THE NATURAL GAS INDUSTRY IN CANADA, 1934.

Natural gas production in Canada during 1934 advanced to 23,162,324 thousand cubic feet valued at \$8,759,652 from the 1933 total of 23,138,103 thousand cubic feet worth \$8,712,234.

Alberta continued to be the leading producing province with an output of 14,841,491 thousand cubic feet; Ontario came next with 7,682,851 thousand cubic feet; New Brunswick followed with 623,601 thousand cubic feet, and Saskatchewan entered the list of natural gas producers with a production of 13,781 thousand cubic feet. Manitoba, as usual, recorded a small output from several private wells.

Wells in the Stony Creek field, near Moncton, are the source of New Brunswick's natural gas supply. This gas is piped to Moncton and Hillsboro where approximately 5,400 consumers are served. Thirty natural gas wells were in operation in New Brunswick at the end of 1934; two wells were abandoned during the year and one new producer was drilled.

The Canadian Seaboard Oil and Gas, Ltd., completed a deep test in 1934 on lot 300, Parish of Saint-Gregoire, in Nicolet county. According to a provincial government report, this well was spudded in some time in February and reached a depth of 6,030 feet in October when it was plugged and abandoned. Eight gas horizons were encountered in the course of drilling, but none of these proved of economic importance.

The Cartier Natural Gas Company drilled two wells in 1934. One in the Parish of Lanoraie, Berthier county, had reached 2,000 feet at the end of the year and the other in the Parish of Saint Hubert, Chambly county, was at a depth of 3,200 feet on December 31st. According to the provincial government's records another well was drilled in Lanoraie Parish by Carl M. Mohr; this well struck a flow of gas, estimated at 15,000 cubic feet per day, at a depth of 1,206 feet, but on deepening to 1,390 feet, a heavy flow of highly saline water was encountered. This water was shut off with a lead plug and the well remains with a valve at the casinghead to seal off the gas.

Ontario's production advanced 7.2 per cent in 1934 to 7,682,851 thousand cubic feet from the preceding year's total of 7,166,659 thousand cubic feet.

Col. R. B. Harkness, Commissioner of Gas for Ontario, reports that 1934 was the outstanding year in new production since the years 1910 to 1914, when the Tilbury field reached its peak of development.

"There is no record compiled to show the increase in open flow by years, until the year 1919, and until 1921 these reports are imperfect, but 1934 exceeds all years since 1919 in open flow of new wells. This is principally the result of drilling in Raleigh township in the Declute field. This field has now been extended a considerable distance to the east. Just how far this field can be extended is uncertain. It is scarcely likely to be more than doubled in area on land, but its limits under Lake Erie are impossible to estimate.

Second in importance is the extension made in the Dover field. The gas and oil in the Dover field is along a probable fault. Subsequent drilling has proven that this fault does exist. In general it lies east and west, and is part of a general east-west system of faulting in Kent and Lambton counties. It has now been traced for a distance of three miles. Accumulation is on the down-throw side of the fault. The largest wells appear to be those nearest the foot of the scarp. The Southern Ontario Gas Company have completed a 4 inch pipe line from the Dover field to connect with their 12 inch pipe line from the Tilbury field to Hamilton. The first delivery was early in December, 1934.

Third in importance is the Eden gas field in Bayham and Middletown townships. This field was discovered in 1932. The gas occurs in a sandstone. Lithologically it resembles the Grimsby sandstone. Walpole township again takes the lead in Haldimand county for activity in drilling. The ratio of dry holes to producing wells is high, but the producing wells were more than average in production.

In 1934 forty-nine drilling rigs were engaged in drilling natural gas wells in Ontario. As a result of this activity, 217 producing wells with a total footage of 187,430 feet and 77 dry holes aggregating 86,681 feet were drilled; this represented an increase of 42,490 feet over the 1933 footage.

On December 31, 1934, there were 2,869 wells producing gas in Ontario. Sixty wells were abandoned during the year.

The companies operating in this industry in Ontario during 1934 reported a total capital employment of \$42,804,458. The industry furnished employment to 486 salaried employees and 588 wage-earners who received a total remuneration of \$1,147,574 in 1934.

Drilling operations at Lloydminster, Saskatchewan, resulted in the bringing in of a large gas producer at a depth of 900 feet. Commercial production commenced in October and the total output for the year was 13,781 thousand cubic feet.

A decline of 3.3 per cent was recorded in Alberta's production in 1934 when 14,841,491 thousand cubic feet were produced as compared with 15,352,811 thousand cubic feet in the preceding year. These figures include only the natural gas consumed for industrial and domestic purposes and do not take into account the waste gas burned in the Turner Valley field and the gas piped to the Bow Island field for storage.

The largest natural gas producing area in Canada in 1934 was the Turner Valley field, located about 35 miles southwest of Calgary. The industrial and domestic consumption from this field in 1934 totalled 9,571,600 thousand cubic feet as against 9,846,431 thousand cubic feet a year ago and 12,242,037 thousand cubic feet in 1931. Approximately 22,900 consumers in Calgary, Lethbridge and the district were served with Turner Valley gas in 1934; in addition, considerable quantities were used for drilling purposes in the field. The producers continued their practice of the past several years of piping large quantities of this gas into the exhausted sands of the Bow Island field.

Consumption of natural gas in the city of Medicine Hat totalled 1,914,606 thousand cubic feet as compared with 2,149,535 thousand cubic feet in 1933. About 2,500 consumers were supplied with gas from the Medicine Hat field in 1934. Wells in the Redcliff field, about two miles west of Medicine Hat, supplied gas to approximately 300 industrial and domestic consumers.

The Viking field, which is approximately 80 miles southeast of Edmonton, was the source of supply for over 10,000 consumers within that city. Outside of Edmonton some 500 consumers were furnished with gas from the Viking field.

The Maple Leaf well, in the Fabyan field, supplied gas to 300 users in Wainwright.

At the close of the year 92 wells were producing gas in Alberta as compared with 87 wells a year ago. The capital employed by companies operating in this industry in Alberta amounted to \$26,101,630. During the year, 377 employees receiving salaries and wages totalling \$496,979 were employed by Alberta producers.

Mixed gas (natural and artificial) imported into Canada from the United States during 1934 reached a total of 107,171 thousand cubic feet valued at \$69,734 as against 100,854 thousand cubic feet worth \$73,435 imported in 1933.

The 198 firms operating in the Canadian natural gas industry during 1934 reported a capital investment of \$70,767,123. On an average, 1,553 salaried employees and wage-earners were employed in this industry in 1934; salaries and wages paid to these employees totalled \$1,789,811. Fuel and electricity used during the year cost the operators \$67,341.
