## VALUE OF FRUIT PRODUCTION, 1953

April 29, 1954 - The total farm value of commercial fruit production in Canada in 1953 was 45.7 million dollars an increase of slightly over two million dollars from the 1952 figure. Farm prices for the 1953 crop were higher for all fruits except pears in which case the price was the same in both years.

In Nova Scotia and Prince Edward Island farm receipts from the 1953 fruit crop were close to those of the previous year. In Nova Scotia higher prices for apples counterbalanced reduced production of all fruits except raspberries. The total value of fruit produced in New Brunswick, however, was down in 1953, due to smaller crops of the principal fruits.

In Quebec the larger apple and blueberry crops in 1953 brought about a six per cent increase in the total farm value of fruit production this year. This was in spite of lower farm prices for apples.

The 1953 Ontario apple crop was larger than that of 1952 which, associated with higher prices, resulted in a substantial increase in the farm value of this fruit. The value and prices of all other fruit crops produced in Ontario were also higher in 1953 than in 1952 to give a total value of 20 million dollars, up by about 2.3 million from the previous season.

In the province of British Columbia the value of the 1953 fruit crop was down slightly from that of 1952. This reduction was due to a drop of about two million dollars in the value of the apple crop brought about by smaller production and a price level lower than in the previous season. However, farm prices for the 1952 apple crop were the highest received during the period 1946-53 and the prices for the 1953 crop were the second highest. The value of all other fruits produced in British Columbia in 1953 was higher than in 1952 which came close to completely compensating for the reduced value of apples.

The Dominion Bureau of Statistics is commencing with this report the publication of statistics on the production and value of blueberries in Canada. information was collected and prepared by personnel of the Canada Department of Agriculture for all provinces for which figures are available except Quebec. Statistics on blueberry production in that province are prepared by the Quebec Bureau of Statistics.

The prices shown in the accompanying table are returns to pickers. The blueberry industry in Newfoundland, the Maritimes and Quebec is based on the wild fruit. However, in certain areas some cultural activities are undertaken. In some cases the blueberry land is burned over each year to control weeds and to effect pruning. Later on in the season dusting may be undertaken for maggot control. A considerable proportion of the blueberry crop is frozen and exported to the United States.

Prepared in the Crops Section in Co-operation with the Federal and Provincial Depts. of Agriculture and the Quebec Bureau of Statistics. In British Columbia blueberry production is based on cultivated fruit most of which is grown in the Fraser Valley.

There is some production of blueberries in the other provinces but no statistics are available at least at the present time.

In 1953 blueberries made up seven per cent of the total value of fruit production in Canada. In the province of Quebec, where most of the blueberries are produced, the value of this crop surpassed that of strawberries and raspberries being second only to apples and accounting for about 35 per cent of the total.
