INTRODUCTION

This report presents results of the sixth survey of urban family expenditure to be carried out by the Dominion Bureau of Statistics since the series of small-scale continuing surveys was initiated in 1953. The survey was carried out in February and March 1965 and refers to the calendar year 1964. The sample of 3,000 households from which 2,034 usable expenditure records were obtained was allocated among eleven major urban centres: St. John's, Halifax, Quebec, Montreal, Ottawa, Toronto, Winnipeg, Regina, Saskatoon, Edmonton and Vancouver.

This survey, like its predecessor in 1959, marked a departure from the series of continuing urban surveys, which has been primarily concerned with obtaining information on spending patterns of a group of middle-income families of specified composition known as the Consumer Price Index "target group". This group was selected from the comprehensive 1947-48 survey to provide the weighting system for the Consumer Price Index which was in effect up to January 1961. The criteria of geographic location, family composition and family income which defined the 1947-48 target group provided the basis for the eligibility criteria which were applied in the surveys of 1953, 1955, 1957 and 1962. However, although the original target group referred to families living in 27 Canadian cities with population over 30,000, the surveys in question have been limited to selected larger cities across Canada.

Each of the four restricted survey programs comprised a record-keeping survey of food expenditure detail by rotating monthly samples throughout the year, followed by a recall survey of the complete budget by a different sample surveyed early in the year following.

The survey was broadened in scope in 1959 and again in 1964, when no restrictions of family composition or income were imposed. The monthly food surveys were omitted and the recall survey was doubled in size. The 1959 survey was expanded further to refer to urban centres with population of 15,000 and over and the sample included households from sixty of these centres. The 1964 survey, like the other surveys since 1953, while referring implicitly to cities with populations of 30,000 and over, concentrated its sample in larger Canadian cities, in order to produce data for individual cities.

Table I shows the survey criteria of family composition, family income and geographic location applied in each of the surveys of the complete budget. For the restricted surveys, the income range was raised in successive surveys from the original target group range of \$1,650-\$4,050 in 1947-48 to \$3,000-\$8,000 in 1962. The eight family types specified in 1953, 1955 and 1957 also referred back to the 1947-48 target group. In 1962, all family types in the size range two to six persons and having at least two adults were included.

TABLE I. Survey Criteria and Sample Size of Urban Family Expenditure Surveys, 1953, 1955, 1957, 1959, 1962 and 1964

Survey year	Survey criteria			Sample size
	Family composition	Family income	Geographic

SAMPLING AND FIELD OPERATIONS

As in previous surveys, the sample was drawn from the Labour Force Area Sample. Eleven metropolitan areas, including city proper and fringe areas, were selected for inclusion in the sample. This selection was made arbitrarily on the basis of practical considerations of regional office location, availability of enumerators and the size of the Labour Force Sample in the city concerned. Each of the urban centres selected was a primary sampling unit in the Labour Force Sample.

Within each city, or primary sampling unit, the secondary unit was the segment. The sample was drawn from households which had been rotated out of the Labour Force Sample from six to eight months earlier, by systematic selection of rotated households. The Labour Force Sample design was in process of revision at this time, and in two of the cities (Halifax and Edmonton) the new sample had been in use long enough to be employed in the survey.

The total of 2,950 households was distributed as follows: St. John's, 150; Halifax, 200; Quebec, 200; Montreal, 500; Ottawa, 300; Toronto, 500;

Winnipeg, 300; Regina, 100; Saskatoon, 100; Edmonton, 250; and Vancouver, 350. This allocation of the sample among cities was disproportionate to the populations represented, in order to allow adequate samples in the smaller cities. The disproportion was later corrected by weighting survey results to give each city its due importance in the composite.

Field work was carried out in February and March, 1965, under the supervision of regional offices of the Dominion Bureau of Statistics. Approximately one hundred enumerators were selected from experienced Labour Force enumerators.

Additional training was given by regional office staff in each city. Members of head office staff visited the regional offices at an early stage in field operations, to review completed schedules and discuss enumerators' problems with them. Completed schedules were given a preliminary editing by regional office staff, which included a balance between receipts and disbursements. Schedules which failed to balance within ten per cent were examined more closely and referred back to enumerators for further inquiry.

SURVEY METHODS AND RELIABILITY OF RESULTS

Survey Methods

The 1964 survey was conducted in the same manner as earlier surveys of family expenditure. The enumerator was first required to list all members of the household and to determine the spending units which comprised the household. The enumerator then completed an expenditure record for each spending unit, recording the information on a detailed schedule. Facsimiles of the Household Control Card (FEX 1) and the Schedule (FEX 2) appear in the Appendix to this report.

The collection of expenditures by recall imposes a considerable task on both the interviewer and the respondents, necessitating lengthy interviews and frequently more than one visit in order to obtain complete information. It is considered that the calendar year provides boundaries which are apt to be more clearly defined in the respondent's mind than any other twelve-month period. Purchases of large items, automobiles, chesterfield suites, etc., may be recalled fairly readily. This is also the case with rent, property taxes and monthly payments on mortgages. Food expenditure, which comprises almost one quarter of the average budget, can be estimated in terms of weekly or monthly expense. Expenses on smaller items, which are purchased at regular intervals, are usually estimated on the basis of amount and frequency of purchase. The accuracy of other family expenditures, such as those for clothing, depends upon the ability of the respondent to remember individual purchases at a considerable level of detail.

Survey Processing

Editing was carried out in several stages. The preliminary edit in the regional office was mainly for completeness, so that, if necessary, a schedule could be returned for further information.

This was the second survey in the series to be processed by computer. The manual editing carried out in head office comprised (1) a review of each schedule for consistency and correct location of items; (2) coding a limited number of items which were reported non-numerically; (3) performing certain adjustments on reported information and (4) reviewing the balancing check. The computer edit performed a variety of consistency checks including the balancing check, and formed the basis of further clerical editing and correction of incorrect entries on tape. Records identified by the computer as being outside the ten per cent limit were submitted to a final appraisal to determine whether they should be accepted or deleted. Experience in 1962 had indicated that in this type of survey too much reliance on a mechanical edit could be as time-consuming as a more complete manual edit, and that, in fact, the identification and correction of errors at this stage demanded much more care and accuracy on the part of the clerical staff.

Response Errors and Sampling Error

Errors in sample surveys can be divided into two main types, errors of response, and sampling errors. Errors of response may be due to inaccurate

answers or incomplete information. The latter may be the fault of the design of the schedule, faulty questioning by the enumerator, or refusal of the respondent to co-operate.

In addition, all samples are subject to sampling error, which arises from the fact that only a portion of the universe is observed. Sampling error is related to the size and efficiency of the sample, the frequency of reporting the item and the variation in expenditures on the item. In general, smaller relative sampling errors are associated with groups of items which are reported by the majority of families, such as totals for food, clothing, household operation, personal care supplies, and medical care. The largest sampling errors occur in individual items infrequently purchased such as major durables or air travel; or groups of items on which the percentage of families reporting expenditure was relatively low. In the detailed tables of this report the percentage of families reporting is shown for each item beside the average expenditure per family.

Reference has already been made in the foregoing sections on survey methods and survey processing to the balancing check which is performed on individual schedules. For the first time in this series of reports, the account-balancing difference is published as a part of the information accompanying each expenditure pattern. For a given group of families, the account-balancing difference represents the average net amount, either positive or negative, by which the schedules comprising the group were not in balance. A positive account-balancing difference indicates an excess of income, other money receipts and debit items of financial change (decrease in assets and increase in liabilities) over expenditures and credit items of financial change (increase in assets and decrease in liabilities). A negative account-balancing difference indicates the reverse, an excess of expenditure and credit items.

Over the whole sample, the account-balancing difference was -\$82, or 1.3 per cent of average income. This relatively small difference is reassuring in that it indicates there was considerable balancing between positive and negative differences over the whole range of records. It is not surprising to find that families in the lower income groups and unattached individuals, who were concentrated largely

in lower income groups, registered relatively small differences. Among unattached individuals, the net difference of -\$3 reflected a balancing between small positive and negative differences in lower income groups, and larger off-setting differences at upper income levels. Among families of two or more, the middle-income groups, from \$4,500 to \$7,000, registered the largest net differences, all of which were negative. On examining differences among family-type groups, it is found that two-adult families with children averaged considerably larger differences than all-adult families. The group corresponding to the 1962 target group registered a larger balancing difference (-\$131) than did all families and individuals (-\$82) or families of two or more (-\$100). Related to the foregoing observations, the largest differences among age-of-head groups occurred in the groups between 25 and 44 years.

Somewhat surprisingly, the classification by number of full-time earners showed that the two-earner group averaged a smaller balancing difference than other groups, and that the balancing difference for the one-earner group exceeded all groups except the very small class containing four or more earners. Similarly, families where the wife was employed outside the home full time averaged a much smaller balancing difference than families where the wife was employed part time or not employed.

Other groups for whom balancing differences were considerably above average were: families where the major income source was self-employment; families with occupation of head classed as managerial; recent immigrants; families which had changed tenure status from renter to owner or vice versa during the year.

It should be noted that the "allowable" balancing difference, which served as an error signal was ten per cent of total receipts or disbursements, whichever was larger. This method allowed a greater margin of error to families who had substantial changes in assets and liabilities, such as the sale or purchase of a home, and probably accounted for the larger difference averaged by the mixed-tenure groups and contributed to the difference of the group of owners with mortgages. For both these groups, average age of the head was lower and there was a greater average number of children, both facts which are consistent with what has been observed in the classifications by age of head and family type.

SURVEY RESPONSE

The sample of 2,951 expected households included 175 vacant dwellings and 64 households which were ineligible. Out of the remaining 2,712 households, 197 represented non-contacts with whom no interview was possible and 515 households which refused to be interviewed even for the completion of the Household Control Card. From the 2,000 households interviewed, containing 2,325 spending units, a total of 2,034 usable schedules was obtained.

The response rate was estimated as being between 68 and 69 per cent of eligible spending units. This was somewhat below the response of 72 per cent obtained in the 1962 survey in which eligibility criteria were applied to eliminate extremes of income and family size. It marked an improvement, however, over the response to the 1959 survey. In both 1959 and 1964 there were some households from which no information on household composition

was obtained, and the response rate had to be calculated, therefore, on the estimated number of eligible spending units in the sample. The unknown portion was considerably greater in 1959 because the sample was drawn from households not previously interviewed, whereas in 1964 information concerning household composition was available from Labour Force documents for the majority of households. For 144 dwellings, where occupancy had changed since the Labour Force Survey, no information was obtained in 1964. For the purpose of calculating the response rates by city in Table II, it was assumed that each of these unknown households contained only one spending unit. If it had been assumed, as was done in calculating 1959 response, that the ratio of households to spending units was the same for unknown households as for the remainder of the sample, the 1964 response rate comparable to the 1959 response of 63 per cent, would have been only fractionally lower, 68.1 instead of 68.7 as shown in Table II.

Although no eligibility criteria of income or family composition were applied, similar to those in the 1962 survey, there were certain conditions under which spending units were not eligible, or were excluded from tabulations. Spending units which were found to have derived the major part of their income

from farming were excluded even though they lived in urban areas. Also excluded were part-year spending units, which comprised families which had immigrated to Canada during the survey year and also units formed by marriage during the year of persons who had both been members of existing spending units previous to their marriage.

Table II presents an analysis of response by city and by family type. Among cities, individual response rates ranged as high as 85 per cent for St. John's and 80 per cent for Winnipeg. The majority of other cities recorded response rates between 65 and 70 per cent. The low response registered by the Regina sample may be attributed speculatively to the difficulty of obtaining willing and experienced interviewers in smaller centres where the number of Labour Force interviewers available for selection is limited. In all but three of the cities in the survey, field operations were administered by a regional office located in that city. The three exceptions were Quebec, Regina and Saskatoon, in which the survey was directed from Montreal, Winnipeg and Edmonton respectively. In such cases, it is possible that weakness on the part of the interviewer may have been aggravated by less easy access to advice and encouragement while the survey was in progress.

TABLE II. Spending Unit Response, by City and by Family Type, Eleven Cities, 1964

Item	Total expected households	Estimated eligible spending units	Usable schedules	Response rate ¹
		number		percentage
City:				
St. John's	150	138	118	85.5

Family type unknown		144	—	—
Totals		2,962	2,034	68.7

¹ Usable schedules as a percentage of eligible spending units.

The classification of response rates by family type shows that, as in previous surveys, families composed of two adults with children under sixteen responded better than did families composed entirely of adults. Response rates over 75 per cent were registered by all families consisting of two adults with one or more children, with the highest response rates of 81 and 82 per cent being shown by families with three or four children. Lowest response rates were registered by families with three adults and one child (64 per cent), four adults (66 per cent), one adult and one or more children (66 per cent) and three adults (68 per cent). It is worth noting that the family types with highest response also showed the lowest percentages of wives employed full time outside the home. Two-adult families without children were exceptional in having a relatively high response (72 per cent) and also a relatively high percentage of wives employed. Responding families composed of three adults, either with or

without children under sixteen showed relatively high percentages of wives employed, and this tendency may be an explanatory factor for non-response in these groups. The necessity of employment outside the home may also explain the lower response rate on the part of families with only one adult (predominantly female) and one or more children. One-person spending units registered a response rate of 66 per cent. This group by itself represented about 16 per cent of eligible spending units, as much as the combined number of eligible units in the four low-response groups mentioned above. It should be noted that response rates by family type were of necessity calculated exclusive of the spending units in 144 households from which no information was obtained, and are therefore overstated in varying degrees. It would seem reasonable to assume that this overstatement applies mainly to the groups where known response was low.

PRESENTATION OF SURVEY RESULTS

The tables in this report represent a selection from a considerably larger number of detailed tables. In Tables 1 to 9, inclusive, patterns of family expenditure for the total sample of families and one-person spending units are presented, classified by important family characteristics. Tables 10 to 14 provide similar information for families of two or more as a group, classified by the major characteristics, city, income, age of head, and also by two additional classifications particularly relevant to families, namely number of full-time earners and employment status of wife. A more restricted group of families corresponding in income range and family size to the 1962 target group is covered in Table 15, and the relatively small group of one-person spending units is shown classified by income and by age of head in Tables 16 and 17. In the foregoing tables information on family attributes in the form of percentages and averages is provided, descriptive of the families in each class.

Tables 18 to 21 provide full expenditure detail for the patterns presented in Tables 1, 2, 3 and 12 respectively. Information is in the form of average expenditure per family and percentage of families reporting. Average expenditure per person may be

derived by dividing average per family by average family size. The average expenditure per family reporting on a given item can be derived by the following calculation:

$$\frac{\text{Average expenditure per family}}{\text{Percentage of families reporting}} \times 100$$

Complete expenditure detail is also available for all classifications shown in Tables 1-17, and for some classifications not shown in this report, namely: cities grouped by region, family income after taxes, immigrant arrival year, mother tongue, and income type. In addition, the following two-way classifications of complete detail are available for analytical uses, and may be obtained subject to the terms of the Statistics Act which prohibits the release of information from individual records:

- City by family income
- City by family income after taxes
- City by family type
- City by tenure of head
- City by mother tongue
- Age of head by family income
- Family type by family income
- Family type by age of head.

CHANGES IN EXPENDITURE PATTERNS, 1959 - 64

A comparison of results from the surveys of 1959 and 1964 indicates that over the five-year period average expenditures made by families and individuals rose by more than 20 per cent. Although the earlier survey referred to a broader segment of the urban population (centres with populations of 15,000 and over), a reasonably valid comparison can be made between the 1964 expenditure pattern for the eleven major centres surveyed in that year and the 1959 pattern for centres with populations of 100,000 and over, which comprised about three quarters of the 1959 sample. The increase in total family expenditure, from \$5,248 to \$6,395 amounting to 22 per cent, included increases in personal taxes, contributions and gifts, and other non-consumption

items. Expenditure on current consumption per family increased by almost 19 per cent, from \$4,462 to \$5,296. The foregoing increases are consistent with per capita advances registered by National Accounts series over the same period for the Canadian economy as a whole. At the national level, per capita personal income rose by 23 per cent, and per capita personal expenditure on consumer goods and services increased by 19 per cent. In spite of differences in content and concept between the two expenditure series, changes in the distribution of personal expenditure as indicated by household surveys, on the one hand, and the aggregative approach on the other, were broadly similar.

The differing rates of increase shown by the expenditure surveys between total expenditure (22 per cent) and current consumption expenditure (19 per cent) reflect the increasing impact of personal taxes on rising incomes as well as increased rates of income tax. As a result, the proportion of current consumption expenditure in total family expenditure declined from 85 per cent in 1959 to slightly below 83 per cent in 1964. However, the 19 per cent increase in average current consumption expenditure was substantially more than the 7 per cent increase registered by the Consumer Price Index over the same period. Increases in expenditure varied in magnitude among consumption groups, ranging from almost 9 per cent for food to increases of 15 per cent for expenditures on clothing and health care respectively, 20 per cent for shelter expenses, to increases of 30 per cent or more for personal care, transportation and recreation. Whereas the increase in average food expenditure approximated the increases in food prices registered by the Consumer Price Index, the increases in the majority of other groups were considerably in excess of the price change measured by corresponding price indexes.

The greater increases in discretionary spending, as compared with the more moderate advances in food and shelter, resulted in some differences in the distribution of expenditure among major categories. The most important change was the smaller proportion accorded to food which declined from 23.2 per cent of total expenditures to 20.7 per cent. Among current consumption items, the importance of food declined from 27.0 per cent in 1959 to 25.0 per cent in 1964. Other groups to show declining importance were clothing, which decreased from 9.1 to 8.6 per cent of total expenditure; shelter from 17.1 to 16.8 per cent; house furnishings and equipment from 4.6 to 4.3 per cent; medical care from 4.2 to 3.9 per cent; tobacco and alcoholic beverages from 4.2 per cent to 4.0 per cent.

Of the items to increase in importance, transportation was the most noteworthy, increasing from 11.3 per cent to 12.1 per cent. The most substantial advance in this group was recorded by car purchase, which increased in frequency as well as in average expenditure per family reporting car purchase. Other groups which moved up fractionally in total spending were recreation, personal care, reading, education and household operation expenses.

Comparisons between 1959 and 1964 results for four cities individually (Montreal, Toronto, Winnipeg and Vancouver) showed changes which paralleled the more important of the changes registered by the

composite. In all four cities current consumption declined in relation to total expenditure, reflecting increases in the share of total expenditure taken by personal taxes. Expenditures on food and on house furnishings and equipment also declined in proportion to total expenditure whereas car expenses increased in importance. Other groups where the composite changes were less marked showed diverse tendencies. The importance of shelter declined in Montreal and Toronto spending patterns, but increased in Winnipeg and Vancouver. The percentage taken by clothing declined in each of the cities except Vancouver, where it remained unchanged.

Changes in the composite spending pattern between years reflect changes in the distribution of families by income level in the samples as well as other factors such as prices and buying habits. A comparison of expenditure patterns for families at the same level of current dollar income in both surveys (taking the 1959 sample of families and individuals in cities of 100,000 and over) showed that although the buying power of the dollar was lower in 1964, the percentage of total expenditure taken for current consumption declined between 1959 and 1964 for all income groups below \$5,000. Across all income groups the percentages taken by food were slightly lower in 1964 and, with one or two exceptions, this was the case also for clothing. On the other hand, the percentage taken by shelter was consistently higher in 1964. It should be noted that the decline in the percentage registered by shelter in the composite expenditure pattern reflected the effect of rising incomes on the proportion of shelter, which tends to decrease as income rises. Thus, although, on average, a slightly smaller fraction of the urban dollar went to shelter, families who had not moved out of their 1959 income bracket would be devoting a higher proportion to shelter in 1964. Families in the lower income groups registered smaller increases in dollar terms than did families at the upper income levels, but the relative impact on low-income budgets was much greater. For families and individuals with incomes under \$2,500 who averaged somewhat older in 1964 than in 1959 average shelter expenses increased by 14 per cent from 1959 to 1964, and the proportion of shelter in total expenditure moved up from 27.5 per cent to 30.1 per cent. In contrast, families in the \$8,000-\$9,999 range averaged a 9 per cent increase in shelter expenses which raised the proportion of shelter from 14.5 to 15.3 per cent. In the group with incomes of \$10,000 and over, shelter expenses rose by 16 per cent, whereas the proportion taken by shelter increased from 11.6 per cent to 13.2 per cent.

PATTERNS OF FAMILY EXPENDITURE

(a) Eleven-city Composite

Expenditure patterns classified according to family characteristics reveal variations, both in expenditure levels and in percentage distribution of total expenditure for families in different socio-economic groups. The level of total expenditure is closely related to family income which in turn is determined by characteristics such as age, education

and occupation of the family head as well as by family composition in its bearing on the number of earners. The distribution of total expenditure among its components reflects the varying impact of the foregoing characteristics and also of other characteristics such as, number of children, city, country of origin, year of arrival of immigrants, tenure, and employment of wife.

The average expenditure pattern of families and individuals differs from the average pattern of families of two or more, mainly in the higher levels of expenditure registered by the latter group. The effect of excluding unattached individuals (one-person spending units) was to raise average total expenditure from \$6,395 for the whole sample to \$7,031 for families of two or more. This difference reflects the effect of the much lower averages of expenditure registered by one-person units. Because of the lesser impact of their expenditures in aggregate, their exclusion had relatively little effect on the average distribution of expenditure. The most significant difference was in shelter expenses, which accounted for 16.8 per cent of expenditures of families and individuals compared to 16.3 per cent for families, reflecting the greater importance of shelter costs (21.8 per cent) in the one-person budget. On the other hand, food, home furnishings, clothing, transportation, recreation and education were each of slightly more importance in family spending than in the expenditure of families and individuals as a group; with the result that current consumption expenditure was of slightly greater importance in the spending pattern of families, accounting for 83.1 per cent compared to 82.8 per cent for families and individuals. Among non-consumption items, personal taxes, gifts and contributions represented fractionally less in the expenditure of families of two or more than for the whole sample, whereas the security group, consisting of life insurance, unemployment insurance and payments to pension plans and annuities was slightly more important in the spending of families of two or more.

About half of the total sample consisted of families of two to six persons with incomes \$3,000-\$7,999. The criteria identifying this group were the same as those employed in the 1962 survey, although it should be noted that, in order to observe a comparable group of families, an upward adjustment should have been made in the income range to take into account the upward shift in the distribution of family incomes between 1962 and 1964. There is some evidence of the upward shift within the limited income range in that average income for the group in 1964 was \$5,615, compared to \$5,436 in 1962. Current consumption expenses claimed almost 86 per cent of the total 1964 expenditure of \$5,877, with food and shelter accounting for 40.2 per cent of total expenditure, in contrast to 37.3 per cent for all families of two or more. Medical care, personal care, home furnishings, household operation, tobacco and alcoholic beverages also took greater shares of expenditure for this middle-income group than they did for the average family of two or more. However, clothing, transportation and recreation were of less relative importance in total expenditure for the restricted group. This was also true of the non-consumption items, personal taxes, security payments and gifts.

It should be noted that family-size differences exist among these three groups, resulting in narrower differences in expenditure on a per person

basis. Over the total sample of families and individuals, averaging 3.3 persons per family, average expenditure per person was \$1,938, compared with an average of \$1,850 per person for families of two or more. For the restricted group of families, with incomes \$3,000 to \$7,999 and family size averaging 3.4 persons, average expenditure per family was \$1,729. Current consumption expenditure averaged \$1,605 per person over all families and individuals, \$1,538 per person for families of two or more, and \$1,485 per person for the restricted group. For basic necessities, i.e. food, shelter, household operation, furnishings and equipment, medical care and personal care, expenditure per person did not differ greatly between all families of two or more and the restricted group. Food and shelter, in fact, averaged slightly more per person for the restricted group than for all families of two or more.

(b) City Patterns

Expenditures by city for the three broad groups comprising families and individuals, families of two or more, and families with incomes \$3,000 to \$7,999 are shown in Tables 1, 10, and 15, respectively. Levels of total expenditure by city reflect average income and other characteristics of city samples as well as differences due to location. The publication of expenditure statistics for city samples, which are not regarded as sufficiently large to yield reliable estimates of average family income, is justified by the fact that valid relationships may be observed within and between cities in spite of income differentials which may represent sampling variations in city income distributions. The fact that Ottawa and Toronto averaged the highest income and expenditure of city samples is consistent with the high income levels prevailing in Ontario metropolitan centres. However, the relative position of other cities in a ranking of cities by average income is open to question, especially the position of Halifax and St. John's in relation to Vancouver and Edmonton. It is interesting to note in Table 15, where extremes of income and family size were excluded, that St. John's had the lowest average income and Toronto the highest among city averages which ranged from \$5,087 to \$5,790. Edmonton and Vancouver were near the top, although still somewhat below Halifax. Additional perspective on city differences is shown in Chart I (page 21) where distributions of families are shown for each city, classified by size of total expenditure.

In spite of the limitations of city samples, the classification of families by location yields some interesting variations in expenditure patterns, which are indicative of city differences. In this, as in earlier surveys, the highest averages of food expenditure were registered by St. John's and Montreal. In the case of St. John's, family size is probably the dominant factor, although price differentials may also have contributed. On a per person basis, Montreal expenditure on food outranked the other cities. However, as a percentage of the total budget, food accounted for 25.3 per cent in St. John's, compared to 24.4 per cent in Quebec, and 23.0 in

Montreal, with the remaining cities ranging between 18 and 21 per cent. For the middle-income group in Table 15, a similar pattern was observed. Dollar averages for food were lower than those shown in Table 1, but the relative importance of food was greater, amounting to 27.4 in St. John's, 25.0 in Montreal and 24.7 in Quebec.

The St. John's expenditure pattern was distinctive also in respect to shelter costs, which accounted for only 14 per cent, in contrast to the high of 17.8 per cent for Halifax. In spite of the fact that St. John's registered the highest expenditure on heating costs, the total of shelter costs was below other cities because of the high percentage of homeowners, (66 per cent) two thirds of whom owned without mortgage. In Halifax, the percentage of homeowners was only 52 per cent and less than a third were mortgage-free. In dollar terms, Halifax expenditure on shelter of \$1,141 ranked below Toronto (\$1,235) and Ottawa (\$1,170). An analysis of city shelter cost by tenure showed that the somewhat higher Toronto average reflected higher homeownership costs rather than higher rents. In fact, Halifax and Ottawa averaged somewhat higher rents per regular tenant than Toronto although the inclusion of roomers and rent-free tenants brought the average rent per tenant in Halifax below both Ottawa and Toronto. In Montreal renters were in the majority, accounting for 73 per cent of the sample. In Quebec also, renters predominated, although the percentage (64 per cent) was lower than Montreal. In the western cities the percentage of homeowners varied between 55 and 60 per cent of families and individuals and total shelter costs averaged between \$900 and \$1,000. Among the western cities Vancouver had the highest shelter costs reflecting the highest fuel costs. In addition to an average expenditure for gas comparable to other western cities there was also an appreciable expenditure on fuel oil.

For the middle-income group in Table 15, shelter costs showed a somewhat narrower range than the city averages for all families of two or more. In St. John's shelter costs for the middle-income group averaged higher than for all families of two or more and assumed a proportion of 17.2 in total expenditure. Among the eleven cities, the proportion taken by shelter costs for this middle-income group ranged from 16.3 per cent in Regina-Saskatoon to 19.0 in Toronto and 20.5 in Halifax.

In each of the three city tables clothing expenditure averaged highest in Quebec and Ottawa. The inclusion of one-person units in Table 1 increased the range in city averages, although levels of average expenditure were lower than for all families of two or more. As a percentage of total expenditure clothing expenses varied from 8.0 per cent in Toronto to 11.6 in Quebec. The comparison in Table 15 shows that for middle-income families the impact of clothing expense was greatest in the two cities where family size was greatest, accounting for 10.8 per cent of total expenditure in Quebec and 9.6 per cent in St. John's. It remained of least consequence in Toronto at 7.7 per cent.

Transportation was an important budget item in all cities. As a percentage of total expenditure average transportation costs by city varied between 10 and 14 per cent for the whole sample. However, it should be noted that city differences reflect not only the varying proportions of car ownership, which are indicated in the tables, but also the highly variable car purchase item for which differences may reflect chance variations in the number of car purchasers in the survey year. The lowest transportation costs averaged in Quebec in Tables 1 and 10 are consistent with the fact that this city also had the lowest percentage of car owners. However, when the middle-income group is compared in Table 15, Montreal had a lower percentage of car owners, and lower car operation expenses than Quebec. The highest car operation expenses were averaged in the western cities where the highest rates of car ownership were reported.

Significant differences between cities in medical and health care expenses borne by survey families reflect to some extent variations between provinces in insurance coverage. The lowest expenditure, registered in St. John's, reflected the lowest expense for prepaid insurance and also the lowest expenditures on dental care and eye care. The highest expenditures, averaged by Ottawa and Toronto, reflected high expenditures on prepaid insurance, exceeded only by Winnipeg, accompanied by high expenditures on directly purchased care, notably dental care. Next to St. John's, the Saskatchewan cities averaged the lowest expenditure, reflecting the compulsory coverage in this province for medical and hospital insurance. Between Quebec and Montreal, the latter city averaged somewhat lower expenditures on insurance premiums but considerably higher expenditures on directly purchased services and on prescription drugs.

Expenditures reported on tobacco and alcoholic beverages by city may have been affected by differing attitudes in different locations, resulting in different levels of reporting accuracy. Highest expenditures were registered by St. John's and Montreal, reflecting the highest city averages on smoking, and expenditures on alcoholic beverages only slightly below the level recorded by the Toronto sample. In most cities, smoking expenses accounted for the larger portion of expenditure on this group. Toronto and Vancouver were the only cities where alcoholic beverages were of more importance than smoking expenses in the expenditure of families of two or more. For the middle-income group alcoholic beverages registered even less importance relative to smoking, with the result that Vancouver was the only city in the sample where families of this group gave more weight to alcoholic beverages.

(c) Patterns by Income Group

Patterns of family expenditure by income group are shown in Tables 2, 11 and 16 for all families and individuals, families of two or more and one-person units, respectively. It can be seen in Table

2 and Table 11 that spending-unit size tended to increase in successive income groups, mainly due to the greater number of adults between 16 and 64 years. The number of children per family increased to a maximum in the groups between \$5,000 and \$6,000 after which it declined slightly. The number of adults 65 years and over declined as income rose, from a maximum of .7 per family in the lowest income group where the average age of head was 61 years. Related to the increase in the number of adults under 65, the average number of earners per family increased from .4 in the under \$2,500 group to 2.0 in the \$10,000 and over group. There was a similar increase in the percentage of families with the wife employed full time, which rose from 4 per cent in the under \$2,500 group of families of two or more to 32 per cent in the \$8,000-\$9,999 group (Table 11).

Current consumption expenses as a group declined in relation to total expenditure as income rose, because of the increasing proportions taken by personal taxes, security payments and gifts. At the lower end of the income scale, 92 per cent of expenditure went for current consumption, in contrast to 75 per cent at the uppermost level. Both food and shelter declined proportionally with rising income; the importance of food decreased from 29 per cent of total expenditure in the lowest income group to 16.5 per cent in the highest; shelter decreased from 30 per cent in the lowest income group to 13 per cent in the highest income class. The proportion taken by clothing, however, rose moderately with income from 6.7 per cent in the lowest group to 9.3 per cent in the highest. For food, shelter and clothing combined, the proportion, averaging 46 per cent of expenditure over the whole sample, decreased from 66 per cent for families with incomes under \$2,500, to 39 per cent for families with incomes over \$10,000. The margin of current consumption over and above food, shelter and clothing increased in proportion to total expenditure from 27 per cent to 36 per cent between the two income extremes. The major part of this increase was taken by transportation which advanced in importance from less than 5 per cent of expenditure in the lowest income group to 14 per cent in the two income groups between \$7,000 and \$10,000, declining slightly in the group with incomes \$10,000 and over. Recreation expenditure also assumed greater importance in the budget as income rose, increasing from 1.8 per cent in the lowest income group to 3.7 per cent in the highest. A comparable increase in importance was noted for furnishings and equipment, although variations between income levels may have reflected to some extent the greater sampling variability in expenditures on appliances and furniture. Expenditure on education, which included adult education courses as well as tuition fees for children at school or university, accounted for .1 per cent in the lowest income group and 1.5 per cent at the highest income level. Household operation, personal care, medical care and reading all tended downwards in importance as income rose.

In Table 16, one-person units are classified in order to show a finer breakdown of individuals with incomes under \$2,500 who constituted over 40 per

cent of the group. As with families of two or more (Table 11) the lowest income groups were on average the oldest. Average age of individuals ranged between 64 and 67 in the groups with incomes under \$2,000, and all groups, with the exception of the \$2,500-\$2,999 group, averaged over 45 years. Expenditure patterns were similar to those in Tables 2 and 11, except that the extension of the lower income classes heightened the differences between the two income extremes. This was most apparent in shelter, personal taxes and food. Shelter declined from 38-39 per cent for individuals with incomes under \$1,500 to 14 per cent for those with incomes over \$8,000. The proportion taken by personal taxes increased from zero in the lowest group to 27 per cent of total expenditure for the \$8,000 and over group. Food declined in importance from 32 per cent to 8.5 per cent between the two extremes of income.

Dollar expenditures on food per individual ranged from \$330 in the lowest income group, to \$1,114 and \$890 in the two groups over \$6,000. In both the income classes under \$1,500, however, from 5 to 6 per cent of individuals had no cash food expenses, because their board was provided in return for services. A similar situation held with regard to shelter: 10 per cent of individuals with incomes under \$1,000 had no shelter expenses, and would therefore be classified in Table 8 (Tenure of Head) as rent-free. Clothing expenses increased from \$52 in the lowest income group to \$527 in the highest. Medical care expenses, averaging \$65 and \$57 in the lowest income groups, reached a high of \$366 in the group with incomes of \$8,000 and over. It should be noted, however, that no account was taken in this survey of welfare benefits other than cash payments.

Over the whole group of one-person units, gifts and contributions represented 5.5 per cent of total expenditure, compared to 2.8 per cent recorded by families of two or more. One-person units showed greater generosity at every income level, in "widow's mite" terms, i.e., the percentage of total expenditure, which ranged from 3.2 per cent in the income group under \$1,000 to 7 per cent in the \$8,000 and over group. In contrast, families of two or more registered gifts and contributions varying between 2 and 3 per cent in income groups under \$8,000 and rising to a maximum of 3.2 for families with incomes of \$10,000 and over.

(d) Patterns by Expenditure Group

Classification of expenditures by level of total expenditure has been regarded as an alternative to the income classification when income information is either unobtainable or unreliable. Table 4, which employs this classification is very similar in appearance to the income classification in Table 2. However, in Table 4 average expenditure is approximately at the mid-point of each expenditure group, whereas in Table 2 the average of total expenditure is frequently above the upper limit of the income range. Average income appearing in Table 4 varies generally above the expenditure average, the only appre-

ciable difference in the other direction being in the expenditure groups over \$8,000. Chart III (page 23) shows the distribution of families within each income group classified according to their total expenditure. It is apparent from this chart that each income class represents a considerable range of expenditure classes, above and below the corresponding expenditure group.

The expenditure classification resulted in minor changes in family size and age of head. The percentage of homeowners in the \$10,000 and over expenditure group was 61 per cent compared to 68 per cent for the corresponding income group. The percentage of Canadian-born heads, and the percentage of wives employed full time were both lower in the \$10,000 and over expenditure class. However, the most interesting differences occurred in the net change in assets and liabilities, and in the account-balancing difference. The net financial changes became positive in all expenditure classes, and were smaller in size at both extremes, compared to the income classification. Families and individuals with incomes over \$10,000 registered a net financial change of +\$1,620, whereas for those with expenditure over \$10,000 it diminished to +\$468, reflecting the upward shift of families below that income level who were overspending, and the downward shift out of the class of families in that income level who were underspending. At the other end of the scale, a small positive change replaced a relatively large negative change, as overspending families moved out of the range and underspending families remained.

Account-balancing differences, which were negative in the income classification except in the top income group diminished in size and became positive in the lower expenditure groups. However, in the expenditure groups over \$5,000 they were negative and became larger in the expenditure groups over \$7,000.

The most striking effect of this re-distribution of families by expenditure level was the diminished average expenditure on transportation in all expenditure groups under \$8,000 compared with corresponding income groups, and the considerable increase in the groups over \$8,000, in which transportation accounted for 14.7 per cent and 15.7 per cent respectively. It was apparent that this increase was largely due to car purchase, which is included in current expenditures as the complete purchase price (excluding trade-in) of cars bought in the survey year. This also accounted for the great difference in the positive financial change, since the effect of increases in savings by families in this class with incomes over \$10,000 was in large measure offset by the increased debts or decreased savings of families with incomes under \$10,000.

(e) Patterns by Family Type

The classification of spending units by family type, as shown in Table 3, is of interest in that it takes into account family composition as well as

family size and sheds some light on changes in expenditure at different stages of the family life cycle. The youngest family-type groups were those composed of two adults and one or more children (under 16), with average age of head varying, from 34.5 to 38.5 years, as number of children increased. Families with three adults and children, four adults with children and five or more adults with or without children ("other" on Table 3), were older families with average age in the forties, the presence of additional adults reflecting the fact that one or more children were over 16 years. Age of head for families consisting only of adults averaged around 55 years, about twenty years older than the two-adult families with children.

Total expenditure by family type ranged from \$3,482 for one-adult spending units to \$9,949 for the "other" group which averaged 6.3 persons, 4.5 of whom were adults and 2.7 of whom were earners. The three family-type groups with income and expenditure over \$9,000, although not the largest in terms of family size, averaged the greatest number of earners per family. The range in earners per family was greater among family-type groups than by income groups, varying from .6 in the one-adult group to 2.7 in the "other" group. Thus, although average income per family for the latter group was \$10,182, on a per earner basis it averaged only \$3,771. The highest average incomes per earner were registered by two-adult families with three and four children, at \$5,887 and \$6,167, respectively. Further information on expenditure by family type is shown on Chart II (page 22) for percentage distribution of family type classified according to the family's total expenditure.

The classification of expenditures by family type reveals two exceptions to the generalization that food expenses take the largest share of the budget. For the one-adult group, shelter was the most important item, taking 21.8 per cent of total expenditure in contrast to 17.8 per cent for food. Also, the pattern of the relatively small group comprising one adult with children indicated that for this family type, on average, food and shelter were of approximately equal importance. While the importance of food in the budget was obviously related to family size and composition, in relative terms it was also conditioned by income and the level of total expenditure. Thus, although high food expenditures per family were registered in the "other" and four-adult groups, where number of earners and income were at a maximum, the largest proportionate spending on food occurred in the group composed of two adults and five or more children, where family size was at a maximum but average number of earners and average income were relatively low. The percentage allocated to food ranged from 30.2 per cent in the latter group down to 17.8 per cent for one-adult units. On a per person basis, however, the order of magnitude was reversed, with the one-adult unit averaging \$621 as compared to \$248 for the family with five or more children.

For all-adult families the percentage taken by shelter decreased with the number of adults from 21.8 per cent for one adult to 13.3 per cent for four adults, reflecting the fact that increases in shelter costs did not keep pace with increases in income arising from the increased number of earners. For two-adult families with children, however, the percentage taken by shelter tended to increase as number of children increased, moving from 17.4 per cent for two-adult families with one child to 18.5 per cent for families with five or more children.

Expenditure on clothing by family type varied between 7.5 per cent and 11.1 per cent of total expenditure. The highest percentage was registered by the "other" group, which averaged the highest expenditure of \$1,106 for an average family of 6.3 persons. For all-adult families clothing expenditure increased with family size from \$261 for one adult to \$813 for four adults. For two-adult families with children expenditure increased as family size increased from one to three children, but declined with four and five or more children. Thus, as with food, expenditure per person on clothing was lowest in the largest family group where it averaged \$73, and highest for the one-adult unit.

Transportation costs averaged highest for the family-type groups with the greatest number of earners, the highest dollar expenditure of \$1,301 being recorded by the four-adult group, 80 per cent of whom were car owners. The percentage of total expenditure ranged between 12.2 per cent and 15.5 per cent in the groups with three or more adults, in contrast to 6.2 per cent for families of one adult and one or more children. Expenditure on medical and health care also averaged a maximum for the families with three or more adults reflecting in part, perhaps, the fact that these families had older heads, as well as higher income levels which may have been associated with higher expenses for voluntary insurance plans and expenses such as dental care, drugs and eye care. Expenditures on health care for two-adult families with children increased as number of children increased up to three and four children, but declined in the group with five or more children, where income was lower, to a level below that averaged by families with only one child. Recreation expenses also increased as number of children increased from one to three, and declined on average in families with four and five or more children. The highest expenditure on recreation was recorded in the "other" group, at \$349 per family, which was 3.5 per cent of total expenditure. The latter proportion compared with 3.5, 3.7, and 3.6 per cent for families of two adults with one, two and three children.

(f) Patterns by Age of Head

Expenditure patterns by age of head are shown for all families and individuals, families of two or more and for one-person spending units in Tables 5, 12 and 17 respectively. Percentage distribution of all families and individuals by age of head classified according to size of their total expenditure appears

on Chart IV (page 24). In both Tables 5 and 12, average income and expenditure increased to a maximum in the two age groups between 35 and 54 and declined in subsequent groups as age of head increased, with the lowest levels of total expenditure being registered in the age groups over 65, where the average number of earners was lowest. Food and shelter expenses assumed greater importance in the upper age groups, accounting for 24.7 per cent and 27.8 per cent, respectively, in the entire group of families and individuals with head over 75 years. It was noted in Table 12 that among families of two or more, although the percentage of homeowners was highest in the age groups from 55 to 64, it was only slightly lower in the age groups over 65, two thirds of whom were recorded as owning their own homes. Thus, in dollar terms these families averaged the lowest shelter expenses. For the majority of budget groups, highest levels of expenditures were averaged by the families between 35 and 54. However, the youngest groups with heads aged under 34 had the highest expenditures on house furnishings and equipment. This was also the case in Table 5 for the 25-34 age groups of families and one-person units but the relatively large number of one-person units under 25 lowered the average for that group. The 25-34 age group also had the highest percentage of car owners and the highest average car operation expenses, although not the highest expenses for car purchase or other transportation.

Over the whole sample of families and individuals, expenses for medical and health care followed a pattern similar to other consumption groups, increasing to a maximum in the 45-54 age group. The presence of unattached individuals in this group resulted in an irregular pattern in age groups over 55. However, a well-defined upturn in the age group 75 years and over was evident in both Tables 12 and 17. For families of two or more, medical care expenses were at a maximum in the oldest group, accounting for 8.5 per cent of family expenditure. The detail shown in Table 21 shows that this family group had highest expenses for doctors' visits, hospital care, nursing care, drugs, and miscellaneous expenses which included ambulances and x-rays. Across the age-of-head groups the medical care detail shows a logical progression: highest expenditures on confinements occurred in the age groups under 45; dental care expenses rose by age of head to a maximum in the 45-54 age group; eye care registered the highest expenses in the 55-64 age group, but was only slightly lower in the adjacent groups; higher expenses on drugs were registered in the age groups over 60 years.

The distribution of one-person spending units by age in Table 17 shows that in spite of the average age of 53.9, almost one third of individuals were under 45 years, about the same percentage were between 45 and 65, while 37 per cent were over 65. The pattern of expenditure by age of head differed for one-person units from that of families, in that the highest level of expenditure was averaged in the 25-34 age group. However, the two groups from 35-54 years had only slightly lower averages of

income and expenditure. Total expenditure declined steadily by age of head after 54 years, with the exception of the 70-74 age group. The higher expenditure in the latter group may be attributed to sampling variation, since it resulted from the inclusion of one high-income individual in a sample of only 33. If this record were deleted, the pattern of expenditure for the 70-74 age group would have assumed levels and proportions between the two adjacent groups.

It has already been noted that one-person units as a group devoted a greater proportion of expenditure to shelter than to food. This was true for all age groups, with the exception of the under 25 group where shelter was second in importance to food. A small percentage of one-person units had no cash expenditures on food and shelter because they were domestic servants living with other spending units. About 6 per cent of these were concentrated in the under 25 group and 5 per cent of the 65-69 age group were in this class.

Variations in expenditure of one-person units among different age groups may have resulted from differing proportions of males and females. Over the whole group, women were in the majority, in a ratio of about 3 to 2. An unpublished table summarizing expenditures of one-person units classified by sex showed that although women averaged lower income and total expenditure than men, they averaged higher expenditures on clothing, shelter, household operation, furnishings and equipment, medical care and personal care. Men, on the other hand, averaged more on food, transportation, recreation, tobacco and alcoholic beverages. Classified by age, it can be seen from Table 17 that highest expenditures on recreation and transportation were averaged by the 25-34 age group, whereas expenditure on smoking and alcoholic beverages was highest in the 35-44 age group. The highest average expenditures for most consumption groups were to be found in the three groups aged from 25 to 54. Exceptions to this were furnishings and equipment, household operation and medical care, which registered highest averages in groups over 54.

(g) Other Classifications

The intention in the foregoing pages has been to direct the reader's attention to highlights of the accompanying tables and to suggest various modes of looking at various tables. There is no pretence at being exhaustive. Very little has been said about the detailed tables, and several interesting classifications remain unexplored. These are Tables 6 to 9 (A11 Families and Individuals), viz., Occupation of Head, Education of Head, Tenure of Head, and Country of Origin of Head; Tables 13 and 14 (Families of Two or More) viz., Number of Full-time Earners, and Employment Status of Wife of Head.

Classification of families and individuals by occupation and by education of head reveal variations associated with the average income levels in

the various classes. Tables 13 and 14 which classify families of two or more according to number of earners and employment status of the wife of head also provide expenditures related to different aspects of family income. It should be noted that in Table 13 the classifying variable is "full-time" earners, i.e., those employed for 48 weeks or more. The number of earners shown as an average in the family characteristics at the top of the table refers to all earners and averages 1.5 for the group.

Slightly more than 60 per cent of families of two or more had only one full-time earner, but averaged .3 additional earners. In Table 14 it can be seen that in 59 per cent of families the wife of the head was not employed outside the home, and that about half of the wives who were employed were full-time earners. Income for the three groups of families showed substantial differences which were reflected in expenditure levels. The largest group where the wife was not employed recorded an average total expenditure of \$6,994 whereas the families with part-time and full-time earners respectively averaged \$7,127 and \$8,120.

The classification by tenure of head provides information on spending by various owner and tenant groups, including shelter costs per owner and per tenant. As indicated throughout the tables the percentage of homeowners over the whole sample was 45 per cent. Over half of these were families with mortgage, who averaged about 15 years younger than the remaining mortgage-free owners. Tenants were divided into regular tenants, roomers, and a small group of rent-free spending units who recorded small outlays on repairs. A third group, called mixed-tenure families, was the youngest tenure group, averaging 39.9 years. These families averaged higher incomes than either owners without mortgage or tenants, but ranked below owners with mortgage in income and family size. They consisted mainly of families who moved from renting to home ownership and consequently averaged the highest expenses for shelter and furnishings and equipment. They registered the largest positive net change in assets and liabilities, but also averaged a high negative balancing difference. (See page 7.)

The classification of families by Country of Origin permits comparison between spending patterns of Canadian-born and foreign-born families, with a breakdown of the latter by country of origin or by groupings of countries. Somewhat more than two thirds of the sample were Canadian-born, and about a third of the foreign-born were of British origin. Income and expenditure levels of Canadian-born families averaged higher than all immigrants combined, but average income was below levels registered by the German and Italian group. The two latter groups were the youngest, and along with Polish-born families registered the highest percentages of wives employed. The German-born group in the sample demonstrated their thriftiness by averaging an unusually high positive net change in assets and liabilities.

OWNERSHIP OF DURABLES

Table III—Percentage Distribution of Durables owned December 31, 1964, by Year of Purchase, — indicated two main concentrations of purchases. About one quarter of the number of each of the main household appliances owned, stoves, electric refrigerators, vacuum cleaners etc., were purchased during the years 1953 to 1957; probably as a result of a build-up of demand, in the war and post-war years, which could not be met due to lack of supply. The purchase of television and television combinations, which came into general use in Canada in the early fifties, was reflected in 32 per cent of those owned in 1964 having been purchased in the years 1953 to 1957 also. Relatively recent developments in the general use of appliances such as dishwasher, humidifier, tape recorder and air conditioner resulted in the largest proportion of those reported in the 1964 survey falling into the period 1963-64. Also,

over 50 per cent of the automobiles owned at the end of 1964 had been purchased within the previous two-year period.

About 90 per cent of all household appliances had been bought new. More automobiles, on the other hand, were purchased used than new, about 55 per cent, reflecting the considerably larger outlay needed for new cars.

Of the older appliances still owned at the end of 1964, sewing machines predominated. Over half the non-electric machines which were purchased new and still owned at the end of the survey year, were bought before 1939 as were 18 per cent of those purchased used. Of the electric sewing machines 10 per cent of those bought used were purchased prior to 1939.

TABLE III. Percentage Distribution of Durables Owned December 31, 1964, by Year of Purchase, All Families and Individuals, Eleven Cities, 1964

Item	Year of purchase								Total
	1963 to 1964	1961 to 1962	1958 to 1960	1953 to 1957	1948 to 1952	1939 to 1947	Before 1939	Gifts or unspecified

Information was also collected on number and proportion of spending units in the survey which had the use of specified major household facilities. The term "use of" allows the inclusion of renters, particularly renters of apartments, and roomers who do not usually own major household appliances. A comparison of the proportion of survey families having the use of telephones, furnaces, refrigerators, cooking equipment and washing machines was very similar to the proportion of households reporting the same

facilities in the Household Facilities and Equipment Survey which covered a national sample of 30,000 households in 1964.¹ In the urban survey 93 per cent of spending units had the use of telephones and 97 per cent refrigerators. The corresponding national proportions in the Household Facilities and Equipment Survey were 88 and 95. For washing machines the national percentage was 87 per cent of households compared to 83 per cent of families in the urban survey.

NOTES AND DEFINITIONS

I. Family and Family Characteristics

Family. — The family or spending unit is defined as a group of persons dependent on a common or pooled income for the major items of expense and living in the same dwelling. Never-married sons or daughters living with their parents are considered as part of their parents' spending unit. In the great majority of cases the members of spending units of two or more are related by blood, marriage or adoption, and are thus consistent with the "economic family" definition employed in surveys of family income. "a group of individuals sharing a common dwelling unit and related by blood, marriage or adoption". The definition of family employed by the population census restricts the family to husband, wife and any unmarried children living with them, or one parent and unmarried children. Individual or one-person spending units are financially independent persons living alone or as roomers.

Family head. — In husband-wife families, the husband was considered as head. In one-parent families with unmarried sons or daughters, the parent was considered head. In all other types of spending units, the head was the person mainly responsible for the maintenance of the spending unit.

Age of family members. — In all cases the age referred to was the age at December 31, 1964, in other words the age attained at the 1964 birthday.

Adult. — Person 16 years of age or over at December 31, 1964.

Child. — Person under 16 years of age at December 31, 1964.

Family type. — Defines the family in terms of numbers of adults (A) and children (C) listed as family members during the survey year, e.g. 2A/1C represents two adults and one child.

Earners. — Any person 14 years of age or over who earned more than \$250 in the survey year.

Employment status of wife. — Refers only to number of weeks worked within the survey year including holidays with pay. No distinction was made between full-day and part-day employment.

Full-time employment refers to employment of 48 weeks or more. **Part-time employment** refers to employment from one to 47 weeks. **No wife of head** refers to families other than husband-wife families, and includes families where the head was a female.

Homeowner. — Refers to families living in a dwelling (either with or without mortgage) owned for the entire survey year by a member of the spending unit.

Car owner. — Refers to families owning a car at December 31, 1964.

Occupation of head. — Based upon the Standard Occupational Classification published by the Dominion Bureau of Statistics, April 1961.

City. — Refers in each case to the metropolitan area or urban area comprising city proper and fringe areas.

Country of origin. — Refers to country where family head was born. **British** includes those born in United Kingdom, Ireland, Australia, New Zealand, South Africa, Malta and Jamaica. **Other West European** includes those born in Belgium, the Netherlands, France, Portugal, Spain, Switzerland and Scandinavia. **Other East European** includes those born in the Ukraine, Russia, Hungary, Lithuania, Latvia, Estonia, Czechoslovakia, Roumania and Greece. **German** also includes immigrants from Austria. **Other** includes Asian except Russian and African except South African.

II. Income, Expenditure and Other Financial Items

Money income. — Included: (1) Employment income i.e. gross income from wages and salaries; net income before taxes from self-employment; and receipts from military pay and allowances. (2) Other income i.e. gross receipts from roomers and boarders; net rentals; family allowances; interest and dividends; all pensions; workmen's compensation and

¹ "Household Facilities and Equipment, May 1964", DBS Catalogue No. 64-202.

unemployment insurance benefits; regular receipts from insurance policies and annuities; and miscellaneous regular income receipts.

Other money receipts. — Reported but not included in income, comprised inheritances; bequests; lump sum settlements from property insurance, accident and health policies; and irregular gifts from outside the family.

Net change in assets and liabilities. — Referred to net changes during the survey year in assets such as bank accounts, money on hand, investments in business, stocks and bonds (excluding change in market value), loans made to others, and the sale of real estate and personal possessions along with net changes during the survey year in liabilities such as mortgages, notes due to banks, loan and insurance companies, etc., instalment purchases, charge accounts and other bills, rents and taxes. If on balance a family dissaved, i.e. if credits (net increase in assets and net decreases in liabilities) were exceeded by debits (net increase in liabilities and net decrease in assets) then, this would result in a negative figure (-). There was no allowance for depreciation in any of these asset changes.

Expenditures for current consumption. — Included expenses incurred during the survey year for food, housing, fuel, light and water; household operations; clothing; automobile purchase and operation; other transportation; medical care; personal care; reading; recreation; education; smoking and alcoholic drinks and a miscellaneous group. Consumer durables such as automobiles and household equipment were considered as consumption items, but changes in equity, purchases and sales of homes were considered as changes in assets and liabilities. Family expenditures for items used partially for business, such as home or cars were adjusted to exclude the amount chargeable to business use. Sales, excise, automobile and real estate taxes were included as part of consumption expenditure for the commodity or service to which these taxes applied.

Food prepared at home. — All food purchased to be served at home or carried away from home in lunches, including cost of food served to boarders.

Rent. — The net family expense for contract rent after adjustment for any use of the dwelling for business. There was, however, no adjustment in rent for partial sub-letting to roomers or boarders.

Fire insurance. — Premiums paid on policies for fire and comprehensive policies. Amounts paid in premiums covering more than the survey year were not pro-rated.

Housing repairs. — Amount spent for labour and materials for all types of repairs and maintenance. Costs of improvements (such as added rooms, garages, etc.) which are considered increases in assets, were not included.

Repair materials. — Cost of materials purchased separately by family.

Repairs—contract cost. — Included both cost of materials and the labour for repair jobs done by professional building craftsmen.

Mortgage interest. — Was calculated on the basis of the terms of the individual homeowner's mortgage contract. The mortgage principal repayments in the survey year were not considered as expenses, and hence they were not included in either shelter costs or total expenditure, but counted as decreases in liabilities.

Other owner expenses. — Included real estate commissions, lawyers' fees connected with home ownership, and mortgage insurance fees and premiums.

Gas. — Delivered in mains, by tank truck or in containers.

Other heating costs. — Included such things as payments for central community heating and rental of heating equipment.

Telephone. — Basic charges plus long distance, installations, extension, etc.

Household moving expenses. — Did not include trailer or truck rental for purposes of moving (See transportation).

Paid help. — Included maids, landscape gardeners, charwomen, lawnmowing, etc.

Miscellaneous household operation. — Included matches, insecticides, flowers for home, ice, rental of freezer lockers, etc.

Other kitchen equipment. — Included wooden utensils, canning materials and jars.

Other kitchen electrical equipment. — Included can openers, blenders, etc.

Other electrical equipment. — Included coffee warmers, heating pads, electric clocks, etc.

Other household textiles. — Included mattress covers, runners, etc.

Car purchase. — Was net of trade-in allowance (or sale) and discount. It included the purchase price of the automobile, extra equipment and accessories bought when the car was purchased and all financing charges. Car purchase was adjusted for business use only for spending units whose major source of income was self-employment.

Car operation. — Where the car was used for both business and family use the car operation expenditures were adjusted to account only for family use.

Other -- boat, steamship. -- Included pleasure cruises but excluded boat passage as part of a package tour (see recreation).

Other prepaid plans. -- Included school insurance.

Physician's care, etc. -- Physician's care, eye care, dental care, hospital care, nursing care, etc. referred only to expenditures made by the family on that portion of the health services **not** covered by the prepaid plan (s) held by the family.

Other medical expenses. -- Included X-rays, laboratory tests, etc.

Other recreation expenses. -- Included repairs to cameras, sporting, recreation goods, recreation on trips not elsewhere specified.

Other miscellaneous. -- Largely fees paid for lawyers' services such as wills, etc.

III. Technical Definitions

Weighted number of families. -- Survey results were adjusted by city weight factors, designed to give each city the relative importance of its population. In some cities different weights were assigned to individuals to compensate for lower response rates for this group.

Weighted percentage of families. -- The weighted number of families in a specified cell was expressed as a percentage of the total weighted number of families in the survey. In the definitions which follow the term "weighted" is implicit.

Family size. -- Family size or "year-equivalent persons" was computed by dividing the total number of weeks during which family members belonged to the unit in the survey year by 52 weeks. In this way, part-year members were counted as fractions of a year-equivalent person.

Average per family. -- The averages were based on all families in each class, whether or not they reported purchases of a particular item. Averages were calculated by dividing the aggregate amount of income or expenditure in a given class by the total number of families in the class. Because all averages for a class are obtained by a common divisor they are additive.

Percentage reporting. -- Percentage reporting was obtained by dividing the number of families reporting the specified item of income, or expenditure, by the total number of families in the class. Average amounts for families reporting a specified item can be developed from this by dividing the average dollar expenditure by the percentage reporting.

Percentage distribution. -- The expenditure on a specified item of expenditure was expressed as a percentage of total expenditure.

A. FAMILY COMPOSITION IN 1964

Line no.	1.	2.	3.		4.	5.	6.		7.
	Relationship to head of family	Age last birthday	Sex		Marital status		Occupation of each family member 14 years of age and over	How many weeks was this person a member of the family?	
			M	F			At home	Away from home	Membership now Check (✓)
01	Head		<input type="checkbox"/>	<input type="checkbox"/>					
02			<input type="checkbox"/>	<input type="checkbox"/>					
03			<input type="checkbox"/>	<input type="checkbox"/>					
04			<input type="checkbox"/>	<input type="checkbox"/>					
05			<input type="checkbox"/>	<input type="checkbox"/>					
06			<input type="checkbox"/>	<input type="checkbox"/>					
07			<input type="checkbox"/>	<input type="checkbox"/>					
08			<input type="checkbox"/>	<input type="checkbox"/>					
09			<input type="checkbox"/>	<input type="checkbox"/>					
10			<input type="checkbox"/>	<input type="checkbox"/>					
11			<input type="checkbox"/>	<input type="checkbox"/>					
12			<input type="checkbox"/>	<input type="checkbox"/>					

8. Relationship of head of family to head of household:
 1 Is head of household
 2 Relative, younger than head
 3 Relative, older than head
 4 Not related to head

9. Was head of family born in Canada? Yes No
 Year of arrival in Canada: _____
 Country of origin: _____

10. Mother tongue of head (language first learned and still understood)
 Check: 1 English 2 French 3 Other

11. Education of head: Enter highest grade (or year) completed in the cell for the highest level of education completed.

None	Elementary		Secondary		University	
	Partial	Complete	Partial	Complete	Partial	Complete
<input type="checkbox"/> 0	<input type="checkbox"/> 1	<input type="checkbox"/> 2	<input type="checkbox"/> 3	<input type="checkbox"/> 4	<input type="checkbox"/> 5	<input type="checkbox"/> 6

B. LIVING QUARTERS AND FACILITIES, DECEMBER 31, 1964

1. Type of dwelling: 1 House 2 Duplex or triplex 3 Other, apartment or flat 4 Rooms 5 Other
 2. Owned or rented:
 1 Owns without mortgage 4 Rents, furnished
 2 Owns with mortgage 5 Rents, unfurnished
 3 Owned part year, rented part year 6 Rent - free

3. No. of rooms in dwelling unit
 No. of rooms rented to others
 No. of rooms used for business

4. Living facilities:

	Yes	No		Yes	No
(a) Running water from taps	<input type="checkbox"/>	<input type="checkbox"/>	(e) Other heating equipment, e.g. space heater	<input type="checkbox"/>	<input type="checkbox"/>
(b) Flush toilet	<input type="checkbox"/>	<input type="checkbox"/>	(f) Mechanical refrigerator	<input type="checkbox"/>	<input type="checkbox"/>
(c) Telephone	<input type="checkbox"/>	<input type="checkbox"/>	(g) Installed cooking stove	<input type="checkbox"/>	<input type="checkbox"/>
(d) Furnace heating	<input type="checkbox"/>	<input type="checkbox"/>	(h) Power washing machine	<input type="checkbox"/>	<input type="checkbox"/>

5. Did living quarters change during 1964? No Yes
 Give date or dates and explain, e.g. - Sold home on June 1, 1964 and moved to apartment

6. For owner occupied dwellings: If you were selling this dwelling now, what price would you expect to get for it?

D. SHELTER EXPENSES IN 1964

I. RENTED LIVING QUARTERS

1. How many months in 1964 did you occupy a rented dwelling? 01
2. Rent payments total (including business quarters) 02

Month	Rent paid for (\$)		Meals per day included in rent	Month	Rent paid for (\$)		Meals per day included in rent
	Quarters only	Quarters and board			Quarters only	Quarters and board	
January				July			
February				August			
March				September			
April				October			
May				November			
June				December			

3. Repairs, decorating, improvements paid by family in rented dwelling 03
4. Concessions in rent made by landlord (explain) 04
5. If the rent paid covered premises used for business or rented to others what percent of rent was chargeable to this use?
- Own business 05 p.c.
- Rented to others 06 p.c.

II. OWNED LIVING QUARTERS

6. How many months in 1964 did you occupy a dwelling you owned? 07
- Report total expenses for your household for questions 7 to 10 below.
7. Property taxes and special assessments 08
8. Premium for insurance on home (total premium paid in last 12 months) 09

9. Repairs and replacements, including decorating. If work done by family member enter under materials only. Repairs restore the home to its original condition, while improvements and additions add to its value. Repairs include painting, papering, repairs to floors, roof, etc. Repairs also include replacement of things worn out, such as water pipes, furnace, hot water heater, etc.

	Materials only		Contract cost	
	\$	¢	\$	¢
(a) Painting, outside and inside	10		24	
(b) Papering and plastering	11		25	
(c) Wood floors	12		26	
(d) Replacement of tiles (linoleum in G. 16)	13		27	
(e) Plumbing	14		28	
(f) Heating system	15		29	
(g) Electrical work	16		30	
(h) Roofing	17		31	
(i) Masonry	18		32	
(j) Carpentry	19		33	
(k) Metal work	20		34	
(l) Grounds	21		35	
(m) Other (specify)	22		36	
	23		37	
			38	

10. If you used your dwelling for your business quarters or for rental quarters as well, what percent of expense was chargeable to this use?
- Own business 39 p.c.
- Rented to others 40 p.c.

D. SHELTER EXPENSES IN 1964 - Concluded

11. Cost of new additions and major improvements (list items). Improvements would include the additions of a room, or the installation of equipment, e.g. screens, which you did not have before. Describe the kind of work done and whether you did it yourself with or without paid help or whether an outside firm or contractor did the job.

01	\$	
02	\$	
03	\$	

Mortgage on owned living quarters

12. If the mortgage refers to a building containing more than one household (duplex, etc.), what percentage of this building is occupied by your household?

		Building occupied at the end of 1964		Other building occupied in 1964	
04		%		05	%
		(a) 1st mortgage	(b) 2nd mortgage	(c) mortgage	
06	\$	23	\$	40	\$
07		24		41	
08		25		42	
09		26		43	
10		27		44	
11	\$ per	28	\$ per	45	\$ per

13. (i) Original value of present mortgage
 (ii) Length of mortgage in years
 (iii) Starting date - Year and month
 (iv) Finishing date - Year and month
 (v) Interest rate on loan - %
 (vi) Regular payments on mortgage

(vii) Type of mortgage:
 Code: (1) C.M.H.C. (2) Institutional (3) Individual

(viii) Was mortgage (1) new or (2) assumed?
 Code

(ix) Charges included in regular payments on each mortgage:
 Interest
 Principal
 Taxes
 Water
 Property insurance
 Mortgage insurance
 Other (what kind?)

		29		46	
13		30		47	
		Yes	No	Yes	No
