nature one possible explanation for the trend might be a moderation in demand. The higher yield on NHA loans – 225 basis points above long-term government bonds – resulted in the major institutional lenders increasing their NHA lending in both absolute and relative terms. The decline in direct CMHC loans was thus offset by private lending. The aggregate levels of mortgage financing were affected by the rising interest rates. While attracting investment funds, the high mortgage rates may have caused some hesitation particularly in borrowers who were buying existing properties. Purchasers of such properties are often able to assume existing mortgages and make alternative short-term arrangements for the balance, rather than refinance the whole mortgage.

Mortgage loan advances in 1969 were considerably above the 1968 mark. The 20 per cent increase took place after a slow start in the first quarter and resulted from earlier commitments. Loan approvals were only marginally above the 1968 amount, but the new residential construction component of the total in fact declined by 5 per cent.

Trust and mortgage loan companies expanded their mortgage lending most, but other institutional lenders were also active. These companies are the mainstay of the mortgage market for existing property and much of their increased provision of funds during the year was directed towards this segment of the market. This may have been a reflection both of a reversal of borrower resistance, mentioned in regard to the 1968 conditions, and of a general acceptance of higher interest rates followed by a willingness by borrowers to re-finance existing property at these rates.

Life insurance companies were also major sources for funds, although competing investment opportunities and their constrained growth pattern restricted the amounts invested in mortgages to roughly the 1968 volume. Chartered banks on the other hand considerably increased their mortgage holdings in the first half of the year and maintained the 1968 second half flow of funds at the same level in the latter half of 1969. This took place in an environment of severe monetary restrictions.

Residual lending by public financial institutions increased only marginally over the previous year, but important changes were recorded in the composition of these funds. Loans provided for low income new housing have almost doubled, while financing to supplement the private mortgage market was practically cut in half.

In the first two quarters of 1970 mortgage loan advances were roughly the same as in the corresponding 1969 period, but below those of the first half of 1968. Shifts in the sectors providing these funds have, how-

ever, occurred. Trust companies remained very active and even increased their participation substantially in the first quarter. The same applies to mortgage loan companies, but chartered banks cut back drastically their mortgage lending. Both life companies and public financial institutions reduced their mortgage loan advances below the first half of 1969 amounts. The very high levels of borrowing cost and somewhat weakening inflationary expectations engendered some borrower resistance. This in combination with general economic conditions resulted in a slow-down in construction activities.

The three-year period was one where many competing demands by other sectors of the economy made it necessary to stimulate the mortgage markets in a number of ways. The rising trend in the interest rate structure is but one symptom of the pressures exerted on capital markets. At the earlier phases of the inflationary spiral investors were lured by the potential gains in the equity markets and at the same time deterred by the built-in loss exposure of fixed income securities. At the more mature phases of the cycle, when the equity markets turned down, the features used to compensate investors for the dangers inherent in bonds in inflationary times made investment in bonds more desirable. The mortgage markets developed incentives in order to protect themselves against the competition from other securities, NHA rates were gradually freed, the terms of the mortgages (in sympathy with other capital market instruments) were shortened, and to relieve the borrower from the growing pressure on his income, amortization terms were lengthened. As in the case of other market instruments the increases in yields for the lender resulted in larger burdens on income supporting the debt. Unlike businesses, individuals may not be able to absorb the increased debt charges, hence the cash flow has to be adjusted to satisfy income coverage requirements. The idea of debt consolidation has gained acceptance in this field also and some primary and secondary lenders developed plans for cooperation by offering one loan at an average interest rate and at a higher encumbrance ratio than if first and second mortgages would have had to be arranged independently.

The attractiveness of the mortgage loan as an investment has greatly increased over this period, which allowed the instrument to reclaim its place in the financial market.

(b) The Determinants for the Supply of Mortgages by Financial Institutions

The supply of mortgage funds comes from basically three sources: (i) individuals and private non-financial business, (ii) private financial institutions, and (iii) public financial institutions.

The group covered under (i) has been ignored in this review. Data on person to person mortgages are not available, and mortgage credit by non-financial businesses, though quite substantial at times, is motivated by

essentially unrelated circumstances. Much of it arises from intra-sectoral sales of existing property owned by industrial corporations and some of it represents collateral security for the extension of trade and other types of credit. (iii) This group covers mainly Central Mortgage and Housing Corporation lending, although that of other governmental agencies is also included. It is assumed that both groups are basically of a residual nature and their intention is to complement private funds. Their role is considered to be exogenously determined and they are treated as policy variables.

This note will focus attention on a selection of the financial institutions. Mortgage lending by them is subject to market forces and it is expected to depend mainly on the desirability of holding mortgage loans relative to other kinds of investments. In testing the functional relationships existing between the supply of mortgage funds and the variables determining the relative desirability of this investment certain limitations have to be pointed out.

First of all it is assumed that interest rate differentials express the difference between mortgages and alternative investments in as much as they apply to risk, marketability, the direct and indirect techniques of mortgage acquisition and lending policies. The validity of such an assumption has not been tested. Institutional and other not quantifiable features may have a decisive influence. To use an extreme example the supply of mortgage financing by mortgage loan companies is less directly related to the competitiveness of mortgage loans, than mortgage lending of some other financial institutions. The administration of a mortgage portfolio by the various financial institutions requires an apparatus which once in existence engenders mortgage investments although purely economic considerations would probably cause the companies to refrain from making such loans.

Another point to be mentioned is the fact that only long-term instruments have been used as alternative outlets for funds. When analysing long-range behaviour this would seem to be perfectly correct. The period examined by this note is however, fairly short (three years) and it covers one with a somewhat unusual economic pattern. It is likely that in certain quarters the preference for short-term instruments was so intense that their exclusion from the range of alternative investments might cause distortions. The decision not to consider short-term securities was based on the fact that the motivation behind the shift towards this instrument is not quantifiable within the framework and terms of reference of this note.

The third limitation of significance relates to the data used. Instead of mortgage approvals, which respond most to current economic conditions, net investment in mortgages have been applied. The reasons for this are given at the end of this note.

A linear multiple regression analysis was used to determine the behavioural patterns of mortgage investment by selected financial intermediaries in this three-year period.

Trust companies. — Investment in mortgage loans by the sector was tested for both levels and flows of mortgage holdings.

Explanatory variables for the levels were: monthly averages of conventional mortgage rates, deposit liabilities of trust companies, mortgage holdings of public financial institutions lagged by one quarter, monthly averages of long-term government bond rates and seasonal factors for the second and third quarters.

Only the conventional mortgage rate, deposit liability and public lending by government enterprises turned out to be statistically significant variables at 5 per cent level of t test. All have the expected signs (public lending negative, others positive). \bar{R}^2 (Adjusted R^2) = .99 D/W (the Durbin-Watson d statistic) = 2.1.

The flow equation uses somewhat different explanatory variables. The difference between conventional mortgage rates and government bond rates, the flow of deposit funds, mortgage outstanding lagged by one quarter, total mortgage flow in the economy and again second and third quarter seasonal factors have been considered. While the signs of all variables are as expected only deposit flows and total mortgage flows are statistically significant. \bar{R}^2 = .91 D/W = 2.3.

Mortgage loan companies. — Both stock and flow models have been tested, but only the flow model is considered to be of interest. Because of the specialization of the sector in mortgage financing the stock model does not really provide good explanations.

The net supply of mortgage loans was considered to be a function of the change in total liabilities of the sector, the differential of conventional mortgage rates and bond rates, the sector's mortgage loan holdings lagged by one quarter, total investment in residential construction and first and third quarter seasonality.

All the variables turned out to be statistically significant, with the exception of interest rate differentials. This is not unexpected in view of the sector's highly specialized nature referred to earlier. \bar{R}^2 = .96, D/W = 1.4.

Life insurance companies. — Independent variables of the stock model of life companies comprises: net liabilities after deductions of policy loans, conventional mortgage rates, bond rates, lending by public financial institutions lagged by one quarter, and third quarter seasonal factors.

The fund supply, public lending and seasonal variables are statistically significant and have the expected signs (public lending has negative coefficient).

Both mortgage rates and bond rates are statistically not significant, but they have the right signs. (Mortgage rates positive, bond rates negative.) The lack of influence by rate changes is explainable by the fact, that life companies have long range forward planning and corresponding commitments and also that in this period many life insurance companies have received equity positions in projects and borrowing companies, which compensated for yield considerations. $R^2 = .99$ $D/W = 2.1$.

In the flow model the same variables were used as in the stock equation. However, most variables were found to be statistically not significant. Exceptions are public lending and third quarter seasonal factors. The comments relating to the stock model may explain the behaviour of the flows as well. The fact that the signs are as expected supports the above reasonings. $R^2 = .60$ $D/W = 2.9$.

Chartered banks. — Due to the very recent expansion of bank lending into the mortgage field a behavioural equation regarding levels of mortgage investment by banks was not considered to be meaningful. The following variables have been assumed to be explanatory in regards to mortgage lending flows: change in total bank assets, mortgage and bond rate differentials, mortgage investment by banks lagged by one quarter, lending by public financial institutions, and third quarter seasonality.

With the exception of one quarter lagged mortgage holding and seasonal factors, all the independent variables are statistically significant. The sign of coefficients are as expected. Total bank assets have an inverse sign, which is explained by two basic facts. The size of mortgage lending relative to total bank lending is quite small and thus it can be easily increased without substantially affecting overall asset growth. The second relevant point is that the measures improving the flow of funds into mortgages were effective enough to stimulate bank investment even though the credit crunch restricted credit expansion in most other areas of the banks' activities. $R^2 = .46$ $D/W = 2.1$.

(c) The Impact of Stabilization Policies on Mortgage Financing

The influence of changes in credit conditions on the housing and mortgage markets is of great interest to economists and other social scientists. The major reason for this is the direct connection existing between the fundamental need for shelter and the allocation of resources among the various sectors of the economy. Many observers hold the view that the sensitivity of residential construction to monetary policy should be minimized. The arguments advanced in favour of reducing such sensitivity are often grouped in two categories.

The first is that fluctuations in credit conditions produce alternative periods of feast and famine in the supply of mortgage money which in turn accentuates

fluctuation in residential construction. While these swings are partially inevitable and perhaps even desirable, if they become too wide they might affect urgent social needs.

The second argument considers that other types of borrowers may not only compete with homeowners, but even have an edge over them if the mortgage borrowers are protected by interest rate restrictions. Loans, bonds and other instruments would divert a portion of the funds available for mortgages to other uses. The resulting reduction in expenditures on construction, if such is intended, is in fact compensated for by an increase in other forms of expenditures, which would also be of a demand stimulating nature. Thus the arrangements responsible for the sensitivity of residential construction contribute little to general economic stability. The main effect is to produce rather arbitrary shifts in resource allocation.

Among opposing views it is held, that government support for low income housing lends the economy a bias which is not contrary to public interest. The effectiveness of monetary policy, according to these opinions, could be seriously impaired if the construction industry — which traditionally responds most strongly to such measures — were to be exempted from the impact of monetary policy. In view of the relatively greater degree of immunity to policy measures displayed by capital outlays of large business and also consumer credit the achievement of desired policy objectives might be rendered much more difficult.

An extension of these arguments centers around the relative elasticity to interest rate of the demand for mortgage funds when compared to that of other type of capital. Some observers tended to maintain that corporate demand for funds is much less elastic than that of the demand for mortgages. A rise in general income levels affects both demands, but the increase will be larger in corporate demand. It follows that if long-run supply and demand forces are favourable for housing, short-run cycles are associated with the availability and credit terms of mortgage funds.

In addition to the financial aspects it has been proved that the role and importance of vacancies and inventory of houses unsold or under construction is important. Thus the influence of stocks relative to physical demand gains in importance in comparison with credit conditions, even when short-run factors are considered.

Viewed against this selection of prevailing views a survey of economic developments related to mortgage financing can be put into proper perspective. While the overall developments of mortgage financing have been sketched in the first part of this review attention will be focused in the following paragraphs on relating these developments to the existing policy posture. Some repetition of sections from the earlier part of this note is inevitable.

STATEMENT 4. Monetary and Fiscal Indicators

Year and quarter	Money supply ¹		Credit expansion ²	Selected interest rates						Surplus (+) or deficit (-) of federal government ³	
				Conventional mortgage		40 bond yield average		90 day treasury bills			
	Average level	Per- centage change		Average of monthly series	Per- centage change	Average of month-end series	Per- centage change	Average of Thursday tenders	Per- centage change		
	\$'000,000		\$'000,000								\$'000,000
1967:

¹ Money supply is defined as total currency and deposits held by general public (excluding government of Canada deposits) in chartered banks. Data are not adjusted for seasonal variations - Average of Wednesdays figures.

² Credit expansion is defined as net increase in financial assets of Sectors V, VI, VII, VIII, IX and XIII.

³ Surplus or deficit is based on National Income and Expenditure Accounts.

SOURCE: Table 3 of Financial Flow Accounts, (DBS Catalogue No. 13-002); Bank of Canada Statistical Summary and McLeod, Young, Weir Bond Yield Average; National Income and Expenditure Accounts, (DBS Catalogue No. 13-001).

Mid-1967 – mid-1968. – The early part of the period under review can be described as a year when the flow of funds into mortgages improved considerably under circumstances of tightness in the credit markets. Disturbances on the international financial scene increased in the fall of 1967 resulting in the devaluation of the pound sterling and spread shortly thereafter into Canada. A severe run on the Canadian dollar developed. The defence of the exchange value of our currency was accompanied by drastic increases in the interest rate structure. Short-term instruments and particularly treasury bill rates reflected this posture even more clearly than those of long-term rates. Increases in treasury bill rates of 22 per cent and 23 per cent in the fourth quarter 1967 and first quarter 1968 respectively represented the steepest climb in the three-year period under review. They exceeded by a wide margin even rate increases of the third quarter of 1969.

On the fiscal side the latter part of 1967 and the first half of 1968 could be described as moderately expansionary although the gap closed somewhat between the rate of increases of federal government expenditures and that of federal revenues.

The first steps stimulating mortgage flows were taken at the end of 1966 by raising the National Housing Act rate ceiling to $7\frac{1}{4}$ per cent and by the establishment of a flexible moving rate from the beginning of 1967. At that point the maximum mortgage rate was to be $1\frac{1}{2}$ per cent above long-term government bond yields. In view of the tightening monetary conditions towards the end of 1967 and early 1968 and the rising interest rates, this arrangement attracted little investment in mortgages so that the adjustment formula had to be increased later during the year to $2\frac{1}{4}$ per cent.

As monetary conditions were motivated largely by international events and the domestic economy was believed to have recovered from the "overheating" of 1965 and 1966 it appeared to be necessary to stimulate the housing markets by means other than the further expansion of credit and money supply. Measures such as the new flexible interest rates, referred to above and raising the amounts on home ownership loans (reducing down payments), the introduction of bank lending, went a long way towards this goal. Apart from promoting the re-allocation of available resources the authorities may have considered it necessary to inject additional funds in

the mortgage markets. Residual lending by public financial institutions was undertaken on a substantial scale. Of a total mortgage lending of almost \$2.2 billion in the year to mid-1968 \$700 million was public financing.

Mid-1968 – mid-1969. — After the exchange crisis had been overcome it was expected that the tight credit conditions would be eased. Such a move was supported by the then prevailing view that inflationary pressures were relenting and that the economy was becoming sluggish. Money supply was increased considerably resulting in a short-lived drop in interest rates. Treasury bill rates moderated by 16 per cent in the third quarter and even long-term rates showed fractional losses. By early fall of 1968 it became evident that the demand pressures had not eased substantially. On the contrary, price pressures increased and monetary policy moved towards progressively severe tightness. Interest rates resumed their upward climb and in the first seven months of 1969 there were three bank rate increases from 6½ per cent to 8 per cent.

The federal government's budgetary position shifted towards a surplus. This became more explicit in 1969 as the seasonal deficit of the first quarter was much lower than in 1968 and the second quarter showed a surplus rather than the deficit recorded in the second quarter of 1968. This in association with a curtailment of government lending relieved the capital markets of much of the burden of government debt financing.

A combination of the public's inflationary expectations, which led to the acceptance of steadily increasing interest rates, and the financial institutions' reaction to these conditions generated a high level of activity on the mortgage markets. In the year to mid-1969 net mortgage advances (exclusive of person to person mortgages) approached \$2 billion. The vigour in the markets was greatly aided by trust and mortgage loan companies. The competition for deposits became very keen and these companies scored a fair amount of success by flexibility in their rate structure and other terms offered to the investing public. As a result the gradually tightening monetary conditions had a lesser impact on the flow of mortgage funds than past experience might have suggested. Further changes introduced in April and mid-year 1969 adjusted the original mortgage terms of the National Housing Act insured loans to allow quinquennial revisions of rates, increased maximum limits on loans and as a final measure removed the last impediment by allowing interest rates to find their own level without reference to government bond yields.

Lending by Public Financial Institutions dropped markedly from over \$700 million in the previous period to less than \$400 million. This moderation in governmental participation in the mortgage markets might be due to a number of factors. An important consideration may have been the fact that an adequate flow of mortgage funds was produced within the framework of existing private resources by stimulating their allocation

to mortgage financing. The government's fiscal policy, its aim to achieve a surplus and to curtail borrowing is another explanation. The emerging demand forces thus stimulated the financial institutions to channel their funds towards satisfying this demand and they were able to attract and provide both investors and borrowers with terms that reflected the prevailing market conditions. An ancillary effect was that by shifting expenditures from other sectors of the economy the available resources were used to help fulfill the housing needs of the population.

Mid-1969 – mid-1970. — The third one-year period ending in mid-1970 has among its ingredients two major components. (a) Restrictive monetary measures had reached their climax and the first signs of abating inflationary pressures surfaced. (b) Upward pushing forces on the exchange value of the Canadian dollar became gradually stronger and mitigated somewhat the impact of policy measures. There was a differential response by the various financial institution to these measures. The impact of these measures was cushioned for awhile by using up available liquidity reserves. The banking system was the first one to react by a drastic turn in the rate of growth of its assets. Interest rates reached record high levels in the fourth quarter of 1969 and although short-term rates receded gradually this year, long-term rates especially mortgage interest rates resisted this trend quite stubbornly.

The government's fiscal policy, which had produced surpluses earlier moved towards a highly restrictive posture and resulted in rapidly rising surpluses in the second half of 1969. Mainly on account of moderating revenues the projected surplus for the current year appears to be dwindling as a result of less restrictive fiscal policies.

In this environment mortgage financing continued to be supported most strongly by the trust and mortgage loan companies. Participation by the banking system became much more restrained in response to the monetary measures instituted. Life companies were very active in the latter half of 1969. The prevailing record levels of interest rates stimulated investment in mortgages. In the first half of 1970, especially in its second quarter, however, life companies' net mortgage advances showed a marked drop from that of previous periods.

Lending by public financial institutions remained virtually unchanged in this last third of our three-year period. From more than \$400 million, \$270 million was advanced in the latter part of 1969. The symptom of lower keyed activity in the mortgage markets in 1970 has permeated most sectors of institutional lending. The fact that financial institutions specializing in mortgage lending were capable in 1970 to rebuild much of their liquidity and in some cases held unusually large liquidity reserves appears to support the view that the demand for mortgages has greatly eased.

In this connection it is to be recalled that in June 1969 the government instituted certain fiscal measures, which were intended to discourage commercial building in some key areas of the country. It is, however, difficult to separate the impact of this action from other forces at work.

Summarizing the overall facts pertaining to the period reviewed by this note a number of conclusions appear to be substantiated.

The Canadian economy has been subjected to strong external and internal demand pressures. This occurred in an environment of unsettled international financial markets and a worldwide acceleration of inflation. Strong corrective measures were taken by the authorities and the economic environment reflected the clash between the forces of stabilization and those of destabilization.

The monetary and fiscal actions of this period appeared to have been aimed at providing the economy with sufficient funds to satisfy shelter needs and yet not upset the overall delicate task of easing demand pressures. This was carried out through a variety of means.

While it is difficult to conclude with certainty that the expansion of the overall credit supply was not the method employed, it appears that the aim to satisfy social needs was achieved rather by way of strongly influencing resource allocations. Lending by government institutions was one vehicle used, although its volume was governed by the fact that at times of progressively growing restraints government supply of credit might be self defeating if it resulted in a stimulus to total spending. Allowing the mortgage instrument to become a highly competitive and attractive investment tended to assure that private resources would be directed into this area. It is of significance that even at the height of the credit squeeze a very large volume of funds flowed into the mortgage markets as a result of the changes that have affected the financial institutions and markets in the last three years.

The points raised in this note were based on statistical data covering net loan advances. Conclusions based on loan approvals may be more relevant, however, the Financial Flow Accounts draw information derived from our quarterly publications and illustrate uses of the flow of funds material.

SOURCES AND METHODS

This is the second part of a series dealing with Sources and Methods that began in *Financial Flow Accounts - First Quarter 1970*. As outlined there, further sections on Sources and Methods will be published in some of the forthcoming issues of this publication. They will initially include sectors, to be followed later by more detailed descriptions of transaction categories.

Sources and methods sections for both trust companies and mortgage loan companies are presented in this issue. The principal reason for this is that the same sources and the same balance sheet headings are used for both of these sectors.

Subsector VI.2.3. - Trust Companies

Trust companies may be incorporated under the Trust Companies Act of Canada or under the corresponding provincial acts. They are the only corporations in Canada with power to act as trustees for property interests and to conduct other fiduciary business. Trust companies act as executors, trustees and administrators under wills or by appointment, as trustees under trusts established by living persons, and as agents in the management of property. They act as trustees for corporation bond issues and as transfer agents for corporation shares. Assets connected with these activities are segregated by trust companies in their estates, trust and agency funds and are not included in the trust company sector of the *Financial Flow Accounts* since it is a convention of these accounts that assets be recorded in the sector of the owner, and not of the trustee.

In addition, trust companies acquire funds by issuing capital stock, accepting money on deposit, selling guaranteed investment certificates and borrowing funds from banks, noteholders and parent companies. Investment of these funds, particularly those arising from accepting deposits and selling certificates, is subject to regulation by the incorporating government.

Company and guaranteed fund assets of trust companies exceeded \$6 billion in the first quarter of 1970. Trust companies rank third in size among financial institutions, being exceeded only by chartered banks and life insurance companies. Their mortgage lending exceeded \$3,400 million, and they held over \$450 million in sales finance company notes and commercial paper. They therefore play an important role in the financial markets.

The basic source of information is a quarterly publication compiled by the Business Finance Division of the DBS, *Financial Institutions - Financial Statistics* (DBS Catalogue No. 61-006). In the following, this publication will be referred to as *Financial Institutions*. The Business Finance Division also supplies data on certain adjustments which will be outlined below wherever necessary. These adjustments, in various categories, account for differences between the flows published in *Financial Flow Accounts* and the balance sheet changes indicated in *Financial Institutions*.

Reference will be made to data for the first quarter of 1970. These data are presented in the following table which is a partial reproduction of Table 6-17 in this publication.

Transaction Categories

1100 - Gross domestic saving = total of category
1200 + category 1400.

1200 - Capital consumption allowances and miscellaneous valuation adjustments: The data can be found in *Financial Institutions*, Table 5, item 44, and Table 8, item 2, depreciation.

1400 - Net domestic saving: Basically, three balance sheet classifications are used; (a) investment reserves, including special reserves, mortgage reserves and all other investment or contingency reserves; (b) reserve fund (or general reserve); and (c) retained earnings or deficit at end of period. The total for financial flow purposes is obtained after various adjustments are made. Examples of these are listed in the next paragraph. The Business Finance Division of the DBS first calculates the changes or "flows" from quarter to quarter in the data for the respective items 22, 23, and 24, shown in Table 4 of *Financial Institutions*, details of which are contained in the following pages of that publication.

Adjustments are made with respect to capital gains and losses, and certain costs which do not involve outlays of funds, such as depreciation, amortization, and deferred taxes. Corresponding amounts are added to or subtracted from the applicable assets or liabilities. This is also done in the case of prior period adjustments which are removed from net retained earnings. Finally, premiums on share capital issues credited to reserves are deducted from the quarterly changes in reserves and added back to the changes in share capital.

Changes during the first quarter of 1970 were:

	Dollars
22 - Investment reserves	1,900,000
23 - Reserve fund	- 230,000
24 - Retained earnings	4,492,000
	6,162,000

The adjustments were mainly:

Plus:	
Depreciation	904,000
Amortization	104,000
	7,170,000

	Dollars
Minus:	
Deferred taxes	218,000
Capital gains	1,822,000
Premiums on share capital issues	243,000
	2,283,000
Total of changes in the first quarter of 1970, adjusted	4,887,000

TABLE 1. Sector Flows, First Quarter 1970
Subsector VI.2.3. Trust Companies

Category No.	Category	1970 1 \$'000,000
1100	Gross domestic saving	5
1200	Capital consumption allowances and miscellaneous valuation adjustments	1
1400	Net domestic saving	4
1500	Non-financial capital acquisition	1
1600	Gross fixed capital formation	1
1800	Net purchases of existing and intangible assets	--
1900	Net lending or borrowing (1100 - 1500)	4
2000	Net financial investment (2100 - 3100)	4
2100	Net increase in financial assets	358
2310	Currency and deposits:	
2311	Currency and bank deposits	- 6
2312	Deposits in other institutions	- 1
2313	Foreign currency and deposits	- 40
2330	Loans:	
2332	Other loans	5
2340	Government of Canada treasury bills	- 1
2350	Finance company and other short-term commercial paper	163
2410	Mortgages	134
2420	Bonds:	
2421	Government of Canada bonds	6
2422	Provincial government bonds	18
2423	Municipal government bonds	11
2424	Other Canadian bonds	4
2510	Claims on associated enterprises:	
2512	Corporate	1
2520	Stocks	4
2530	Foreign investments	37
2610	Other financial assets	13
3100	Net increase in liabilities	354
3310	Currency and deposits:	
3312	Deposits	310
3330	Loans:	
3331	Bank loans	3
3332	Other loans	- 2
3510	Claims on associated enterprises:	
3512	Corporate	12
3520	Stocks	2
3610	Other liabilities	29
4000	Discrepancy (1900 - 2000)	--

However, in the *Financial Flow Accounts*, depreciation is shown separately in category 1200 (\$1 million), and thus, the flow in category 1400 for the first quarter of 1970 is about \$4 million.

The foregoing indicates again that, because of adjustments, the flows published in *Financial Flow Accounts* may not directly agree with the balance sheet changes shown in *Financial Institutions*.

1500 – Non-financial capital acquisition = total of category 1600 + category 1800.

1600 – Gross fixed capital formation: The quarterly changes in fixed assets are deemed to be capital formation. They are adjusted by adding back the

depreciation in order to obtain gross figures, as indicated in the explanations for category 1400. Item 5 – real estate and equipment – shows a net decrease of \$346,000 on pages 12-13 of *Financial Institutions* for the first quarter of 1970. (The latter will be abbreviated from now on as I/70.) After adding depreciation, the rounded gross amount for *Financial Flow Accounts* is \$1 million (cf. *Financial Institutions*, pp. 16-17, item 39).

1800 – Net purchases of existing and intangible assets: This category has not been used for trust companies, as details have not been available.

1900 – Net lending or borrowing (1100 minus 1500): After the deduction of “non-financial capital acquisition” from “gross domestic saving,” a surplus (or

deficit) is left in this category, to be invested in financial assets (or, in the case of a deficit, to be met by borrowing).

2000 -- Net financial investment (2100 minus 3100): This equals changes in "net increase in financial assets" minus "net increase in liabilities," and it differs from "1900 -- net lending or borrowing" by the amount of the "discrepancy" -- category No. 4000. The data in Table 1 show that there is no discrepancy in the trust companies subsector in I/70.

2100 -- Net increase in financial assets = total of categories 2310 to 2610, i.e., all financial assets.

2310 -- Currency and deposits include categories 2311 to 2313.

2311 -- Currency and bank deposits: The changes or "flows" in the Canadian dollar items "1.a.i. -- Cash and bank demand deposits" and "3.a.vii -- Bank term deposits," listed in Table 4 of *Financial Institutions*, are added. (Item 3.a.vii includes deposit receipts, certificates of deposit, savings certificates and all other term deposits in Canadian chartered banks.)

Changes during I/70:

	Dollars
1.a.i. -- Cash and bank demand deposits	- 320,000
3.a.vii -- Bank term deposits	- 5,980,000
The total of	- 6,300,000

was not materially affected by a minor adjustment made to item 1.a.i.

2312 -- Deposits in other institutions: The quarterly flow for this category consists of the total of the changes in the Canadian currency item "1.a.ii -- Demand deposits in other institutions" and "3.a.viii -- Term deposits, other institutions." These can be found in *Financial Institutions*, Table 4, and in Table 8, items 21 and 30. Item 3.a.viii includes guaranteed investment certificates, and all other term deposits in Canadian trust and mortgage loan companies.

Changes during I/70:

	Dollars
1.a.ii -- Demand deposits in other institutions	- 1,887,000
3.a.viii -- Term deposits, other institutions	624,000
Total	- 1,263,000

2313 -- Foreign currency and deposits: The change for this category can be ascertained by reference to item 2 in Table 4 of *Financial Institutions* as well as item 22 in Table 8. This consists of foreign currency on hand and on deposit, including swapped deposits.

2330 -- Loans include only category 2332.

2332 -- Other loans: This category contains collateral loans, including loans to certificate and debenture holders. The flows are derived from *Financial Institutions*, Table 4, item 3.a.x, or Table 8, item 32.

2340 -- Government of Canada treasury bills: Data are obtained from *Financial Institutions*, Table 4, item 3.a.i, or Table 8, item 23.

2350 -- Finance company and other short-term commercial paper: This category consists of short-term notes of sales finance companies and commercial paper of unaffiliated companies. Financial flows are obtained from *Financial Institutions*, Table 4, items 3.a.v and 3.a.vi, as well as Table 8, items 27 and 28.

Flows during I/70:

	Dollars
3.a.v -- Sales finance company notes	41,631,000
3.a.vi -- Commercial paper	121,152,000
Total	162,783,000

2410 -- Mortgages contain mortgages and sales agreements: (i) Loans under the National Housing Act, including insured and joint loans, and (ii) conventional mortgage loans, including second mortgages. The changes are derived from *Financial Institutions*, Table 4, items 3.b.i and 3.b.ii.

Changes during I/70:

	Dollars
3.b.i -- NHA loans	23,182,000
3.b.ii -- Conventional mortgage loans	113,201,000
Total	136,383,000

	Dollars
Minus:	
Adjustment for capital gain on 3.b.ii	1,822,000
Adjustment resulting from a change in size of sample (re 3.b.ii)	80,000
Total	134,481,000

2420 -- Bonds consist of categories 2421 to 2424.

2421 -- Government of Canada bonds: This is the total of Government of Canada direct and guaranteed bonds. Financial flows for I/70 are obtained from *Financial Institutions*, Table 4, item 3.a.ii, or pp. 16-17, item 24. They were not significantly changed by one of the adjustments made by the Business Finance Division of the DBS.

2422 -- Provincial government bonds consist of direct and guaranteed bonds. The data can be found in *Financial Institutions*, Table 4, item 3.a.iii, or Table 8, item 25.

2423 - Municipal government bonds include debts of school commissions and hospitals. The quarterly flow is indicated in the aforementioned publication, Table 4, item 3.a.iv, or Table 8, item 26.

2424 - Other Canadian bonds contain corporation and institution bonds and debentures. The change during I/70 is obtainable from *Financial Institutions*, Table 4, item 3.a.ii or pp. 16 - 17, item 31.

2510 - Claims on associated enterprises include only category 2512.

2512 - Corporate: These claims consist of investments in subsidiary and affiliated companies which are not consolidated in the return the trust companies submit to the Business Finance Division of the DBS, and they are specified according to (i) shares and (ii) advances, promissory notes, etc. The flows during I/70, according to *Financial Institutions*, Table 4, items 3.e.i and 3.e.ii, were:

	Dollars
3.e.i - Shares	2,053,000
3.e.ii - Advances, etc.	- 758,000
Total	1,295,000

2520 - Stocks are comprised of investments in Canadian preferred and common shares. The data for I/70 are published in *Financial Institutions*, Table 4, item 3.c, or pp. 16 - 17, item 35.

2530 - Foreign investments contain investments in foreign bonds, debentures, treasury bills, mortgages, notes, shares, etc., excluding investments in and advances to subsidiary and affiliated companies. The change in I/70 is indicated in the previously mentioned publication, Table 4, item "3.d - Foreign securities" and Table 8, item 36.

2610 - Other financial assets consist of interest, dividends, and rents receivable (including amounts due and accrued), and other assets. The flows are derived from *Financial Institutions*, Table 4, items 4 and 6.

Flows during I/70:

	Dollars
4 - Interest, dividends and rents receivable	10,035,000
6 - Other assets	13,357,000
	23,392,000

Plus:

Amortization of other assets

The total of

was not materially changed by one small adjustment each to items 4 and 6.

3100 - Net increase in liabilities = total of categories 3310 to 3610.

3310 - Currency and deposits include only category 3312.

3312 - Deposits are comprised of (i) demand or savings deposits, viz. (a) chequing deposits and (b) non-chequing demand deposits, as well as (ii) certificates, debentures, and term deposits, including guaranteed investment certificates,¹ debentures, savings deposit certificates, instalment certificates, and all other time deposits (a) with an original term of less than one year, (b) with an original term of one to six years, and (c) with an original term of over six years. These are listed in *Financial Institutions*, Table 4, items 11.a, 11.b, 12.a, 12.b, and 12.c, as well as in Table 8, items 6 to 10. The latter will be used for further explanations, as statistical revisions of \$16.9 million each to items 12.a and 14 have not been incorporated as yet in the column for the fourth quarter 1969, in Table 4. After these revisions, the totals of the balance sheet items 12.a and 14 in that column will read (in thousands of dollars) 1,040,864 and 37,558 respectively.

The following adjustments, both concerning reclassifications of balance sheet items, have already been made and are (as the above-mentioned revisions) reflected in Table 8: About \$10 million was added to the change in I/70 in item 11.b and deducted from 11.a, and \$9.8 million was added to the change in 12.b and deducted from 12.a. After these adjustments for I/70 and revisions of IV/69, the changes or flows during I/70 appear in Table 8 as:

	Dollars
Demand deposits:	
6 - Chequing	- 25,089,000
7 - Non-chequing	40,713,000
Term deposits:	
8 - Less than one year	177,495,000
9 - One to six years	114,936,000
10 - Over six years	1,970,000
Total	310,025,000

3330 - Loans contain categories 3331 and 3332.

3331 - Bank loans consist of loans and overdrafts from Canadian chartered banks (i) in Canadian currency and (ii) in foreign currency. The changes can be ascertained by reference to *Financial Institutions*, Table 4, items 13.a.i and 13.a.ii, and Table 8, items 11 and 12.

¹ Guaranteed investment certificates usually mature in periods ranging from one to five years. Trust companies, by extension of their fiduciary powers, may accept funds in trust deposit accounts and issue "guaranteed certificates" or "guaranteed receipts." The funds held by trust companies are backed not only by a general claim on their assets, but by specifically segregated and ear-marked assets. Thus, their accounts must distinguish between the assets held against "company funds" (capital and reserves) and the assets in which "guaranteed" funds are invested.

Changes during I/70:

	Dollars
13.a.i – Bank loans, Canadian chartered banks: Canadian currency ..	3,329,000
13.a.ii – Foreign currency	–
Total	3,329,000

3332 – Other loans comprise other bank loans, and short-term loans and notes payable (excluding amounts owing to parent and affiliated companies). The data are shown in *Financial Institutions*, Table 4, items 13.b and 14, as well as Table 8, items 13 and 14. As explained above under category 3312, a statistical revision of \$16.9 million is to be made in the column for the fourth quarter 1969, in Table 4, after which the total of balance sheet item 14 will read \$37,558,000. Thus, the flows for I/70 are:

	Dollars
13.b – Other bank loans	– 257,000
14 – Other loans and notes payable ..	– 2,027,000
Total	– 2,284,000

3510 – Claims on associated enterprises include only category 3512.

3512 – Corporate claims consist of debts owing to parent and affiliated companies, including bonds, debentures, notes, and other short and long-term non-market debts. The flows are derived from *Financial Institutions*, Table 4, item 15, and Table 8, item 15.

3520 – Stocks contain paid-in capital: (a) preferred shares outstanding, and (b) common shares outstanding, including contributed or paid-in surplus such as premium on shares. According to the aforementioned publication, Table 4, items 21.a and 21.b, as well as Table 8, item 5, the flows during I/70 were:

	Dollars
21 – Paid-in capital:	
a – Preferred shares outstanding	– 226,000
b – Common shares outstanding	2,869,000
	2,643,000

Minus:

Adjustment resulting from a change in size of sample (re 21.b)	250,000
	2,393,000

Plus:

Premiums on share capital issues re 21.b	243,000
Total	2,636,000

3610 – Other liabilities include (a) deferred income, (b) accumulated deferred income taxes, (c) interest, dividends, current taxes and other liabilities, including amounts due and accrued, and (d) minority interest in subsidiaries. The data can be found in *Financial Institutions*, Table 4, items 16, 17 and 18. (The amounts applicable to item 19 – minority interest in subsidiaries – have been insignificant.)

Changes during I/70:

	Dollars
16 – Deferred income	621,000
17 – Accumulated deferred income taxes	– 218,000
18 – Other liabilities (including interest, etc.)	28,851,000
19 – Minority interest in subsidiaries	–
	29,254,000

Plus:

Adjustment re item 17, as mentioned under category 1400	218,000
---	---------

The total of

29,472,000 was not materially changed by a small adjustment made to item 18.

4000 – Discrepancy (1900 minus 2000): As indicated under category 2000 and in Table 1, there is no discrepancy in the trust companies' subsector in I/70. Categories 1900 and 2000 each amount to \$4 million.

Subsector VI.2.4. – Mortgage Loan Companies

This subsector includes the companies that raise funds from the public (directly or through publicly-owned parent companies) primarily for mortgage lending. It contains all companies incorporated under the Dominion Loan Companies Act, savings certificate companies and other institutional lenders engaged principally in mortgage lending; however, privately financed mortgage companies are excluded unless they are owned by a parent company classed as a financial institution.

Mortgage loan companies obtain most of their funds from sales of debentures and savings certificates to the public, and from chequing and non-chequing deposits. The bulk of these companies' funds is invested in (mostly residential) mortgages and agreements of sale. The importance of mortgage loan companies in the financial markets may be illustrated by the fact that in the first quarter of 1970 their total assets exceeded \$3.4 billion, their conventional mortgage loans, \$2.3 billion, and their NHA loans amounted to almost \$230 million.

As previously indicated, the data for mortgage loan companies are compiled in the same way as those for trust companies; identical questionnaires with the same classification of balance sheet items are used.

Therefore, the detailed description of the sources and methods is not repeated here. Instead, the reader is asked to turn to the description in the above sources and methods section for trust companies, substituting Tables 9, 10 and 13 for Tables 4, 5 and 8 respectively in *Financial Institutions – Financial Statistics* (DBS Catalogue No. 61-006). However, for some transaction categories – especially those subject to adjustments – data for the changes or flows during I/70 are supplied in the following. In addition, the *Financial Flow Accounts* data for mortgage loan companies for I/70 are presented in Table 2 which is a partial reproduction of Table 6-18 in this publication.

TABLE 2. Sector Flows, First Quarter 1970
Subsector VI.2.4. Mortgage Loan Companies

Category No.	Category	1970 I \$'000,000
1100	Gross domestic saving	2
1200	Capital consumption allowances and miscellaneous valuation adjustments	1
1400	Net domestic saving	1
1500	Non-financial capital acquisition	1
1600	Gross fixed capital formation	1
1800	Net purchases of existing and intangible assets	--
1900	Net lending or borrowing (1100 - 1500)	1
2000	Net financial investment (2100 - 3100)	--
2100	Net increase in financial assets	114
2310	Currency and deposits:	
2311	Currency and bank deposits	12
2312	Deposits in other institutions	- 1
2313	Foreign currency and deposits	- 2
2330	Loans:	
2332	Other loans	1
2340	Government of Canada treasury bills	- 2
2350	Finance company and other short-term commercial paper	27
2410	Mortgages	56
2420	Bonds:	
2421	Government of Canada bonds	3
2422	Provincial government bonds	11
2423	Municipal government bonds	--
2424	Other Canadian bonds	--
2510	Claims on associated enterprises:	
2512	Corporate	4
2520	Stocks	- 2
2530	Foreign investments	- 1
2610	Other financial assets	8
3100	Net increase in liabilities	114
3310	Currency and deposits:	
3312	Deposits	55
3330	Loans:	
3331	Banks loans	8
3332	Other loans	38
3510	Claims on associated enterprises:	
3512	Corporate	--
3520	Stocks	2
3610	Other liabilities	11
4000	Discrepancy (1900 - 2000)	1

Some Transaction Categories

1400 - Net domestic saving.	Dollars
Changes during I/70:	
22 - Investment reserves	236,000
23 - Reserve fund	6,000
24 - Retained earnings	- 102,000
	140,000
Plus:	
Depreciation	548,000
Amortization	133,000
Prior period adjustment and residual ..	51,000
	872,000
Minus:	
Deferred taxes	168,000
Capital gains	198,000
Gross domestic saving	506,000

As a result of rounding, \$1 million was shown in the *Financial Flow Accounts* in category 1200 as capital consumption allowances and \$1 million (instead of nil) in category 1400.

1600 - Gross fixed capital formation.

Changes during I/70:	Dollars
5 - Real estate and equipment	758,000
Plus:	
Depreciation	548,000
Total	1,306,000

2311 - Currency and bank deposits.

Changes during I/70:	Dollars
1.a.i. - Cash and bank demand deposits	7,485,000
3.a.vii - Bank term deposits	4,648,000
Total	12,133,000

2312 - Deposits in other institutions.

Changes during I/70:	Dollars
1.a.ii - Demand deposits in other institutions	- 773,000
3.a.viii - Term deposits in other institutions	- 17,000
Total	- 790,000

2350 - Finance company and other short-term commercial paper.

Flows during I/70:

	Dollars
3.a.v - Sales finance company notes	7,960,000
3.a.vi - Commercial paper	19,326,000
Total	27,286,000

2410 - Mortgages.

	Dollars
3.b.i - NHA loans	19,608,000
3.b.ii - Conventional mortgage loans	34,070,000
Total	53,678,000

Plus:

Adjustment for reclassification (re 3.b.ii)	2,065,000
Total	55,743,000

2424 - Other Canadian bonds.

	Dollars
3.a.ix - Corporation bonds	2,027,000
Minus:	
Adjustment for reclassification	2,065,000
Total	- 38,000

2512 - Claims on associated enterprises: Corporate.

	Dollars
3.e.i - Shares	1,162,000
3.e.ii - Advances, promissory notes, etc.	3,819,000
Total	4,981,000

Minus:

Adjustment for reclassification (re 3.e.ii)	574,000
Total	4,407,000

2520 - Stocks.

	Dollars
3.c - Canadian preferred and common shares	- 1,955,000
Adjustment for capital gain	- 198,000
Total	- 2,153,000

2530 - Foreign investments.

	Dollars
3.d - Foreign securities	- 1,391,000
Plus:	
Adjustment for reclassification	574,000
Total	- 817,000

2610 - Other financial assets.

Flows during I/70:

	Dollars
4 - Interest, dividends and rents receivable	4,107,000
6 - Other assets	3,741,000
	7,848,000

Plus:

Amortization of other assets	133,000
The total of	7,981,000

was not materially changed by a small adjustment to item 6.

3312 - Deposits.

Flows during I/70 (cf. *Financial Institutions*, Table 9):

	Dollars
Demand deposits:	
11.a - Chequing	- 2,579,000
11.b - Non-chequing	6,871,000
Term deposits:	
12.a - Less than one year	- 12,963,000
12.b - One to six years	69,285,000
12.c - Over six years	- 4,728,000
Total	55,886,000

3331 - Bank loans.

Changes during I/70:

	Dollars
13.a.i - Bank loans, Canadian chartered banks:	
Canadian currency	14,576,000
13.a.ii - Foreign currency	- 6,986,000
Total	7,590,000

3332 - Other loans.

Flows during I/70:

	Dollars
13.b - Other bank loans	5,000
14 - Short-term loans and notes payable	38,453,000
Total	38,458,000

3520 - Stocks.

Flows during I/70:

	Dollars
21 - Paid-in capital:	
a - Preferred shares outstanding	1,132,000
b - Common shares outstanding	477,000
Total	1,609,000

3610 - Other liabilities.

Changes during I/70:

	Dollars
16 - Deferred income	830,000
17 - Accumulated deferred income taxes	- 168,000
18 - Other liabilities (including interest, etc.)	10,379,000
19 - Minority interest in subsidiaries	- 15,000
	11,026,000

Plus:

Adjustment re item 17, as mentioned under category 1400	168,000
Prior period adjustment re item 18	26,000
Total	11,220,000

TABLE 6-14. Sector Flows, by Quarters, 1968-70

Part of the discrete category (amounts equal to net domestic savings category 1400) is due to the fact that the banks' earnings are reflected both in the savings and transfers to a specific item on a uniform basis during their fiscal year.
