INDUSTRIAL RESEARCH-DEVELOPMENT EXPENDITURES IN CANADA 1959

Published by Authority of The Honourable George Hees, Minister of Trade and Commerce

April, 1961 6602-513

Price 75 cents

ROGER DUHAMEL, F.R.S.C., Queen's Printer and Controller of Stationery, Ottawa, 1961

PREFACE

This publication, prepared by the Dominion Bureau of Statistics in cooperation with the National Research Council, presents in tabular form an estimate of the magnitude and direction of the research-development program undertaken by Canadian industry in 1959 and provides an indication of the relative size of the 1960 program. A survey of industrial research and development is being conducted every second year. The next survey will be for the year 1961.

The current survey sought information on the cost of research-development conducted by the reporting companies, the source of these funds, and expenditures on purchases of research-development results from others. It also requested data on the principal fields of science and industrial product groups in which the work was being carried out, and the number of professionally-trained research personnel and technicians employed.

The concepts and definitions used parallel those followed in earlier surveys. They were formed as a result of consultations held with senior officials of the National Research Council, scientists and administrators of Canadian companies who were known to have a substantial interest in industrial research, and with several trade and professional associations.

The assistance of the many business firms who have cooperated with us by submitting reports is gratefully acknowledged.

WALTER E. DUFFETT,

April, 1961.

Dominion Statistician.

General Review

Industrial research-development expenditures in Canada are outlays for research performed within the reporting companies' Canadian facilities and payments to other research organizations operating in Canada. Statistics on expenditures for researchdevelopment outside Canada are collected but are subject to variation from accounting procedures and do not, in any case, reflect researchdevelopment activity Canada. in Industrial research-development activities range from pure research intent upon obtaining new knowledge in the life and physical sciences to conceiving and developing new products, new processes and major changes in products and processes and bringing them to the stage of production. Such activities as market and sales research and process and quality control are excluded.

The research-development expenditures of Canadian industry in Canada amounted to \$99.3 million in 1959, a decrease of 22.6% from the \$128.2 million spent in 1957. The decline in research-development expenditures was due to a substantial decline in research-development spending in the Transportation Equipment Industry, a reduction from \$64.6 million in 1957 to \$25.6 million in 1959. While outlays in the Transportation Equipment Industry declined, industrial researchdevelopment by all other industrial groups increased 20% from \$60.9 million in 1957 to \$72.9 million in 1959.

More than 97% of industrial research and development in Canada in 1959 as in 1957 was done within the reporting companies' own facilities (Intramural). In 1959, the Products of Petroleum and Coal Industry was the only industry to show a substantial increase in payment for researchdevelopment in Canada outside the reporting company.

In 1959, the reporting company financed a greater portion of research-development done within the company than in 1957, 65.7% as against 39.1% in 1957. Contribution of associated companies increased from 7.3% to 10.1%. In 1959 the reporting and associated companies financed 75.8 per cent or \$73.3 million of total research-development within reporting companies as against 46.4 per cent or \$57.7 million in 1957. Funds from the Federal Government for industrial research and development declined \$41.4 million from \$62.5 million in 1957 to \$21.1 million in 1959 or from 49.4 per cent of total funds for industrial research-development within reporting companies to 21.8 per cent. Federal funds for industrial research-development were concentrated in the Transportation Equipment Industry and the Electrical Apparatus and Supplies Industry. The amount going to Transportation Equipment Industry declined from \$58.0 million in 1957 to \$14.0 million in 1959, while funds to the Electrical Apparatus and Supplies Industry

increased from \$2.0 million to \$6.4 million. Funds from sources other than the Federal Government and associated companies declined between 1957 and 1959.

Research-development expenditures allocated by scientific field indicated that in 1959, more than half of these expenditures were for engineering research-development, \$51.6 million or 53.3 per cent; \$15.3 million or 15.9 per cent was for research-development in chemistry; and \$11.3 million or 11.7 per cent for metallurgy.

Research-development costs divided by Industrial groups indicated that in 1959 Aircraft and Parts accounted for 24.4 per cent or \$23.6 million; Chemicals (except drugs and medicines) \$16.1 million or 16.6 per cent; Primary Metals \$10.2 million or 10.6 per cent; Electrical Equipment other than Electronics \$8.5 million or 8.8 per cent. The remaining industrial groups accounted for \$27.9 million or 28.8 per cent.

Capital expenditures on new or extended facilities including special buildings and equipment use in Industrial Research-development for decreased by 15.4 per cent from \$12.6 million in 1957 to \$10.7 million in 1959. Capital expenditures decline was particularly large for the Transportation Equipment Industry falling from \$5.4 million in 1957 to \$1.4 million in 1959. Capital expenditures in industries other than Transportation Equipment increased from \$7.2 million in 1957 to \$9.3 million in 1959. Substantial increases in capital expenditures were incurred by the Nonferrous Metal, Electrical Apparatus and Supplies, Petroleum and Coal, and Chemical Industries, and to a lesser extent the Textile. Non-metallic Minerals and Food and Beverage Industries. The remaining industries showed a decline in capital expenditures for 1959.

The number of persons doing industrial research and development in reporting companies declined from 11,479 in 1957 to 9,949 in 1959 or by 13.3 per cent. The largest decrease occurred in the Transportation Equipment Industry where researchdevelopment staff fell from 4,118 in 1957 to 1,460 in 1959, or by 64.5 per cent. In industries other than the Transportation Equipment Industry persons doing research-development increased in number during the same period from 7,593 to 8,479 or 10.5 per cent. The increase in the number of scientific engineers and other research scientists in other than the Transportation Equipment Industry was from 3,136 to 4,141 or 32.0 per cent.

Grants in aid of research showed a significant increase from \$559,036 in 1957 to \$708,485 in 1959 representing an increase of 21.1 per cent. The Chemical Products Industry, Non-ferrous Metal Industry, Food and Beverage Industry, and industries providing transportation, storage, communication and public utilities services provided grants totalling \$406,000 or 57 per cent of the total.

Expenditures on Industrial Research-development

Expenditures for industrial research-development in Canada amounted to \$99.3 million in 1959, having declined 22.6 per cent from \$128.2 million in 1957. Most of the industrial research and development in Canada is done within the reporting companies' research facilities, \$124.5 million or 97.2 per cent in 1957, \$96.7 million or 97.4 per cent in 1959. The industrial research-development done in Canada but outside the reporting company, amounted to less than 3 per cent of the total in the two years, \$3.7 million in 1957 and \$2.6 million in 1959. These payments are made to commercial laboratories, educational institutions, research institutions, government research laboratories and others.

Year	Firms conducting research- development	development company company		the reporting		orting	
	No.	\$'000	\$'000	%	\$'000	70	
1955	377	53, 277	51,386	96.4	1,891	3.6	
1957	455	128, 181	124, 531	97.2	3,650	2.8	
1959	471	99, 272	96,690	97.4	2, 582	2.6	

The method of accounting for expenditures for research-development financed by the reporting companies, but done outside Canada, have been found to vary from firm to firm. Significantly higher figures would be obtained and much of the variation from firm to firm removed if uniform accounting practice was applied in pro rating research done in other countries according to the activity of the Canadian company relative to the parent or affiliate in another country.

		Don			
Year	Done within company	In Canada	In other countries	Total	Total
		mil	lions of dollars	5	
1957	124.5	3.7	19.8	23.5	148.2
1958	132.5			27.0	159.5
1959	97.7	2.6	21.7	24.3	121.0
1960	01.0			27.3	109.1

Research-development Expenditures

The decline in total research-development expenditures of 22.6 per cent or \$28.9 million results from a fall in research-development expenditures of the Transportation Equipment Industry from \$67.3 million in 1957 to \$26.4 million in 1959. This substantial decline in expenditures of the Transportation Equipment Industry more than offsets a rise of 20 per cent in expenditures by all other industries from \$60.9 million in 1957 to \$72.8 million in 1959.

The Chemical Products Industry showed the largest increase, \$2.5 million or 21 per cent, in expenditures on research-development or from \$11.7 million in 1957 to \$14.2 million in 1959. Three other industries increased their expenditures by about \$1.5 million, Electrical Apparatus and Supplies Industry \$1.6 million or 11 per cent; Iron and Steel Products Industry \$1.5 million or 37 per cent; Products of Petroleum and Coal Industry \$1.5 million or 50 per cent. The Wood Products Industry showed the highest percentage increase, 88 per cent, but this was from only \$140.1 thousand to \$262.8 thousand.

The three major industries accounting for the largest portion of research-development cost were the Transportation Equipment Industry, the Electrical Apparatus and Supplies Industry and the Chemical Products Industry. However, because of the drop in research-development expenditures of the Transportation Equipment Industry in 1959, these three industries accounted for only 57.1 per cent of total research-development expenditures or \$56.7 million in 1959 as against 73.0 per cent or \$93.5 million in 1957.

	195	7	1959		
Industry	Amount	Per cent of total	Amount	Per cent of total	
	\$'000	%	\$'000	%	
Transportation equipment	67,279	52.5	26,437	26.6	
Electrical apparatus and supplies	14,457	11.3	16,021	16.1	
Chemical products	11,748	9.2	14, 244	14.4	
Sub-totals	93, 484	73.0	56, 702	57.1	
Other industries	34,697	27.0	42,570	42.9	
Totals	128, 181	100.0	99, 272	100.0	

The survey, conducted during 1960, indicated that for the year 1960, research-development done within the reporting companies would decline to \$81.8 million from \$96.7 million in 1959, as compared with \$132.5 million in 1958 and \$124.5 million in 1957. Total research-development expenditures including those made for researchdevelopment outside Canada would decline from \$121.0 million in 1959 to \$109.1 million in 1960, from highs of \$148.2 million in 1957 and \$159.5 million in 1958. Research-development performed within the reporting companies declined most markedly in the Transportation Equipment Industry from \$64.6 million in 1957 to \$25.6 million in 1959, to \$8.1 million in 1960. A decline of \$1.3 million was expected in research-development outlays in the Chemical Products Industry from 1959 to 1960. A rise of \$3.9 million was indicated for all other industry groups in 1960. The Electrical Apparatus and Supplies Industry with expenditures of \$17.6 million spent more than any other industry for research-development done within the company in 1960; Chemical Products Industry was second with expenditures of \$12.8 million and the Transportation Equipment Industry third with expenditures of \$8.1 million in 1960.

Source of Funds

In 1959, reporting and affiliated companies provided 75.8 per cent or \$73.3 million of funds for research-development within reporting companies, in contrast to \$57.7 million or 46.4 per cent in 1957, an increase of 27.0 per cent or \$15.6 million between 1957 and 1959.

In 1957 the Federal Government was the major source of funds for research-development within reporting companies, providing 49.4 per cent or \$61.5 million in contrast to 21.8 per cent or \$21.1 million in 1959. Federal Government support of industrial research-development declined to \$40.4 million in 1959 or to 34.3 per cent of the 1957 level.

The largest increase in research-development financing by reporting and affiliated companies was in the Transportation Equipment Industry which provided \$11.6 million for research-development in 1959 and \$4.0 million in 1957, an increase of \$7.6 million or 188.9 per cent. However, since research-development within companies of this industry fell to \$8.1 million in 1960 from \$25.6 million in 1957, a sharp decline in company support must have occurred in this industry in 1960. Reporting companies and affiliates in the Chemical Products Industry increased support of researchdevelopment by \$2.7 million or 23.4 per cent in 1959 more than in 1957. The affiliated companies in the Iron and Steel Industry increased support by \$1.5 million. A decline of reporting company and associated company support of \$2.7 million or 22 per cent occurred in the Electrical Apparatus and Supplies Industry.

Federal Government support was concentrated in two major industries, the Transportation Equipment Industry receiving \$58.0 million or 94.2 per cent in 1957 and \$14.0 million or 66.2 per cent in 1959, the Electrical Apparatus and Supplies Industry receiving \$2.0 million or 3.2 per cent in 1957 and \$6.4 million or 30.2 per cent in 1959. These two industries together received \$60.0 million or 97.5 per cent in 1957 and \$20.4 million or 96.4 per cent in 1959 of all Federal Government funds for research-development in industry.

Information on source of funds is not available for 1960. However, most of the decline in expenditures within reporting company research-development occurred in the Transportation Equipment Industry which fell from \$25.6 million to \$8.1 million indicating that Federal support as well as company support must have declined substantially.

Funds received from "other" sources for research-development projects carried by the reporting company decreased in 1959 from \$5.3 million (4.2 per cent of total) in 1957, to \$2.3 million (2.4 per cent of the total) for 1959.

The second second second second second second	195	7	1959

Source of Funds for Research-development Done Within the Reporting Company, 1957 and 1959

Funds received from the parent, affiliated and/or subsidiary companies increased by 7.7 per cent and accounted for 10.1 per cent of total funds for intramural¹ industrial research-development expenditures in 1959 as against 7.3 per cent for 1957.

Industrial Research-development by Size of Firm

The larger firms with annual sales over \$50 million performed 54.3% of the total industrial ¹ Refers to research-development activity done within the reporting company regardless of the source of funds.

research-development program in 1959, a decline from 72 per cent in 1957. The substantial decline in research-development expenditures in the larger firms of the Transportation Equipment Industry in 1959 resulted in a decline in the dominating position of larger firms in Canada's industrial research-development program. However, the larger firms, excluding the Transportation Equipment Industry, spent \$31.0 million in 1957 and accounted for 51 per cent of the research-development performed by these industries. In 1959, expenditures by these firms increased to \$40.9 million, accounting for 56 per cent of the research-development.

how the support support of an end and	Research-		oups ¹	11.25.1999

¹ Size groups are based on annual sales value, 1959.

? Two largest size groups combined.

³ Two smallest size groups combined.

Firms with annual sales between \$10 million and \$49 million increased their research-development expenditures from \$19.5 million in 1957 to \$30.7 million in 1959. The increase in expenditures by firms in this size group was concentrated in the Transportation Equipment Industry, although this size of firm also increased their expenditures in the following industries; Paper Products, Iron and Steel Products and Chemical Products. The two largest size groups accounted for 85.2 per cent of research-development in Canada in 1959, a slight decrease from 87.3 per cent in 1957. Firms with annual sales under \$10 million reduced their research-development programs slightly from \$16.0 million in 1957 to \$14.7 million in 1959.

Expenditures on Industrial Research-development Outside the Reporting Company

Expenditures in 1959 on research and development done outside reporting organizations, less than 3 per cent of total expenditures, were largely for the Transportation Equipment Industry and Products of Petroleum and Coal Industry with expenditures of \$1.5 million out of \$2.6 million. In 1957, Transportation Equipment Industry paid \$2.7 million to others for research in Canada out of total payments to others in Canada of \$3.7 million.

Most of the funds paid for research-development outside the reporting company went to other companies which did not report receipt of these funds. Funds to non-reporting companies represented 63.8 per cent of total funds for research-development outside reporting companies in Canada in 1959, as against 76.4 per cent of the total in 1957, a decline of \$1.1 million from \$2.8 to \$1.7 million.

The commercial laboratories and the educational institutions received larger proportions of funds available in 1959 than in 1957. In 1959 Educational Institutions received \$181,402 as against \$76,800 in 1957, and the commercial laboratories received \$390,247 as against \$239,232. On the other hand, substantially less was given to research institutions for research-development projects. Payments made for research-development done by parent affiliated and/or subsidiary companies increased slightly. The following table shows the amount and change in the allocation of funds paid for researchdevelopment done outside the reporting company.

Payment Made for Research-development Done Outside Reporting Company 1957 and 1959

	1957		1959	
	Amount	Per cent of total	Amount	Per cent of total
the second of the second of the second of	\$'000	%	\$'000	%

Others	-		23	0.9
Totals	3,640	100.0	2,576	100.0

Industrial Research-development Expenditures by Scientific Fields

Of the \$96.7 million industrial researchdevelopment program done within the reporting company, 81.0 per cent went for engineering, chemistry and metallurgical science. Engineering accounted for 53.3 per cent of the total and of this mechanical engineering accounted for 18.3 per cent, electrical engineering 14.8 per cent, and other engineering fields 11.6 per cent. The largest expenditures in the non-engineering sciences were for chemistry, 15.9 per cent and metallurgy, 11.7 per cent.

Per Cent Distribution of Intramural Research-development Expenditures

Industrial Research-development Classified by Product Fields

An analysis of research-development in each of the product fields in which research-development was carried out for 1959, indicated that the aircraft and parts product field ranked first in dollar volume of research-development performed in 1959, accounting for \$23.6 million or 24.4 per cent of expenditures within reporting companies. Most of the expenditures in this field, \$23.0 million, were made by the Transportation Equipment Industry.

The Federal Government provided the Transportation Equipment Industry with \$13 million and much of this was for aircraft and parts.

Product field	Amount	Per cent of total
	\$'000	76
Aircraft and parts	23,601	24.4
Chemicals (except drugs and medicines)	16,089	16.6
Electronics	10,369	10.7
rimary metals	10,250	10.6
achinery (excluding electronics)	8,489	8.8
achinery (excluding electrical)	3,597	3.7
abricated metals	2,653	2.7
etroleum and netural gas	2,271	2.4
rugs and medicines otor vehicles and parts rofessional and scientific instruments	2,030	2.1
otor vehicles and parts	1.536	1.6
rofessional and scientific instruments	953	1.0
ther	14,853	. 15.4
Totals	96,690	100.0

The second largest product field of researchdevelopment separately was Chemicals, excluding Drugs and Medicines. Accounting for \$16.1 million or 16.6 per cent of the total. Product fields falling in the category "Other" include pulp and paper products which make up almost all the output of the Paper Product Industry. This industry accounted for \$5.6 million or 38.2 per cent of the \$14.9 million. The Food and Beverage Industry accounted for another 10.7 per cent or \$1.6 million.

Expenditures For Research-development Facilities

Capital expenditures on new or extended facilities, including special buildings and equip-

ment for use in industrial research-development fell by 15.4 per cent from \$12.6 million to \$10.7 million between 1957 and 1959. Capital expenditures for the Transportation Equipment Industry fell sharply, \$5.4 million in 1957 to \$1.4 million in 1959. Capital expenditures for researchdevelopment increased for the Non-ferrous Metal Industry, Electrical Apparatus and Supplies Industry, the Petroleum and Coal Industry and Chemical Industry. Capital expenditures in 1959, for industries other than the Transportation Equipment Industry increased from \$7.2 million in 1957 to \$9.3 million in 1959 or by 28 per cent.

Industry	Amount	Per cent of tota	
	\$'000	%	
1957

Capital Expenditures on Research-development Facilities, 1957 and 1959

Industrial research-development done within reporting companies required 9,949 employees in 1959, or 83 per cent of the 11,479 required in 1956. Supporting personnel accounted for 5,808 or 58.4 per cent of all employees in 1959 and 41.6 per cent or 4,141 were professional staff. A greater proportion of research-development personnel were professional in 1959 than in 1957, or 41.6 per cent to 37.9 per cent.

	195'	7	1959		
	Number	Per cent	Number	Per cent	
		%		%	
Professional personnel: Engineers Other professions Sub-totals	2,744 1,610 4,354	23.9 14.0 37.9	2,404 1,737 4,141	24. 2 17. 4 41. 6

Most of the decline in research-development personnel between 1957 and 1959 occurred in the Transportation Equipment Industry and a small decline occurred in the Non-ferrous Metal Industry and Rubber Industry. In 1959 the Transportation Equipment Industry had decreased its engineering staff by 42.5 per cent from 1,163 to 662; its professional staff other than engineering by 45.0 per cent from 149 to 82 and its supporting personnel by 74.5 per cent from 2,800 to 716. A slight decrease in the number of research-development personnel employed occurred in the Rubber Industry and Nonferrous Metal Industry although research-development expenditures were higher.

The most important decline in supporting personnel between 1957 and 1959, both relatively and in number, occurred in the Transportation Equipment Industry. The ratio of number of supporting personnel to professional employees is indicated in the following table:

Supporting Personne	1 Employed	per	Professional	Employee	1957	and	1959)

According to Training and Industry

Of the total 4,141 professional personnel 3,111 or 75.1 per cent had Bachelor degrees, 480 or 11.6 per cent had Master degrees and 550 or 13.3 per cent had Doctorate degrees. The majority of those holding Bachelor and Master degrees were employed in the Transportation Equipment, Electrical Apparatus and Supplies and Chemical Products Industries. Those holding Doctorate degrees were

Distribution of Research-development Personnel concentrated in the Chemical Product and Paper Product Industries.

> Of the total 5,808 supporting personnel employed on research-development activity, 54.9 per cent or 3,186 were Technicians, 14.8 per cent or 862 were skilled craftsmen and 30.3 per cent or 1,760 were supporting personnel.

> Again, the same major industries employed over 80.0 per cent of the total supporting personnel employed on research-development activity.

Size groups are based on annual sales value, 1959.
Sales of firms reporting research-development expenditures.
Size groups 1 and 2 combined.
Includes firms in development stage for which no figure corresponding to sales value is obtainable.
All size groups 2 and 4 combined.
Size groups 3 and 4 combined.
Includes tobacco and tobacco products, leather products, printing and miscellaneous manufacturing industries.
Includes construction industry, scientific and engineering services, and trade associations.
Trade associations, medical foundations and other firms for which no figure corresponding to sales value was obtainable are included in this p. group.

SECTION III

11

.

There is no generally accepted definition of the term "research-development". The concepts and definitions used in this survey parallel those used in previous studies which were developed in consultation with the National Research Council and others having an intimate knowledge of industrial research. They were also tested through visits to a number of companies active in the research field. The aim was to arrive at a definition which would describe the type of information required, and at the same time conform as far as possible with recognized accounting practices.

In general, research-development was defined as the activities directed to pure or basic research and to the conception and development of new products or processes or major changes in existing products. This concept would cover laboratory scale activity, the design and operation of pilot plants and the development of techniques or processes to the stage where the operation could be taken over by production departments. The design and operation of pilot plants and the development of techniques or processes may result in the inclusion of firms which do not conduct laboratory scale research. Included in research-development expenditures were supporting services, wages and salaries of all research personnel, materials and supplies used, and an estimated portion of overhead costs. This latter item would include stenographic services, delivery services, storage facilities, light, heat, power, etc.

Such activities as market research to establish consumer preference or distribution studies and sales promotion were excluded. Similarly, routine quality or quantity control of a process or product as well as costs of patents were also excluded. Changes in process or improvements in a product to meet the requirements of a specific customer were not considered as research activity unless such changes were major in nature and resulted in the production of an improved product in volume on a continuing basis.

Although the records of some respondents did not follow the definitions as set out in the schedule, reporting companies were asked to follow the definitions as closely as possible for purposes of comparability. As a result of conversations with many officials in industry, and an examination of the individual returns received, it is felt that any variations in interpretation of the type of data to be included in the questionnaire were not significant enough to make any appreciable difference in the published data.

COVERAGE

Only those industries which were thought to be doing a significant amount of research were surveyed, and within the selected industries only those firms which were thought to be large enough to support some sort of research program on a continuing basis were contacted.

All industry groups as defined in the standard industrial classification were included except Clothing, Printing and Publishing, Retail and Wholesale Trade, Hospitals, Personal Services, and Fishing and Agriculture. This latter group was thought to contain few, if any, industrial firms which would carry out any appreciable amount of researchdevelopment as defined in this survey. Crown companies were included along with the private sector of Canadian business. The industries included in the survey were as follows:

Mining:

Companies primarily engaged in metal and nonmetal mining, fuels, limestone quarrying and oil prospecting.

Foods and Beverages:

Companies primarily engaged in manufacturing food preparations.

Tobacco and Tobacco Products:

Companies primarily engaged in curing tobacco and manufacturing cigars and cigarettes.

Rubber Products:

Companies primarily engaged in manufacturing all kinds of natural or synthetic rubber products, such as tires, rubber footwear, mechanical rubber goods, and rubber sundries.

Leather Products:

Companies primarily engaged in tanning, curing and finishing hides and skins, and manufacturing footwear (except rubber), leather belting, leather gloves, luggage, handbags and similar products.

Textiles:

Companies primarily engaged in manufacturing cotton, woollen or silk (including artificial silk) thread, yarn or woven fabrics, dyeing and finishing textiles, and in the manufacture of cordage, rope and twine, and coating, waterproofing, and otherwise treating fabrics. (Production of clothing, and related fabrication is excluded).

Wood Products:

Companies primarily engaged in producing lumber and wood basic materials, and manufacturing finished articles made entirely or mainly of wood. Companies engaged in manufacturing furniture and window and door screens and shades, regardless of materials used, are also included.

Paper Products:

Companies primarily engaged in the manufacture of pulp either from wood or other fibres, conversion of these pulps into any kind of paper or paper board, or the manufacture of paper and paper board into converted products.

Iron and Steel Products:

Companies primarily engaged in manufacturing primary iron and steel, fabricated and structural steel, sheet metal and iron products, industrial and household machinery and agricultural implements.

Transportation Equipment:

Companies primarily engaged in manufacturing or assembling motor vehicles and parts, aircraft and parts, railroad equipment, and other transportation equipment such as boats, motorcycles, bicycles, etc.

Non-Ferrous Metal Products:

Companies primarily engaged in the smelting and refining of non-ferrous metals, and in the manufacture of aluminum, brass, and copper products, including jewellery and silverware.

Electrical Apparatus and Supplies:

Companies primarily engaged in manufacturing heavy electrical machinery, batteries, radios, television, and electronic components and electrical appliances.

Non-Metallic Mineral Products:

Companies primarily engaged in manufacturing articles made entirely of mainly of non-metallic minerals such as cement, asbestos, clay, glass, stone and concrete.

Products of Petroleum and Coal:

Companies primarily engaged in refining crude petroleum, and in manufacturing products from petroleum as well as coke and coke-oven products, paving and roofing materials, and other products made from coal.

Chemical Products:

Companies primarily engaged in manufacturing industrial chemicals, medicinal and pharmaceutical preparations, soaps and washing compounds, paints, varnishes and allied paint products, and miscellaneous chemicals including fertilizers, sweeping compounds, adhesives, polishes and dressings, etc.

Miscellaneous Manufacturing:

Companies primarily engaged in manufacturing professional and scientific instruments, surgical, medical and dental instruments, and clockwork operated devices.

Construction:

Contractors engaged in the construction of buildings and highways, heavy construction and marine construction.

Transportation, Storage and Communication:

This group includes the following:

- Transportation companies, primarily engaged in the operation of airor water transportation services, and railway transport.
- (2) Storage companies, primarily engaged in the operation of grain elevators and other storage facilities, including refrigeration.
- (3) Communication companies, primarily engaged in the operation of radio, television, broadcasting and telephone services.

Public Utility Operations:

Companies primarily engaged in the distribution of electric power, and the manufacture and distribution of gas.

Service:

This group includes the following:

- (1) Engineering and Scientific: Companies primarily engaged in providing engineering, chemical, metallurgical and architectural services. This includes research laboratories except medical and dental, which are classified as health services and excluded.
- (2) Associations: Trade or industrial organizations supported by members operating in Canadian industry, and conducting research on behalf of their paying members.

Only the larger firms were considered as being in a position to maintain full time research-development establishments. However, to ensure as complete coverage as possible, the survey was extended to include all firms in the industries noted above with 100 or more employees.

Research activity is generally conducted for the benefit of the entire firm rather than in the interests of an individual branch plant. Consolidated reports were therefore requested from "multiple" firms. In cases where all branches of a firm did not operate in the same industrial field, the firm was classified in the industry in which the major part of its operations were performed. This may lead to over or under statement of research in particular industries. Respondents were requested to report the names of firms or associations from which they secured results of research activity, either with or without payment. Firms so reported and located in Canada, were checked against the mailing list, and, if they were not already included in the survey, they were immediately sent a questionnaire for completion. This source resulted in comparatively few additions to the mailing list, but did insure more complete coverage. It also resulted in the inclusion in the survey of a few firms with less than 100 employees.

SURVEY METHODS

All firms in the survey were originally contacted by mail. Response was exceptionally good and the final result was a completed return received from over 98% of the firms contacted.

In order to ascertain the total cost of researchdevelopment, respondents were asked to report not only the cost of their own activities in this field, but also payments made to other companies or organizations both within Canada and outside the country. To avoid duplication, firms were also asked to list the companies to which such payments were made as well as those from which payments were received for research results. Adjustments were then made on the reports received.

During the editing of the questionnaires some difficulties or differences in interpretation were encountered. These instances were clarified through correspondence or by telephone and on the advice of the respondents, adjustments were made in the reports. 1752) 2001 9333 an 111 933

INDUSTRIAL RESEARCH-DEVELOPMENT EXPENDITURES

1959

	Taken in conformity with the requirements of the Statistics Act.
Please correct any mistakes in name or address	Chap. 257 of the Revined Statute of Canada, 1952.

This survey is being conducted in cooperation with the National Research Council, in an effort to assess the magnitude of the industrial research program in Canada in terms of total expenditures incurred in the various scientific fields, numbers of trained personnel employed, and sources of funds.

Industrial research-development includes basic and applied research in the sciences, including medicines, and in engineering, and in the design and development of prototypes and processes. Do not include quality control, routine testing of products, testing of sasembly line and production techniques, market trassarch, sales promotion, sales service, geological and geophysical exploration or research in the social sciences or psychology. (SEE DEFINITIONS ON PAGES 3 AND 4).

Please complete the acbedule as fully as possible. Your best estimate will be satisfactory if precise figures are not available. NOTE: In the case of parent-subsidiary operations a consolidated return covering all companies which are within the organization will be satisfactory.

	ECTION A			
2. Average number of persons employed by reporting company in all its activities in Canada during 1959. Include employers of auboridiaries and/or affiliates if consiliated reports. (Estimate only) 3. DEFINITIONS

A. CONCEPT OF INDUSTRIAL RESEARCH-DEVELOPMENT:

Industrial research-development comprises activities ranging from pure research intent upon obtaining new knowledge in the life and physical sciences, to conceiving and developing new products, new processes and major changes in products or processes, and bringing them to the stage of production. Such activities as market and sales research and process and quality control are excluded, as well as other special cases owlined below. In case of doubt, please feel free to ask about special situations which you may encounter.

The following kinds of activity are to be included in the concept of industrial research-development:

i. Laboratory scale activity.

- 2. The design and operation of pilot plants or prototypes, provided the main purpose is one of the following:
 - (a) To test experimental conclusions reached at the laboratory level.
 - (b) To establish finished product formulas, specifications or standards.
 - (c) To design special equipment required by a new or improved process.
 - (d) To prepare operating instructions for use at the manufacturing level. ...
- 3. The engineering activity necessary to advance the design of a product or a process from the laboratory to the stage where it can be turned over to a production unit. The design, construction and testing of full scale models prior to production is included, along with the development of designs for special manufacturing equipment and tools required.
- 4. The preparation of drawings, formulas, specifications and manuals of instruction for the use of manufacturing units, all of which are based on the research activities. (See No. 9 in the following section).

The following activities are NOT to be included in the concept of industrial research-development:

- 1. Market research and development, including statistical surveys of consumer preferences, estimates of possible markets, distribution outlets, etc.
- 2. Development of advertising programs including sales promotion and demonstration of new products.
- 3. Economic research and other research in the social sciences.
- 4. Application for patents, including related legal work.
- 5. Experimental work performed to provide additional information as required for the completion of patent litigation.

6. Routine quality or quantity control of a process or products at the manufacturing level.

- 7. Investigation and/or analytical work in connection with mechanical interruptions in production (i.e. trouble shooting).
- 8. Work required for the minor modification of a specific product to meet the requirements of a specific customer.
- 9. Assistance furnished at the manufacturing level to facilitate production in accordance with established formulas, instructions or finished product specifications. This includes the cost of printing blueprints and instruction manuals. (See No. 4 in preceding section).

10, Geological or geophysical exploration.

B. COST OF INDUSTRIAL RESEARCH-DEVELOPMENT:

Include all costs incurred for industrial research-development work done

If you maintain a separate industrial research-development organization, include all operating costs of this organization minus an estimated allowance of the cost of non-research technical services as outlined (Nos. 1 to 10) in the preceding section. Include also an estimate of the cost of industrial research-development work done by company divisions or technicians not part of the indus-trial research-development organization. Exclude capital expenditures as part of current industrial research-development costs, but include in this cost Item 13. Costs incurred as a result of industrial research-development activity within your company organization may include but are not limited to the following:

- Wages, salaries and related costs, including "fringe benefits", of all research personnel, including scientists and all classes of supporting staff.
- 2. Materials and supplies used (or purchased), including the cost of purchasing, receiving, inspection, storage and transportation.
- 3. Literature purchased to provide hackground information necessary for research operations.
- 4. Company overhead, which is an estimated share of the functions supporting industrial research-development activity.

If industrial research-development operations are being conducted for your company by outside organizations, enter the cost in Section 8(b). Your entries should include the total charges for the work including professional fees and administrative costs.

C. DEFINITION OF INDUSTRIAL GROUPS AS NOTED IN ITEM 11:

Aircraft and Parts:

Research and development related to piloted and unpiloted aircraft and parts of all types such as engines, landing gear, pro-pellers, turrets and all auxiliary equipment specifically adapted for aircraft, including guided missiles. Radar and radar equip-ment and other electronic devices for aircraft should be included with electronics, and aeronautical instruments should be included with professional and scientific instruments.

Chemicals (except Drugs and Medicines):

Research and development related to organic and inorganic chemicals including petro-chemicals, primary plastics, synthetic fibres, explosives, scaps and glycerines, paints and varoishes and other products of a chemical nature.

Drugs and Medicines:

Research and development related to medical and pharmaceutical preparations. This includes patent and preparatory medicines, veterinary medicines, vitamin products and biological products, such as antitoxins, bacterins, serums, vaccines, etc.

Electrical Equipment (except Electronics):

Research and development related to systems, machinery, apparatus and supplies for generation, storage, transmission and transformation and utilisation of electrical energy, except those of an essentially electronic nature.

Electronics:

Research and development related to electronic systems and components, whether for wire and wireless telephone and telegraph of all kinds, radio and television transmitting and receiving, object detection, industrial controls and business machines.

Fabricated Metals:

Research and development related to fabricated metal products such as fabricated structural metal products, metal stamping, pressiog and coating, hardware, tools and cutlery, fabricated wire products and non-electric heating apparatus. Exclude machinery and transportation equipment.

Machinery (except Electrical):

Research and development related to machinery and movers other than electrical equipment, including engines and turbines, agricultural, construction and mining machinery, metal working machinery and other special and general industrial machinery and equipment. Exclude motor vehicles and other transportation equipment.

Motor Vehicles and Parts:

Research and development related to motor vehicles including passeager auromobiles, commercial cars and buses, trucks and truck trailers, universal carriers, and special purpose motor vehicles such as ambulances, fire engines, etc.

Petroleum and Natural Gos:

Research and development related to perroleum and natural gas. Petro-chemicals should be included under chemicals above. Geological and Geophysical activities are NOT to be reported.

Primary Metals:

Research and development related to smelting, refining, rolling, drawing, extruding and alloying of metals and the manufacture of castings, forgings and other basic metal products.

Professional and Scientific Instruments:

Research and development related to professional and scientific instruments and equipment, including surveyors, nautical, navi-gational and aeronautical instruments; instruments for laboratory work and scientific research; surgical, dental and medical instruments; ejecttic and mechanical measuring instruments and surgical supplies; and photographic equipment and supplies.

D. SUPPORTING PERSONNEL: (Item 14(b) refers)

Technicians:

Technical personnel having high school graduation or equivalent and additional technical training, who assist scientists and engineers in industrial research-development work (i.e. laboratory technicians and assistants, draftsmen, etc.).

Skilled Craftsmen:

Workers in positions requiring specialized training and experience and who are engaged in industrial research-development work (i.e. glassblowers, machinists, modelmakers, etc.).

Other Supporting Personnel:

All other persons whose pay is included in Item 8(a).

INDUSTRIAL RESEARCH-DEVELOPMENT EXPENDITURES IN CANADA 1959
