SYMBOLS

The interpretation of the symbols used in the tables throughout this publication is as follows:

- nil or zero.
- trace, or amount too small to be shown.
- A “adult”.
- C “child”.
- 2A/5+C “two adults and five or more children”.

INTRODUCTION

This report presents results of a survey of urban consumer expenditure covering the year 1959 and referring to families and unattached individuals in urban centres of 15,000 and over. The survey was the fourth in a series of continuing surveys which were initiated in 1953 and have been carried out at two-year intervals.¹ However, the 1959 survey marked a departure from the surveys taken in 1953, 1955 and 1957, in that it was the most comprehensive survey of urban expenditure undertaken since the survey of 1947-48 which referred to all non-farm families and individuals.

This publication is similar in contents and format to *City Family Expenditure 1957* and earlier publications of the same title referring to 1955 and 1953. The change in title to *Urban Family Expenditure* recognizes the fact that "urban" is a more appropriate description of the survey population which, in earlier surveys as well as in 1959, referred to urban centres inclusive of fringe areas. This change also corrects a discrepancy which has existed between the two series of expenditure survey publications, *Urban Family Food Expenditure* and *City Family Expenditure*.

The three surveys prior to 1959 were designed to permit a continuing review of the expenditure patterns of families comparable to those selected from the 1947-48 survey as providing "wide representation of urban families consistent with reasonable similarity of spending habits".² The 1947-48 "target group" which provided the weighting system for the Consumer Price Index was selected on the basis of three criteria, i.e., geographic location, family size and family income, which defined the target group for 1947-48 as those families:

- (a) living in 27 Canadian cities with over 30,000 population
- (b) ranging in size from two adults to two adults and four children
- (c) with annual incomes during the survey year ranging from \$1,650 to \$4,050.

The continuing surveys from 1953 to 1957 were confined to selected cities, ranging in number from five major cities in 1953 to nine cities in 1957 which included the five original cities and additional regional representation. The family size criteria remained unchanged, but the income range of families surveyed was projected upward to

¹ Because 1961 was a Census year, the next expenditure survey program was postponed to 1962, in which monthly food surveys were conducted throughout the year and a recall survey, covering all expenses and income for 1962, was planned to be taken early in 1963.

² *The Consumer Price Index for Canada*, Catalogue No. 62-518.

\$1,800-\$6,500 in 1953, \$2,000-\$6,500 in 1955 and \$2,500-\$7,000 in 1957 in keeping with shifts in wages and salaries since 1947-48.

At the time of the 1959 survey the Consumer Price Index was being revised in accordance with the spending pattern derived from 1957 expenditure data. There was, consequently, no likelihood that information collected in 1959 would be utilized directly for revision purposes. It seemed timely, therefore, to accede to requests from other users in government and business for a less restricted survey, and in doing so, to permit a re-examination of the target group limits established and projected from 1947-48 data. In order to concentrate all resources on enlarging the complete budget survey, the monthly food surveys which had hitherto been part of each survey program were not undertaken in 1959. The coverage of the survey was broadened to make it more comparable with the surveys of non-farm income conducted by the Central Research and Development Division. While it was not feasible within the survey budget to sample all non-farm population, the expenditure survey universe was broadened to include all families and individuals in cities of 15,000 and over. Such cities comprised the Labour Force self-representing areas and were a sub-universe of the income survey.

The text which follows contains material descriptive of the 1959 survey, covering the sample design, definitions, survey methods and response and a review of expenditure data.

In presenting expenditure data, it was not possible to provide data at the city level which would be completely comparable to published 1957 data because of the smaller size of city samples. However, the following three major population groups have been distinguished, for each of which expenditure patterns by regions and five major cities are presented herein:

Group I: All Families and Individuals in cities of 15,000 and over.

Group II: All Families of Two or More Persons in cities of 15,000 and over.

Group III: All Families of Two or More Persons with income ranging from \$2,500 to \$6,999, in cities of 15,000 and over.

Group III provides the closest comparison to previous surveys, which were restricted further to include only families of two adults with up to four children, three adults with up to one child, and four adults. As an aid to interpretation, a comparison of 1959 expenditure patterns among all three groups is presented in Table II (page 10) for the composite of cities of 15,000 and over.

SAMPLE DESIGN

The sample was a multi-stage probability sample of approximately 3,000 households from the self-representing areas (urban centres with populations of 15,000 and over) of the Canadian Labour Force Survey. These households were allocated to provide:

- (a) a 1/1500 sample in Toronto and Montreal
- (b) a 1/ 800 sample in Vancouver
- (c) a 1/ 300 sample in self-representing areas in Newfoundland
- (d) a 1/ 600 sample in the remaining self-representing areas.

Of the 81 self-representing areas, 35 were large enough to support at least one enumerator's assignment. The remaining 46 areas were grouped into strata according to size, geographic location and average income levels. The strata were formed to permit the probability selection of at least two urban areas from each stratum. Twenty-five areas were thus drawn into the sample, making a total of 60 urban areas.

Within the self-representing areas, Labour Force sample segments were selected as follows: in Toronto and Montreal one-third of the Labour Force segments were selected, from which one-fifth of the number of households in the Labour Force one per cent sample were drawn to obtain a sampling ratio of 1/1500; in Vancouver one-half of the Labour Force segments were selected and one-quarter of the households were used in order to obtain a sampling ratio of 1/800; in all other areas, all the segments in the Labour Force Survey were selected and one-sixth of the households, except in Newfoundland, where one-third of households were selected.

As far as possible the subsample consisted of "new" households which were defined as households drawn from a Labour Force Sample which would not be enumerated for at least two years. Alternatively, if it was not possible to select new households, the subsample was drawn from a Labour Force sample which had been used in a survey of at least two years earlier. In either case, a systematic subsample was selected, using a random start.

FIELD OPERATIONS

The survey was carried out in March and April, 1960 through the regional offices of the Special Surveys Division. Prior to the survey, officials from the Prices Division visited as many of the regional offices as resources permitted in order to review the schedule content and enumerator instructions with regional officials. These officials in turn instructed the interviewers who were chosen from the most experienced of the enumerators employed in the Labour Force Survey.

For each household in his assignment the interviewer was provided with a Household Control Card on which the address and household identification number had been recorded. On this card he was

instructed to enter the names of all household members and to determine the spending-unit composition of the household. (See Definitions.) If it was not possible to obtain an interview, the reason for non-interview was written across the card. After the interviewer had completed the Household Control Card, he proceeded to fill in an expenditure questionnaire for each spending unit. As the schedules were completed they were returned to the regional headquarters where they were subjected to a preliminary edit. Schedules which appeared to be incomplete or which showed an excessive imbalance between receipts and disbursements were returned to the interviewer for further information.

DEFINITIONS

In the surveys of 1953, 1955 and 1957, the term **family** was used synonymously with **spending unit** which was defined as a group of persons dependent on a common or pooled income for the major items of expense, and living in the same dwelling. The inclusion of unattached individuals in the 1959 survey widened the definition to cover financially independent individuals. In the great majority of cases the members of spending units of two or more are related by blood, marriage or adoption, and are thus consistent with the income survey definition of a family as "a group of individuals sharing a common dwelling unit and related by blood, marriage or adoption". Unmarried sons or daughters with regular incomes are not considered separate spending units unless their status in the

household is that of a roomer, with finances entirely separate from those of the parent family. However, lodging families, whose heads are not heads of households, and who may be married children living with a parent family, are considered separate spending units.

The survey schedule required a complete record of all money receipts and disbursements. Receipts included employment income, other regular income, irregular money receipts and dissavings. Disbursements, on the other hand, comprised consumption purchases incurred in the survey period, gifts and contributions to organizations or persons outside of the family, personal tax payments, security payments and savings.

Employment income included gross income from wages and salaries; income before tax from self-employment; and receipts from military pay and allowances. **Other income** included receipts from roomers and boarders; net rentals; family allowances; interest and dividends; all pensions; workmen's compensation and unemployment insurance benefits; regular receipts from insurance policies and annuities; and miscellaneous regular income receipts. **Irregular money receipts** included inheritances; bequests; lump sum settlements from property insurance; accident and health policies; and irregular gifts from outside of the family. **Dissavings** referred to net decreases in assets, such as bank accounts, money on hand, investments in business, stocks and bonds, loans made to others, and the sale of real estate and personal possessions, along with net increases in debt, such as mortgages, notes due to banks, insurance companies and individuals, loan companies, instalment purchases, charge accounts and other bills, rents and taxes.

Consumption expenditures included expenses incurred for food; housing, fuel, light and water; household operation; clothing; automobile; other transportation; medical care; personal care; recreation; reading; education; smoking and alcoholic drinks; and a miscellaneous group. **Gifts and contributions** refer to outlays for persons or organizations outside of the family. **Personal tax payments** cover income, personal property, poll taxes, duties and succession duties. Sales, excise, automobile and real estate taxes are included as part of consumption expenditure for the commodity or service

to which these taxes apply. **Security payments** relate to outlays for insurance premiums, retirement or pension funds, and to mutual benefit society payments. **Savings** refer either to net increases in assets, such as bank accounts, money on hand, investment in business and real estate, bonds and stocks, improvements on real estate, and loans to others; or to net decreases in debt such as decreases in amounts owed on mortgages; notes due to banks, insurance companies, individuals, loan companies, balances owing on instalment purchases, charge accounts and other bills due, and rents and taxes due.

A few items noted here in the category of expenditure may be considered by some readers as savings. Purchases of motor cars and other consumer durables, with the exception of houses, are classed as expenditure, as are also life insurance premiums and pension payments. The payment on a home mortgage is treated as a combination of expenditure and savings. Taxes, insurance and mortgage interest are allocated to expenditure, while repayment on the principal of a mortgage is allocated to savings.

Certain payments by families have been allocated only in part to family expenditure. One instance is a combined payment allocated partly to the family budget and partly to a business budget. Examples of this are housing and fuel outlays where the quarters are used for both business and family use, or expenditures for automobiles where only a certain proportion of use is for family purposes.

SURVEY METHODS AND RELIABILITY OF RESULTS

1. Methods of Data Collection

The 1959 survey was conducted in the same manner as earlier surveys of annual expenditure. Interviewers asked families to recall their purchases for the year 1959. Previous surveys were carried out in the January following the survey year. In the 1959 survey there was a time lag between the end of the year and the start of the survey in March, 1960, and thus some risk that 1960 purchases might be reported in error. However, it was considered that this danger was more easily guarded against by the interviewers than the errors inherent in the alternative of asking the respondent to recall expenditure and income for a twelve-month period other than the calendar year. The March-April collection period was advantageous in its proximity to the period when respondents would be recalling income and expenditure for the purpose of completing income tax returns.

The collection of expenditure data by recall imposes a considerable task on both the interviewer and the respondent. Expenditures on sizeable items such as rent or homeownership, purchases of household durables and cars, and major medical expenses are relatively easy to remember. Other areas such as personal care, household operation, recreation

expenses and clothing expenditure involve greater demands on memory and the ability to make estimates of weekly or monthly expenditure from which to derive annual estimates. Expenditures on tobacco and alcoholic beverages are considered to be subject to errors arising from inability to remember, incomplete coverage of all family members and possibly some deliberate understatement.

2. Editing Methods

Editing of survey data was carried out in two stages; a preliminary edit was made in survey regional offices, and a more detailed edit was carried out in the head office. As a check on the consistency of records of income and expenditure, information was collected on changes in the family's financial position during the survey year. The regional office edit consisted of a comparison of total receipts (income, other money receipts, decrease in assets or increase in debts) with total disbursements (expenditure, increase in savings or assets, decrease in debts). If the difference between the two totals exceeded ten per cent of the larger total, the record was examined for possible errors or omissions and returned to the enumerator with suggestions as to the type of error which

might have occurred. While this procedure had obvious pitfalls, such as the danger of the enumerator or respondent forcing the schedule into balance, considerable missing information was obtained by this review. Re-interviews resulted in adjustments on both the debit and credit sides.

In the more detailed editing process conducted in head office, schedules which passed the regional office edit sometimes proved to be outside the balancing limits. Schedules were not automatically ruled out of the survey because of excessive balancing differences. In some instances the fault appeared to be in the section on change in assets and debts. Such schedules were reviewed carefully and included or excluded on the basis of completeness and consistency of income and expenditure data. Information on financial change was tabulated but has not been published owing to the fact that schedules were accepted on which this information was unsatisfactory.

Certain adjustments were made as part of the editing procedure. These consisted mainly in allocating expenditures between expenditure and savings, or between business and family expenses, as indicated in the Definitions Section.

3. Response Errors and Sampling Error

Errors in expenditure surveys can be divided generally into errors of response and sampling error. Errors of response may arise not only from inaccurate reporting but also from faulty questioning, either on the part of the designer of the schedule or the enumerator. Non-response may also be regarded as a response error, because information is lacking for some of the units selected for observation.

In addition to response errors, there is a degree of error inherent in all sample surveys, arising from the fact that only a fraction of the universe is observed. In a probability sample the extent of the sampling errors can be estimated; however, the high rate of non-response in family expenditure surveys tends to reduce the accuracy of estimates of sampling error. Published estimates of sampling error for selected items in the 1957 survey³ ranged from 1.0 per cent for food purchased for home consumption to 20 per cent for bedroom suites and 26 per cent for refrigerators. Although the sample was larger in the 1959 survey, it referred to a much broader population, and city samples were generally much smaller than in earlier surveys.

SURVEY RESPONSE

The sample size of 3,000 households was based on an expected response rate of approximately two-thirds of eligible households. Response was calculated in two stages: the response of households to the Household Control Card, and the response of the spending units in the households to the expenditure questionnaire. Table I summarizes these two phases of response.

The estimated overall response rate was 63 per cent, slightly above the net 1957 response of 61 per cent. The average represented a wide range of response among cities. In five of the nine cities included previously, response was considerably better than in 1957, while in three cities (Halifax, Kitchener-Waterloo and Toronto) 1959 response was below the 1957 levels. The Ontario average response was the lowest regional response rate recorded in the survey, and, of Ontario cities, Toronto was among the lowest with a response rate of 45 per cent.

It was not possible in 1959 to tabulate response according to family type and age of head, as in previous surveys when this information was available from Labour Force field assignment cards. For a portion of the non-respondents, information on family size and age of head was collected on the Household Control Card. Tests indicated that averages of the above characteristics did not differ significantly as between usable schedules and all spending units for whom characteristics were known. The main differences in family type distributions arose in the higher rate of known non-response for one-person units in the Maritime region and the Ontario region.

Because characteristics of non-respondents were only partially known, no attempt was made to

compensate for response deficiencies by family characteristics. However, weighting was applied to compensate for differing response levels among regions. Within regions, wherever weighting was necessary to compensate for varying sampling rates, (Newfoundland, Montreal, Toronto, Vancouver) a further adjustment was made to compensate for response differences. For the remaining cities, individual adjustments were not feasible because of the smallness of the samples. It was considered that, within regions, city differences were of less significance than possible sampling variations, and the average response rate for regional groups of cities became the basis of adjustment of weights for regional aggregates.

The proportion in the weighted sample of one-person units to families of two or more was below that indicated by available check data. One-person units accounted for 15 per cent of the 1959 expenditure sample as compared to about 21 per cent indicated by a Labour Force sample of 22,000 households surveyed in May 1958. This difference was concentrated in the Ontario and Maritime regions where the proportion of one-person units was about half that indicated in the larger survey. However it should be noted that the tabulation of individuals and families in the latter case was based on the income survey definition of family as two or more persons living in the same household and related by blood, marriage or adoption.

PATTERNS OF EXPENDITURE, CITIES OF 15,000 AND OVER

1(a). All Families and Individuals by Selected Groups

Table II presents expenditure patterns for all families and individuals surveyed in urban centres of 15,000 and over and for selected groups in the population. Of the 1,960 spending units surveyed, 288 were one-person units, and 1,672 were families of two or more.*

Families of two or more are shown subdivided into two alternative groupings. The first of these classifies families by income level into "under \$2,500", \$2,500-\$6,999, and \$7,000+. The middle-income group represents the income range surveyed in 1957, and for this group detailed expenditure data by region and city are provided in Basic Tables 14 and 15. The second classification divides families of two or more into the group of families conforming to 1957 criteria of family composition as well as income, and the residual group which would have been excluded by 1957 survey restrictions.

The composite pattern for all families and individuals was dominated by the expenditure pattern of families of two or more. The average total expenditure of \$5,115 per spending unit represented an average of \$2,456 for one-person units and \$5,570 for units of two or more. On a per person basis, the composite of all families and individuals averaged \$1,545, as against \$2,456 per person for one-person

units and \$1,505 per person for families of two or more. Although levels of expenditure per spending unit were lower for all families and individuals as a group than for families of two or more, average expenditures per person were higher for all categories shown in Table II except clothing. The inclusion of one-person units resulted in only small changes in the percentage distribution of expenditure, the most important difference being in the higher percentage going to shelter costs.

The average one-person unit allocated 22.4 per cent of total expenditure to housing, fuel, light and water, compared with 16.4 per cent by families of two or more, proportionately less in the one-person budget was taken by food, furnishings and equipment, clothing, cars and medical care. Gifts and contributions and personal taxes, however, took a greater share of expenditure of one-person units than of families.

The restriction of families of two or more to the income group \$2,500-\$6,999 eliminated 511 families, 146 in the under \$2,500 group and 365 in the \$7,000+ group. Average family size was reduced very slightly from 3.70 persons to 3.69 persons by the income restriction. Total expenditure per family was \$4,870, compared to \$5,570 for all families of two or more, but on a per person basis expenditure decreased from \$1,505 for all families to \$1,320 for the \$2,500-\$6,999 group. The main difference in the percentage distribution of expenditure was in the slightly higher percentages of the total going to current consumption, specifically to food and shelter for the middle-income group, as compared to all families.

At the two income extremes, the "under \$2,500" group and the \$7,000+ group averaged total expenditures of \$2,295 and \$8,868 respectively, or

* In this and all other tables of expenditure, the "number of families in sample" has been included to indicate the size of sample on which the expenditure statistics are based. As such, "number of families" has not been corrected for non-response or differences in sampling rates among cities and regions and therefore does not represent the distribution of families in the population. In contrast, all other data in the Tables have been "weighted" and are intended to represent the population groups to which they specifically relate.

\$925 and \$2,111 per person. Both these groups showed considerable divergence from the average pattern for families of two or more and from the middle-income group.

The completely restricted group, designated as corresponding to the 1957 survey, with an average family size of 3.20 persons, averaged total family expenditure of \$4,804 as compared with \$4,870 for the group restricted in respect to income

only. However the family size difference resulted in smaller amounts being expended on food and clothing, although, the percentage distribution of expenditure showed only small differences. The "Other Families" group which was outside 1957 survey restrictions averaged 4.41 persons in size and a total expenditure of \$6,646. Average expenditure per person was \$1,507, as compared to \$1,505 for all families of two or more and \$1,501 for the group corresponding to the 1957 survey.

TABLE II. Average Expenditure Patterns by Selected Groups, All Families and Individuals, 1959

¹ 1957 target group comprised families consisting of two to four adults; two adults and one to four children; three adults and one child; within the income range \$2,500 - \$6,999.

1 (b). All Families and Individuals, by Family Type

Expenditure patterns for all spending units classified by type are presented in Table III, and also in Basic Table 2. These include one-person units as well as families of two or more. Twenty families consisting of one adult and one or more children are included in the total but not shown separately.

The average total expenditure by family type groups ranged from \$2,456 for one-person units to \$7,968 in the "Other group" which was a composite of larger families with an average size of 6.63 persons, of whom 4.59 were adults and 2.85 were earners. Within this range, total expenditure increased as the average number of adults and earners increased. Where the number of adults remained constant, as among two-adult families with

one or more children, no clear relationship was apparent between family size or earners per family and level of expenditure. Family heads of two-adult families with children averaged between 35 and 37 years of age, which was considerably below the average age in other family type groups. (See Table 16.) Total expenditure for two-adult family type groups ranged in the \$5,000 to \$6,000 interval, with \$5,140 being registered in the 2A/1C group and \$5,960 in the 2A/4C group. The latter group averaged slightly older than other two-adult families including the largest (2A/5+C) group in which total expenditure averaged \$5,353. Levels of total expenditure for families of three adults with children, reflecting additional earners per family, were \$6,982 for families with one child and \$6,802 for families with two or more children. Average age of head in the former group was 49.4 years compared with 44.6 in the group with two or more children.

Among all-adult family types, total expenditure per person tended to decline as the number of adults increased. For example, expenditure per person was greatest in one-adult units at \$2,456 and least for four-adult units at \$1,951. Among two-adult families, expenditure per person tended to decline as the number of children increased. Per person expenditure decreased from \$2,232 for two adults with no children to \$718 for families with two adults and five or more children.

The percentage of total expenditure going to food increased slightly with family size among all-adult family types, from 21.6 per cent in the one-adult group to 22.5 in the four-adult group. Among families with children the percentage allocated to food increased as number of children increased from 22.6 in the 2A/1C group to 31.2 per cent in the 2A/5+C group. A similar pattern was observed in respect to clothing, with the exception that one-adult units devoted a greater percentage of total expenditure to clothing than did two-adult units; otherwise the percentage increased as family size increased in all-adult families and as number of children increased in families with children. The highest expenditure on clothing, both absolute and relative, was registered by the predominantly adult "Other" group. The percentage spent on Other Commodities and Services which included transportation, medical care, personal care and recreation, increased with family size in adult units. However

among families with children, the percentage rose to 27.2 in the 2A/2C group and declined in three- and four-children families to 25.0 and 23.3 per cent respectively.

Shelter, household operation and house-furnishings and equipment declined in relation to total spending as number of adults increased in all-adult families and as number of children increased in families with children. Among all-adult groups the percentage spent on shelter decreased from 22.4 in the one-adult group to 11.7 in the four-adult group. Among two-adult families with children, the shelter component tended to decline, but within much narrower limits, from 18.4 per cent for two-adult families with one child to 15.0 per cent for two-adult families with five or more children. However, the largest family size group designated as "Other" devoted the smallest percentage (12.6 per cent) of expenditure to shelter.

The percentage of total expenditure taken by current consumption was highest at 90.5 per cent in the 2A/5+C children group, and lowest in the 3A/1C group at 83.2 per cent, reflecting the varying impact of personal taxes, gifts and contributions and security on the family budget. The percentage going to personal taxes registered a low of 3.1 per cent in the 2A/5+C group where the number of children was greatest and the number of earners relatively low. In contrast, the 3A/1C group paid out 8.4 per cent of expenditure on personal taxes.

TABLE III. Average Expenditure Patterns by Family Type, All Families and Individuals, 1959

¹ Includes the following groups: 4A/1+C; 5A; 5A/1+C; 6+A; 6+A/1+C. Twenty families composed of one adult and one or more children are excluded from "Other" but included in total.

2(a). Families of Two or More, by Region and City

Expenditure patterns for families of two or more by region are presented in Table IV. Further detail is shown in Basic Tables 5 and 13. With the exception of the Atlantic Provinces, where total expenditure of \$4,760 reflected income levels considerably below the other regions, family expenditure averages by regions ranged between \$5,500 and \$5,700 in 1959. The somewhat lower average for Ontario reflects in part the greater number of smaller cities represented in the regional average. In other areas, the major city or cities, where levels of family income and expenditure were higher, dominated the regional pattern. It should be noted that income distributions, and hence expenditure levels, in regional and city samples were subject to sam-

pling variability and the effects of varying response among family types and income groups.

Expenditure patterns for the Atlantic Provinces and Quebec showed the greatest deviations from the average pattern. Larger family size in both regions and the lower level of total expenditure in the Atlantic Provinces were factors which led to greater proportions of expenditure being devoted to current consumption. The percentage of total expenditure taken by food was 28.4 per cent in the Atlantic Provinces, and 26.4 per cent in Quebec, compared with 22.1 per cent to 22.9 in the other regions. Consistent with the relatively larger expenditure on basic necessities, families in these two regions spent relatively less on car transportation and recreation.

TABLE IV. Average Expenditure Patterns by Region, Families of Two or More, 1959

Totals	100.0	100.0	100.0	100.0	100.0	100.0

Expenditure on shelter costs was highest in Ontario, both in dollars per family and in percentage of expenditure on all items. The percentage of total expenditure taken by shelter ranged from a low of 15.1 in the Prairie Provinces to 17.1 in the Ontario region. The two western regions expended proportionately more on furnishings and equipment than the other regions, 5.8 per cent for the Prairies and 5.6 per cent for British Columbia, compared with the Canada Composite of 5.0 per cent. Clothing expenditure was a more important item in Quebec than in other regions, reflecting the greater number of adults in Quebec families.

Some differences within regions and between major cities are revealed in Basic Table 6 which sets forth expenditure patterns for selected cities and city groups. This table brings out the differences in levels and patterns of expenditure for Montreal and Toronto as against other cities in Quebec and Ontario. Total expenditure per family for both Montreal and Toronto was above the average for other cities in their respective regions. The pattern for Other Quebec Cities showed a greater proportion of total expenditure allocated to food and clothing and a smaller proportion expended on shelter than did the Montreal pattern. Average family

size in Other Quebec Cities was 4.44 persons as compared to 3.78* persons in Montreal. Similarly, the percentage distribution of total expenditure for Other Ontario Cities showed a higher proportion for food and a lower proportion for shelter than the Toronto pattern.

Among the five major cities presented in Table 6, average expenditure ranged from a low of \$5,386 in Winnipeg to a high of \$6,412 in Edmonton. This disparity in expenditure between the two Prairie cities reflects differences in family size, age of head and, in particular, in number of earners which averaged 1.76 per family for Edmonton and 1.50 for Winnipeg. A ranking of the five cities according to average expenditure per earner (families of two or more) was as follows: Toronto (\$4,104), Vancouver (\$3,854), Montreal (\$3,716), Edmonton (\$3,643) and Winnipeg (\$3,591). With the exception that the order of Vancouver and Toronto was reversed, this ranking was consistent with that obtained from income tax statistics of average taxable income in 1959.⁵

The main differences in expenditure pattern between Winnipeg and Edmonton were the greater percentages of total expenditure devoted by Edmonton families to furnishings and equipment.

³ Published annually by the Department of National Revenue in Taxation Statistics, Queen's Printer, Ottawa.

clothing and car expenses. Edmonton families allocated 86.0 of total expenditure to current consumption, compared to 83.8 per cent by Winnipeg families. A comparison of the Vancouver pattern with that for the British Columbia region showed that whereas dollar expenditures were somewhat higher for Vancouver than for the regional average, the percentage distributions of expenditure were not significantly different.

The exclusion of income extremes resulted in narrower variations among regions and cities. Table V shows expenditure patterns by city and city groups for families of two or more within the income range \$2,500 - \$6,999 which coincides with the income range covered in 1957. Even within these limits, total expenditure ranged from \$4,560 for Other Quebec Cities to \$5,419 for Edmonton, as compared with a range from \$5,048 to \$6,412 between the same centres for families of all incomes. In this middle-income range the percentages of total expenditure taken by food and shelter were higher than for all survey families, but differences among regions were not changed appreciably. Other Quebec cities and Montreal still registered higher percentage expenditures on food and clothing compared with other cities; Toronto families allocated the largest percentage of total expenditure to shelter; Edmonton families led in the percentage spent on furnishings and equipment.

TABLE V. Average Expenditure Patterns by City and City Group, Families of Two or More with Income \$2,500 - \$6,999, 1959

Average expenditure per person ranged from \$1,015 in Other Quebec Cities where family size was largest (4.49 persons) to \$1,498 in Vancouver where family size was least (3.40 persons).

Complete expenditure detail relating to Table V appears in Basic Table 15, in order to provide a measure of comparability with city data published in 1957. Data by region for this group are contained in Basic Tables 12 and 14.

2 (b). Families of Two or More, by Family Income

Average expenditure per family and the percentage distribution of expenditure at each income level may be seen in Table VI. A more detailed presentation of expenditure by income appears in Basic Table 7. In classifying families by income, the measure of income used is the family income before taxes and other deductions. Other money receipts, which include money from inheritance, lump sum payments from insurance policies and other irregular money receipts are not included in the family income figures used for classification purposes.

For all expenditure categories it was generally true that expenditure increased as income

increased. However, the percentage of total expenditure allocated to food and housing decreased steadily as income increased. Between the lowest income group and the highest, the percentage allocated to these basic necessities diminished by half, from 58 per cent of total expenditure to 29 per cent. Relative expenditure on household operation also declined, but within very narrow limits, as income rose. On the other hand, there was no relationship apparent between level of income and the proportion of expenditure allocated to furnishings and equipment.

The percentage spent on clothing increased from 7 per cent in the lowest income group to around 10 per cent in the income levels over \$7,000, with a slight decline occurring in the \$10,000+ group. Automobile expense was the most important component of the classification "Other Commodities and Services", and the one in which the effect of increasing income was most apparent. Expenditure on automobile purchase and operation, averaged \$71 in the lowest income group and \$1,235 in the \$10,000+ income group. However, the percentage of total expenditure increased with income until it levelled off around 10 per cent in the \$5,500-\$10,000 range and declined slightly in the \$10,000+ group.

TABLE VI. Average Expenditure Patterns by Income Group. Families of Two or More, 1959

Rising income was accompanied by decreases in the proportion spent on medical care and increases in the proportion of expenditure on education. The percentage spent on recreation tended upward with income, remaining relatively constant, however, in the income groups from \$3,000 to \$7,000. Minor variations in the proportions of expenditure recorded for smoking and alcoholic beverages were not related directly to income level.

As income increased the percentage of total expenditure that was used for current consumption declined, reflecting larger portions of expenditure taken by personal taxes, security and gifts. This fact had a bearing on the percentage allocation of individual items which tended to be smaller as current consumption declined, from 94.8 per cent in the lowest income class to 75.4 in the \$10,000+ group.

In summary, the effect of larger income on expenditure patterns was to decrease the relative importance of current consumption, particularly of food and shelter and to increase the relative importance of expenditure on cars, education and clothing up to certain levels of income where their relative importance became steady.

2(c). Families of Two or More, by Level of Total Expenditure

Expenditure patterns of families classified by level of total expenditure are shown in Basic Table 8.

Current consumption expenses include purchases incurred in the survey year for cars, and other major purchases such as furniture and appliances. Such purchases, whether made from family savings or by instalment payments, tend to move families into expenditure classes above their income classes. On the other hand families who are saving for anticipated major purchases may fall into expenditure classes considerably below their income level. It should be noted that whereas car purchase counts as a current expense, house purchase payments are recorded as additions to capital, with only mortgage interest being assigned to current expenses.

On the whole, patterns of expenditure by expenditure class were similar to those by income class, in that the basic expenses of food and shelter decreased in relative importance as expenditure level increased, whereas the importance of Other Commodities and Services increased. However the range in expenditure between the lowest class and the highest was wider in the expenditure classification for all categories of current consumption. The greater range was particularly apparent in automobile expenses which increased from \$25 in the under \$2,500 expenditure class to \$1,660 in the \$10,000 and over group, in contrast to a range from \$71 to \$1,235 per family in the income classification. Similar differences were apparent in the range in percentages of total expenditure taken by other categories. Food accounted for 36.9 per cent of

expenditure in the under \$2,500 expenditure class, compared to 32.9 per cent in the under \$2,500 income class. The percentage devoted to furnishings and equipment tended to increase as expenditure level increased, showing a greater correlation with expenditure level than with income level.

Personal taxes and security differed from the current consumption categories in that the range of expenditure from lowest to highest classes was narrower in the expenditure classification than in the income classification. Expenditures on personal taxes ranged from \$13 in the under \$2,500 expenditure class to \$1,410 per family in the expenditure class \$10,000 and over, in contrast to a range of \$6 to \$1,613 in the corresponding income classes.

The percentage of total expenditure devoted to current consumption ranged from 94.8 in the under \$2,500 expenditure group to 78.5 in the \$10,000 and over expenditure group. Greater percentages of total expenditure were attributed to current consumption at expenditure levels over \$7,000 than were recorded at corresponding income levels.

2(d). Families of Two or More, by Age of Head

Expenditures classified by age of family head as shown in Table VII revealed differences associated with the family life cycle. The variables of family size and composition and earners per family presented in Table 16 illuminate some of these differences. Total expenditure, average family size and average number of earners tended to follow similar patterns, with above-average expenditures occurring in the three age groups from 35 to 59 where family size and number of earners were at a maximum. However, the peak for total expenditure coincided with maximum number of earners in the 45-54 group rather than in the 35-44 group where average family size was greatest.

With the exception of housing, and furnishings and equipment, expenditure per family on the main categories shown in Table VII tended to follow the pattern of total expenditure, increasing as age of head increased, generally to the 45-54 group, and thereafter declining. Expenditure on housing, fuel, light and water had two peaks, both in dollar terms and in its share of total expenditure. The level of housing expenditure per family was at a high of \$962 in the 25-34 age group, after which it tended downwards as age of head increased, until the 65-69 age group where a new high of \$977 was established. The housing expenditure decline reflected decreasing expenditures on rent and mortgage interest as family heads grew older. The upturn at the 65-69 level reflected increases in these items and also in household repairs. Furnishings and equipment expenditure decreased as age of head increased from \$334 in the age group under 25, to \$130 per family in the 70+ group. The percentage of total expenditure taken by this category also declined from 7.1 in the youngest group to 3.7 per cent in the oldest.

Total expenditure per person decreased from \$1,670 to \$1,307 as age of head increased in the age groups up to 35-44, reflecting family size increases, and then rose to a high of \$1,995 per person in the 60-64 age group, diminishing again in the age groups of 65 and over to \$1,491 in the 70+ group. This pattern was reflected in the main components of expenditure as well as the total.

In the percentage distribution among categories of expenditure, the upper age group showed

the most significant variations from the average pattern. Food and housing items combined were of greater importance in the 65-69 and 70+ age groups. The relative contribution to clothing increased with age of head to a maximum of 10.4 per cent in the 45-54 age group and declined to 7.5 per cent in the 70+ group. The percentage of total expenditure accounted for by current consumption was 88 per cent at the two age extremes, under 25 and 70+, tending downward as age of head increased to 83.3 per cent in the 60-64 age group.

TABLE VII. Average Expenditure Patterns by Age of Head, Families of Two or More, 1959

2(e). Families of Two or More, by Employment Status of Wife of Head

Almost 24 per cent of survey families of two or more reported that the wife of head contributed to family earnings. Table VIII and Basic Table 10 show how patterns differed among families where the wife of head was employed outside the home full time (48 weeks or more in the survey year), where the wife was employed for a part of the sur-

vey year, and where the wife of head had no outside employment. A residual group characterized as "no wife of head" comprised about 10 per cent of families, those which did not fall into the usual husband-wife family groups. In this group, in which the average age of head was 56 years, family size averaged slightly less than three persons, and total expenditure averaged \$4,640 which was considerably below expenditure levels of the other groups.

TABLE VIII. Average Expenditure Patterns by Employment Status of Wife of Head.
Families of Two or More, 1959

Totals	100.0	100.0	100.0	100.0	100.0

A comparison of average expenditure with average income for these groups is of interest. Table IX shows that on average for all survey families expenditure and income were almost in balance. However for the group of families where the wife was employed full time, income exceeded expenditure by 8 per cent. These families were smaller and younger than the other groups, with 3.08 persons per family and average age of head 39 years. They spent approximately the same amount on food as families where the wife was not earning, in which family size was 3.94 persons. Total expenditure per person was \$2,176, compared with \$1,505 for all survey families, \$1,586 for families where wife was employed part-time, and \$1,410 for the group in which wives were not earners. As might be expected, expenses for food and shelter accounted for smaller percentages of total spending than in other groups, and personal taxes took a relatively larger share.

Family heads in the group in which wives recorded earnings for part of the survey year were slightly older than in the full-time earning group. Family size averaged 3.52 persons and number of earners at 2.19 compared with 2.17 for the full-time group and 1.18 for families where the wives were not earners. However, average family income was below that reported in both these groups, and was, in fact, about 4 per cent below the average expenditure level for the group. Dollar expenditures on furnishings and equipment, clothing, transportation, recreation, smoking and alcoholic beverages were above the survey average, although below the average amounts expended by families with wives earning full-time. The part-time group devoted larger percentages of expenditure to furnishings and equipment and car expenses than did any other group.

Of the 1,672 families of two or more in the survey 1,118 families were in the group charac-

terized as "wife not earning". The pattern for this group, therefore, dominated the composite pattern for all families of two or more. Families were above average in size (3.94 persons) and age of head averaged 46 years. Average total expenditure was

\$5,556 as against the survey average of \$5,570. This group allocated relatively more to food and shelter than did families where wives were employed, but relatively less to clothing, car and other transportation.

TABLE IX. Relationship Between Employment Status of Wife and Other Family Attributes, 1959

Employment status of wife	Average family size	Average age of head	Earners per family	Average expenditure	Average income
No wife of head.....	2.97	56	1.49	4,640	4,665
Wife employed full time	3.08	39	2.17	6,702	7,256
Wife employed part time	3.52	40	2.19	5,582	5,385
Wife not earning	3.94	46	1.18	5,556	5,498
All families of two or more	3.70	45	1.45	5,570	5,556

PRESENTATION OF SURVEY RESULTS

In the basic tables of this report, Tables 1 to 12 present summary expenditure data, comprising average dollar expenditure per family and percentage distribution of expenditure among the main categories of family spending. In Tables 13, 14 and 15 full expenditure detail is presented in the form of percentage of families reporting and average dollar expenditure per survey family. The latter figure is obtained by dividing aggregate expenditure by the total number of families. Average expenditure per family reporting may be derived from the published figures as follows:

Average expenditure per family
Percentage of families reporting X 100

Information on family attributes referring to family groups shown according to various classifications in Tables 1 to 15, appear in Table 16.

Table X may assist the reader in locating tables referring to specific groups. Bracketed tables indicate that the group in question is presented as a component of the larger group to which the table refers.

01

P. CHANGE IN FAMILY FINANCIAL POSITION

We want change in the family's assets and debts during the survey year. For certain items, namely cash, stocks and bonds, money owing to family and money owed by family, there is space on the schedule for the entry of amounts outstanding at the beginning and end of the survey year. If this information is available, please enter it here. If the respondent prefers to give you only the amount of change, enter it under Net Increase or Net decrease.

Change (\$) Net Increase	Assets	Amount outstanding		Change (\$) Net Decrease
		Now	12 Months Ago	
02	1. Cash held in Banks, Savings Accounts, etc. and Cash on hand	\$	\$	12
03	2. Value of Stocks and Bonds			13
	3. Money owed to Family:
