HOUSEHOLD FACILITIES AND EQUIPMENT

I INTRODUCTION

In September, 1954, the Dominion Bureau of Statistics carried out a special survey of housing characteristics, and household equipment in private homes. The survey was made in conjunction with the monthly labour force survey. Over 30,000 households, chosen by area sampling methods, in 114 areas were visited. A similar survey was carried out in September, 1953, the results of which were contained in the report "Household Facilities and Equipment, September, 1953".

Estimates based on data obtained from the survey are presented in the following tables of this report:

Tables 1 - 7:	Housing characteristics
Table 8:	Electrification of dwellings
Tables 9 - 16:	Heating facilities
Tables 17 - 19:	Plumbing facilities
Tables 20 - 24:	Household equipment
Tables 25 - 27:	Telephones, radios and television receivers
Tables 28, 29:	Automobiles

II DEFINITIONS

DWELLING: A dwelling is defined as a structurally separate set of living premises with private entrance from outside the building, or from a common hallway or stairway inside. All occupied dwellings are represented except hotels, large lodging houses, institutions, clubs, camps, and other such collective types of living quarters.

HOUSEHOLD: A person or a group of persons occupying one dwelling unit is defined as a "household". Every individual is a member of some household. The number of households will thus be equal to the number of occupied dwellings.

SINGLE DETACHED DWELLING: This type of dwelling is commonly called a single house, i.e., a house containing one dwelling unit and completely separated on all sides from any other building or structure.

SINGLE ATTACHED DWELLING: Each half of a semi-detached (or double) house, and each section of a row or terrace is defined as a "single attached" dwelling.

APARTMENTS AND FLATS: These include:

- (i) dwelling units in apartment blocks or apartment hotels;
- (ii) suites in duplexes or triplexes, i.e., where the division between dwelling units is horizontal;
- (iii) suites in structurally converted houses;
- (iv) living quarters located above, or in the rear of stores, restaurants, garages, or other business premises;
- (v) janitors' quarters in schools, churches, warehouses, etc.; and
- (vi) private quarters for superintendents in hospitals or other types of institutions.

ROOMS: In determining the number of rooms in a dwelling, only those rooms used or suitable for living purposes, including rooms occupied by servants, lodgers, or members of lodging families, are counted. The following are not counted as rooms: bathrooms, pantries, halls, clothes closets, and rooms used solely for business purposes. Summer kitchens, sun-rooms, rooms in basements or attics are not counted unless they are finished off and suitable for living quarters throughout the year. "Kitchenettes" are included if the normal kitchen functions are carried out therein and if they contain, as a minimum, cooking facilities (such as a stove or range) and a sink or tub.

MONTHLY RENT: Figures on monthly rent are based on the rent paid for the month of September, 1954.

III RELIABILITY OF ESTIMATES

The estimates in this report are based on a sample of households and may differ from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions and enumerators.

The approximate sampling variability of estimates of various sizes is shown in the table below. The chances are about 19 out of 20 that the difference between the estimate and the figure which would have been obtained from a complete census is less than the sampling variability indicated.

<u>Size of Estimate</u>	<u>Sampling Variability</u>
4,000	2,000
10,000	4,000
25,000	6,000
50,000	8,000
100,000	11,000
250,000	16,000
500,000	22,000
1,000,000	30,000

The sampling variability associated with estimates of less than 4,000 is proportionately larger than fifty per cent. In the tables, estimates which are less than 4,000 are replaced by an asterisk.

The yearly estimates of household facilities, obtained from the Labour Force continuing sample, are subject to a sampling variability whose size, for differing estimates, is approximated in the above table.

Differences from year to year in corresponding estimates are themselves subject to a variability which is dependent on the sizes of the estimates, their inherent variability, and the interdependence of the samples used. In the Canadian Labour Force Survey the samples from year to year differ in the households enumerated and, in some cases, in the geographical areas included in the sample. The estimates as here published constitute the best 1954 estimates of the numbers of households and their characteristics. However, differences between successive years, especially for smaller provinces in matters where the change has been small are subject to substantial sampling variation. This variation could be reduced by an increase in the sample size from the one per cent here used, but it is considered that for most analyses of household facilities the accuracy here provided is adequate. It is suggested that in using this series of annual bulletins to establish year-to-year changes in household facilities the comparison be confined to percentages of households having given facilities.

In addition to the sampling variability outlined above, the data obtained from either a sample or a census will differ from the actual data because of enumerator and respondent variations. The principal elements of this nature are as follows:

1. The enumerator may misinterpret the concepts and definitions despite careful instruction.
2. The enumerator may, by chance, phrase questions which influence the answers of the respondent.
3. The respondent may, by chance, phrase answers which influence the questions by the enumerator.
4. There may be deliberate mis-statements by either enumerator or respondent.

The non-sampling error is as prevalent in a complete count as in a sample, and, in some cases, may exceed the error introduced by sampling.
