# DEPARTMENT OF TRADE AND COMMERCE DOMINION BUREAU OF STATISTICS MINING, METALLURGICAL AND CHEMICAL BRANCH OTTAWA - CANADA

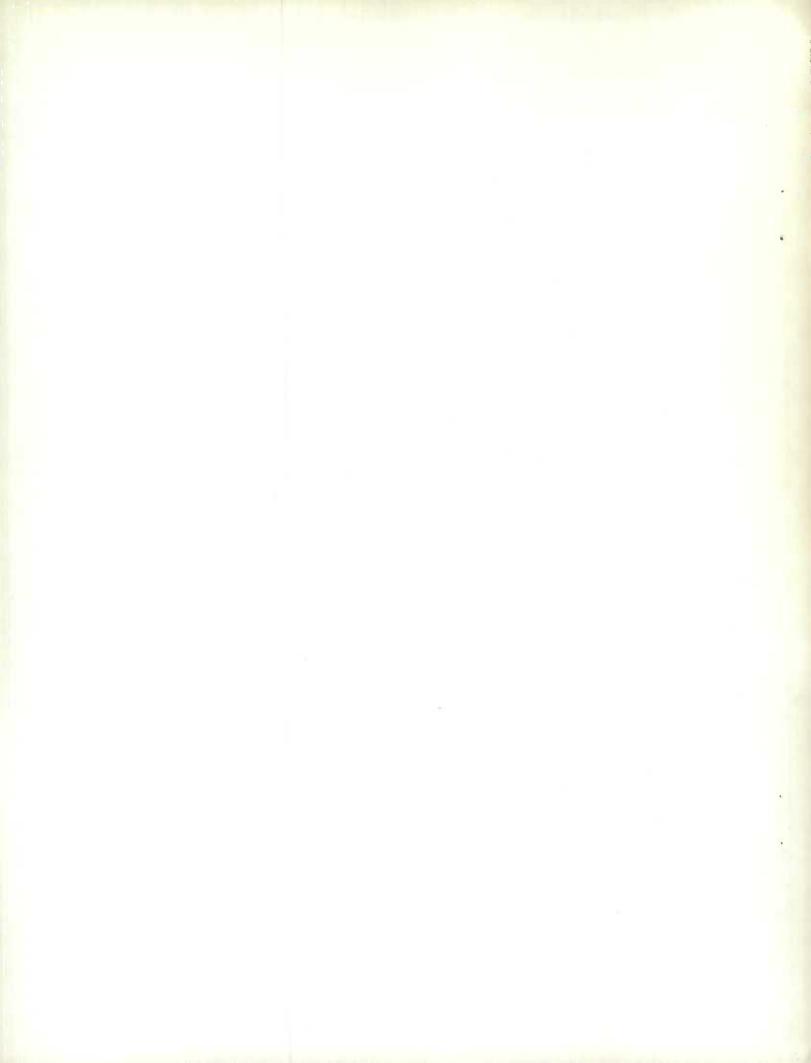

Dominion Statistician: R. H. Coats, LL.D., F.R.S.C., F.S.S.(Hon.)
Chief - Mining, Metallurgical and Chemical Branch: W. H. Losee, B.Sc.
Mining Statistician: R. J. McDowall, B.Sc.

## THE NICKEL-COPPER MINING, SMELTING AND REFINING INDUSTRY IN CANADA, 1937.

Production of new nickel in Canada from all sources and in all forms totalled 224,905,046 pounds valued at \$59,507,176 during 1937. This was an increase over 1936 in output and value of 32.5 and 35.6 per cent respectively, and represents a new all time high record in the production of nickel in Canada. Practically the entire production of Canadian nickel comes from ores mined in the Sudbury district of Ontario. The nickel bearing deposits of the Sudbury area also contain relatively high values in copper and the platinum metals and the recoveries of these metals in 1937 were also the greatest ever realized in the history of the Canadian nickel-copper mining industry. The output of copper in Ontario in 1937 was estimated at 322,039,208 pounds, valued at \$41,716,364 while the combined values of platinum metals recovered during the same period from nickel-copper ores totalled \$9,931,532. Copper recovered from Ontario nickeliferous ores, in 1937, comprised approximately 61 per cent of the total Canadian copper output for the year, while the value of the platinum metals produced in the same period exceeded the combined values of all metals produced in the Yukon, Northwest Territories and Nova Scotia in 1937 and was greater than the total value of all metals produced in the entire Province of Ontario in 1899.

In addition to production of nickel, copper and the platinum metals there is an increasing output from these ores of the associated metals - silver, gold, selenium and tellurium; sulphur for the manufacture of sulphuric acid is also recovered in the gaseous state from waste smelter gases. The total gross value of the various products of the Canadian industry, considered as a whole, was estimated at \$111,353,066 in 1937 compared with a corresponding value of \$77,593,731 in the preceding year. It is also interesting to note that silver recovered from the Sudbury nickel-copper ores totalled 2,364,010 fine ounces in 1937, a recovery that was some 548,961 ounces in excess of the total silver produced in 1937 from silver-cobalt ores mined in the noted Cobalt and Gowganda camps; silver recovered from nickel-copper ores during 1937 amounted to 10.3 per cent of the total silver produced by the entire Canadian mining industry. Gold recovered from Canadian nickel-copper ores totalled 75,458 fine ounces in 1937. In 1926 the corresponding production of this metal, recorded as being recovered from this source, was only 4,447 ounces.

Two companies operate both mines and metallurgical plants in the Sudbury area. The International Nickel Company of Canada, Limited, conducts smelting operations at Copper Cliff and Coniston, Ontario, while the Falconbridge Nickel Mines, Ltd., smelt their ores at the Falconbridge mine located a few miles east of the town of Sudbury. This last named company treat their matte in a refinery located at Kristiansand, Norway. The relatively small amount of nickel oxide produced at Deloro, Ontario, is recovered from silver-cobalt-nickel-arsenic ores mined in Northern Ontario. Smelter matte made by the International Nickel Company is treated in plants located at Clydach, Wales; Huntington, West Virginia, and at Port Colborne and Copper Cliff, Ontario. In British Columbia a relatively small tonnage of crude nickel ore was mined and exported

during 1937 by the B. C. Nickel Mines, Ltd.

The number of firms reported as actually engaged in the production of nickel or in the exploration or development of nickel bearing deposits in Canada totalled 9 during 1937 as compared with 5 in 1936. Of the 1937 operations 6 were located in Ontario, 2 in British Columbia and 1 in New Brunswick. Smelting and refining operations were confined to the Province of Ontario. Capital employed in 1937 by the industry, as a mole, amounted to \$104,313,953; employees numbered 10,758; salaries and wages distributed totalled \$18,752,727 and the net value of all products of the industry was estimated at \$92,687,996 as against a corresponding value of \$63,244,633 in 1936.

The International Nickel Company of Canada Ltd., reported that, in 1937, ore requirements totalled 5,880,278 short tons of which 3,804,409 tons were extracted from the Frood mine, 1,283,046 tons from the Creighton, 399,076 tons from the Levack and 393,747 tons from the Garson. The Levack mine was re-opened in March and a new shaft at the property was being sunk to a depth of 2,000 feet; this shaft, together with a new surface plant and mine equipment is expected to be ready for operation in 1939 for an output up to 4,000 tons per day.

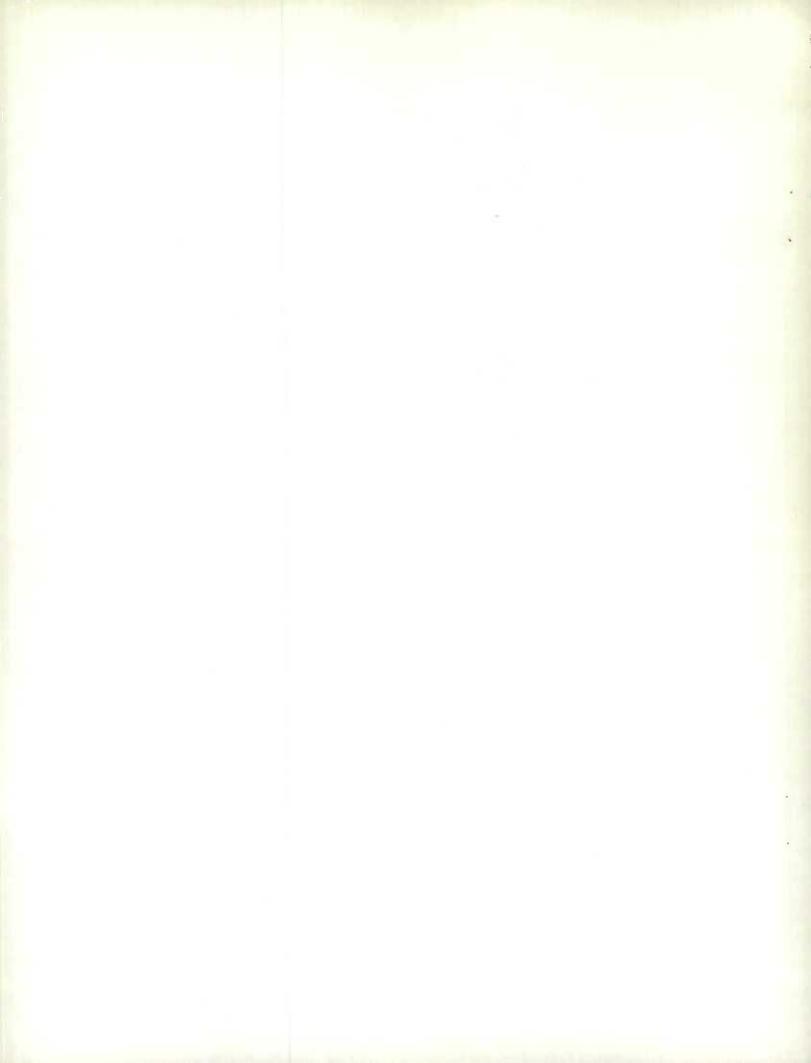

As a result of a comprehensive survey it was decided by the International Nickel Co. to adopt open pit mining for the upper portion of the Frood ore body and it is intended that 4,000 tons of ore per day will be available from this operation during the early months of 1939. The combination of surface mining and mining at depth will assume, it is stated, an average grade of ore over the future life of this mine. In all the mines ordinary development in 1937 was continued by the company at a rate conforming with production requirements. The total footage advance was 60,639 feet, thus bringing the total underground workings in the four operating mines to 673,120 feet or approximately 127 miles.

The concentrator of the International Nickel Company operated at capacity in 1937 and treated 4,583,100 tons of ore at a rate slightly in excess of 12,500 tons per day. The Copper Cliff smelter produced 188,169 tons of bessemer matter and 158,100 tons of converter copper. The Coniston smelter was operated at full capacity and ore to the amount of 891,956 tons was treated and 54,329 tons of bessemer matte produced. At the Port Colborne, Ontario, refinery 147,264,099 pounds of refined nickel was produced in 1937. The electrolytic copper refinery of the Ontario Refining Co. Ltd., located at Copper Cliff, processed 159,286 tons of converter copper made at the Copper Cliff smelter and produced 145,600 tons of refined copper.

In Wales at the Clydach nickel refinery (The Mond Nickel Co. Ltd.) the output of pellet nickel was 39,554,965 pounds, in addition to which, 11,755,800 pounds of salts were produced, containing 2,430,130 pounds of nickel; with completion of improvements this refinery is expected to reach a production rate of 50,000,000 pounds per annum. Due to increased output of nickel at Port Colborne and Clydach the production of by-product platinum metals at the Acton (England) platinum metals refinery was 255,165 ounces, comparable with 232,343 ounces in 1936.

The total number of employees at the end of 1937 was 17,434, distributed as follows: Canada, 11,486; Great Britain, 3,421; United States, 2,472; other countries, 55. During the year the Company provided for contributory non-occupational accident and sickness insurance benefits for all its imployees in Canada and the United States, whose remuneration is on an hourly basis.

Proven ore reserves at December 31, 1937, were reported by the International Nickel Company of Canada, Ltd., at 206,397,000 short tons. While the total

ore reserves show an increase of 3,777,000 tons over the figures first reported in 1930 the net result is that, due to the inclusion of lower grade ores, the total ore reserves now contain 6,739,000 tons of copper nickel, comparable with 6,927,000 tons of copper nickel in the reserves as at December 31, 1929.

Falconbridge Nickel Mines Ltd., reported that all units of the plant, as completed in the expansion programme of 1936 were in continuous operation throughout 1937, with the expected increase in production being fully realized.

Of a total of 5,141 feet of drifting and cross-cutting, 3,518 feet were along the ore zone on different levels, the greater part of this footage being acounted for on the 1,200 and 1,750 levels at No. 5 shaft. No. I shaft was deepened 915 feet from the sump below the 1,200 level to a total depth of 2,126 feet; at the end of the year preparations were under way to resume sinking at No. 5 shaft early in 1938. From the total ore hoisted some 12,243 tons of waste was picked and discarded; of the 438,629 tons of ore treated in 1937, 195,658 tons was milling ore and 242,971 smelting ore. Matte produced totalled 13,384.2 short tons containing 7,384.4 short tons of nickel and 3,522.8 short tons of copper. The company's refinery in Norway operated steadily and normally throughout the year with the exception of a five week's close down due to a strike, and the disorganization due to same; custom nickel matte containing 895.76 metric tons of nickel was received at this plant in 1937.

In addition to the new areas in the Falconbridge mine itself the company was able to bring into the ore reserves for the first time, tonnages from their noldings in other sections of the Sudbury district. Total ore reserves as of December 31, 1937 were reported at 6,332,601 tons averaging 1.82% nickel and 0.89% copper.

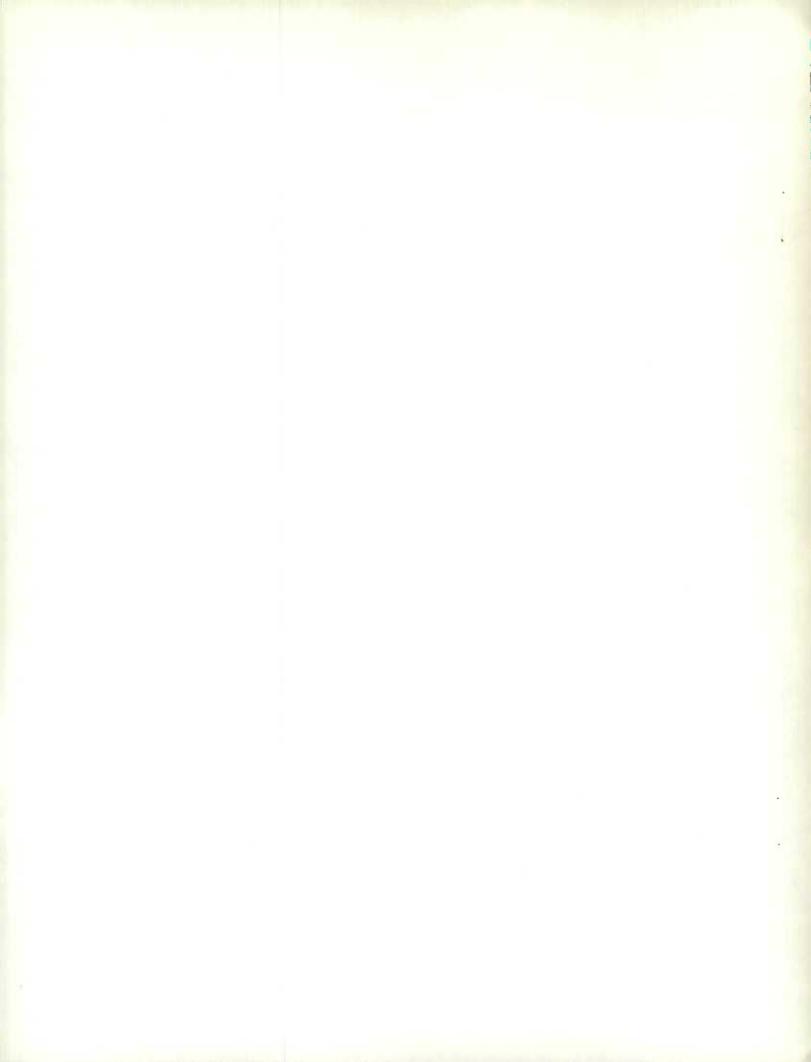

Drury Nickel Mines Ltd., formerly the Van Nickel Mines Ltd., reported early in 1938 that some 2,000 feet of diamond drilling was being conducted on its property located near Worthington in Drury township of the Sudbury district.

Diamond drilling in 1937 was also reported by the Anglo-Sudbury Nickel Corp. Ltd. This company holds mining properties in the townships of Wisner, Norman, Trill, Levack and Bowell — districts of Algoma and Sudbury. The Ontario Nickel Corp. Ltd. did not operate its smelter in 1937 and only minor surface operations were conducted on its properties; these were limited to the first six months of the year. Development operations on a nickel-copper deposit in Denison township were also reported as being conducted in 1937 by Denison Nickel Mines Ltd.

In New Brunswick, diamond drilling operations were conducted in 1937 on a nickel-copper deposit located near St. Stephen. This property is owned by the Maruba Corp. Ltd.

In British Columbia mining operations under contract were conducted during October and November, 1937, by the Western Nickel Corp. Ltd. on a nickel deposit located near Yale.

According to the British Columbia Department of Mines the development work conducted during the first six months of 1937 by the B. C. Nickel Mines Ltd. at its property nearChoate, consisted of raising 177 feet, cross-cutting 83 feet, drifting 17 feet, and station-cutting 2,000 feet. All cross-cutting and drift-work served to open up a known ore-body — the Prida of Emory. During May and June about 3,500 tons of average-grade ore was produced to supply prospective nickel-concentrate buyers with a sample of the product. During the remainder of the year all underground work was discontinued and a skeleton crew maintained to keep the buildings, plant and road in condition until such time as a decision is come to for the erection of a mill.

The Bureau of Mines, Ottawa, stated in a report that important new activities in Ontario during 1937 included the incorporation of Kenora Nickel Mines Ltd., as a subsidiary of Coniagas Mines Limited, to develop the latter's nickel property at Empire Lake in the Kenora District; and the purchase, after diamond drilling, of the Cross nickel property at Shebandowan Lake, west of Port Arthur, by the International Nickel Company of Canada Ltd.

<sup>(</sup>x) Includes a relatively small quantity of nickel recovered annually from silvercobalt ores; Canadian nickel production comes almost entirely from Ontario ores.

Nickel output from January 1 - June 30, 1938, totalled 109,286,472 pounds worth \$28,559,696 compared with 111,610,392 pounds valued at \$29,218,283 during the first six months of 1937. Output consisted of refined nickel made at Port Colborne, nickel in matte exported by the International Nickel Company of Canada, Limited, and the Falconbridge Nickel Mines Ltd., and nickel in nickel oxide sold.

## DEVELOPMENTS IN OTHER COUNTRIES

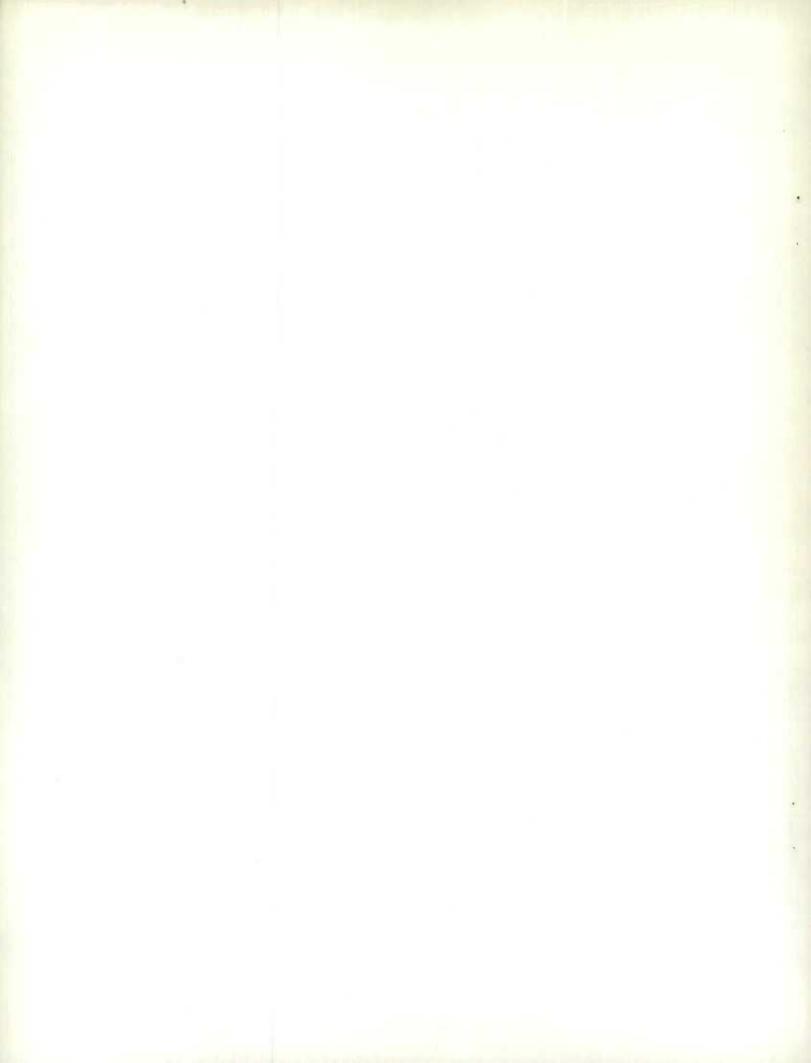

#### New Caledonia

There are a large number of superficial deposits scattered over the island and these occur in the peridotites altered to serpentine and in which the nickel is in the form of garnierite and noumeits, hydrous silicates of nickel and magnesium. It is estimated that a total of 5 million tons of this ore has been mined with a nickel content of 220,000 tons, the ore averaging 4.4 per cent nickel.

Shipments of ore began in 1875 and up to 1910 amounted to 1.7 million tons. Because of the high freight rates, only the ore above 6 percent nickel could be exported. In 1910 the first reduction plant was built on the island and a nickel matte containing from 40 to 50 percent nickel was produced for export. Thus shipments of ore were gradually reduced from 150,000 tons in 1911 to zero by 1921. In 1916 a start was made to produce a higher grade matte and since 1920 the matte exported has had a content of from 77 to 78 percent Ni.

| Production | 1929          | 1932            | 1935             | 1936          | 1937          |
|------------|---------------|-----------------|------------------|---------------|---------------|
| Ore        | 135,000 5,471 | 92,100<br>3,915 | 171,000<br>7,039 | 196,000 6,075 | 249,000 6,830 |

There are two principal productive groups of mines, the most important being that at Voh-Koné on the southeast side of the island and includes the Guerioum, bilboruet, A.S., and Advance Caledonia Mines. The other group is that of Thio on the northwest side and includes the Zizette, St. Martin II E., Emma, and Petit Bel-Air

Mines. There are two other mines, the Ouli-Ouli at Kua and the "Plum" group of prospects at Poro on the northwest side of the island, which have been reopened recently by a Japanese company and the ore is shipped to Japan.

Formerly there were three smelters, one at Thio, one at Yate on the north-west side of the island, and the third at Noumea on the southeast. Only the smelter of Doniambo at Noumea was in operation in 1936. It is planned, however, to start up the plant at Yate where there is a waterfall which will yield 25,000 H. P.

The furnaces at these smelters are from 100 to 150 tons daily capacity. Ground gypsum is added to the nickel concentrates and this mixture is made into briquets before it is introduced into the blast furnaces which produce a matte with 40 to 50 percent nickel. The addition of gypsum is necessary to supply the required amount of sulphur for the matte. This matte goes to the Bessemer convertors in which it is readily reduced to nickel sulphide with 78 percent nickel and the slag from these furnaces is returned to the blast furnaces as a flux. Thus the only metal loss is that in the slag from the blast furnaces and contains about 0.6 percent nickel. At the smelters 0.4 tons coke and 0.1 tons gypsum are used per ton of ore smelted.

Electric furnaces for direct treatment of the ore were introduced at the Yate plant and good results were obtained, the consumption of power being 1,200 Kw. Hr. and that of electrodes 12 kg. per ton of ore treated. These furnaces were idle in 1936.

The nickel sulphide matte is shipped to the refineries in Europe for further treatment.

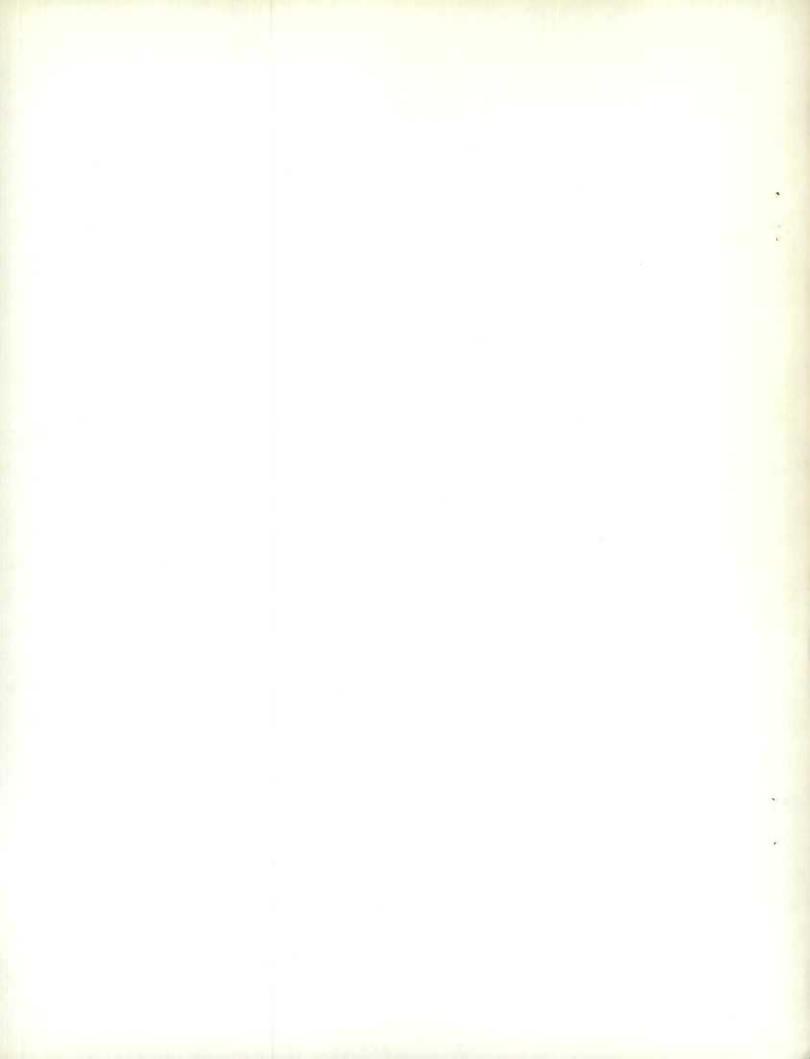

Two large companies were operating the nickel mines and plants, namely, the Soc. Caledonia and the Soc. Le Nickel up to July 1937, when the Soc. Caledonia was absorbed by the Soc. Le Nickel, with a capital of 93,500,000 francs. (Foreign Minerals Quarterly -- U. S. Bureau of Mines.)

#### Japan

The Toho Kinzoku Seiren Kabushiki Kaisha (Oriental Metal Refining Co., Ltd.) is being organized in Tokyo. The capital stock, amounting to ¥10,000,000, of which ¥5,000,000 will be paid in, will be controlled by the Furukawa Denki interests and the Nihon Kokan interests. The company plants to construct a nickel plant at Takkiri-kei, Karenko Province, Taiwan, capable of handling 50 tons of nickel ore daily and producing about 4,000 tons of refined nickel annually. Power is to be supplied by a 50,000-kw water power plant to be erected at the entrance to Takkiri Gorge. Water will be piped through three 10-foot aqueducts from the proposed dam at Batagan, 5 miles away. For much of the distance the aqueducts will consist of tunnels dug through the mountains. Work on the nickel refinery and dam is expected to begin about August 1938 and to be completed in March and June, 1939, respectively. Construction of the power plant will begin about November 1938 and it should be completed in the summer of 1939. Electric power from the Karenko Electric Power Co. at Karenko can be utilized if the refinery is ready for operation before the power plant. (Foreign Minerals Quarterly -- U. S. Bureau of Mines.)

#### Russia

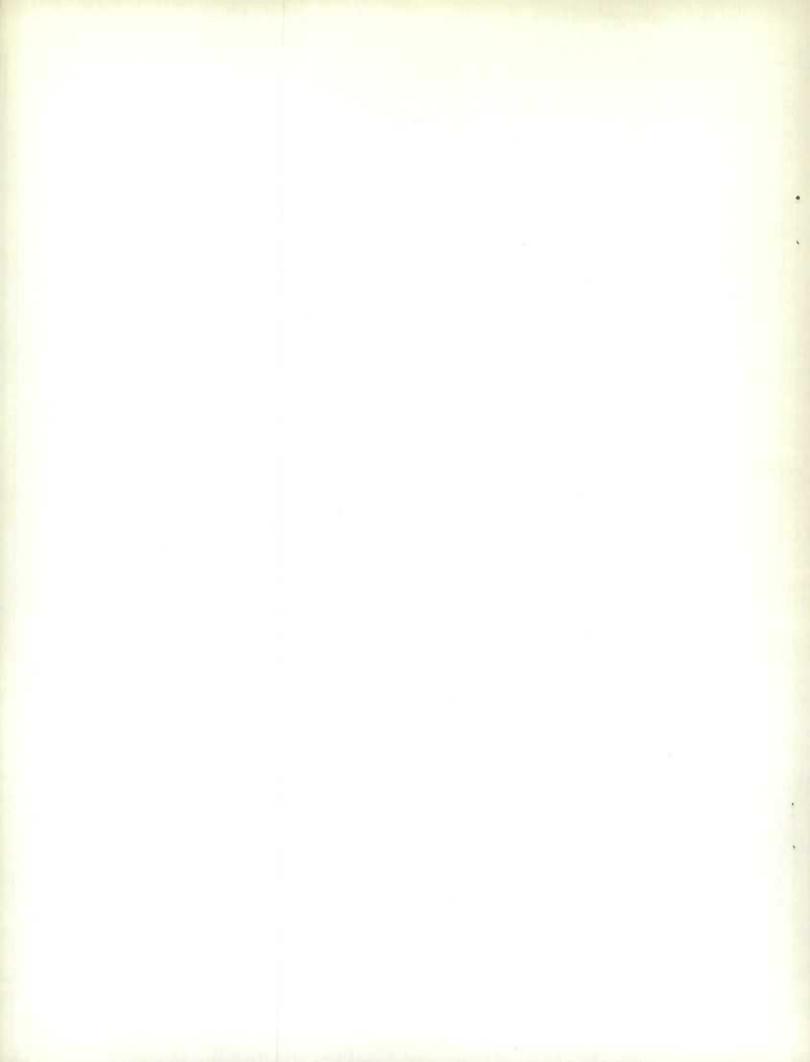

"The present sources of Soviet nickel are the Ufalei and Aktyubinsk groups of nickel deposits, both in the Urals. In 1934 the proven reserves of the Ufalei group of deposits were estimated at 14,000 tons. It was calculated that unless

developments augmented substantially the available resources of the Ufalei area the Ufalei refinery, constructed in 1934 with planned capacity of 3,000 tons of ferronickel per year, will soon have no raw material supply for its operation.— The proven resources of Aktyubinsk deposits in 1935 were estimated at 21,300 tons of nickel content said to amount from 1.35 to 1.65 per cent. On the basis of Aktyubinsk nickel deposits the construction of a nickel plant at Orsk was started in 1935. This plant was expected to be completed and put in operation by the beginning of 1938. It was reported that a small nickel plant in Moncha-Tundra was to be completed by the end of 1938. The construction of Noril nickel combine plant in Siberia is to be completed during the third Five-Year plan method. The Moncha-Tundra and Noril plants are to be operated on sulphurous nickel ore, which is available there in abundant quantities". (Foreign Minerals Quarterly — U. S. Bureau of Mines.)

#### Finland

According to the annual report of the International Nickel Company of Canada Ltd., work on the Kaulatunturi mine in Finland was continued by the Mond Nickel Co. Ltd., throughout 1937 and \$717,753.63 was expended. A substantial tonnage of ore of excellent grade has been proven by diamond drilling and prompt steps are being taken to develop the property for an output up to approximately 1,000,000 pounds of nickel and 500,000 pounds of copper per month. To open up the mine and adit must be driven, surface plant erected, housing for employees provided and hydroelectric power plant installed. To date\$1,025,994.13 has been expended and it is estimated that an additional \$6,000,000, of which \$2,500,000 has already been authorized, will be required to complete the projected program by 1940. The plan of operation contemplated is to produce bessemer matte in Finland.
