CHART 3

DAIRY STATISTICS OF CANADA

(1938)

Dominion Statistician:	R. H. Coats, LL.D., F.R.S.C., F.S.S. (Hon.)
In Charge of Dairying Statistics:	P. H. Ferguson, B.S.A., M.Sc.

MILK PRODUCTION

The first milk production estimate was contained in the Census Report for 1911, showing a farm output of nearly 7 billion pounds in 1900 and slightly more than $9\frac{3}{4}$ billion pounds in 1910. The increase thus reported occurred during a ten-year period of extensive land settlement. During this period the number of farm holdings advanced approximately one-third, and breeding stock was shipped in large numbers to the Western Prairies to meet the needs of the new colonists. In the course of the next decade (1910-1920), a marked development took place in live stock and dairying enterprises; and since the quest for new lands had practically subsided, the number of farm occupants increased only 4 per cent while the milch cow population made a gain of 28 per cent. But the increase in milch cows was only partially reflected in the milk production estimate for 1920 which amounted to approximately $10\frac{1}{2}$ billion pounds. In the subsequent period (1920-1930), the movement toward dairying was much more pronounced; and the production of milk as shown in the revised estimate for 1930 reached a total of over 13 billion pounds, nearly double the amount produced at the beginning of the century. This increase was accompanied by a greater production per cow. In 1900, the average yield was 2,851 pounds; in 1920, it advanced to 3,189 pounds, and in 1930 to 3,578 pounds. The production per farm also advanced. From an average of 13,436 pounds in 1900 it increased to 14,911 pounds in 1920 and to 17,605 pounds in 1930.

In 1938, the production of milk in the Dominion was estimated at approximately $15\frac{3}{4}$ billion pounds, representing a gain of about $\frac{1}{2}$ million pounds over the revised figure for 1937 and about $2\frac{3}{4}$ billion pounds over the 1920 estimate. The advance recorded in 1938 was reflected in the milk production per cow which moved up to 4,071 pounds, or the equivalent of 142 pounds of butter-fat.

BUTTER AND CHEESE PRODUCTION

The dairy butter make in 1900, as reported in the Census for the following year, was slightly more than 105 million pounds, while the creamery butter production was only 36 million pounds. The cheese factory output which stood at nearly 221 million pounds began to show evidence of a decline as early as 1907, and at the time of the next decennial Census the production had fallen to less than 200 million pounds. Dairy butter, on the other hand, advanced to 137 million pounds in 1910, the largest production ever recorded, and creamery butter advanced to 65 million pounds. In subsequent years competition continued to favour the creamery industry, and according to the first annual report of dairy factory production for the year 1915, the creamery make had stepped up to 84 million pounds while the cheese factory output declined to 184 million pounds. The 1920 census estimate placed the creamery butter make close to 112 million pounds while the output of cheese was reduced to 149 million pounds. The rise of the creamery industry also became a competitive factor in the production of dairy butter. In 1920, the farm dairy product fell to approximately $10\frac{3}{8}$ million pounds, a reduction of 34 million pounds in ten years. Two years later,

Milk production data appearing in this report for the years prior to 1938 have been revised since the publication of the 1937 issue of "Dairying Statistics of Canada". Complete revisions for the years 1930-1933 may be found in a "Supplementary Statement" issued in September, 1939.

the creamery butter output exceeded cheese production for the first time, and in the course of the next few years had won a position of undisputed leadership. In 1934, cheese factory production fell to 99 million pounds, the lowest annual output of the present century.

The production of creamery butter in 1938 reached a total of nearly 267 million pounds. This was a gain of 81 million pounds over the output of 1930, and an increase of 20 million pounds over the previous year. Factory cheese production in 1938 was slightly above 121 million pounds, and while it represented an advance of 2 million pounds over 1930, it showed a reduction of 9 million pounds in comparison with the output of the previous year. Since 1920 there has been little variation in the dairy butter make, the changes shown being due principally to an element of instability in the size and buying power of the rural population. In 1930, the make declined to $97\frac{1}{2}$ million pounds, but since that time the trend has moved in a slightly upward direction. The 1938 make was estimated at approximately 105 million pounds, a comparative figure to that shown in the census of 1900. The total production of all dairy products manufactured in 1938 amounted to 10,524,427,900 pounds in terms of milk. Of this amount, 59.4 per cent was used in creamery butter production, 27.4 per cent in dairy butter, and 12.9 per cent in the manufacture of cheese; while the remaining 4.3 per cent was employed in the production of concentrated milk products, ice cream and farm-made cheese.

CONCENTRATED MILK AND ICE CREAM PRODUCTION

The demand for canned and powdered milk in both Canadian and Empire markets has given rise to a marked expansion of the milk manufacturing industry in the last few years. In 1938, approximately 122 million pounds of concentrated whole milk products and about 39 million pounds of milk by-products were produced in the Dominion. Compared with the previous year these figures represent increases of approximately 13 per cent and 34 per cent respectively, and quite significant advances over the production figures for 1930. Of the whole milk products, evaporated milk constituted about 86 per cent of the total, while the output of skim milk powder represented 66 per cent of the milk by-products.

Ice cream production is another branch of the dairy industry which has developed quite rapidly in the course of the last few years. The total production in 1938 was 8.7 million gallons, showing only a slight gain over the previous year but an increase of nearly 3 million gallons over the production recorded in 1930. Approximately two-thirds of the total output was produced by dairy factories; 22 per cent was produced in specialized ice cream plants, and 12 per cent was the product of the confectionery, bread and biscuit industry.

MILK OTHERWISE USED

The estimated quantity of milk employed for purposes other than for manufacturing reached a total of 5.2 billion pounds in 1938, or approximately one-third of the total production. Fluid milk sold off farms is the leading item in this division. In 1938, it amounted to 2.8 billion pounds; milk retained on farms for home consumption represented 1.7 billion pounds, and milk fed to live stock accounted for the balance, amounting to $\frac{3}{4}$ of a billion pounds. Compared with the previous year, the three items together (milk otherwise used) reveal an increase of 114 million pounds, and in comparison with 1930 a gain of 503 million pounds is shown.

CONSUMPTION OF DAIRY PRODUCTS

The disappearance of creamery and dairy butter in Canada reached a total of nearly 357 million pounds in 1938, and constituted about 96 per cent of the total production. The per capita consumption was 31.83 pounds. The domestic disappearance of cheese was less than 41 million pounds in 1938, and differing from butter represented only about one-third of the total make. The per capita consumption in 1938 was 3.62 pounds, a figure which has varied very little from year to year. Approximately 115 million pounds of concentrated milk products were used in Canada in 1938 compared with less than 79 million pounds in 1930. The former represented 71 per cent of the total output and 10.26 pounds in consumption per capita. About the same percentage was used in the Dominion in 1930, but the per capita consumption was only 7.72 pounds. The per capita consumption of ice cream has increased considerably in recent years. In 1938 it was estimated at .77 gallons whereas in 1933 it was only .53 gallons.

The consumption of fresh milk, together with cream expressed as milk, reached a total of 4.3 billion pounds or 3.3 billion pints in 1938. This represented a daily consumption for the whole of Canada of .82 pints per person. It is important to observe that the milk producers supplying their own homes consumed 1.17 pints per day while those required to purchase their supply averaged only .70 pints per day. This explains in some measure the variations in the total consumption in the different sections of the Dominion.

EXPORTS AND IMPORTS

The export movement of Canadian butter has followed a more or less erratic course throughout the years. The amounts exported from Canada were comparatively small until 1918 when shipments increased to nearly 11 million pounds as compared with $4\frac{1}{4}$ million pounds in the previous year. During the period 1915 to 1918, exports averaged a little over $6\frac{1}{2}$ million pounds per year, and the total for the four years represented 7.7 per cent of the factory output. After the war a more pronounced advance was recorded. In 1919 export shipments reached $16\frac{1}{2}$ million pounds; and while a low tide movement was revealed in the two subsequent years, there followed a four-year period (1922 to 1925) in which exports moved up to exceptionally high levels. The average was approximately 21 million pounds annually, and the total exports during these four years represented 12.6 per cent of the creamery butter make. The all-time high was reached in 1925 when $26\frac{1}{2}$ million pounds were shipped from Canadian ports. A sharp reduction occurred in the course of the next twelve months, and a definite slump developed in 1927. From 1927 to 1930 the yearly average was slightly over $1\frac{3}{4}$ million pounds; in the period 1931 to 1934 the average was $4\frac{3}{4}$ million pounds, and from 1935 to 1938 the yearly average was nearly $5\frac{1}{4}$ million pounds. In 1935, the exports of $7\frac{3}{4}$ million pounds were the highest since 1931 when nearly 11 million pounds of butter were shipped out of Canada. In 1938 they fell slightly below 4 million pounds, a comparable figure to that of the previous years but the lowest since 1934.

The butter import movement has also revealed significant variations from year to year. From 1915 to 1918 the quantities of butter brought into Canada were exceedingly small, averaging $2\frac{1}{4}$ million pounds per year, but in the next four-year period they had increased to an average of $3\frac{1}{4}$ million pounds, and the same average was maintained during the four subsequent years. Commencing with 1926, imports moved to exceptionally high levels, and from 1927 to 1930 they averaged $25\frac{3}{4}$ million pounds, the highest figure being $38\frac{1}{2}$ million imported in 1930. The total imports during this four-year period were $95\frac{1}{4}$ million pounds in excess of the exports. Between 1931 and 1934, imports averaged only $1\frac{3}{4}$ million pounds. The largest amount

shown for any one year in this period was in 1934 when 3 million pounds were shipped into Canada as against exports of less than $\frac{1}{2}$ a million pounds. During the period 1935 to 1938, imports again tapered off to exceedingly small quantities. The only large movement into the Dominion occurred in 1938 when a small surplus of Canadian butter produced seasonal price advances on the Canadian markets which permitted the entry of nearly $5\frac{1}{4}$ million pounds, most of which came from New Zealand and Australia during the early spring. The figure given exceeded the exports by $1\frac{1}{4}$ million pounds.

Differing from butter, exports of cheese have remained relatively constant. During the period 1915 to 1918, they averaged $167\frac{3}{4}$ million pounds, and for the four years represented 89.9 per cent of the cheddar cheese production. The high point in the export movement was reached in 1917 when over $176\frac{1}{4}$ million pounds of cheese were shipped out of the Dominion. The decline in production, which developed more pronounced tendencies in the early twenties, was reflected in the movement of cheese to overseas markets. Hence, by 1929 less than 93 million pounds were shipped out of Canada; by 1933 exports had fallen to 74 million pounds, and in 1935 they declined to less than 56 million pounds. During the period 1935 to 1938, the yearly average was about 77 million pounds, and the total export movement for the four years was only 65.2 per cent of the total cheese factory output of Canada.

Cheese imports have never occupied a very important place in the trade of Canada, averaging about 1 to 3 million pounds annually during the past twenty years. In 1938 the imports were slightly less than $1\frac{1}{2}$ million pounds, and the varieties imported were principally those not manufactured in this country. Great Britain is now the important market for concentrated milk products, replacing the position held by the United States in the 1915 to 1918 period, and during 1938 took 14.5 per cent of the Canadian production. Total exports have also increased. In 1934, approximately 26 million pounds were shipped out of Canada, while in 1938 the shipments reached a total of 35 million pounds. The latter figure was about $1\frac{3}{4}$ million pounds above that of the previous year. The imports of concentrated milk products are relatively small, averaging about $\frac{1}{2}$ a million pounds annually. In 1937, however, they reached nearly $1\frac{1}{2}$ million pounds, and in 1938 fell just slightly below 1 million pounds.

VALUE AND INCOME

The farm value of the milk production of Canada and the farm income from milk production was shown for the first time in the advance issue of this report, while comparative figures for 1930 to 1933 were published in a supplementary statement. The farm value of milk in 1938 amounted to more than 150 million dollars as compared with 141 million dollars in 1930 and 114 million dollars in 1932. The gross farm income from milk production represents the income from products consumed in farm homes as well as the sales income, and is the equivalent to the farm value less milk fed to live stock. In 1930 the gross income was 134 million dollars while the sales income was only 109 million dollars. In 1932, these items fell to 109 and 88 million dollars respectively, but with the advent of higher prices in 1938 they advanced to 144 million dollars and 119 million dollars. The sales income for 1938 as shown in the latter figure, represented 82.3 per cent of the total farm value of milk production.

The total value of milk production includes manufactured products valued at factories, fluid milk valued at plants, bottled and ready for delivery to householders, and the value of milk left on farms. The total value of the dairy production

of Canada during 1938 amounted to over 220 million dollars compared with 218 million dollars in 1930 and approximately 158 million dollars during the low tide of farm business activity in 1932. In 1938 the income from milk and cream sold off farms for fluid and factory use was approximately 112 million dollars. Enhanced in value, however, by the process of manufacturing, by factory charges and by haulage costs, the value of these products increased to over 180 million dollars, an increase of 68 million dollars. Thus, the farm value of milk sold off farms for manufacturing and for fluid distribution represented only 62.3 per cent of the value of the factory products.

BUTTER AND CHEESE PRICES

Creamery butter prices at Montreal based on the daily quotations of the Canadian Commodity Exchange for first grade solids, averaged $26 \frac{7}{8}$ cents in 1938 as compared with $26 \frac{1}{2}$ cents in 1937 and $23 \frac{5}{8}$ cents in 1936. At Winnipeg the creamery butter prices in 1938 averaged $25 \frac{1}{4}$ cents, and at Vancouver they averaged $30 \frac{1}{4}$ cents. According to the Montreal report, prices reached the highest level about the middle of March, and the average for that month was $35 \frac{3}{4}$ cents. The lowest point was reached in December, and the average for that month was $21 \frac{1}{2}$ cents. The difference between the high point of $36 \frac{1}{8}$ cents in March and the low point of $20 \frac{3}{4}$ cents in December represented a reduction of $15 \frac{3}{8}$ cents. The maximum spread between 1937 prices and 1938 prices was $11 \frac{1}{4}$ cents and occurred in the middle of February; while the minimum spread was $\frac{1}{8}$ of a cent, recorded in the month of July.

Ontario coloured cheese at Montreal averaged $14 \frac{1}{4}$ cents in 1938 for the first-grade product as compared with $14 \frac{1}{8}$ cents in 1937 and $12 \frac{7}{8}$ cents in 1936. From the high point of $15 \frac{3}{4}$ cents in the spring months to the low point of $11 \frac{1}{4}$ cents in December, a difference of $4 \frac{1}{2}$ cents is shown. The widest spread between 1937 and 1938 prices appeared in the month of December when a difference of $3 \frac{1}{4}$ cents was indicated, while the narrowest spread was revealed late in August when 1938 prices reached a parity with those of the previous year.

Table I - Total Milk Production of Canada and Disposition Thereof, by Provinces, 1934 to 1938.

Province and Year	Total Milk Production	Manufactured		Milk Otherwise Used		
		On Farms	In Factories	Fluid Sales	Farm Consumed	Fed on Farms
	Lb.	Lb.	Lb.	Lb.	Lb.	Lb.

+ Total ice cream production in 1938 includes the dairy factory output shown in the above table, plus 1,953,000 gallons valued at \$2,381,000 produced in specialized ice cream plants, and 992,000 gallons valued at \$1,205,000 produced by the confectionery, bread and biscuit industries. Thus, dairy factories accounted for 66.0 per cent of the total production while the other two industries contributed 22.5 per cent and 11.5 per cent, respectively.

Table X - Estimated Consumption of Milk in Canada, by Provinces, 1934 to 1938.

Note - The term "Milk Producers" refers to that part of the population located on farms where cows are kept; while the term "Non-Producers" includes all the urban dwellers, plus the occupants of farms where there are no cows. Otherwise described the former group is composed of those who produce the milk used in their own homes, while the latter represents those who purchase their domestic milk supply.

Table XI - Estimated Consumption of Milk and Dairy Products in Canada, 1934 to 1938.

Product	Year	Total Consumption			Percentage of Total Milk Production	Per Capita Consumption of Product	Per Capita Consumption in terms of Milk
		Quantity of Product	Percentage of Total Make +	Quantity as Milk			
		Lb.	%	Lb.	%	Lb.	Lb.
