## PREFACE

*Fixed Capital Flows and Stocks, 1926-1973* (Catalogue 13-211) presents estimates of fixed non-residential capital stock and flows in Canada for the years 1926 to 1973. Specifically, it contains estimates of capital stocks and flows relating to the whole Canadian economy (excluding housing). As a result it is a larger set of estimates than the one presented in earlier reports which covered only Canadian manufacturing industries; *Fixed Capital Flows and Stocks, Manufacturing, Canada 1926-1960, Methodology* (Catalogue 13-522), *Fixed Capital Flows and Stocks Manufacturing, Canada, 1926-1960, Statistical Supplement* (Catalogue 13-523), *Fixed Capital Flows and Stocks, Manufacturing, Canada 1926-1960* (Catalogue 13-543). The data in this report are given by major industries according to the 1960 Standard Industrial Classification both in constant (1961) and current dollar valuation. The present volume is the annual update which presents estimates of the five most recent years.

It is hoped that the work on capital stock measurement currently underway in the National Wealth and Capital Stock Section of the Construction Division will result in improvement in the series as well as in the estimation of alternative measures (more realistic survival and depreciation functions). These alternative series will be released from time to time as they become available, some of the series are already available in printout form.

Given the nature of the material contained in this report the data are always subject to improvement; comments, therefore, on the part of users will assist us in future research in the difficult area of capital measurement.

The series given in this report are also available in CANSIM (Canadian Socio-Economic Information Management System), the Statistics Canada computerized time series data bank. Table 3 gives for each series in the data bank its CANSIM matrix identification number. A "matrix" in CANSIM is roughly equivalent to a "table" and in the context of the capital stock and flow data contains all the series pertaining to a specific industry.

PETER G. KIRKHAM,  
*Chief Statistician of Canada.*

## PRÉFACE

La publication *Flux et stocks de capital fixe, 1926-1973* (catalogue 13-211) est consacrée aux estimations des flux et stocks de capital fixe non résidentiels au Canada de 1926 à 1973. Plus précisément, elle donne les estimations des flux et stocks de capital pour l'ensemble de l'économie canadienne, à l'exception du logement. C'est pourquoi elle contient un ensemble d'estimations plus vaste que celui qui figure dans les publications antérieures, et qui ne portait que sur le secteur de la fabrication. Ces publications sont respectivement *Fixed Capital Flows and Stocks, Manufacturing, Canada, 1926-1960: Methodology*, (catalogue 13-522), *Flux et stocks de capital fixe, industries de la fabrication, Canada, 1926-1960, supplément statistique* (catalogue 13-523) et *Flux et stocks de capital fixe, industries manufacturières, Canada 1926-1969* (catalogue 13-543). Les données contenues dans la présente publication sont classées par grand groupe d'industries selon la classification type des industries de 1960; elles sont exprimées à la fois en dollars constants de 1961 et en dollars courants. La présente publication est une révision annuelle, présentant les estimés des cinq dernières années.

On espère que les travaux, actuellement en cours à la Section de la richesse nationale et des stocks de capital de la Division de la construction, sur les mesures du stock de capital se traduiront par de meilleures séries et de meilleures estimations des autres mesures possibles, sous la forme de fonctions de survie et d'amortissement plus réalistes. Ces autres séries seront publiées de temps à autre à mesure qu'elles seront disponibles, certaines d'entre elles étant déjà imprimées.

Compte tenu de la nature du contenu de la présente publication, les données peuvent toujours faire l'objet d'améliorations. C'est pourquoi les commentaires des utilisateurs nous aideront à l'avenir dans nos recherches sur ce domaine difficile qu'est la mesure du capital.

Les séries publiées dans le présent ouvrage sont également stockées dans le CANSIM (Canadian Socio-Economic Information Management System – Système canadien d'information socio-économique), qui est la banque de séries chronologiques informatisée de Statistique Canada. Le tableau 3 donne pour chaque série faisant partie de cette banque de séries chronologiques son numéro d'identification matriciel CANSIM. Une "matrice" dans le CANSIM correspond en gros à un "tableau", et, dans le contexte des stocks et flux de capital, elle contient toutes les séries relatives à une activité économique donnée.

*Le statisticien en chef du Canada,*  
PETER G. KIRKHAM.

## SYMBOLS

The following standard symbols are used in Statistics Canada publications:

- ... figures not available.
- ... figures not appropriate or not applicable.
- nil or zero.
- amount too small to be expressed.
- P preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

## SIGNES CONVENTIONNELS

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

- ... nombres indisponibles.
- ... n'ayant pas lieu de figurer.
- néant ou zéro.
- nombres infimes.
- P nombres provisoires.
- r nombres rectifiés.
- x confidentiel en vertu des dispositions de la Loi sur la statistique relatives au secret.

## INTRODUCTION

The procedures and problems associated with the estimates of capital stocks are fully described in Catalogue 13-522 referred to in the preface. The purpose of this introduction is to present a brief outline of the basic methodology underlying the capital flow and stock data presented in this report.

Capital stocks in existence have traditionally been considered one among several factors of production. The measurement of capital in both theoretical and technical formulations is closely related to investment to the extent that a certain technical link between the two concepts and definitions (stocks, flows) has to be established before any elaboration can be made in the direction of capital measurement.

Traditionally the relationship between the capital stock and the corresponding flow of capital services has been one of proportionality. This assumption implies that the services of capital goods acquired at different points in time are perfect substitutes in production. From this substitutability over time stems the property of proportionality between the capital services from each capital good and the stock of capital as measured by adding together all past investment acquisitions.

There is a substantial literature, both theoretical and technical, relating to the measurement of capital. Among a number of methods the "PERPETUAL INVENTORY" method is generally preferred primarily because of its malleability in the creation of time series of capital stocks.

Briefly, this method involves the accumulation over a period of years of investment expenditures by industry to obtain its capital stock in any given year.

The basic ingredients required are:

- (i) annual investment series by industry and category of expenditure
- (ii) price deflators relating to the investment series
- (iii) estimates of average economic lives of the assets used in the various industries.

The reliability of the capital stocks series thus generated depends of course on the quality of the investment data being cumulated, on the realism of both the service life assumption and the method by which capital assets are considered to depreciate over their service life.

As an aid to a better understanding of the mechanics of the "perpetual inventory" method an illustration of the actual computing process is given. Assume that the capital assets in a particular industry remain in production 10 years before they are retired.

Les méthodes et problèmes associés aux estimations des stocks de capital sont décrits au complet dans le catalogue 13-522 mentionnée dans la préface. La présente introduction vise à décrire brièvement la méthodologie à la base des données sur les stocks et flux de capital présentées dans le présent ouvrage.

Les stocks de capital existants ont toujours été considérés comme l'un des facteurs de production. La mesure du capital tant du point de vue théorique que pratique est étroitement liée aux investissements, dans la mesure où il faut établir un certain lien technique entre les deux concepts et définitions (stocks, flux) avant de pouvoir progresser dans la mesure du capital.

La relation entre le stock de capital et le flux correspondant de services de nature capitale a toujours été une relation de proportionnalité. Ce postulat implique que les services des biens de capital acquis à différents moments sont des substituts parfaits dans la production. De cette notion de possibilité de substitution dans le temps découle celle de proportionnalité entre les services de nature capitale provenant de chaque bien de capital et le stock de capital, mesuré par la somme de toutes les acquisitions faites grâce aux investissements.

Un nombre appréciable d'auteurs se sont penchés sur la mesure du capital à la fois du point de vue théorique et du point de vue pratique. Parmi les diverses méthodes existantes, on préfère généralement celle de "l'inventaire perpétuel" avant tout pour sa souplesse lors de la création de séries chronologiques de stocks de capital.

En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissements de l'industrie pour obtenir son stock de capital pour une année donnée.

Les éléments fondamentaux nécessaires sont :

- (i) les séries annuelles des investissements, par industrie et catégorie de dépense
- (ii) les indices de déflation se rapportant aux séries sur les investissements
- (iii) les estimations de la durée de vie économique moyenne des actifs utilisés par les diverses industries.

La fiabilité des séries de stock de capital ainsi produites dépend naturellement de la qualité des données sur les investissements qui ont été réunies, du réalisme à la fois de l'hypothèse de durée de vie et de la méthode que l'on a retenue pour la dépréciation des actifs de nature capitale tout au long de leur vie utile.

Afin de mieux faire saisir le mécanisme de la méthode de "l'inventaire perpétuel", le lecteur trouvera ci-après une illustration du processus réel de calcul, tableau 1. Supposons que les actifs de nature capitale d'une industrie donnée demeurent en production 10 ans avant d'être retirés.

Investment expenditures pertaining to the types of capital assets in question, adjusted for prices, are cumulated for a period of 10 years. In the 10th year a measure of the gross stock of this industry's capital asset is obtained. In the eleventh year the investment expenditures of the first year are deducted from the cumulated total while the purchases of capital assets of the new year are added. We proceed in the same manner for all subsequent years.

In the gross capital stocks capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life, these estimates are known as net capital stocks. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimates. The net stocks presented in this report have been prepared by means of using the "straight-line" method. The net stock is always equal to the difference between the cumulative value of past gross investment and cumulative depreciation. Table 1 summarizes an exemplary illustration of the computational procedure involved in the "perpetual inventory" method. Table 2 shows the industries for which capital flow and stock estimates are presented in this volume together with the types of assets and their service lives.

In the context of the "perpetual inventory" method the value of the capital stock can also be viewed as the weighted sum of past gross investment expenditures. The weights used can be thought of as the resultant of two factors. The first factor relates to the mortality of an asset namely the probability that the assets of a certain age are in existence when the stock is being estimated. In other words this factor relates to the depreciation in the sense of physical decay, retirement, etc.

The second factor deals with the value of the assets still present in the stock. If the items included in the stock retain their original value then of course we are measuring the gross stock, if their value is diminishing over their service life then we are measuring the net stocks where allowances have been made for wear and tear and obsolescence.

We can summarize the nature of the calculations involved in measuring the stock of capital in the following fashion:

Les dépenses d'investissement se rapportant aux catégories d'actifs de capital considérées, après déflation, sont sommées sur une période de dix ans. La dixième année, on obtient une mesure du stock brut des actifs de capital de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulatif, et on ajoute les achats de nature capitale au cours de la nouvelle année. On procède ainsi de la même manière pour toutes les années suivantes.

On regroupe dans les stocks bruts de capital les actifs de nature capitale à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations stocks nets de capital. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Les stocks nets indiqués dans la présente publication ont été calculés grâce à la méthode dite "linéaire". Le stock net est toujours égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée. On trouvera au tableau 1 un exemple récapitulatif de la méthode de calcul utilisée dans la méthode de "l'inventaire perpétuel". Le tableau 2 présente les industries dont les estimations des flux et stocks de capital figurent dans le présent ouvrage, ainsi que les différentes catégories d'actifs et leurs durées de vie.

Dans le cadre de la méthode de "l'inventaire perpétuel", on peut aussi considérer la valeur du stock de capital comme la somme pondérée des dépenses d'investissement brutes antérieures. Les coefficients de pondération utilisés peuvent être considérés comme le résultat de deux facteurs. Le premier de ces facteurs se rapporte à la disparition d'un actif, c'est-à-dire à la probabilité que les actifs d'un certain âge existent encore lors de l'estimation du stock. En d'autres termes, ce facteur se rapporte à la dépréciation, dans le sens de dégradation physique, de retrait, etc.

Le second facteur a trait à la valeur des actifs faisant encore partie du stock. Si les éléments du stock conservent leur valeur originale, naturellement nous mesurons alors le stock brut; si leur valeur diminue tout au long de leur durée de vie, nous mesurons alors les stocks nets, après avoir pris en compte l'usure et l'obsolescence.

Nous pouvons résumer ainsi la nature des calculs entraînés par la mesure du stock de capital:

$$1. \text{ Gross stock at the end of period} = \sum_{i=1}^L W_i I_{it}$$

where  $L$  = the assumed economic life of the capital asset,  $W_i = 1$  during the lifetime of the asset and  $I_{it}$  = the investment expenditures during each period. This assumption about the weight ( $W_i = 1$ ) is only one among many possibilities such as a distribution of weights derived from studies of the "survival curves" of individual pieces of equipment.

2. Net stock at the end of the period

$$= \sum_{i=1}^L W_i I_{it} d_i$$

where  $L$ ,  $W_i$  and  $I_{it}$  as before and

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

which indicates that the value of the asset declines linearly. Again this assumption is one among many alternatives. In recent years the diminishing balance system of depreciation has become increasingly popular.

It should be noted that the above stocks relate to the end of each calendar year and some minor adjustments are necessary to centre the estimates of the middle of each calendar year.

As mentioned before for certain industries alternative measures are available where alternative assumptions such as a bell-shaped distribution of weights and different depreciation functions have been used. It is hoped that in the near future a separate publication dealing with these alternative measures will become available.

#### Brief Explanation of Terms

**Constant valuation** measures values in constant prices (1961).

**Current valuation** measures values in the prices of the given year.

**Depreciation** is the allowance made for physical deterioration and obsolescence.

**Discards** (retirements) are the value of gross investment that is withdrawn from the stock.

**Gross fixed capital formation** (gross investment) is the value of new fixed capital goods purchased by the industries for which stock measurement is estimated. The investment expenditures are grouped by types of capital assets (construction, machinery and equipment etc.).

$$1. \text{ Le stock brut en fin de période est} = \sum_{i=1}^L W_i I_{it}$$

où  $L$  est la durée de vie présumée de l'actif, et  $I_{it}$  sont les dépenses d'investissement au cours de chaque période. L'hypothèse relative au coefficient de pondération ( $w_i = 1$ ) n'est qu'une des nombreuses possibilités, comme par exemple une distribution des coefficients de pondération obtenue à partir d'études des "courbes de survie" des différents éléments du matériel.

2. Le stock net en fin de période est

$$= \sum_{i=1}^L W_i I_{it} d_i$$

où  $L$ ,  $W_i$  et  $I_{it}$  ont la même signification que précédemment, et

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

ce qui signifie que la valeur de l'actif diminue de façon linéaire. Là encore, cette hypothèse n'est qu'une des nombreuses possibilités. Au cours des dernières années, le système d'amortissement par le solde décroissant s'est de plus en plus répandu.

Il est à noter que les stocks ci-dessus se rapportent à la fin de chaque année civile, et qu'il est nécessaire d'apporter quelques ajustements mineurs pour le centrage des estimations sur le milieu de l'année.

Comme on l'a mentionné précédemment dans le cas de certaines industries, on dispose d'autres mesures lorsque d'autres hypothèses, comme par exemple celles d'une distribution en cloche des coefficients de pondération et de différentes fonctions d'amortissement, ont été utilisées. On espère faire paraître dans un proche avenir une publication distincte qui leur sera consacrée.

#### Brève explication des termes utilisés

**Évaluation constante:** mesure les valeurs en dollars constants de 1961.

**Évaluation courante:** mesure les valeurs aux prix de l'année en cours.

**Dépréciation:** prise en compte de la dégradation physique et de l'obsolescence.

**Retraits:** valeur des investissements bruts retirés du stock.

**Formation brute de capital fixe** (investissement brut): valeur des nouveaux biens d'immobilisation acquis par les industries dont on estime le stock. Les dépenses d'investissement sont groupées par catégorie d'actifs de nature capitale (bâtiments, machines et matériel, etc.).

**Gross stocks** are the cumulative value of gross investment in capital goods less cumulative discards.

**Mid-year gross and net stocks** are stocks adjusted to the middle of each year. Using the notations of Table 1 they are derived as follows:

$$\frac{K_n + K_{n-1}}{2} \text{ and } \frac{N K_n + N K_{n-1}}{2}$$

**Net stocks** are gross stocks less deductions of losses in value through physical deterioration and obsolescence.

**Service life** is the length of time during which capital assets are present in useful economic production before retirement occurs.

**Straight-line depreciation** for a capital asset is equal to its gross value divided by its service life.

**Stocks bruts:** valeur cumulative des investissements bruts en capital moins les retraits cumulatifs.

**Stocks bruts et nets du milieu de l'année:** Stocks ajustés sur le milieu de chaque année. En utilisant les symboles du tableau 1, on les calcule suivant les formules

$$\frac{K_n + K_{n-1}}{2} \text{ et } \frac{N K_n + N K_{n-1}}{2}$$

**Stocks nets:** stocks bruts moins pertes de valeur en raison de la dégradation physique et de l'obsolescence.

**Durée de vie:** durée de la présence des actifs de nature capitale dans la production économique utile avant retrait.

**Amortissement linéaire:** dans le cas d'un actif de nature capitale, il est égal à la valeur brute de cet actif divisée par sa durée de vie.
