STATISTICS OF PRODUCTION

In the collection of production data, the Dominion Bureau of Statistics makes a division between primary and secondary production. In the first-named class, there are separate sections for the collection of statistics on (a) Agricultural Products, (b) Furs, (c) Fish, (d) Forest Products, (e) Mineral Products.

In the second are included (a) Manufacturing and (b) Construction.

Manufacturing is subdivided into nine groups of industries, producing concerns being classified according to the principal component material of their major products. For example, makers of leather goods are classified under "Animal Products"; the pulp and paper industry, under "Wood and Paper," etc. An outline of the scheme of classification in use for manufacturing industries is given below:

Manufactures of:

- (1) Vegetable Products, including—Coffee and Spices; Cocoa and Chocolate; Preserved and Canned Products; Piekles, Vinegar and Cider; Flour and Cereals; Bread and other Bakery Products; Macaroni and Vernicelli; Distilled and Brewed Liquors and Wines; Rubber Products; Starch and Glucose; Sugar; Tobacco Products; Linseed Oil and Oil Cake.
- (2) Animal Products, including—Fish and Fish Products; Dairy Factory Products; Meat and Meat Products; Leather and Leather Products; Furs and Fur Products.
- (3) Textiles and Textile Products, including—Cotton Textiles (Cloth, Yarn, Thread and Waste); Woollen Textiles (Cloth, Yarn, Blankets, Felt and Waste); Silk Products; Factory-Made Clothing; Carpets, Rugs and Mats; Cordage, Rope and Twine.
- (4) Wood and Paper, including—Pulp and Paper Mill Products; Paper Goods; Printing, Publishing and Lithographing; Saw and Planing Mill Products; Furniture; Carriages, Wagons and Sleighs; Wooden Containers; Woodenware; Turned Wood Products; and the Output of Similar Wood-Using Industries.
- (5) Iron and Steel and their Products, including—Pig Iron and Ferro-Alloys; Steel and Rolled Products; Castings and Forgings; Boilers and Engines; Agricultural Implements; Machinery; Automobiles; Auto Accessories; Bicycles; Railway Rolling Stock; Wire and Wire Goods; Sheet Metal Products; Hardware and Tools; Miscellaneous Iron and Steel Products.
- (6) Manufactures of Non-Ferrous Metal Products, including—Aluminium and Aluminium Ware; Brass and Copper Products; Lead, Tin and Zine Products; Precious Metals Products; Electrical Apparatus and Supplies; Miscellaneous Non-Ferrous Metal Products.
- (7) Manufactures of Non-Metallic Mineral Products, including—Aerated Waters; Asbestos and Allied Products; Cement Products and Sand-Lime Brick; Coke and By-Products; Glass (blown, cut, ornamental, etc.); Illuminating and Fuel Gas; Products Made from Imported Clay; Monumental and Ornamental Stone; Petroleum Products; Miscellaneous Manufactured Non-Metallic Mineral Products, including (a) Artificial Abrasives; (b) Abrasive Products; (c) Artificial Graphite and Electrodes; (d) Gypsum Products; (e) Mica Products.
- (8) Chemicals and Allied Products, including—Coal Tar and its Products, Acids, Aikalies, Salts and Compressed Gases; Explosives, Ammunition, Fireworks and Matches; Fertilizers; Medicinal and Pharmaceutical Preparations; Paints, Pigments and Varnishes; Soaps, Washing Compounds and Toilet Preparations; Inks, Dyes, and Colours; Wood Distillates and Extracts; Miscellaneous Chemical Products including (a) Adhesives, (b) Baking Powder, (c) Boiler Compounds, (d) Celluloid Products, (e) Flavouring Extracts, (f) Insecticides, (g) Polishes and Dressings, (h) Sweeping Compounds, (i) Chemical Products n.e.s.
- (9) Miscellaneous Products, including—Brooms and Brushes; Electric Light and Power; Musical Instruments, etc.

The statistics of manufactures are also classified according to the use or purpose of the end product as follows:—

- (1) Food, including—Breadstuffs; Fish; Nuts; Fruits and Vegetables; Meats; Milk Products; Oils and Fats; Sugar; Infusions; Miscellancous.
- (2) Drink and Tobacco, including-Beverages, alcoholic; Beverages non-alcoholic; Tobacco.
- (3) Clothing, including—Boots and Shoes; Fur Goods; Garments and Personal Furnishings; Gloves and Mitts; Hats and Caps; Knitted Goods; Waterproofs; Miscellaneous.
- (4) Personal Utilities, including—Jewelry and Time-Pieces; Recreational Supplies; Personal Utilities, n.e.s.
- (5) House Furnishings.
- (6) Books and Stationery.
- (7) Vehicles and Vessels.
- (8) Producers' Materials, including—Farm Materials; Manufacturers' Materials; Building Materials; General Materials.
- (9) Industrial Equipment, including—Farming Equipment; Manufacturing Equipment; Trading Equipment; Service Equipment; Light, Heat and Power Equipment; General Equipment.
- (10) Miscellaneous.

PREFACE

Supplementing the reports issued by the Bureau on the primary production of metals and minerals, there are several other reports each of which contains detailed statistics relative to a particular group of industries using mineral products as their raw materials.

The present report deals with the manufactures based on the non-metallic minerals. Last year the report on this subject covered the five-year period 1919-1923; the present report provides corresponding data for the year 1924, but also contains comparative figures for preceding years.

The report covers such leading industries as coke-making, the production of illuminating and fuel gas, the refining of petroleum, the manufacture of glass, as well as several others of less commercial importance such as the manufacture of acrated waters, the production of sandlime brick, concrete tile and blocks, the fabrication of brake linings and other commodities from asbestos and magnesia, and the manufacture of artificial abrasives and graphite electrodes by means of the electric furnace. Certain other industries such as the clay products industry in all its phases, (brick and tile, clay sewer pipe, firebrick, fireclay products, stoneware, and pottery); the portland cement industry; the manufacture of lime; and the production of salt are also included though often regarded as primary mineral industries as in most cases their raw materials are not recognized as articles of trade. For example, brick-making plants are usually located in close proximity to deposits of suitable clay, the raw material being obtained on the property at no further cost than that of the labour required in digging operations; thus it may be said that a brick is the first commercial product obtained from the clay or it may also be said that a brick is a manufactured product. It is thought that the inclusion of these industries in the present report as well as in the report on primary mineral production will be of value as giving a comprehensive purview of the subject of "Manufactures of the Non-Metallic Minerals of Canada." The duplication is of course eliminated from all general production totals.

On the next preceding page there is a brief note on the Bureau's classification of industries for the collection of production statistics, which shows the place of the present report in the general scheme.

As in the previous issue there has been included a list of the names and addresses of the reporting firms arranged by industries and by provinces.

The present report was prepared by Mr. H. McLeod, B.Sc., under the direction of Mr. S. J. Cook, B.A., A.I.C., F.C.I.C., Chief of the Mining, Metallurgical and Chemical Branch.

R. H. COATS,

Dominion Statistician.

MANUFACTURE OF THE NON-METALLIC MINERALS IN CANADA, 1924

CHAPTER ONE

GENERAL REVIEW

(a) Summary

Products manufactured from non-metallic minerals in Canada during 1924 were valued at \$111.151,828 as compared with \$113,453,012 in the preceding year; this figure includes clay products worth \$1,879,769 from plants using imported clay as raw material. Previous to 1924 these data were not included in the non-metallic products. Raw materials costing 61·7 million dollars were converted into commodities having a selling value of 111·2 million dollars creating a value of 49·5 million dollars added by manufacturing. The aerated waters industry, the manufacture of asbestos and allied products, the glass industry, and the moanmental and ornamental stone industry maintained the production values of 1923; illuminating and fuel gas, and the miscellaneous non-metallic mineral products industries declined slightly, the manufacture of cement products and sand-lime brick, and the coke and its hy-product industry showed a considerable falling-away in the value of outputs; petroleum refining improved considerably with a production worth \$49,411,067, an increase of 3·1 million dollars over 1923. The entire industrial group with a total capitalization of \$161,390,016 employed 16,938 men and paid 21·6 million dollars in wages and salaries.

Of the 814 plants in Canada reporting a production of non-metallic mineral products in 1924, the number located in Ontario was 436; production from these plants had a sales value of \$54,455,407. Quebec come next with 183 plants and production valued at \$22,864,601; Nova Scotia ranked third with 34 plants having a total output worth \$9,104,294; British Columbia had 37 concerns producing \$8,068,762 worth of commodities; 32 establishments in Alberta made \$7,346,582 worth of non-metallic products; Manitoba's 33 plants had an output valued at \$2,351-632; Saskatchewan had 25 plants and a production worth \$6,315,382; New Brunswick had 31 plants with an output valued at \$563,917, and Prince Edward Island's 3 plants had an output valued at \$81,148.

In 1923 there were 794 plants in operation in this industrial group. Returns for 1924 showed a gain of I plant in New Brunswick, 8 in Quebec, 2 in Ontario, 2 in Manitoba, 3 in Saskatchewan, 7 in Alberta, and a loss of 2 in Nova Scotia and 1 in British Columbia.

By industries, petroleum products led the list with a total production value of \$49,411,067, followed by the illuminating and fuel gas industry at \$18,101,724; glass, \$10,776,816; coke and by-products, \$10,438,462; miscelfaneous non-metallic mineral products, \$6,991,904; aerated waters, \$6,354,358; monumental and ornamental stone, \$4,730,572; products from imported clay, \$1,879,769; cement products and sand-lime brick, \$1,877,817; asbestos and allied products, \$589,339.

The total capital employed in the non-metallic mineral products industry was slightly less than in the previous year and amounted in all to \$161,390,016 of which \$117,406,001 represented the value of lands, buildings, tools, etc.; \$31,190,192 the value of noterials on hand and in process, and working capital amounted to \$12,793,823. Ontario plants reported a total investment of \$71,813,426; Quebec plants accounted for \$28,246,887; and Nova Scotia for \$22,381,211. Alberta and British Columbia were each credited with about 12 million dollars' investment; Manitoba and Saskatchewan with about 6 million dollars cach; New Brunswick with about one-half million dollars and Prince Edward Island with \$84,966.

Including both salaried employees and wage-earners, 16,938 persons found employment in the manufacture of non-metallic mineral products in 1924 as against 17,936 in the preceding year. Salaries and wages amounted to \$21,586,516, an increase of a million dollars over 1923. The trend of employment as reflected by the monthly records of the number of wage-earners on the rolls on the fifteenth of each month showed 13,362 wage-earners (exclusive of salaried employees) on the rolls in January, and a slightly lower number of 13,248 in March from which point the number employed rose gradually to a maximum of 14,829 in June. Employment then gradually fell away until in October there were 14,329 persons enrolled and in December only 12,739.

Imports into Canada of non-metallic minerals declined in value from \$165,093,416 in the calendar year of 1923 to \$134,842,648 in 1924; United States supplied \$116,345,580 worth or 80.6 per cent of the total while only \$9,564,163 worth or 7 per cent, came from United Kingdom. Exports were valued at \$20,949,776, the lowest in several years; 63 per cent went to the United States, 5 per cent to United Kingdom and the remaining 32 per cent to other countries.

In studying the production of non-metallic mineral products in Canada it has been found convenient to arrange the industries under the following groups: aerated waters; asbestos and allied products; cement products; sand-lime brick; coke and by-products; glass; illuminating and fuel gas; products from imported clay; monumental and ornamental stone; petroleum products; miscellaneous non-metallic mineral products.

(b) By Industries

Aerated Waters.—The aerated waters industry is distributed fairly well over the whole Dominion; almost every town has a small soda water and soft drinks plant while in the larger cities, where consumption is greatest, the establishments have so increased in size as to make the enterprise of considerable industrial importance.

In the peak year of 1920, acrated waters valued at more than 9 million dollars were produced. Sales in recent years have not been so large, but during the last three years the annual production value has been maintained at about 6-5 million dollars. In 1924, returns were received from 296 plants in Canada distributed as follows: Prince Edward Island, 2; Nova Scotia, 16; New Brunswick, 15; Quebec, 80; Ontario, 131; Manitoba, 8; Saskatchewan, 12; Alberta, 16; British Columbia, 16. These firms employed 1,543 persons and produced \$6,354,358 worth of acrated waters from materials costing \$1,982,340. In 1923, the 295 plants then in operation employed 1,724 persons and had a production valued at \$6,408,832.

Asbestos and Allied Products.—Under this heading have been included the data reported by manufacturers who use asbestos as a major constituent of their products which included sheets and boards, roofing and flooring, asbestos and magnesia packing and pipe covering, cement, and such plastic products as boiler lining. Most of the plants making these materials are located in Ontario and Quebec. In 1924 there were 2 plants in Quebec, 5 in Ontario and 1 in each of the provinces of Nova Scotia and British Columbia; the number of plants in operation was unchanged from the total in 1923. Production was valued at \$589,339 as compared with \$583,013 from the same plants in 1923.

Cement Products.—This group includes those firms who produce concrete blocks, tile, sewer pipe, sills, piles, posts and other manufactures of concrete and artificial stone with cement as a binding medium. In 1924 the 116 plants reporting in this industry had a combined output valued at \$1,257,871. Ontario's 92 plants had a production valued at slightly over a million dollars; there were also 18 plants in Quebec, 3 in New Brunswick, 2 in Saskatchewan and 1 in Nova Scotia. These plants represented a capital investment of 1.7 million dollars and afforded employment to 455 persons during the year. Records of the many small concerns operating on part time only are not included in this report.

Sand-Lime Brick.—Practically all of the sand-lime brick produced in Canada is manufactured by large brick companies, whose plants are located near the industrial centres. In 1924 there were 10 plants in Ontario and 1 in each of the provinces of Manitoba and Saskatchewan making 12 plants in all with a production valued at \$619,946 as against \$897,060 by the 8 plants in operation in 1923.

Coke and By-Products.—The coke industry in Canada is dependent more or less upon the demand of the iron and steel industries and of the smelters treating the non-ferrous metal ores although in recent years, the use of coke for domestic heating has opened a new market. Coke plants are located in the provinces of Nova Scotia, Ontario, Alberta and British Columbia. This industry, as here reviewed, includes only those plants producing metallurgical coke. There is also a production of gas-house and petroleum coke, but these are dealt with in other sections of this report.

The Dominion Iron and Steel Company, Limited at Sydney, N.S., make hy-product coke from their own coal; the Steel Company of Canada, Limited and the Hamilton By-Products Coke Ovens Limited at Hamilton, Ont., and the Algoma Steel Corporation, Limited at Sault Ste. Marie, Ont., make by-product coke from United States coal. In the Crow's Nest Pass coal area in Alberta and British Columbia, beehive coke is made from domestic coal by the Crow's Nest Pass Coal Company; much of this coke is sold for use at the smelter of the Consolidated Mining and Smelting Company at Trail, B.C. Coal from Vancouver Island is shipped to Anyox, B.C., and there made into by-product coke by the Granby Consolidated Mining, Smelting and Power Company for their own use.

The total value of coke made in Canada during 1924 by the plants in this group amounted to \$7,268,713; that imported during the calendar year cost \$3,131,485 while the value of coke exported was \$393,979. In 1923 the production of coke was valued at \$10,236,524, imports were worth \$5,790,771, and exports, \$433,497.

Glass.—In the glass industry are included those plants making pressed and blown glass, window glass, cut glass, plain or bevelled mirrors, and also those plants engaged principally in the bending of plate and sheet glass, and assembling leaded and other art glass.

In 1924 pressed and blown glass was made by 10 plants in Canada while 38 different establishments were engaged in the bevelling, bending and cutting of glass. Production of pressed and blown glass was valued at \$8,799,420 and other glass products at \$1,977,396. There is no plate glass made in Canada and the entire supply, therefore, is imported and cut and bevelled as required.

Illuminating and Fuel Gas.—The illuminating and fuel gas industry in Canada is centred chiefly in the larger cities where domestic and industrial demand is greatest. In 1924 there were 44 gas plants in Canada with a production of gas and by-products valued at \$18,101,724 as compared with \$19,605,340 in the previous year. Capital employed amounted to 42.8 million dollars, of which 36.2 million dollars was the value of fixed assets such as buildings, lands and plant equipment. Employment was afforded to 3,648 persons, and salaries and wages paid during the year totalled \$4,835,351.

Since more use is made of coal gas and carburetted water gas than any other kind, these are the most important products. Pintsch gas is made at many divisional points along the railroads and is supplied in cylinders for railway-car lighting purposes. Acetylene gas is used in several prairie towns where the size of the municipality is not large enough to warrant a coal-gas plant or where the cost of coal for gas-making is prohibitive.

By-products of this important industry, including coke, tars, light oils, etc., made available by large-scale production, provide an incentive to increase plant size where an increase in population and the number of industries to be served, warrant the additional outlay, and where the by-products are readily marketable.

Products from Imported Clay.—Under this classification are listed those firms that produce clay products such as pottery, sanitary ware, refractories, porcelain insulators, etc., from special clays imported for the purpose. In 1924, there were 12 plants in Canada using imported clay as a raw material. These plants, representing a capital investment of \$1,677,533, employed 489 persons during the year and produced commodities valued at \$1,879,769 from raw materials costing \$535,793. Previous to this year, the data regarding products made from imported clay were shown in the Bureau's Annual Report on the Mineral Production of Canada.

Monumental and Ornamental Stone.—This group includes all firms engaged in the cutting of monumental and building stone. In 1924 there were 210 plants in this group and production was valued at \$4,730,572. Many of the establishments are small and employ only

2 or 3 persons. Much of the stone used as raw materials in this industry is imported from other countries. Because of the known value of Italian marbles, Scotch granites and Vermont marbles and granites, it has been difficult to educate the Canadian people to the fact that Canadian granites and marbles and building stone, worthy of an edifice, exist in abundance.

Petroleum Products.—This is by far the largest industry of the group under review and includes the refining of petroleum, both domestic and imported, and also the compounding of lubricating oils and greases consisting wholly or in part of mineral oils. In 1924 there were 25 plants operating in this industry of which 17 refined petroleum and 8 made oils and greases. Production reached a value of \$49,411,067 as compared with \$46,280,534 by the 20 plants operating in 1923. This was the only industry in the non-metallic group to record a substantial increase in production value in 1924.

Miscellaneous Non-Metallic Mineral Products.—Many firms in Canada produce non-metallic mineral products that do not naturally fall in any of the groups previously considered. A miscellaneous group has accordingly been made and divided into the following classes: artificial abrasives and abrasive products; graphite products, including artificial graphite and electrodes; gypsum products; mica trimming, and miscellaneous non-metallic mineral products.

The principal products of the 36 firms thus grouped were carborundum, alundum, grinding wheels, graphite electrodes, gypsum wall board, plaster of paris models, trimmed and split mica and sundry foundry supplies as facings, sand, etc.

The abrasive products industry was the most important of this group with a production valued at 5.6 million dollars.

Primary Products.—As a matter of general interest, a summary of the principal statistics relating to the manufacture of structural materials and clay products during the years 1920 to 1924 has been abstracted from the Annual Report on the Mineral Production of Canada issued by the Bureau. Data in the report on the mineral production of Canada, show the production of primary raw materials but there are many products described therein which are produced by a manufacturing process though the cost of the raw materials used apart from the labour involved, is generally considered as negligible. These industries, on the border-line between mining and manufacturing, may be classified under either heading, so that, while the Bureau reports show them under "primary mineral production" for convenience, the inclusion herein of the principal data in regard thereto may interest the general reader.

Under the heading "Clay Products" are the brick and tile industry, the clay sewer pipe industry, the fire brick and fire clay products industry and the stoneware and pottery industry.

Brick and tile manufacturing represented a capital investment of 24.4 million dollars in 1924 when 192 plants were operating. These plants furnished employment to 3,332 people who received salaries and wages to the value of over 3 million dollars. Fuel used cost about 1.5 million dollars, and the net value of the products made exceeded 7 million dollars. In 1923, there were 204 plants operating; the capital employed in operating plants was about one-half million dollars more than in 1924, and the products manufactured were greater in value by about one million dollars. In 1922, returns were received from 216 plants and the products were valued at about 8.9 million dollars.

The clay sewer pipe industry showed no great change in 1924. Five plants were in operation with a capital of about 3 million dollars. They employed an average of 467 people who received in the neighbourhood of a half million dollars in wages and salaries. Fuel cost about \$28,000 and the value of the products was almost 1.4 million dollars.

In the firebrick and fireday products industry, 7 plants were in operation in 1924, as against 6 in 1923. About 1.85 million dollars was invested in the industry and, on the average, 208 hands were employed, to whom over a quarter of a million dollars was paid in salaries and wages. The cost of fuel amounted to nearly \$75,000 and the value of the products was slightly under \$600,000.

Six plants were engaged in the manufacture of stoneware and pottery, with a capitalization of almost \$400.000. This industry employed slightly more than 100 people, and wages and

salaries paid totalled about \$115,000. The amount of fuel used does not vary much from year to year, \$14,642 worth being used in 1924. The value of the products amounted to about one-quarter of a million dollars.

Under the general heading of "Structural Materials," the commodities cement and lime are also included. The cement industry is naturally dependent on the amount of construction undertaken each year. There were 10 plants making cement in 1924 and 1923. Capital employed amounted to 36.7 million dollars in 1924 as against 38 million dollars in 1923. In 1924, there were 1837 people employed, and payments for salaries and wages amounted to 2.5 million dollars. Miscellaneous expenses amounted to 1.5 million dollars and fuel to about 2.8 million dollars. The value of the products was 13-4 million dollars. In 1923, the value of products was given as 15 million dollars.

In the manufacture of lime in 1924, reports were received from 49 plants; the total capital employed was \$5,165,964, and there were on the folls 927 persons who received nearly one million dollars in salaries and wages. Miscellaneous expenses amounted to over \$750,000, and the cost of fuel was \$740,878. Lime to the value of \$3,178,541 was made in 1924.

In the chapters pertaining to the several different industries under review will be found further excerpts from the Annual Report on the Mineral Production of Canada for 1923, and 1924, which it seemed advisable to add to this report as relative information. Throughout this report the data given, refer to the group of industries mentioned above as being included in the Bureau's classification of "Manufacturers of the Non-Metallie Minerals"; only in the Summary Tables are figures given for those "manufacturing" industries which are reviewed in detail in the "Annual Report on the Mineral Production of Canada," and which may as readily be classed either as "primary" or as "secondary" industries. References to these industries are mostly in the form of abstracts from other reports.

(c) By Provinces

Prince Edward Island.—Only 3 establishments in Prince Edward Island made non-metallic mineral products in 1924. Of these 2 made aerated waters and I produced monumental stone.

Nova Scotia.—In 1924, Nova Scotia had 16 plants producing acrated waters; 13 in the monumental and ornamental stone industry, and 1 plant in each of the asbestos and allied products, cement products, coke, gas, and petroleum refining industries. These plants represented a capital investment of over 22 million dollars, afforded employment to 773 persons and had a combined production in the neighbourhood of 9 million dollars.

New Brunswick.—New Brunswick was represented in the non-metallic mineral products industry by 31 different firms which produced only half-a-million dollars' worth of commodities altogether. There were 15 concerns manufacturing aerated waters; 3 making cement products; 2 in the gas industry; 9 in the monumental and ornamental stone group; 1 in the glass industry and 1 making products from imported clays.

Quebec.—Quebec ranked next to Ontario as a producer of manufactures from non-metallic mineral products. In 1924, there were 183 plants operating in the following industries: aerated waters, 80 plants; monumental and ornamental stone, 42 concerns; cement products, 18 establishments; miscellaneous non-metallic mineral products, 17 plants; glass, 11 plants; imported elay products, 5 plants; gas, 4 plants; petroleum products, 4 establishments; and the asbestos products industry, 2 concerns. The combined production of these plants amounted in value to \$22,864,604 of which the petroleum industry contributed \$7,044,019; the gas industry, \$6,512,962; the glass industry, \$3,817,455; and the acrated water industry, \$2,204,763.

Ontario.—Of the 814 plants in Canada engaged in the manufacture of non-metallic mineral products during 1924 over half or 436, were located in Ontario; and of a total production valued at \$111,151,828 for the industry, Ontario accounted for \$54,455,407.

By industries, petroleum products held first place with 8 operating plants, a capital investment of 15 million dollars and a production valued at 18·7 million dollars; the illuminating and fuel gas industry was second with 21 establishments and an output worth 8·8 million dollars; the coke industry held third place when the 3 plants produced nearly 7 million dollars' worth of commodities. Class products and the miscellaneous non-metallic products each had an output worth nearly 6 million dollars; aerated waters and monumental and ornamental stone each approached the 2·5 million dollar mark; and imported clay products, cement products and sand-lime brick, and asbestos followed in the order named.

Including 1276 salaried employees, the non-metallic industry in Ontario gave employment to 8,655 persons throughout the year, while expenditures in salaries and wages amounted in all to \$11,506,180.

Manitoba.—Manitoba had 12 plants in the monumental and ornamental stone industry; 8 in the aerated waters industry; 8 in the gas industry; 3 in the glass group and 1 in each of the sand-lime brick and petroleum industries. These 33 establishments used 1·1 million dollars' worth of raw naterials in the production of 2·3 million dollars' worth of non-metallic mineral products and afforded employement to 434 persons throughout the year.

Saskatchewan.—Production of non-metallic mineral products in Saskatchewan was valued at \$6,315,382. There were 25 plants in operation during the year; 12 made aerated waters; 7 produced finished stone products; 2 produced illuminating and fuel gas; 2 made cement products; 1 plant refined petroleum and 1 made sand-lime brick.

Alberta.—With 32 plants in this group Alberta contributed over 7 million dollars to the total value of non-metallic mineral products made in Canada. Alberta was represented by 16 firms manufacturing acrated waters; 8 plants producing petroleum products; 6 concerns producing monumental and building stone; 1 plant making gas; and 1 making glass products.

British Columbia.—British Columbia's output of manufactured non-metallic mineral products totalled slightly over 8 million dollars in value. The petroleum industry was the most important with the gas industry and the coke industry next in line. There were 2 plants in the petroleum industry; 2 in the coke industry and 5 in the gas industry. There were also 16 plants making aerated waters, 7 producing finished stone products, 4 making glass products and 1 plant in the asbestos group.

Table 1A.—Summary Statistics Relating to the Manufacture of Non-Metallic Mineral Products Industries in Canada, 1920-1924

^{*}The Miscellaneous Non-Metallie Mineral Products group includes: The Abrasive Products Industry, the Artificial Graphite and Electrodes Industry, Gypsum Products Industry, Mica Trimming Industry, and, in 1922 to 1924, the Artificial Abrasives Industry.

Table 1B.—Summary of Principal Statistics Relative to Certain Mineral Industries, in Canada, 1920-1924

Note—The foregoing list of industries includes all those shown in the Bureau classification under the heading "Manufactures of Non-Metallic Mineral Products." But there are several other groups classified by the Bureau as primary mineral industries which are ordinarily regarded as manufacturing enterprises. These industries have been described in the Annual Report on the Mineral Production of Canada to which the reader is referred information, but for convenience of reference and for the making of a grand total the principal statistics relating to them have been repeated below.

(From The Annual Report on the Mineral Production of Canada.)

CHAPTER TWO

THE AERATED WATERS INDUSTRY

General.—The aerated waters industry in Canada is one of considerable importance and is widely distributed over the Dominion. Demand for these beverages is greatest in the more thickly populated sections, and so, naturally, the industry is centred in Ontario and Quebec. In 1924, there were 131 plants making carbonated beverages and aerated waters in Ontario; 80 in Quebec; 16 in Nova Scotia; 16 in British Columbia; 15 in New Brunswick; 16 in Alberta; 12 in Saskatchewan; 8 in Manitoba; 2 in Prince Edward Island making 296 plants in all.

In the manufacture of aerated waters, cleanliness is the prime requisite. Empty bottles returned from the dealers are thoroughly washed, sometimes with a weak solution of caustic soda, and then rinsed with hot and cold water. The cleansed bottles are placed in a travelling device, which passes under an automatic machine that feeds the required amount of flavouring extract or syrup into each bottle. Carbonated water is then added, the bottles are capped, and placed in boxes ready for shipment or delivery. As all this work can now be done with automatic machinery, each bottle of a given size contains the same amount of a uniformly flavoured product. It is recommended that all water be cleansed by filtering before being earbonated as it is generally conceded that while carbonation helps to kill dangerous bacteria, no manufacturer should depend solely on this factor to make his products pure.

The business is one that lends itself to manufacturing on a small scale with a very limited equipment as evidenced by the fact that 118 plants in Canada had a production valued at less than \$5,000 each and 71 others were each below the \$10,000 mark. On the other hand, the firms manufacturing the more widely known and popular brands of carbonated beverages, maintained large plants in several different cities. Altogether the 296 plants employed a capital of slightly over 9 million dollars and made \$6,354,358 worth of products. Many of the smaller plants are really only bottling works. They purchase flavours or extracts from the manufacturers and then carbonate the waters and add the flavouring.

Table 23.—Summary Statistics of the Aerated Waters Industry in Canada, 1920-1924

[·] Includes cost of electricity used.

Capital Employed.—Capital invested in the aerated waters industry in Canada showed an increase in 1924 of a million dollars over 1923 and reached the record total of \$9,385,802, of which 57 per cent was tied up in fixed assets such as lands, buildings and plant equipment. Ontario accounted for about 45 per cent of the total investment, while Quebec accounted for about one-half of the remainder.

Employment.—Including salaried employees as well as wage-earners, the total number of employees was 1,543 as compared with 1,724 in 1923. Wages and salaries at \$1,807,572 were also slightly below the corresponding figure for the preceding year.

Some years ago the areated waters industry in Canada was largely seasonal in nature and there was very little production during the winter months. Now due to the persistent advertising of large companies, people have been educated to the fact that carbonated waters are less likely to carry disease germs than some ordinary drinking waters and for this reason carbonated beverages are used to a greater extent throughout the year. But the sultry summer months promote the more extensive use of all cold carbonated drinks and the summer season is the busy time for all bottling companies in Canada. This seasonal trend is shown by the monthly employment records. In January, 1924, there were only 855 wage-earners on the rolls but by August the number had risen to 1,512, an increase of over 40 per cent during the first eight months of the year. From this point employment gradually fell away until, in December, only 915 names were recorded. The average for the year stood at 1,167 as against 1,303 in the preceding year.

Mineral Waters (From the "Annual Report on the Mineral Production of Canada, 1924").— Mineral waters produced in Canada during 1924 amounted to 209,353 imperial gallons valued at \$15,421 as compared with 232,451 gallons valued at \$16,455 in the previous year. Mineral springs in Ontario and Quebec contributed the whole of the Canadian production. In the present compilation there has been included a record of all natural mineral waters sold to the general public for medicinal purposes. No record has been kept of the shipments made of ordinary spring waters. The values given, do not take into account any mineral waters used at the springs for drinking or bathing purposes but include only the shipments from the springs in bottles or other containers.

CHAPTER THREE

ASBESTOS AND ALLIED PRODUCTS

General.—Although Canada produces about 85 per cent of the world's supply of crude asbestos, the fabrication of asbestos products and other similar materials such as compounds of magnesia and asbestos, used for insulating purposes in the protection of hot water and steam lines, boilers, etc., is yet in its infancy in Canada. During 1924, Canada exported \$7,561,221 worth of asbestos and of this amount only \$44,132 worth was in the form of manufactured materials. Imports of manufactured asbestos commodities in the same year were worth \$660,764 while the value of the production in Canada amounted to only \$589,339.

The heat-insulating properties of asbestos have been known for a long time, but it is only in recent years that there has been any great development in the application of this fact; now, however, practically every steam power plant of any size is properly insulated and the practice has been extended to the domestic heating plants. Pipes and conduits are covered with air-cell insulating materials and boilers are proterted with a preparation of asbestos and magnesia bonded with fireclay or sodium silicate. Manufacturers want the maximum power delivered for every pound of coal burned and the householder is equally anxious to get the greatest possible amount of heat out of each ton of coal used. Prevention of heat losses, is the first step towards the attainment of these ends. Not only is asbestos used to prevent heat losses as just noted, but it is also used in insulation of refrigerating plants with a view to preventing the access of heat to the refrigerating liquids. Other uses are found in the manufacture of brake-linings, building materials such as shingles, roofing felts, flooring sheathing, etc., refractory cements, insulating materials used in electric wiring, fireproofing materials and packings for pistons and pumps.

Most of the Canadian plants making asbestos products are subsidiaries making only a limited number of commodities and marketing all lines produced by the parent company. The close relation between the manufacturing and the jobbing divisions of such concerns made it difficult in some instances to obtain a separation of the data relating to manufacturing operations only. The same 9 plants operated in 1924 as in the previous year; there were 5 plants in Ontario, 2 in Quebec and 1 in each of the provinces of Nova Scotia and British Columbia.

Table 31.—Summary Statistics of the Asbestos and Allied Products Industry in Canada, 1920-1924

^{*} Includes cost of electricity.

Capital Employed.—Capital employed in the asbestos products industry amounting to \$1,468,728 was only slightly below the 1923 figure. Lands, buildings and plant equipment were valued at nearly a million dollars. Ontario plants accounted for \$519,650 or about 35 per cent of the total capital employed in the industry.

Table 32.—Capital Employed in the Asbestos and Allied Products Industry in Canada, by Classes and by Provinces, 1923 and 1924

^{*} Totals for Canada also include data for 1 firm in Nova Scotia, 2 in Quebec and 1 in British Columbia.

Employment.—Plants fabricating asbestos products employed 43 salaried employees and 77 wage-earners, 120 persons in all, and paid out \$169,979 in salaries and wages. The trend of employment is distinctly seasonal, the demand for asbestos building materials, etc., being greater in the summer months. In January, there were 74 wage-earners employed; in June, 110; in October, 45, and at the end of the year there were only 43 wage-earners on the rolls. The last three months of 1924 showed the lowest employment records of any year since the Bureau started collecting data on this industry in 1919.

¹ Includes composition flooring, furnace cements, silicate, boiler cleaners, asbestos shingles, millboard, corrugated sheathings, and asbestos building lumber.

Primary Production of Asbestos (From the "Annual Report on the Mineral Production of Canada, 1924").—Production of asbestos in 1924 amounted to 225,744 tons valued at \$6,710,830 as against 231,482 tous valued at \$7,522,506 for 1923. Although this marked a decrease of 2·3 per cent in quantity and 10·8 per cent in value, the production of asbestos in Canada in 1924 was the second greatest ever recorded. The average value per ton received by the operators was \$29.73 while in 1923 receipts averaged \$32.50.

Asbestos rock mined during the year amounted to 3,323,505 tons. In the same period the mills handled 2,760,470 tons or 83 per cent of the tonnage raised, and produced 226,469 tons of marketable asbestos or 8·2 per cent of the mill input.

Exports of asbestos other than sand and waste decreased 27,821 tons in 1924 to a total of 109,730 tons and the exports of sand and waste increased approximately 17,000 tons to 95,019 tons. The decrease in export of the former grade was no doubt due to the consumption of this materials at the new asbestos manufacturing plant located at Asbestos, Quebec.

Lower prices also prevailed for Rhodesian asbestos in 1924 as the quantity produced during the year was about 6,000 tons higher than in 1923, while the total value decreased 3.7 per cent,

CHAPTER FOUR

THE CEMENT PRODUCTS INDUSTRY

General.—The cement products industry in Canada in 1924 as reviewed hereunder, covers the operations of 116 different plants distributed as follows: 1 in Nova Scotia, 3 in New Brunswick, 18 in Quebec, 92 in Ontario, and 2 in Saskatchewan. The industry also includes many small plants which consist only of a gasoline engine and a cement mixer set up at a suitable place where good clean sand and gravel are procurable, but as local conditions largely control the outputs of these plants and as many reported that they manufactured cement blocks, etc., in spare time only, no record of such operations has been included in this report. Of the 116 plants reporting in 1924 only 4 had a production valued in excess of \$50,000 each; 8 others were above \$25,000 each; 10 others exceeded \$10,000 each; 14 others were above \$5,000 each; and the output of 80 plants was below the \$5,000 mark each.

Portland cement is the best known binder for stone aggregates because of its peculiar setting qualities as it will harden under water or in the air, and for that reason, is adaptable to many kinds of building construction. The use of concrete blocks, sewer pipe and cement drain tile is being extended annually. In private dwelling construction, the concrete-block house is quite common; the blocks used are hollow, the air space acting as a non-conductor of heat both in summer and winter. Concrete lintels, sills, caps for verandah posts, etc., and the manufacture of cement tile for sewage and drainage purposes, afford new avenues for the use of concrete products. Tile or drainage pipe can be molded into any desired shape for the particular purpose in view or they can be manufactured in sections and transported long distances to be fitted together on the job.

Table 41.—Summary Statistics of the Cement Products Industry in Canada, 1920-1924

[•] Includes cost of electricity.

Capital Employed.—In 1924 the total capital employed in the cement products industry was \$1,673,758. Ontario led with a capital investment of \$1,348,246 or about 80 per cent of the total capital employed in the industry.

^{* 1923} totals for Canada also include data for Nova Scotia, Saskatchewan and British Columbia; 1924 totals for Canada include data for 1 plant in Nova Scotia and 2 in Saskatchewan.

Employment.—In this industry as in others that supply materials for the building trade, there is a distinct seasonal trend. At the beginning of 1924 there were 214 wage-earners employed; this number gradually increased to 466 in May after which there was a decline to 400 in August, 357 in October and 191 in December, making an average of 400 wage-earners for the year. Salaried employees numbered 55 thus making a total of 455 persons employed as compared with 421 in 1923. Salaries and wages in 1924 totalled \$425,078.

Materials Used.—The main materials used in this industry were portland cement, sand, gravel and crushed stone. In 1924 the cost of these and other raw materials amounted to \$470,361 which together with \$22,909 expended for boxes, crates, etc., made a total expenditure of \$493,270 as compared with \$596,654 in the previous year.

Table 46.—Materials Used in the Cement Products Industry in Canada, 1923 and 1924

Products.—It was not found feasible to give the number of cement bricks, building blocks, drain pipes, etc., manufactured, because of the different sizes made; in many cases, also, only the value was reported. In 1924, the total value of production stood at \$1,257,871 a decline of 16 per cent from 1923. Hollow building blocks produced, were worth \$523,326 and sewer pipe and culvert tile made, during the year were valued at \$419,730.

Primary Production of Cement (From the "Annual Report on the Mineral Production of Canada, 1924").—Sales of cement in Canada in 1924 at 7,498,624 barrels were slightly less than the sales for the preceding year which amounted to 7,543,589 barrels. The total value of sales in 1924 was \$13,398,411 as against \$15,064,661 in 1923. The total mill output amounted to 7,768,652 barrels, an increase of 80,456 barrels over the output for the preceding year.

Exports of Canadian cement amounted to only 153,520 barrels, a decrease of 340,231 barrels from the total for the preceding year. Importations amounted to 27,672 barrels, an increase of 10,000 barrels over the figures for 1923. While the apparent consumption of cement in Canada during 1924 amounted to 7,372,776 barrels, or 4·3 per cent more than in 1923, this total was 17·3 per cent less than the figures for 1913, when cement consumption in Canada reached its peak.

Ten plants, having in all a daily capacity of 34,235 barrels, were operated during the year. In addition to these, there were ten other plants in Canada which were idle during the whole period. Ontario and Quebec were the principal producing provinces. Sales from Ontario plants amounted to 3,564,499 barrels, averaging \$1.59 per barrel; Quebec plants sold 2,758,316 barrels at an average price of \$1.74. The average selling prices f.o.b. plant in the other provinces, were as follows: Manitoba, \$2.60; Alberta, \$2.27; British Columbia, \$2.63. For Canada the average was \$1.79 per barrel.

CHAPTER FIVE

THE SAND-LIME BRICK INDUSTRY

General.—Sand-lime brick is used extensively in the building trade. By the addition of hydrated lime to sand in the proper proportions, a mixture can be made from which it is possible to produce fairly durable bricks. Methods of manufacture were described in the review of the industry for 1923. In general, the essentials to the production of high-grade brick are: thorough hydration of lime before being made into brick form; the proper percentage of lime and sand; the highest pressure to form the brick; and the elimination of manual labour to attain consistent results.

The sand-lime brick industry in Canada is centred in Ontario where there were 10 plants in operation in 1924; there was also 1 active plant in Manitoba and 1 in Saskatchewan. Production of sand-lime brick in that year had a total selling value of \$619,946 as compared with \$897,960 from the 8 plants that reported in 1923, the best year on record for the industry.

Table 49.—Summary Statistics of the Sand-Lime Brick Industry in Canada, 1920-1924

^{*} Includes cost of electricity.

Capital employed.—Ontario plants accounted for 70 per cent of the total capital employed which in 1924 amounted to \$1,346,239. Lands, buildings and plant equipment were valued at \$1,182,579, an increase of 48 per cent over the corresponding figure for 1923.

^{*} Totals for Canada include data for 1 firm in Manitoba and 1 firm in Saskatchewan.

Employment.—In 1924 there were 236 people employed in the manufacture of sand-lime brick in Canada, and salaries and wages amounted to \$248,045; in the previous year there were 225 persons employed and expenditures in salaries and wages totalled \$285,248. With the exception of February when the number of wage-earners dropped to 120, employment was fairly steady, there being an average of 209 wage-earners on the rolls during the year with a maximum of 229 attained in December.

Firms in this industry operated their plants on an average of 191 days during the year and paid an average yearly wage of \$953 to each person on the wage-roll throughout the year.

Primary Production of Brick, Lime and Sand (From the Annual Report on the Mineral Production of Canada, 1924). Brick.—Ontario is the leading province in the manufacture of building brick in Canada. During 1924, Ontario's production was valued at \$3,279,291. Quebec came next with a total valued at \$1,844,680. Alberta, British Columbia, Manitoba, Nova Scotia, Saskatchewan, New Brunswick and Prince Edward Island follow in the order named. The total Canadian production in 1924 had a selling value of \$5,722,997 as against \$6,701,317 in 1923.

In the city of Medicine Hat, Alberta, a large brick company uses natural gas from its own wells for brick-burning. Distributing pipes from the wells are led to the kilns. Maintenance of the temperature desired is easily accomplished by the regulation of the gas-flow.

Lime.—Production of lime in Canada during 1924 amounted to 9,136,952 bushels valued at \$3,178,541 as against 10,035,319 bushels valued at \$3,266,608 in 1923. The average prices obtained for quicklime during the year was 33·6 cents per bushel and hydrated lime sold for \$11.92 per ton.

Importations of lime were recorded at 4,418 tons appraised at \$46,578 and exports amounted to 22,750 tons worth \$411,122.

Sand and Gravel.—Sand and gravel produced in 1924 totalled 11,603,500 tons valued at \$3,181,083 as against 12,752,515 tons valued at \$3,016,518 in 1923. This was a decrease in quantity of 1,149,015 tons and an increase in value of \$164,565.

Imports of sand and gravel into Canada during the year amounted to 150,868 tons a decrease of 204,258 tons from the total recorded for 1923. Importations of silica sand, for the manufacture of glass and carborundum, and for use in foundries totalled 131,778 tons or 21 per cent less than in the preceding year. (See also the chapter on The Glass Industry.)

CHAPTER SIX

THE COKE AND BY-PRODUCTS INDUSTRY

General.—Coke is produced in Canada in three different industries. Besides that produced in the familiar beehive and by-product ovens, coke is obtained in the manufacture of illuminating and fuel gas and in the refining of petroleum. Petroleum coke is of little importance as the production is relatively small and it is not commonly sold in competition with gas-house or by-product coke; it is used in the manufacture of electrodes and as a fuel in the refineries. Gas coke is used extensively as a domestic fuel but is usually too soft for metallurgical or foundry purposes, the industries which consume the great bulk of all the coke produced in Canada.

In 1924, the total production of coke in Canada amounted to 1,486,237 tons as compared with 1,707,034 tons in 1923.

A large part of the output of coke is used in the metallurgical industry where it is employed as a blast furnace fuel to the exclusion of almost any other fuel and it is also used in foundry and other metallurgical operations. The coke-producing industry, therefore, is to a great extent operated as an adjunct to metallurgical works, especially iron blast furnaces, and the output of coke bears a constant relation to the output of pig iron which in turn is controlled by the condition of general business. Even the growing demand for coke as a domestic fuel has not destroyed this parallelism; blast furnaces and other metallurgical industries continue to be the principal customers of the cokemaker.

Coke is produced by the destructive distillation of bituminous coal and is made in two kinds of ovens,—the by-product and the beehive types. From the by-product oven, as the name implies, are recovered coke, breeze, gas, animonia liquor which may be made into animonium sulphate, and light oils, such as toluol, benzol, motor oil, etc. The bechive type is designed to produce coke only and no provision is made for the recovery of the by-products.

Metallurgical coke is made in Canada by (a) Dominion Iron and Steel Company, Ltd., at Sydney, N.S., (b) Steel Co. of Canada, Ltd., at Hamilton, Ont., (c) Algoma Steel Corporation, Ltd., at Sault Ste. Maric, Ont., (d) Hamilton By-Product Coke Ovens Ltd., at Hamilton, Ont., (e) Crow's Nest Pass Coal Company Ltd., and (f) Granby Consolidated Mining, Smelting, and Power Co., Ltd., at Anyox, B.C. The by-product type of oven is operated by all these companies with the exception of the Crow's Nest Pass, who, as yet, have not deemed it advisable to instal the newer type of oven.

In general, by-product coke is made by charging bitumionus coal of a good coking quality into a fire-brick chamber called a retort. This chamber is narrow and long, approximately 20 inches wide by 35 feet long and 6 feet high. On each end are iron doors that are opened for discharging the coke and which are luted up while the coking is going on. The coal is distilled by the gas produced from a previous charge, this gas having been washed and then stored in a storage tank. Pre-heated air is admitted with the gas to increase the temperature around the oven. Two sets of burners operate intermittently, so that the burning gas may pass in first one direction and then in an opposite direction around the retort. This insures even heating of the oven and results in better coking conditions. Coking time varies from 12 to 72 hours. About 70 per cent of the coal used is recovered in the form of coke, which includes the breeze or fine coke.

In the carbonization of coal in a by-product oven, much of the volatile matter is driven off in the form of a vapour which is afterwards condensed to form tar. Tar thus obtained may be refined and as such forms the basis of the many organic derivatives now used in a variety of processes. The nitrogen in the coal is converted into ammonia which is recovered and sold in the form of crude ammonia liquor or converted into ammonium sulphate for fertilizing purposes. Crude light oils consisting principally of benzol are also recovered. The gas produced is used for heating the ovens or sold for other heating purposes.

The data given in Tables 61-67, show the production of coke and by-products in Canada in 1924, in both the beehive and by-product plants but do not include the coke produced in gas plants or in petroleum refinerics. These latter industries are treated in separate chapters of this report.

^{*} Includes cost of electricity.

Capital Employed.—Capital employed in the coke and by-products industry in Canada in 1924 amounted to \$24,315,744, most of which was tied up in lands, buildings, and plant equipment. This was an increase of 3.9 millions over 1923 due to the opening of another large by-product coke plant in Ontario during the year. Ontario's plants accounted for 45 per cent of the total capital investment.

Table 62.—Capital Employed in the Coke and By-Products Industry in Canada, by Classes and by Provinces, 1923 and 1924

^{*1923} total for Canada includes data for Nova Scotia, Ontario and British Columbia: 1924 total for Canada also includes data for I plant in Nova Scotia and 2 in British Columbia.

Employment.—Although there was one more operating plant in 1924, only 530 persons were employed throughout the year as against 598 in 1923. Employment was greatest in the forepart of the year and reached a maximum in March after which there was a distinct falling off for the remainder of the year. The coke industry is closely related to the iron and steel industry and conditions generally follow the same trend.

Materials Used.—Both imported and domestic coal are used in the coke-making industry in Canada. In 1924, the cost of foreign coal used for coke-making was \$4,415,142; Canadian coal used cost \$2,110,064. Only 1,410,917 tons of coal were used in 1924 as compared with 1,707,024 tons in 1923. Sulphuric acid is used to convert the ammonia recovered to ammonium sulphate which finds an extensive market as a fertilizer.

Total value of materials used			11,437,863		6,879,516

Products.—The amount of coke manufactured in this industry in 1924 was 985,305 tons valued at \$7,268,713; this was 21 per cent in quantity, and 30 per cent in value below the production of 1923. The decrease was due to the lessened demand in the metallurgical industry. In 1924, Ontario's ovens produced 562,618 tons of coke or 61 per cent of the total production in this industry.

Disposition of coke by the producing plants showed that 13,123 tons were used in the coking plants for heating and power development; 781,445 tons were used in the associated metallurgical works; and 190,737 tons were sold during the year.

The percentage of yield of coke obtained from any coal is dependent primarily upon the quantity of volatile matter present in the coal. Practically all the volatile matter is eliminated during coking, the fixed carbon and ash with only a low percentage of volatile matter being left to form the coke. Yields of coke from any particular coal are lower in the beehive than in the by-product ovens because in the former a small part of the coke is burned in order to produce the heat required for the coking operations. In 1924, 1,410,917 tons of bituminous coal were treated to produce 985,305 tons of coke, an average yield of 65 per cent.

Most of the gas from the by-product ovens was used either to heat the ovens or in the associated steel plants; some gas was sold for domestic and industrial uses.

Ammonia liquor recovered in the plant, was nearly all made into ammonium sulphate and marketed as such. Tar and tar products and light oils were also recovered.

CHAPTER SEVEN

THE GLASS INDUSTRY

General.—This report of the glass industry in Canada covers the manufacture of pressed and blown glass and window glass, the bevelling, cutting and bending of imported glass—there being no plate glass manufactured in Canada—and the manufacture of leaded art glass, and glass cutting.

In the pressed and blown glass and window glass industry there were 10 plants operating in 1924 including 6 in Ontario, 3 in Quebec, and 1 in Alberta. Plants which cut and bevelled plate glass, manufactured cut glass, and made ornamental glass, numbered 38 in the Dominion in the same year. Of these, 8 operated in Quebec, 22 in Ontario, 3 in Manitoba, 4 in British Columbia, and 1 in New Brunswick. In 1923, there were 11 plants making pressed, blown and window glass and 35 in the cut, plate and ornamental glass industry making 46 in all or 2 less than in 1924. The 2 additional plants operating in 1924 were small, however, and in spite of the greater number of plants in operation the total value of production in 1924 at \$10,776,816 was slightly lower than in the preceding year.

Glass is produced by the fusion of silica, lime or lead, and sodium or potassium salts. Oxides of other metals are sometimes introduced into the melt, but only for some particular purpose, such as for colouring, toughening or lowering or raising its fusibility. White arsenic, As₂O₃, is almost always used. It is reduced first to metallic arsenic, which then volatilizes; it is said that its use makes a much clearer glass. Silica is supplied in the form of sand, which is required practically free from iron oxide for the finer glass, but for the more common ware such as bottle glass, a small percentage of iron is permissible.

Lime is supplied in the form of ground limestone, which should be free from magnesia and iron. Magnesia raises the melting point and also makes the glass very hard. Burnt lime and hydrated oxide of lime are also used. Lead is added as litharge or red lead. The higher oxide is preferred because of the oxygen liberated, which assists in oxidising any iron present and also prevents the lead from being reduced to the metallic state. Sodium is added either as the carbonate or as the sulphate. When the latter is used, carbon is also added as a reducing agent. Potassium carbonate in the form of pearl ash is the chief source of potash. Other metallic oxides are sometimes introduced to impart a particular colour to the glass.

Glass is made by introducing into a carefully-made fireclay pot or tank the required amount of raw materials and fusing by means of a flame free from smoke. Good dry hardwood was originally used for fuel, but high-grade coal and gas or, more particularly natural gas, are being utilized at the present time.

Generally speaking, there are two kinds of furnaces: the pot furnace and the tank furnace. A tank furnace is more economical when a large amount of the same kind of glass is required. Fireclay for the pot furnace is mixed with old ground-up pots, wetted and kneaded until the whole becomes plastic, allowed to age and then built into pots by hand. Tank furnaces consist of a fireclay hearth or tank with a silica-brick arch and the heat is applied to the top of the charge. A bridge or wall of fireclay is placed across the hearth. The charge is introduced at one end and as the glass melts, it flows under the partition and is drawn off at the other end without interrupting the process.

Window glass was formerly made entirely by band but in the modern plants the use of compressed air and newer machinery has replaced much of the manual labour formerly so characteristic of this industry. In making window glass a quantity of molten glass is collected on the end of a hollow iron blow-pipe and then by blowing and manipulation, it is made into a long cylinder of glass. This cylinder is laid on a table and cut along the longer axis, after which it is placed in the "flattening oven" with the cut on the upper side. In some plants the cylinder is cut into two semi-cylinders before flattening. The temperature is slightly raised and the cylinder gradually opens until it lies perfectly flat. It is then passed slowly through an annealing oven which is hot at one end and cool at the other.

Gradual cooling of the glass prevents the setting up of internal stresses. When the glass leaves this last oven it is ready to be cut into commercial sizes.

Bottles, lamp chimneys and other similar hollow-ware are made by blowing the molten glass into a mould; mechanical devices make it possible to produce many of these moulded products at one operation.

For the manufacture of plate glass, the molten glass is poured on a perfectly flat table and rolled to the desired thickness. After careful annealing, it is polished first by abrasion with coarse sand, then with finer abrasive materials, and finally with felt and rouge.

Cut glass is nearly always lead glass which has been either blown or pressed into moulds of the desired shape. The blank is cut by being held against a fast-revolving wheel of steel or sandstone fed with some abrasive material and water.

Coloured glass is made by adding the oxides of different metals, the choice of oxide being governed by the effect required.

Capital Employed.—Although there were 48 plants reporting in 1924 as compared with 46 in the previous year, capital employed in the glass industry as a whole in Canada dropped 1.6 million dollars to \$13,304,814. This decline was almost entirely accounted for by a decrease in the value of lands, buildings and plant equipment which fell to \$8,414,045 in 1924 from \$9,945,874 in 1923, due to the closing of one large glass factory in Ontario. The glass industry is centred in the provinces of Ontario and Quebec which together accounted for about 93 per cent of the total capital invested in the industry.

Employment.—Glass manufacturing and working in 1924 afforded employment to 244 salaried workers and 2,893 wage-earners, a total of 3,137 as compared with 3,350 in 1923. Salaries and wages amounted to \$3,666,213. Each wage-earner received an average yearly wage of \$1,090. Operating plants in this industry worked on the average 301 days during the year.

Materials Used.—Materials used in the manufacture of pressed and blown glass include silica sand, soda ash, nitrate of soda, burnt lime, white arsenic and various other materials. A large amount of sand is imported; in 1924 the imports amounted to 131,778 tons valued at \$324,279. The chief sources of supply are the United States and Belgium, sand from the latter country being brought in as ballast by returning vessels.

In the plate, cut and ornamental glass industry the materials used include glass blanks, sheet and window glass, figured, coloured and cathedral glass, and such materials as lead, solder, zinc, copper, silver, silver nitrate and carborundum.

CHAPTER EIGHT

THE ILLUMINATING AND FUEL GAS INDUSTRY

General.—The illuminating and fuel gas industry in Canada includes the manufacture of coal gas, carburetted water gas, Pintsch gas—for the illumination of railway coaches—and acetylene gas. Gas is also recovered as a by-product in the manufacture of coke and in the refining of petroleum but the outputs of these industries are not included in this review.

In 1924 there were 44 gas plants in operation in Canada, distributed as follows: 1 in Nova Scotia, 2 in New Brunswick, 4 in Quebec, 21 in Ontario, 8 in Manitoba, 2 in Saskatchewan, 1 in Alberta and 5 in British Columbia. Of these plants 11 made carburetted water gas only; 12 produced straight coal gas only; 6 made both water gas and coal gas; 6 produced acetylene gas only; and 9 others made Pintsch gas only. As illuminating and fuel gas may be made by several different methods and as the manufacture of straight coal gas and carburetted water gas are the most important, a short description of their manufacture is given here.

Coal gas is prepared by the destructive distillation of bituminous coal, and water gas is made by the action of steam on incandescent coke or anthracite coal. Straight water gas, being non-luminous, is mixed or rather carburetted with gases derived from oils which are rich in hyrdocarbons. This enhances both the heating values and lighting properties of the gas. Many straight coal gas plauts are also equipped to make carburetted water gas, in which process the hy-product coke from the coal gas process can be utilized.

Straight Coal Gas.—In the manufacture of coal gas, a coal with a high volatile content is charged into fireclay retorts heated externally by direct fire or by producer gas made from by-product coke. There are three types of retorts in use—the horizontal, the inclined and the vertical. The inclined and vertical retorts may be operated continuously, but the horizontal retorts are intermittent in operation.

In the operation of the vertical retort, the coal is charged from a hopper at the top and is distilled by the heat from the burning producer gas which surrounds it. The coke is drawn off from a hopper at the bottom. The products of distillation, gases, ammonia, tars, etc., are led off by a vertical pipe from the top of the retorts. Thence it is led to the foul main, and from the foul main to the primary condenser, and then to the exhauster.

The exhauster is the controlling factor and its function is to draw the gases from the retorts through the different mains and primary condensers and then act as a pump to force them through the remaining parts of the plant.

The gases are forced from the exhauster to a secondary condenser and then through the tar exhauster, after which they are led to a scrubber and a washer machine, for the removal of the ammonia.

From the scrubbers and the washers the gas passes through purifying boxes containing hydrated ferric oxide, which absorbs the sulphur compounds. It then goes through the plant meter to the gas holder, from which it is delivered through the main to the users.

Carburetted Water Gas.—In the manufacture of water gas, anthracite coal or by-product coke is charged into a large cylindrical holder called a generator and is heated up to white heat by means of an air blast.

The gases given off while this operation is carried on are led in at the top of an adjoining circular chamber called a carburettor which is filled with firebrick staggered to allow the free passage of the gas. By means of another blast of air entering also at the top of these chambers, partial combistion of the gases is effected and the small pieces of firebrick are raised to a white heat. The remaining gases are led to another similar chamber called a super-heater, which is also loosely filled with firebrick. Another air blast led in at the bottom promotes the combustion of the remaining gases and these heat the firebrick to a red heat; any gases not burned are led off at the top of the superheater to the open air. When the carburettor and superheater have reached the necessary temperature the air blast is cut off and steam is forced into the generator where it is decomposed and with the aid of carbon, forms hydrogen and carbon monoxide. While this non-illuminating gas is passing into the carburettor, oil in an atomized form is forced in against the white hot firebrick and is broken up into a gas rich in hydrocarbons.

The oil gases and the water gas mix, and pass through the superheater where they are fixed and made non-condensable. The gas thus formed is passed into a storage tank, and from there it is drawn through the purifying apparatus.

In 1924, gas rates in the different towns were as follows: Montreal, \$1.10 per M; Halifax, \$2.00 per M less 5 per cent; St. John, \$2.25 per M plus meter rental; Brandon, \$2.10 per M; Winnipeg, \$1.30 per M; Westminster, \$2.75 per M less 10 per cent; Nelson, B.C., \$2.20 per M; Vancouver, \$1.50 less 10 cents per M; Belleville, \$1.30 per M; Guelph, \$1.20 per M less 10 cents per M; London, \$1.15 per M; Toronto, \$0.85 per M plus 50 cents service charge; Cobourg, \$2.50 per M; Owen Sound, \$1.50 per M less 10 per cent; Port Hope, \$2.50 per M with \$6.00 per year service charge; Ottawa, \$1.60 per M less 10 cents per M with 18 cents per month service charge; Kitchener, \$1.60 per M less 10 cents per M with 10 cents per month meter rent; Stratford, \$2.00 per M plus 25 cents meter rent; Cornwall, \$2.20 per M less 20 cents per M; Waterloo, \$2.00 per M; Oshawa, \$1.90 per M; St. Thomas, \$1.70 per M less 10 cents; Kingston, \$1.70 per M plus 17 cents per month meter rent; Brockville, \$1.80 per M; Barrie, \$2.00 per M plus 75 cents service charge; Quebec, \$2.00 per M less 25 per cent; and Sherbrooke, P.Q., \$1.75 per M less 15 per cent. Acetylene gas was worth about \$2.00 per C. cubic feet, and Pintsch gas cost \$1.50 per receiver of 167 cubic feet.

Table 75.—Summary Statistics of the Illuminating and Fuel Gas Industry in Canada, 1920-1924

Capital Employed.—Capital employed in the gas industry amounted to \$42,818,276 a decline of 2-7 million dollars from the 1923 figure. Previous to this there had been a substantial increase in each year since 1919 when the first returns on this industry were compiled. Ontario's plants represented a capital investment of 23-5 million dollars or 55 per cent of the total for Canada.

Employment.—In spite of the decline in value of production in 1924 the gas industry afforded employment to 3,648 persons as compared with 3,021 in 1923. Salaries and wages also increased to \$4,835,351 from \$3,801,832 in 1923. Each wage earner received an average yearly wage of \$1,262. Plants in this industry operated continuously throughout the year.

Materials Used.—Bituminous coal having good gas-making qualities is the principal raw material used in this industry. In 1924 more than 4.7 million dollars was paid for 681,480 tons of bituminous coal for this purpose. Gas oil is also an important raw material; in 1924 over a million dollars was paid for this commodity for use in gas making. Materials that were used as boiler or retort fuel are shown in the fuel consumption table.

Products.—The output of the gas industry includes the primary products such as coal gas, water gas, etc., made for sale and also certain by-products such as coke, tar, ammonium sulphate, etc., part of which are sold and part used as fuel in the gas producing plants.

In 1924, the total gas made available for distribution was 13,227,402 thousand cubic-feet; of this amount 110,810 thousand cubic feet was used in the gas plants, and 11,879,111 thousand cubic feet was sold for industrial or domestic purposes bringing a gross revenue of \$14,268,315, and 1,237,481 thousand cubic feet was not accounted for. In addition, the by-products were worth \$3,833,409 thus bringing the total value of production in the gas industry in 1924 to \$18,101,724 as compared with \$19,605,340 in the previous year.

Primary Production—Natural Gas (From the "Annual Report on the Mineral Production of Canada, 1924)".—The production of natural gas in Canada in 1924 amounted to 14,881,336 thousand cubic feet valued at \$5,708,636 as compared with 15,960,583 thousand cubic feet valued at \$5,884,618 in 1923. Ontario and Alberta are the two principal areas where this natural resource occurs and in 1924 these provinces produced about equal amounts. The unit value received for natural gas in Ontario is twice as much as that received in Alberta. New Brunswick is the next greatest producer and Manitoba usually reports a small production.

In Alberta and Ontario the manufacture of carbon black from natural gas is a promising new industry and the Dominion Government has already published regulations covering the manufacture of this product from natural gas.

CHAPTER NINE

THE IMPORTED-CLAY PRODUCTS INDUSTRY

General.—This industry includes all plants in Canada that manufacture clay products, such as porcelain insulators, fireclay goods, and earthenware, from special clay imported for the purpose. Most of this clay comes from the United States but considerable quantities are also obtained from the United Kingdom.

In 1924, there were 12 plants in Canada manufacturing products from imported clay. These were distributed as follows: 6 in Ontario, 5 in Quebec, and 1 in New Brunswick. Of these plants, 3 produced fireclay goods only; 3 others made porcelain insulators only; and the remainder manufactured sanitary earthenware, pottery and building tile. The total production amounted in value to \$1,879,769.

Table 84.—Summary Statistics of the Imported-Clay Products Industry in Canada, 1924

Year	Number of plants	Capital em- ployed	Number of ployees	Salaries	Wages	Cost fuel and electricity	Cost of materials	Selling value of products	Value added by manu- facturing

Capital Employed.—Capital employed as represented by lands, plant and equipment, stocks on hand and in process, and cash and trading accounts totalled \$1,677,533. Lands buildings and plant equipment were valued at nearly a million dollars. Ontario accounted for about 60 per cent of the total capital employed.

Canada	961,927	415,535	390,071	1,677,533		

Employment.—The imported-clay products industry in 1924 afforded employment to 45 salaried employees and 444 wage-earners, a total of 489 persons to whom \$567,143 were paid in wages and salaries. The year opened with 520 wage-earners on the roll; by July the number had declined to 410, after which there was a slight recovery until in November 440 wage-earners were employed.

Plants in this industry operated on an average of 279 days during the year. Each wage-earner received an average yearly wage of \$1,043.

STRUCTURAL TILE.—Records of the production of structural tile in Canada include such items as hollow blocks, fire-proofing and load-bearing tile, roofing tile, and floor tile. Sales of these products amounted in value to \$963,302 in 1924. Hollow blocks are manufactured in every province except New Brunswick and Prince Edward Island. Roofing tile is made in Ontario only. Floor tile is made in Ontario and also in small quantities in British Columbia.

Sewer Pipe.—Production of sewer pipe in Canada in 1924 amounted to 76,355 tons valued at \$1,594,280 as against 70,252 tons valued at \$1,616,324 in 1923. During the year under review, sales of drain tile made in Canada reached a total value of \$409,369 as against \$323,314 for the year 1923, an increase of \$86,055. Ontario accounted for more than 50 per cent. of the total production of drain pipe and sewer pipe in Canada,

Reference Refereday—Sales of firelay or refractory clay sold as such, in Canada, during 1924 were valued at \$26,258. Shipments of this commodity were made from deposits in the provinces of British Columbia, Saskatchewan, New Brunswick and Nova Scotia during the year.

Firebrick—Firebrick produced from domestic clays totalled 4,327 thousand valued at \$209,256, as against 6,122 thousand valued at \$295,037 in the previous year. British Columbia was the principal producer, accounting for 68 per cent of the total Dominion sales.

Imports of firebrick into Canada during 1924, consisting of magnesite brick, silica brick, firebrick of a kind not made in Canada, and fire brick, n.o.p., were appraised at \$1,365,644.

Sanitary Ware and Pottery from Domestic Clays.—Pottery from domestic clays sold during 1924 amounted in value to \$238,342 as against \$229,547 in the preceding year. Pottery produced from imported clays was valued at \$53,678, making the total production worth \$292,020.

CHAPTER TEN

THE MONUMENTAL AND ORNAMENTAL STONE INDUSTRY

General.—The cutting of ornamental and building stone is an industry that is well distributed throughout the whole Dominion. In 1924 reports were received from 210 plants located as follows: 1 in Prince Edward Island; 13 in Neva Scotia; 9 in New Brunswick; 42 in Quebec; 113 in Ontario; 12 in Manitoba; 7 in Saskatchewan; 6 in Alberta and 7 in British Columbia. The majority of these plants are small concerns employing only 2 or 3 men, but there are also quite a number operating on a large scale with productions in excess of \$100,000. In 1924, plants in this industry afforded employment to an average of 1,344 persons during the year and had a combined output valued at \$4,730,572.

In some sections of Canada, suitable stone is not available locally and must be imported from other countries. There are sections of the province of Ontario where a very good grade of granite is obtainable but the quarrying of this material is an expensive operation and unless the demand is great near the quarry the return on the required investment in many cases is hardly enough to recompense the operator. In foreign countries, where this industry has been developed to a greater extent and where the demand for the product is much larger, the cost of quarrying has been reduced to a minimum so that the surplus stock can be experted to other countries and sold there at a price that competes with the domestic quarried stone. Granite and marble, rough and dressed, are regularly brought into Canada. In 1924 imports of stone totalled \$910.157.

The importation of stone and quarry products into Canada from certain parts of the United States in recent years has been the subject of much concern on the part of government authorities in both countries; some stone was found to be infested with the brown-tail or gypsy moth which is particularly destructive. Now, all the stone for export from these areas is examined by officials of the United States' Department of Agriculture; if the stone is free from traces of the objectionable moths the officer signs a clearance certificate without which the stone cannot be brought into Canada.

Table 98.—Summary Statistics of the Monumental and Ornamental Stone Industry in Canada, 1920-1924

^{*} Includes cost of electricity.

Capital Employed.—Capital employed in this industry in 1924 amounted to \$4,944,269, only slightly below the corresponding figure for 1923. Lands, buildings, machinery and tools were valued at \$2,214,307 or 45 per cent of the total investment. Ontario led with \$2,674,090 or 54 per cent of the total, while Quebec accounted for \$1,080,515 or 22 per cent of the total capital employed in the industry.

Employment.—In 1924 this industry afforded employment to 209 salaried employees and 1,135 wage-carners, a total of 1,344 persons to whom \$1,887,462 was paid in salaries and wages. There is a slight seasonal trend to the industry as indicated by the monthly employment records. Employment drops off during the winter months when there is less activity in the building trade. In January there were 819 wage-earners on the rolls and this number gradually increased until a maximum of 1,252 was reached in August. By the end of the year the number had declined to 978 making an average for the year of 1,135 wage-earners as against 1,054 in 1923.

Materials Used.—The total cost of materials used amounted to \$1,441,753 as against \$1,683,126 in 1923. This included the cost of imported stone as well as domestic marble and granite, limestone and other materials.

Table 103.—Materials Used in the Monumental and Ornamental Stone Industry in Canada, 1923 and 1924

		1924
Materials	Cost at works	Cost at works
Cost of all stone used.		1,441,753

Products.—The products of this industry find their market either as monuments or stone for building purposes. More granite and marble, cut and polished, was used for building purposes than in 1923 but the use of limestone for the same purpose fell off slightly. The total production in 1924 was valued at \$4,730,572 as compared with \$5,025,003 in the previous year

Primary Production—Stone (Abstracted from the "Annual Report on the Mineral Production of Canada, 1924").—Sales of stone quarried in Canada during 1924 totalled 4,768,014 tons valued at \$6,407,757 as against 4,111,334 tons valued at \$5,903,289 in 1923. This was an increase of 16 per cent in quantity and 8.5 per cent in value. In point of value, Quebec was the largest producer, but having regard to quantity, Ontario had the greater output; British Columbia was next in importance and Nova Scotia, Manitoba, New Brunswick and Alberta followed in the order named.

Ontario produced more crushed stone than any other province but Quebec, had a greater production of monumental and ornamental stone, and also led all the other provinces in the production of rough and dressed building stone.

Limestone quarried and used by the operator in the manufacture of lime has not been included in this record. In order to avoid duplication of entries only the quantity and value of lime made are recorded.

CHAPTER ELEVEN

THE PETROLEUM PRODUCTS INDUSTRY

General.—The petroleum products industry in Canada includes those plants engaged in (a) the refining of crude oil from the production of gasoline, kerosene, lubricating oils, waxes and petroleum coke; (b) the manufacture of commercial lubricants consisting wholly or in part of mineral oils. Because the output of the latter section is small as compared to the former and because some companies distilling crude oil also produce hubricating compounds there has been little attempt to separate the data between these two sections.

In the petroleum refining section there were 17 plants in operation during 1924. Of these, 2 were located in Quebec, 3 in Ontario, 7 in Alberta, 2 in British Columbia and 1 in each of the provinces of Nova Scotia, Manitoba and Saskatchewan. These plants represented a capital investment of \$53,095,784, afforded employment to 3,603 persons and had a production valued at \$48,677,347. Eight other plants reporting to the Bureau made lubricating oils and greases as their principal product; 2 of these were located in Quebec, 5 in Outario and 1 in Alberta. These plants employed a capital of only \$700,010, gave employment to 66 persons throughout the year and made \$733,720 worth of commodities for sale.

As compared with 1923 the value of production for the industry as a whole was higher by 3 million dollars although fewer persons were employed and the capital employed was less by 7 million dollars. There were 5 more plants reporting in 1924 of which 2 compounded lubricating ails and greases, 2 refined imported oils on a small scale and 1 extracted gasoline from natrual gas.

Owing to the increase in the consumption of gasoline in the internal combustion engine, the petroleum refining industry has become one of great industrial importance. For this reason a brief description of the processes used has been included for the information of the general reader.

Petroleum Refining.—Petroleum is an oily liquid, which is found widely distributed throughout the earth's crust. The origin of this remarkable and useful substance has been the subject of controversy among scientists for a long time. Some believe that petroleum was formed as the product of chemical reactions among inorganic substances, while others contend that it has resulted from the decomposition of animal and vegetable matter.

Petroleum as it comes from the earth is generally spoken of as "crude" and it is divided into two main classes, (a) paraffin base oil and (b) asphlatic base oil. There is no sharp line of demarcation, as oils from some districts contain both asphalt and paraffin.

The Canadian oils from the Petrolia field are paraffin base oils having a high sulphur content.

The refining of petroleum means the breaking-up of the crude oil into its marketable products, which are gasoline, kerosene, fuel and gas oils, lubricating oils, tar, petroleum jelly and wax, and petroleum coke. This breaking-up is done by what is known as "fractional distillation." The crude oil is led into large horizontal cylindrical stills set in brick-work and properly insulated. Heat is supplied by burning gas, oil or coal. On the top of the still is a done connected with the condensers by a large pipe 12 to 16 inches in diameter. The condenser pipes from the still are immersed in cooling tanks through which cold water is continually circulated so that the vapours in the mines are condensed to a liquid which is then drawn off for further treatment.

The products from the crude still are naphtha, kerosene, gas oil, wax distillates and residual coke. The naphtha is led to a steam still where gasoline and benzenes are separated, the gasoline being run into an agitator where it is washed with sulphuric acid and the benzenes being treated in a similar way in another agitator. The gas oils are either sold for the enrich-

ment of coal or water gas or are eracked into fuel oil and gasoline. The wax distillates are put through a refrigerating and pressing process for the extraction of crystalline waxes. The remaining oil is further fractionated for the production of various grades of lubricants.

Table 109.—Summary Statistics of the Petroleum Products Industry in Canada, 1920-1924

Year	Num- ber of plants	Capital employed	Number of em- ployees	Salaries 8	Wagos 8	Cost of fuel	Cost of materials	Selling value of products	Value added by manu- facturing

^{*}Includes cost of electricity.

Capital Employed.—The total capital employed in petroleum refining and in the manufacture of greases, etc., in 1924 amounted to \$53,795,794 a decline of over 7 million dollars from that reported in 1923. Lands, buildings and plant equipment were valued at \$34,613,268 in 1924 as compared with \$47,955,301 in the previous year; materials on band and in process increased in value by 6 million dollars and the cash and open accounts showed a slight increase in value over 1923.

Employment.—In 1924, salaried employees numbered 448 and wage-earners 3,221 as compared with 432 and 3,824 respectively in 1923. However salaries and wages were slightly higher in 1924 at \$5,749,705 as compared with \$5,648,320 in the previous year. There is a slight seasonal trend to the industry, employment being greatest in the summer months. In January there were 3,116 wage-carners employed and in February a minimum of 2,976. Then there was a gradual increase until a maximum of 3,395 was reached in August, after which the number gradually declined to 3,023 at the end of the year.

The larger refineries operated continuously during the year but many of the smaller plants operated only part of the time; the average number of days on which plants in this industry operated during the year stood at 288.

Fuel.—The principal fuels used in this industry are bituminous coal and fuel oil. A large amount of heat is required for distillation purposes and the location of the plant determines the type of fuel to be used. In 1924, more money was spent for fuel oil than for coal; fuel oil cost \$1,901,128 as compared with \$978,076 for coal. The total cost of fuel amounted to nearly 3.6 million dollars.

Materials Used.—To date Canada has had to depend on foreign countries for her supply of crude oils. Most of the oil refined in Canada is obtained from the United States but large quantities are also brought from Mexico and Peru. In 1924, the value of Canadian crude oil used was less than one-half million dollars whereas imported oil was valued at more than 33 million dollars. This feature is very important as it emphasizes the fact that the discovery of crude oil in Canada in large quantities is necessary to put the country in an independent position. Other principal materials are listed in the accompanying table. In an industry such as this the consumption of containers, cooperage stock, etc., is of considerable importance and in 1924 amounted to nearly 1.5 million dollars in value; the practice in the trade is to charge the consumer for the containers and to allow a rebate when the containers are returned. In 1924 the total amount spent for materials was \$37,092,711 as compared with \$36,816,696 in 1923.

Products.—The total production of the petroleum industry in 1924 was valued at \$49,411,067 an increase of 3 million dollars over the output value of 1923. Of this amount $2 \cdot 4$ million dollars represented the value of intermediate products used chiefly as a fuel in the reporting plants.

The production of gasoline has been almost doubled in the past six years; in 1919 only 86 million gallons were made as compared to the record production of 160 million gallons in 1924. The value of production, however, has increased only from 22.9 million dollars in 1919 to 25.8 million in 1924. The drop in price of gasoline during the last few years was due largely to the great increase in the available supply of crude oil resulting from the discovery of new fields in the United States.

The output of kerozene in 1924 amounted to 61 million gallons, a decrease of 6 million gallons from 1923; the production of lubricating oils declined nearly 2 million gallons to 15 million gallons; asphalt remained about the same as in the previous year at 20 million gallons; and fuel and gas oils were produced in much larger quantities than in 1923.

Primary Production—Crude Petroleum (From the "Annual Report on the Mineral Production of Canada, 1924").—Production of crude petroleum in Canada in 1924 amounted to 160,773 barrels valued at \$467,400 as compared with 170,169 barrels valued at \$522,018 in 1923, a decrease of approximately 9,000 barrels.

The average values received, per barrel, in the producing provinces in 1924 were as follows: New Brunswick, \$3.83; Ontario, \$2.86; and Alberta, \$4.90.

The value of importations of petroleum and its products into Canada during 1924 increased approximately \$5,000,000 over the total in the preceding year.

CHAPTER TWELVE

MISCELLANEOUS NON-METALLIC MINERAL PRODUCTS INDUSTRY

General.—Under this heading are included the industries making (a) artificial abrasives and abrasive products; (b) graphite products such as artificial graphite and graphite and carbon electrodes; (c) plaster, castings and models; (d) gypsum products; (e) products of the mica trimming shops; (f) miscellaneous products such as foundry supplies, facings, etc. In 1924, this group included 36 plants, gave employment to 1,767 persons and had a combined production valued at \$6,991,904. The abrasives industry is by far the most important of this group with a production worth \$5,628,653; gypsum products were worth \$791,363; mica products were valued at \$419,877; and graphite products were worth \$99,316. Short descriptive notes of the manufacturing processes have been included after the general tables relating to the group as a whole.

Employment.—The number of persons employed in these industries in 1924 was 1,767, comprising 110 male and 43 female employees on salaries; 748 male and 866 female employees on wages. In the mica trimming shops the work is not heavy; girls are employed to split the mica in preparation for its marketing. Expenditures for salaries and wages totalled \$1,328,976 in 1924.

The Artificial Abrasives and Abrasive Products Industry.—Natural abrasives, such as corundum, which were used extensively at one time have now been displaced to a large extent by artificial carborundum and other products of the electric furnace.

Carborundum is a silicon carbide, SiC, made as the result of reaction at high temperatures between silica and carbon. A charge is made up of the required amount of silica, and carbon in the form of coke, and a small amount of sawdust and salt. The sawdust tends to make the charge porous, thus allowing the gases to escape; the salt reacts with the iron and aluminium oxides forming volatile chlorides. The ingredients are thoroughly mixed and are charged to an especially constructed electric resistance furnace made up of fire brick and so built that the bottom of the furnace and the end walls holding the electrodes are permanent; the sides are loosely built to permit the escape of the gases. After the charge has been placed in the furnace up to the level of the electrodes, a core of graphite is laid through from one end of the furnace to the other; this acts as the current carrier and also as the resistor or heating element. The remainder of the charge is then laid on top and the current is turned on. At the end of the operation the carborundum in crystal form is found surrounding the core. Around this is a layer of uncrystallized carbide which is known as fire sand and is used as a low grade refractory for some furnace linings. The outside layer is made up of silicous material and part of the unreduced charge. The carborundum is broken up and sent to the crushers, where it is ground to the required sizes. Any impurities are then removed and the material is sized, preparatory to being made into grinding wheels, sharpening stones, etc.

The making of abrasive wheels has reached a high degree of perfection. The composition of a wheel, depends on the purpose for which it is to be used and the selection and composition of the proper materials to ensure good results are often subjects of considerable research, particularly when the new applications of the artificial abrasive are contemplated. After the wheel is moulded it is burnt in a specially built kiln. The kiln is coal fired and the hot gases pass down through the piles of wheels which have been previously placed in fire clay containers called "saggers." When the burning operation has been completed, the wheels are removed from the kiln and each is finished up ready for market. Each wheel is sized on a specially constructed lathe, steel dressing tools being used. The bushings are fitted and the testing begins. Perfect balance, soundness, proper size and exactness as to grade and composition are all ensured by a series of careful tests, before the completed wheel is passed for shipment. Failure to detect even minor flaws in an abrasive wheel might result in a very serious accident as the wheels, when in use, are rotated at high speeds; to understand why the greatest precautions are essential in the examination of these wheels, one has only to think what might happen if such a wheel were to fly to pieces while in use in a shop filled with workmen.

In the manufacture of abrasive cloth and sand paper, natural abrasives such as garnets, sand, emery and corundum are used as well as the artificial abrasives. The materials are carefully sized so that all ranges of abrasive papers can be obtained.

In 1924 there were 12 firms in Canada making artificial abrasives or abrasive products. Artificial abrasives were made by 5 firms, 4 in Ontario, and 1 in Quebec, while 7 plants in Ontario manufactured grinding wheels or similar abrasive products.

The total capital employed in the industry amounted to \$5,550,930 of which 3-6 million dollars was invested in lands, buildings, and plant equipment. Employment was afforded to 91 salaried employees and 543 wage-earners, while payments for salaries and wages during the year amounted to \$900,849.

The total cost of the materials used was \$1,864,975, while the products made had a total selling value of \$5,628,653. The following tables show the principal items of production and consumption.

Primary Production—Corundum (From the "Annual Report on the Mineral Production of Canada, 1924".)—No production of corundum in Canada was reported during the year 1924. Corundum is found in an area embracing several townships in Renfrew and Hastings counties in the province of Ontario. The industry made its appearance there in 1900, production reaching a maximum of 2,914 tons in 1906. From 1907 to 1913, although the yearly production was smaller, it remained fairly constant. In August, 1918, operations were indefinitely suspended, but during the years 1919, 1920 and 1921 old tailings were treated for the recovery of grain corundum. In 1921, grain corundum amounting to 403 tons valued at \$55,965, was exported to the United States, but no shipments have been reported since that time.

Imports into Canada of grindstones, burrstones, emery and other abrasive materials amounted in value to \$1,175,641 in 1924. Exports during the same year, were valued at \$2,665,856; the greater part of this sum represented sales of the artificial abrasive, carborundum. Grindstones and stones for the manufacture of grindstones imported were valued at about \$50,000; natural abrasives, \$10,000; and artificial abrasives, made up into wheels, stones, etc., totalled \$13,000 in value. There was also an item of 2 tons of corundum valued at \$251 exported, but no report has been received advising as to whether this amount was mined or not.

Garnets.—The production of garnets during 1924 amounted to 360 tons, with a value of \$7,200, as compared with a production of 1,250 tons valued at \$100,000 in 1923. The product was shipped to Niagara Falls, N.Y., for use as an abrasive material.

Grindstones, Pulpstones and Scythestones.—The production of grindstones, pulpstones and scythestones in Canada in 1924 amounted to 2,691 tons valued at \$130,824 as compared with the 1923 production of 2,014 tons valued at \$80,083. Of the year's shipments, Nova Scotia contributed 338 tons valued at \$12,525; the production in New Brunswick amounted to 2,113 tons valued at \$99,299, and British Columbia reported 240 tons valued at \$19,000.

Table 125.—Production of Grindstones, Pulpstones and Scythestones, in Canada, 1923 and 1924

Total	2,914	89,683	2,691	139,824

Tripolite.—Shipments of tripolite in 1924 amounted to 33 tons valued at \$338 as against the 1923 production of 130 tons valued at \$3,250.

Tripolite is a siliceous material closely related to quartz and is used extensively as an abrasive. It is usually given a preliminary calcine in rotary furnaces before shipment. The entire Canadian production is derived from a deposit of this commodity at Silica Lake, Colchester County, Nova Scotia.

Volcanic Ash.—In 1924, for the first time, production of volcanic ash from the province of Saskatchewan was reported. This amounted to 245 tons valued at \$1,103.

The Graphite Products Industry.—Artificial graphite is made by subjecting amorphous carbon to the high temperature attainable in an electric furnace. It was while experiments with silicon carbide (carborundum) were being carried on that artificial graphite was disovered and it was found that at extremely high temperatures obtainable by means of an electric arc the silicon was volatilized leaving the graphite behind. Anthracite coal has been found to be the best form of carbonaceous material for this purpose because the impurities contained assist in making carbides, which is a transition stage between the rarbon and the graphite. When a form of carbon other than anthracite coal, such as petroleum coke, is used as a raw material, oxide of iron or some other carbide-forming substance is added to the mix.

When it is desired to make electrodes or slabs (rectangular-sections) petroleum coke is generally used. Coke, iron oxide and a suitable binder, all finely ground, are mixed and put through an extruding machine which forms the required sizes. These are then baked and afterwards graphitized.

The furnace is similar to that used for making carborundum. The slabs or electrodes are placed at right angles to the longitudinal axis of the furnace; the piles are separated by ground coke or coal to increase the resistance sufficiently to ensure the heating of the furnace to the proper reaction temperature. When electrodes of circular section are made, it is not necessary to place coke around them as the point of contact between them is small and the resistance offered is sufficient. The charge is covered with a layer of sand and coke and the current is turned on. As the charge becomes graphitized the resistance falls; when minimum resistance is reached the operation is complete.

Graphite electrodes are used extensively in electric furnace work as their electrical conductivity is about four times that of amorphous carbon; the size required, therefore, for a given piece of work is proportionately smaller than if carbon electrodes were used. An economical feature of the graphite electrodes is the ease with which they can be machined. As an electrode is fed into the furnace and burns away, another is screwed on to the threaded end and the whole of the first electrode may then be used. Amorphous carbon electrodes cannot be machined and the waste is far greater than when graphite electrodes are used.

Because of the fact that graphite can be machined, sawed, drilled, etc., it is adaptable to a variety of uses. From it are made discs, bushings, washers and moulds for casting precious metals and high temperature alloys. Ground graphite is used as a lubricant. Only 1 plant in Canada making graphite products reported to the Bureau in 1924.

Primary Production—(From the Annual Report of the Mineral Production of Canada, 1924). Graphite—Shipments of graphite from Canadian mines in 1924 amounted to 1,334 tons valued at \$76,117 as against 1,113 tons valued at \$67,873 shipped in 1923.

The Black Donald Graphite Company, Limited, at Calabogie, Ontario, operating the mine at White Fish Lake, mined 3,290 tons of ore and milled 2,790 tons. Shipments of graphite from this property totalled 1,288 tons. The remaining 46 tons included in the Canada total were from the province of Quebec.

The Gypsum Products Industry.—Pure gypsum is a hydrous calcium sulphate $(CaSO_4 \cdot 2H_2O)$. It is seldom found pure in nature; clay, limestone, silica, etc., are generally present in varying quantities. When pure the colour is white, but it may be grey, yellow or perhaps blue depending on the nature and the quantity of the impurities. Beds of gypsum occur in nearly every province in Canada and many deposits have been worked for a long time. Many companies quarry, crush and calcine right at the mine.

Crude gypsum is used as a fertilizer, as a retarder in portland cement, for erayon manufacture and in certain paints. When it is calcined or partly dehydrated it goes under the name of plaster of Paris for which there are many uses such as moulds for dental work, surgical casts and plaster ornaments. It is also used for wall plasters, but when used alone it sets so quickly that the workmen find it hard to handle; the addition of a retarder, or substance which temporarily absorbs the water required for the crystallization or setting, slows up the process so the work can be done properly. Another use is in the manufacture of gypsum board, which is made by mixing finely ground gypsum with sawdust, moulding it into boards and allowing it to dry. The boards can be cut and nailed to the walls as required.

The gypsum products industry in Canada is confined to the manufacture of wall coating, gypsum board, and plaster of Paris models and statues. In 1924 there were 6 plants in operation, 4 in Ontario and 2 in Quebec, with a total capital investment of half a million dollars. Employees numbered 192 and salaries and wages totalled \$214,274. The cost of materials amounted to \$315,556 and products made were valued at \$791,363.

Table 129.—Materials Used and Products Made in the Manufacture of Gypsum Products in Canada, 1923 and 1924

Item	1923 Value	1924 Value
Materials used including glue, gypsum, clay, whiting, colours, plaster of Paris. Products made including wall-conting, gypsum board, wall board, plaster castings, statues, etc.	\$	\$ 315,556 791,363

Primary Production—Gypsum (From the "Annual Report on the Mineral Production of Canada, 1924).—Increased production of gypsum raised the total for the year 1924, to 646,016 tons with a valuation of \$2,208,108 as compared with 578,301 tons at \$2,243,100 in 1923. Production included lump, crushed, fine ground and calcined gypsum, the last named item comprising sales and also the calcined gypsum used in the calcining plants, for the production of wall plaster, wall board, alabastine and other gypsum products. The average values received by the operators were as follows: lump, \$1.81; crushed, \$1.82; fine ground, \$5.82; and calcined, \$10.27 per ton. Compared with 1923, the imports remained constant, while the exports, principally crude gypsum, increased approximately 75,000 tons to a total of 477,462 tons. The total gypsum mined during 1924 was 703,733 tons and the crude gypsum calcined in Canada amounted to 144,744 tons.

Provincial quarry outputs were as follows: Nova Scotia, 478,184 tons; New Brunswick, 95,641 tons; Ontario, 98,324 tons; Manitoba, 31,554 tons and British Columbia, 30 tons.

For statistical purposes, as noted above, the production of gypsum is considered to be the sum of the quantities disposed of in the different marketable forms, care being taken to avoid duplication; the values used are those at point of shipment.

Exports of Canadian crude gypsum principally to the United States totalled 472,236 tons. Ground gypsum and prepared wall plaster exported during the year amounted to 5,226 tons; United States, Newfoundland, Australia and New Zealand were the principal importers of these materials.

The Mica Trimming Industry.—The mica industry in Canada is centred in the provinces of Ontario and Quebec. Many mining companies operate their own trimming shops. Smaller operators sell the rough cobbed material to operators who do the trimming in shops located some distance from the mines but close to an abundant labour supply. As much of the work is not heavy, girls are employed who become expert in the work of trimming, splitting and sizing of mica.

The equipment necessary for the trimming and splitting of mica is not extensive. Much labour is saved by first running the rough material through a screen of about 2-in, mesh, to shake out the dirt and the small pieces of rock. The mica is then separated roughly into different grades for trimming and splitting. The larger sizes are the most expensive and at one time the smaller sizes 1 x 1 in, and 1 x 2 in, were discarded as scrap. It has since been found that thin sheets can be stuck together with shellar and built up into a mica board of any desired thickness. In this way small irregular pieces can be utilized and the scrap or waste from these shops is sold to operators of grinding mills who in turn sell their product to patent roofing companies, manufacturers of lubricants, and rubber companies.

There were only 16 plants in Canada engaged in the trimming and culling of mica in 1924 as compared with 19 plants in 1923. The total capital invested in 1924 amounted to \$423,028. Salaries amounting to \$33,369 were paid to 23 persons, and \$142,081 was paid out for wages. Among the wage-carners in this industry, female help predominates; in 1924 there were on the average 43 males and 847 females. Materials used cost \$181,463 and the value of the resultant products was \$419,877.

Primary Production—Mica (From the "Annual Report on the Mineral Production of Canada, 1924").—The total production of mica in 1924 amounted to 8,182,374 pounds valued at \$357,272 or an average price of 0.04 cents per pound as against 7,049,039 pounds valued at \$326,974 in 1923.

Shipments of rough-cobbed grades were nearly 100 per cent higher in 1924 than in the previous year. Thumb-trimmed production was also greater by approximately 240,000 pounds while splittings were less by about 46,000 pounds. Scrap material, which includes mich that is too small and irregular for splitting, and the refuse from the trimming shops, is ground and bolted into various sizes, grading from 20-mesh to 200-mesh. Grades ranging from 20 to 80-mesh are used in the manufacture of prepared roofings, the 40-mesh grade, if free from grit, is used as a lubricant in some axle greases, and the 200-mesh grade is used as a filler in rubber manufacture.

The deposits of phlogopite mica in the Lièvre-Gatineau district, Quebec, and in Frontenac County, Ontario, continued to be the source of practically the entire Canadian production. It will be noted that the stated value of the exports of Canadian mica exceeded by a considerable amount the value placed on shipments reported by operators. An explanation of this lies in the fact that the exportation consisted principally of mica splittings shipped from large trimming shops situated in Ontario and Quebec.

Under the United States "New Tariff Act" the duties on the different grades of mica are as follows: Mica, immanufactured, valued at not above 15 cents per pound—4 cents per pound; mica, unmanufactured, valued at above 15 cents per pound—25 per centum ad valorem; mica, cut or trimmed and mica splittings—30 per centum ad valorem; mica plates, and built-up mica, and all manufactures of mica, of which mica is the component material of chief value—40 per centum ad valorem; ground mica—20 per centum ad valorem.
