HOUSEHOLD FACILITIES AND EQUIPMENT

MAY 1961

I INTRODUCTION

The estimates of total households for Canada and the provinces contained in this report are based on estimates of population derived from the 1956 Census adjusted for biths and deaths, immigration and emigration since then. These may differ from the counts obtained in the 1961 Census, the results of which are still being tabulated. See also the last paragraph of this section and the sections on "Coverage" and "Reliability of Estimates".

Since 1953, the Dominion Bureau of Statistics has carried out an annual survey of household characteristics and household equipment in private homes. This report presents the results of the latest survey, carried out in May 1961. The survey was made in conjunction with the monthly labour force survey. Over 35,000 households, chosen by area sampling methods in about 170 areas were visited.

There were several changes in the content of the survey questionnaire from last year. Questions on automatic dishwashers, F.M. radio receivers, and phonographs and record players were included for the first time in the survey this year. Electric floor polishers, lawn mowers and outboard motors, which were covered in 1960, were not included on the 1961 questionnaire.

A summarization by broad groupings of the characteristics covered in the tables of this report follows:

Tables 1 - 9: Housing characteristics

Tables 10 - 13: Heating equipment and fuel

Tables 14 - 17: Water supply and plumbing facilities

Tables 18 - 24: Household appliances

Tables 25 - 28: Telephones, radios and televisions
Table 29: Phonographs and record players

Tables 30 - 31: Automobiles and garage facilities.

The estimates of total households for the 1958, 1959, 1960 and 1961 surveys were based on the 1956 Census and are not strictly comparable with those for the 1953-1956 surveys which were based on the 1951 Census. The originally published estimates of total households for 1957 were based on the 1951 Census; however, to provide comparability with the 1958 estimates, they were revised to the 1956 Census base and published as an appendix in the 1958 report.

II COVERAGE

The sample for this survey is designed to include all households in Canada with certain exceptions. Excluded are: households in the Yukon and Northwest Territories; households on Indian reserves; institutional households; military camps; other collective type households such as those living in hotels, large lodging houses, clubs, logging and construction camps; certain private households living in trailers, in summer cottages, on boats, etc. 1961 Census reports to be issued starting about mid-1962 will contain counts of total dwellings as well as data on housing characteristics and household equipment. In addition to provincial data, the Census will provide statistics for more detailed geographical areas, such as counties and urban centres.

III DEFINITIONS

DWELLING: A dwelling is defined as a structurally separate set of living premises with private entrance from outside the building, or from a common hallway or stairway inside.

HOUSEHOLD: A person or a group of persons occupying one dwelling unit is defined as a "household". Every individual is a member of some household. The number of households will thus be equal to the number of occupied dwellings.

SINGLE DETACHED DWELLING: This type of dwelling is commonly called a single house, i.e., a house containing one dwelling unit and completely separated on all sides from any other building or structure.

SINGIE ATTACHED DWELLING: Each half or a semi-detached (or double) house, and each section of a row or terrace is defined as a "single attached" dwelling.

APARTMENTS AND FLATS: These include:

- (i) dwelling units in apartment blocks or apartment hotels;
- (ii) suites in duplexes or triplexes, i.e., where the division between dwelling units is horizontal;
- (iii) suites in structurally converted houses;

- (iv) living quarters located above, or in the rear of stores, restaurants, garages, or other business premises;
- (v) janitors' quarters in schools, churches, warehouses, etc.; and
- (vi) private quarters for superintendents in hospitals or other types of institutions.

ROOMS: In determining the number of rooms in a dwelling, only those rooms used or suitable for living purposes, including rooms occupied by servants, lodgers, or members of lodging families, are counted. The following are not counted as rooms: bathrooms, pantries, halls, clothes closets, and rooms used solely for business purposes. Summer kitchens, sun-rooms, rooms in basements or attics are not counted unless they are finished off and suitable for living quarters throughout the year. "Kitchenettes" are included if the normal kitchen functions are carried out therein and if they contain, as a minimum, cooking facilities (such as a stove or range) and a sink or tub.

BEDROOMS: Included as "bedrooms" are all rooms designed and furnished as bedrooms, and used as such, even though the use may be occasional as in the case of a "spare" bedroom. Bed-sitting rooms, or other such rooms used for sleeping and living, are not included. In the case of all one-room dwellings, such as bachelor apartments, and of many other small dwellings, no "bedroom" would be reported.

IV RELIABILITY OF ESTIMATES

The estimates in this report are based on a sample of households and may differ from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions and enumerators.

The approximate sampling variability of estimates of various sizes is shown in the table below. The chances are about 19 out of 20 that the difference between the estimate and the figures which would have been obtained from a complete census is less than the sampling variability indicated.

These estimates are averages since sampling variability differs from characteristic to characteristic and from year to year.

Size of Estimate	Sampling Variability
4,000 10,000 25,000 50,000 100,000 250,000	2,000 4,000 6,000 8,000 11,000 16,000
1,000,000	22,000 30,000

The sampling variability associated with estimates of less than 4,000 is appreciably larger than fifty per cent. In the tables, estimates which are less than 4,000 are replaced by an asterisk.

The yearly estimates of household facilities, obtained from the Labour Force sample, are subject to a sampling variability whose size, for differing estimates, is approximated in the preceding table.

Differences from year to year in corresponding estimates are themselves subject to a variability which is dependent on the sizes of the estimates, their inherent variability, and the interdependence of the samples used. In the Canadian Labour Force Survey the samples from year to year differ in the households enumerated and, in some cases, in the geographical areas included in the sample. The estimates as here published constitute the best 1961 estimates of the numbers of households and their characteristics. However, differences between successive years, especially for smaller provinces in matters where the change has been small are subject to substantial sampling variation. This variation could be reduced by an increase in the sample size from the one per cent used, but it is considered that for most analyses of household facilities the accuracy provided is adequate. In using this series of annual bulletins to establish year-to-year changes in household facilities, the effect of sampling variability will be reduced to some extent if percentages of households having given facilities are compared rather than estimates of actual numbers.

In addition to the sampling variability outlined above, the data obtained from either a sample or a census will differ from the actual data because of enumerator and respondent variations. The principal elements of this nature are as follows:

- 1. The enumerator may misinterpret the concepts and definitions despite careful instruction.
- 2. The enumerator may, by chance, phrase questions which influence the answers of the respondent.
- 3. The respondent may, by chance, phrase answers which influence the questions by the enumerator.
- 4. There may be deliberate mis-statement by either enumerator or respondent.

The non-sampling error is as prevalent in a complete count as in a sample, and, in some cases, may exceed the error introduced by sampling.
