CONSUMER MARKET DATA

INTRODUCTION

Recent years have witnessed an increasing demand for information to serve as a basis for estimating the relative values of different sections of the country as markets for various commodities or services. It is a commonplace that marketing effort should be distributed geographically in accordance with the purchasing power of the markets concerned. Any estimate of the capacity of a market to absorb a commodity must be founded on a number of factors such as the character and buying habits of the population, their source and size of income, accessibility, competition to be met and other indicators of the market in question.

To meet these demands for information a large body of statistical data exists. Population statistics are of long standing. Figures covering industrial production date back to 1870. Statistics of distribution are of more recent origin, the first complete census of all merchandising establishments having been taken as part of the Decennial Census of 1931 and covered the business transacted in the preceding year. The object of this handbook is to bring together under one cover some of the salient facts of population, production and distribution, broken down into small geographical units convenient for the market investigator. References are made to the original reports in which the figures were originally published and in which further details may be found.

ARRANGEMENT AND USE OF DATA

The information presented has been arranged by provinces. Within each province figures are given for counties or Census divisions in the western provinces and wherever possible for centres of 2,000 population or over within each county or Census division. The size of locality for which separate figures are available is not uniform for all series and the detail presented in the handbook has, of necessity, been governed by this factor. Nor has it been possible to have figures for all series relate to the same period. The population statistics relate to 1931. Wholesale and retail trade figures on a detailed regional basis are available only for 1930 as a result of the Census of Merchandising which was taken for that year. Statistics of industrial production are collected annually. Figures for this series shown herein relate to the year 1936, the latest available when the compilation of the handbook was commenced. Other series relate to the year 1937.

A great deal of data exist which relate to markets for a wide variety of commodities. The first step was to select those items which promise to be of the greatest value. In this connection the Bureau has been influenced by the procedure in a similar work of the Bureau of Foreign and Domestic Commerce of the United States Department of Commerce. Because the problems and source material of the United States and Canada are in many ways similar and in the belief that it will add to the convenience of American and Canadian students, an effort has been made in the present handbook to parallel the American publication and provide similar information wherever possible. Unfortunately some important types of data have had to be omitted either because they were not available by geographic divisions or not at all. The items of information in the following pages fall into five groups:

1. Population and Dwellings--The first group of factors shows the number of persons, the proportion of Canadian born, British born and foreign born, the number of households and the number of dwellings in each geographical unit. These data should indicate with some accuracy the number of purchasing units within the community being studied.

2. Business and Industry--While population statistics are usually the starting point of any market investigation, they must be qualified by many factors. The second group of items, therefore, supplements the first group with statistics of business and industry in each geographical unit. The object is to "describe" the community economically. The number of retail stores and their sales are given as well as the number of wholesale establishments and volume of wholesale sales. Both retail and wholesale statistics have been taken from the 1930 Census. The number of manufacturing plants and value of their production as ascertained for 1936 are also shown together with the number of farms and gross value of farm production for 1930. These factors serve to indicate the character of the various communities, showing whether they are predominantly agricultural, industrial or commercial.

3. Employment and Payroll--Under this heading information taken from the 1931 Census is given on the number and wages of employees engaged in retailing and wholesaling. Similar information regarding employees engaged in manufacturing is shown for 1936. No figures are available showing the income of farmers, professional men or those engaged in the various services.

4. Retail Distribution by Groups, 1930--This group of factors shows the importance of the different types of retail outlets in each community. The total number of retail stores and volume of sales are shown by kind-of-business groups, indicating where the community spends its retail dollar.

5. Related Indicators of Consumer Purchasing Power--The final group of statistics completes the economic picture of the community. It consists of five factors which are regarded as indicative of the community's purchasing power and for which figures are available. These should be studied in connection with the foregoing statistics. Passenger cars registered, new passenger car sales, domestic electric meters and homes with radios are given for 1937 and are shown in terms of every 100 households for each geographical unit whenever available. Farm values for 1931 are also shown.

In the tabulation of retail sales there is a tendency to overestimate the purchasing power of the urban dweller compared with that of people living in rural communities. There is no information showing the proportion of business done in city stores by urban and rural dwellers. This, however, should not seriously affect the value of the tables. The actual sales potential of the market is shown. Whether that market value is due to purchases made by residents or out-of-town visitors may

be regarded as of secondary interest to the student of marketing. Nevertheless this factor will be misleading in any calculation of per capita consumption of goods for restricted areas.

6. Annual Statistics, Retail Trade--Complete statistics on retail trade are available only for the one year 1930 as a result of the Census of Merchandising and Service Establishments taken in connection with the Population Census of 1931. Annual surveys of retail trade for which returns are secured from a sample number of firms serve to indicate the trend in dollar sales during recent years. These trends, when applied to the total sales for 1930 as obtained from the complete Census, provide the most accurate information available regarding the total volume of retail business since the Census year. Annual statistics are published only by provinces and not for counties, cities or towns. Tables from the summary report for 1938 have been reproduced and appears in an appendix to this handbook.

DESCRIPTION OF INDIVIDUAL STATISTICAL SERIES

Population¹ and Dwellings²

Fifty-six statistical factors are shown in the following tables. Among the first of these are population statistics which are regarded as being of first-rate importance in market analyses. The last Census taken in Canada was in 1931. There has been an estimated increase of approximately 1,000,000 in Canada's population since that date, but since it is not possible to estimate the territorial distribution of this increase, the population statistics presented have been confined to those of the Census year.

1. Persons--Total Number--The Census of Canada is taken on the "de jure" as distinguished from the "de facto" principle. Each person, therefore, is enumerated as belonging to the locality in which he or she is regularly domiciled, and not assigned to the locality in which they are found on the Census date. The "de jure" procedure is necessitated by the fact that Canadian parliamentary representation is distributed on the basis of population. The "de jure" method also lends itself readily to the increasing need for normal population data in the study of housing, public health, local transportation needs, municipal status and similar social problems.

2. Per Cent Canada Total--This series shows the percentage that the population of each subdivision forms of the population of the country as a whole. The series presents a ready measure of the relative importance of different regions as a market for those commodities for which the per capita consumption is fairly uniform.

3. Persons, Canadian-Born--The character of a community is influenced by the nationality of its population. The buying habits of native-born Canadians differ from those of the foreign-born population. Knowledge of the extent to which each group comprises the population of an area is, therefore, of value.

4. Persons, British-Born--Over 11 per cent of Canada's population in 1931 were British born. The distribution of this British-born element in the population is given as Item No. 4.

¹ See Volume 11--Census of Canada, 1931.

² See Volume V--Census of Canada, 1931.

5. Persons, Foreign-Born--There are instances in Canada where the population of a community is predominantly one of foreign nationality or a mixture of foreign nationalities sometimes of kindred races. Undoubtedly, to a person investigating the market possibilities of one of these areas this fact is of prime importance. The buying habits of German, Russian, Rumanian or other first-generation nationals, if they predominate in a district, may be such as to either create or adversely affect a market for certain particular products. The total number of all foreign-born is shown for each section but the scope of the handbook did not permit a further breakdown of population by nationalities. This information is available to those interested, however, in Volume 11 of the Census of Canada, 1931.

6. Households, Total Number--Information regarding the number of households in various communities may be useful to many market investigators and has, therefore, been included as the sixth item in the statistical series. A household for Canadian Census purposes is defined as follows: "A group of persons living together in a dwelling whether or not related by ties or kinship." Thus a servant on the premises or a lodger is included as a member of the household. Two or more households may occupy the same dwelling but are considered as separate households provided they occupy separate portions of the dwelling and their housekeeping is entirely separate. The figures given are exclusive of hotels, rooming houses, institutions, camps, tents, etc. Persons living in these dwellings do not constitute a household in the accepted sense of the term. They are classified in the Census as "exceptional households" and are shown separately. While not included with households in the following statistics, it may be mentioned that the population of these "exceptional households" was 3.3 per cent of the total population of Canada in 1931.

In the tables the number of households is given for each province and county and for each urban centre with a population of 10,000 or over. The number of households in smaller urban centres is not available.

7. Dwellings, Total Number--A dwelling house for Census purposes is a place in which at the time of the Census, one or more persons regularly slept. It need not be a house, but may be a room in a boat, tent, factory, car, store or office building. A building containing apartments or flats counts only as one dwelling house. The number of dwellings is given by province and county and for cities and towns of 10,000 population or more. Similar information for individual smaller urban centres is not available. Figures on households and dwellings have been taken from Volume V of the 1931 Census report.

Business and Industry

Information regarding population is very significant to the market analyst but the population data which are compiled must be modified or interpreted by means of many significant statistical series. The character of the population and consequently its needs and desires are influenced by the economic character of the community; that is to say, by the types of business and industry which support that community, and by the volume of trade and prosperity which those businesses and industries enjoy. The needs and desires of people in a highly industrialized centre will differ from those of people in rural districts. Knowledge of the extent to which a population engages in retailing, wholesaling, manufacturing or farming sheds light on the character of a community and may be used in modifying and interpreting the population statistics and in estimating the probable value and type of that community as a market.

The series in this section are taken from information collected by the Bureau regarding retailing, wholesaling, manufacturing and farming and are designed to "characterize" or "describe" the population areas dealt with in the first section.

8 and 9. Retailing, 1930, Number of Stores and Sales--The statistics for this series have been taken from Volume X--Census of Canada, 1931. Retail merchandise establishments have been defined by the Census as "all establishments which are engaged principally in selling merchandise at retail." A retail establishment is any place where retail trade is carried on. It may be a store, an agency, a depot, an office, or there may be no fixed place of business as in the case of house-to-house peddlers. As the Census was based on establishments, each unit or branch of a multiple or chain organization was treated as a separate retail establishment. On the other hand, a store which combined a variety of businesses, such as a department store, was considered as one establishment only. The classification of stores as establishments results in the sales of each store, including any mail-order sales, being attributed to the locality in which the establishment is situated. Interpretation of the sales of retail stores given in the following series should take into consideration, therefore, the fact that large centres in which mail order houses are located are credited with mail-order sales with the result that their sales are inflated insofar as local demand is concerned.

Some stores engage in both retail and wholesale business. In the following series all those stores whose business was more than 50 per cent retail are classed as retail stores. In addition to retailing goods, some establishments also provide services, and here again the criterion is the amount of goods or services sold. If the service receipts are less than 50 per cent of the total trade, the business is still considered as a retail merchandise establishment.

10. Per Cent of Canada Sales--This series gives the percentage which the sales of any of the geographical units shown form of the total for Canada. In other words, it shows at a glance what portion of the Canadian retail dollar is spent in each county and city or town with a population of 2,000 or over. For example, the series shows that 3.61 per cent of the retail sales of Canada in 1930 were made in the Province of Nova Scotia and it shows the extent to which each county of Nova Scotia shared in these sales.

11. Per Capita Sales--This series gives the average retail expenditure per person in 1930, based on sales in the locality in which he lives. As the handbook has been compiled primarily for the student of marketing attention has been focused on sales as distinguished from consumption. The per capita sales of the communities shown should not, therefore, be confused with their probable per capita consumption. As a matter of fact, the retail sales of many communities have been augmented by the purchases of rural dwellers from surrounding counties, from tourist visitors and from orders filled by mail-order houses.

12 and 13. Wholesaling, Number of Stores and Total Sales--The statistical series dealing with wholesaling have been taken from Volume XI of the Census of Canada, 1931. The wholesale field for purposes of the Census includes all establishments engaged in the purchase for resale, sale or distribution of goods on a wholesale basis. It thus includes all agencies which intervene in the sale of merchandise between the manufacturer or producer on the one hand and the retailer or wholesale buyer on the other. In addition to what are popularly known as wholesale houses or wholesale merchants, the Census also covers such wholesale establishments as chain store warehouses, bulk-tank stations, brokers, commission merchants, manufacturers' sales branches, selling agents, assemblers of agricultural products, etc.

For some purposes it would have been useful to consider as wholesale establishments only those firms engaged in selling to retailers. Unfortunately, it is impossible to classify trading establishments in such a simple manner. In the first place even regular wholesale merchants do not sell only to retailers and secondly, it is necessary to include in the wholesale field the many specialized types of establishment engaged in wholesale distribution. As in the case of the retail trade, the Wholesale Census was taken on the basis of establishments which enables data to be compiled by geographical location but, of course, does not provide information as to the destination of the goods sold.

14 and 15. Manufacturing, 1936. Number of Plants and Gross Value of Production--These statistical series, included as an aid in determining the character of the communities studied, were taken from reports of the annual Census of Industry for 1936. They serve to indicate the degree to which various districts are industrialized. Further information regarding the nature of the industry in each region will be found in the Census of Industry reports.*

16, 17 and 18. Farms, Total Number, Gross Value of Production and Average per Farm--A striking feature of the Canadian economy is the diversity of Canada's sources of wealth. One of the most important of these sources is agriculture, so much so that the economic life of many sections of the Dominion is completely dependent upon the production and price of farm products. The market which these sections may offer for many commodities is, therefore, directly affected by the crops and prices of the current season. It would be impossible in a basic work of this nature to give current information on economic conditions, but it is within the scope of this survey to indicate the extent to which various localities are devoted to or dependent on agriculture. The number of farms by counties is shown together with the gross value of their production and average value of production per farm for the year 1930. Production includes value of field crops, vegetables, fruits and maple products, forest products, greenhouse and hothouse products, nursery products, stock sold alive, stock slaughtered and other animal products. More detailed information regarding agriculture will be found in the Census of Canada, 1931, Volume VIII, "Agriculture."

Employment and Payroll

The importance of population statistics in market analysis has been emphasized. But even the most densely populated centre offers a market, only to the extent that its people are able to buy, an ability which depends in turn on their income. Primarily, the income of a community depends upon the proportion of those gainfully employed and the amount of salaries and wages which they receive. There are other sources of income, of course, but to the market investigator one of the most significant sources is that of salaries and wages, which, for the most part, go back into circulation as payment for commodities consumed and services used.

Statistical series have been given in the following tables for three groups of wage earners, those engaged in retail trade, those engaged in wholesale trade, and those engaged in manufacturing. These figures have been taken from the results of the Census of Merchandising for 1930 and from the annual report of the Census of Industry for 1936. The figures shown were reported by the business or industrial firms who were asked to indicate the average number of persons employed and the total amount paid in salaries and wages for the year. Additional information regarding weeks of employment and earnings for the year ending June 1, 1931, was obtained from each individual wage earner at the time of the last Census. The results are contained in

* Geographical Distribution of the Manufacturing Industries of Canada, 1936.
Dominion Bureau of Statistics.

Volume V of the 1931 Census Report. These figures are not broken down by counties or for small towns, nor do they include persons working on their own account.

19 and 20. Retailing, 1930, Number of Employees and Salaries and Wages Paid-- Every retail firm in Canada was asked to report the average number of their full-time employees for the year 1930 or in the case of firms known to have a large number of employees to report the number of their employees on certain specified dates. Averages were then computed in the Bureau. The salaries, wages, commissions and bonuses shown consist of payments made to full-time employees and do not include such withdrawals as may have been made by proprietors or firm members.

21 and 22. Wholesaling, 1930, Number of Employees and Salaries and Wages Paid--The number of employees shown in the following tables is the number of full-time employees on the payrolls of all wholesale establishments in Canada in 1930. The term "employees" embraces all persons other than proprietors or firm members who were in receipt of salaries, wages, or commissions from the reporting establishments. It includes salesmen, executives and all other kind of help employed on a full-time basis.

The salaries, wages or commissions shown are the amounts paid to salaried employees and wage earners during the year. The income of proprietors and firm members is not included.

23 and 24. Manufacturing, 1936, Number of Employees and Salaries and Wages Paid--These figures have been taken from reports of the annual Census of Industry and include data for wage earners and salaried employees in the manufacturing industries.

25 and 26. Farm Population, 1931, and Percentage of Total Population--It is not possible to show the income of the farm population on a basis comparable with the incomes shown for the three previous groups. The farmer, however, offers a distinctive market for a wide range of commodities and knowledge of the proportion of farm population in a district is of value. This series gives the farm population and its percentage of the total population for counties or Census divisions. More detailed information on the subject may be found in Volume VIII of the 1931 Census.

Retail Distribution by Groups, 1930

The Retail Merchandise field was divided for the purpose of the 1930 Census of Merchandising into nine broad groups: Food, country general stores, general merchandise, automotive, apparel, building materials, furniture and household, restaurants and lastly, other retail stores. These groups embrace a number of detailed classifications by kinds of business consisting of nearly 200 items. The kind-of-business classification to which each store was assigned was related generally to the name by which it was popularly known or to the principal lines of merchandise carried. That classification, however, was not meant to be synonymous with the commodities handled. Few stores confine their sales to any one product or group of products and some stores, such as department and general stores, carry a wide variety of goods. The investigator must understand, therefore, that the figures given for a group are not synonymous with the product indicated by the group name. Group totals only are shown in the accompanying tables. Figures for individual lines of business, together with a considerable amount of material on a commodity basis, will be found in Volume X of the 1931 Census Report.

27 and 28. Food Stores--Food stores include the following classifications: Bakeries and caterers, candy and confectionery stores, dairy produce dealers, delicatessen stores, fruit and vegetable stores, grocery stores (without meat), combination stores (meats and groceries), meat market (including sea foods), other food stores.

29 and 30. Country General Stores--These stores are situated in town, or less than 10,000 population and in rural communities, and correspond roughly to general merchandise stores in larger cities. Three kinds of stores are included under the headings: first, general stores with groceries, dry goods and apparel; and secondly, general stores with groceries and other merchandise. In both these kinds of stores the sale of food products constitutes about half of the total trade. In the former, the sales of dry goods and clothing form a substantial part of the business, while, in the latter, the emphasis is more on hardware and farm supplies, but a general line of merchandise is carried in both types. The third kind of store in this group is the general store without groceries. These stores handle all lines of goods except groceries required by rural dwellers. Substantial commodity lines are hardware, building materials, farm supplies, and dry goods.

31 and 32. General Merchandise Group--This group includes department stores, dry goods stores, general merchandise stores and variety, 5- and 10-cent and to-a-dollar stores.

Department stores have been classified as such if the sales were in excess of \$100,000 per annum and if it was clear from the report furnished that the merchandising operations were departmentalized.

Dry-goods stores carry a general line of dry goods, such as linen, woollen and cotton piece goods, notions, draperies, curtains and generally women's ready-to-wear and accessories.

General merchandise stores include departmentalized stores with sales of less than \$100,000 and also stores with sales of more than \$100,000, but which do not operate as department stores. Many of these larger stores are located in unincorporated industrial towns. Two kinds of business are included, general merchandise stores with food departments and those without foods. Apart from this distinction the two kinds of stores tend to sell the same lines of merchandise, consisting mainly of women's and men's clothing, dry goods, hardware, home furnishings and footwear. These stores do not usually carry furniture.

Variety, 5- and 10-cent, and to-a-dollar Stores--This is a composite classification which has been employed because of the limited number of companies operating in each field. Besides the popular 5- and 10-cent chain stores, there have been included in this classification the chain stores which handle higher priced merchandise and which occupy an intermediate position between the 5- and 10-cent and to-a-dollar stores on the one hand, and the full-fledged department stores on the other. While such quasi-department stores included in this classification carry some lines of clothing, apparel and house furnishings they are to be distinguished from department stores by the limited nature of the merchandising services which are offered, the relative low prices of the goods stocked, and the absence of higher grades of furniture and specialized lines of clothing and apparel.

33 and 34. Automotive Group--This group embraces those types of retail establishments engaged primarily in merchandising rather than servicing and catering to the needs of the automotive trade. The group includes motor vehicle dealers, filling stations, stores specializing in tires, batteries or other accessories and it also includes garages provided that the sale of merchandise forms at least 50 per cent of the total annual receipts. Garages in which receipts from repairs and services formed the main source of income were classified as service garages and were not included in the Merchandising Census.

35 and 36. Apparel Group--Included in this group are all stores whose stock-in-trade consists chiefly in clothing or shoes. Men's clothing or furnishings stores, women's apparel and accessories stores, family clothing stores and shoe stores are the main types of business included. Custom tailors and the shops operated by furriers are included in this group even although part of the activities of these stores are industrial rather than distributive in nature.

37 and 38. Building Materials Group--This group includes those lines of retail business generally thought of as being associated with the building trades: hardware stores, lumber and building material dealers, electrical shops, heating and plumbing shops, and paint and glass stores.

39 and 40. Furniture and Household Group--This group is comprised of stores engaged mainly in the retail distribution of furniture, house furnishings and related items. It includes furniture stores, household appliance stores, music and radio stores in addition to a number of less important classes of retail outlets such as stores specializing in china, glassware, crockery, etc., picture and picture framing shops and stores selling awnings, flags, window shades and tents.

41 and 42. Restaurant Group--The restaurant group includes those retail establishments engaged primarily in the preparation and serving of meals. It includes restaurants, cafeterias, lunch rooms and lunch counters. Dining rooms, lunch rooms or cafeterias operated in connection with hotels, department stores, drug stores, etc., are not included. Receipts from such are included in the total sales of the main establishment of which the serving of meals forms but a supplementary or subsidiary part.

43 and 44. Drug Stores--Two kinds of drug stores are included in this classification--drug stores and drug stores with fountains. Considerable demand exists for separate information regarding these two types but unfortunately the returns secured from drug stores were not generally such as to enable this distinction being made.

45 and 46. Other Retail Stores--Included under this heading are miscellaneous types of business which cannot be classified to any of the previous broad categories. Some of the more important classes included here are coal and wood yards, tobacoo stores, government liquor stores, book stores and farm implement dealers.

Related Indicators of Consumer Purchasing Power

Other factors might be suggested which would furnish a basis for estimating relative markets for different goods or services. Some must be discarded because of the lack of accurate or sufficiently detailed data; still others because of lack of space and the consequent necessity of selecting only those factors which appear to be of the greatest significance. For one or other of these reasons it has been necessary to omit such data as individual income tax returns, residential telephones, value of specified farm products, number and sales of independent stores and chains, rented and owned homes, statistics concerning relief payments, wired homes, magazine and newspaper circulation, bank and postal savings deposits, life insurance sales, homes with gas, wages of farm labourers, and many others. Data are available for the factors mentioned below and these are included in the tables.

47 and 48. Passenger Cars Registered, 1937, and Number per 100 Persons--
Passenger car registrations and allied data are reported by the provinces to the Bureau each year. The figures used in the handbook have been taken from the report, "The Highway and Motor Vehicle in Canada, 1937," issued by the Transportation and Public Utilities Branch of the Dominion Bureau of Statistics. Motor car registrations for Quebec counties were supplied through the courtesy of the Canadian Automobile Chamber of Commerce. The figures originated with Micht's Directories. To those engaged in automotive and allied lines, the series should be valuable as a direct indicator of the probable market for their product. To all investigators, it will be one indicator of the standard of living in the various communities.

49 and 50. New Passenger Car Sales, 1937, and Number per 100 Households--
These figures were compiled in the course of a special survey made by the Bureau, the results of which were published in a report, "Motor Vehicle Retailing in Canada Calendar Year, 1937." They refer to sales of new passenger cars only although figures may be found in the original report on sales of both new and used passenger and commercial vehicles. Sales of new passenger cars may be an indication of the temporary prosperity of a district, just as increased sales of used cars may be taken by some as an indication of economic depression. But here it may be said again that it is not the purpose of the handbook to make any attempt to gauge the seasonal prosperity or otherwise of the territories being examined. Its purpose rather is to give as normal a picture of the community as possible, leaving it to the investigator to apply any one of the current economic barometers which suits his purpose. In this respect the item of new passenger car sales may not be an altogether reliable factor when given for one year only as local seasonal conditions for that year may be such as to produce a distorted picture. If used at all this factor should, therefore, be considered in the light of known conditions and in company with other factors. With these limitations in mind it should be a valuable statisticsl series particularly for selected allied lines.

51 and 52. Domestic Electric Meters, 1937--Number per 100 Households--
These figures were compiled from the annual report of the Electricity and Gas Inspection Services of the Department of Trade and Commerce for the fiscal year ending March 31, 1938. All electric light and power companies in Canada are registered under the provisions of the Electricity Inspection Act and are required to report certain details of their activities annually. Among these they must report the number of domestic meters served from each one of their power stations and give a list of the communities served. In compiling the present series from these reports it was necessary in a few cases to use estimates. Where the communities served from one station were located in different counties, the number of meters reported for the central station was distributed on the basis of population. Obviously such a method, if generally used, would completely nullify the value of the series. Fortunately, it was necessary to resort to this expedient in only a few cases. In order that the investigator may be able to place a proper valuation on the series, all estimates have been indicated in the tables.

The value of this factor of domestic electric meters will be appreciated most by producers of electrical equipment. In addition to offering a direct indicator for electric products, however, it is also a measure of the standard of living in a community. The series has been limited to domestic meters as it was felt that the inclusion of commercial and power meters would tend to detract from its value as an indicator of consumer purchasing power.

53 and 54. Homes with Radios, 1937, Number per 100 Households--It is to be expected that the value which investigators attach to any statistical series will vary according to the applicability of that series to their own particular product.

It is felt that the number of radio homes is an indication of purchasing power sufficiently important to be included here for use with other factors. This series has been provided through the courtesy of the Canadian Broadcasting Corporation and represents estimates of the number of homes equipped with receiving sets in 1937.

55 and 56. Farm Values and Average Value per Farm--No record is available of the amount of income received by farmers in each county. The value of the farms in a community is included as providing some indication of the market potentialities of that community. This final series gives the farm values together with the average value per farm. These figures were taken from the Census of Canada, 1931, Volume VIII, "Agriculture" and refer to the year 1930. They include the value of land, buildings, implements and machinery, and live stock.

Footnotes

- (x) - figures withheld to avoid disclosing individual operations.
- (y) - partially estimated --see introduction.
- (a) - figures not available.
- (b) - not applicable.
- (c) - additional store shown in county total had sales of less than \$500.
- (d) - included with Lennox County.
- (e) - includes Manitoulin.
- (f) - less than .01 per cent.
- (g) - includes Addington County.
- (h) - included in Algoma.
- (i) - included with Fort Erie.
- (j) - included with Toronto.
- (k) - includes 270 in miscellaneous categories.

APPENDIX

Annual Statistics of Retail Trade

The Retail Trade statistics contained in the main section of this handbook relate to the year 1930 and were taken from the results of the Census of Merchandising and Service Establishments which form part of the Decennial Census of 1931. Comprehensive statistics on a similar scale broken down by counties, cities and towns are not available for more recent years since only one complete census of trading establishments has been made.

In order to provide the most accurate estimates possible of the total volume of retail trade in more recent years, the Bureau has conducted an annual survey of retail trade based on a sampling plan. Returns are secured annually from approximately 25,000 retail outlets and these reports are used in arriving at the trend in business since the Census year. The trend value thus determined is then applied to the total sales volume for 1930, as obtained from the results of the complete Census in order to give an estimate of the volume of business for the year in question. Tables presented in the Dominion Summary Report for 1938 are printed in the Appendix to this handbook.

It is, therefore, evident that figures presented for the years 1931 to 1938 are estimates based on indexes computed from returns from a sample number of firms. The chief factor which may not be reflected in the sales indexes is variation in trade due to changes in the number of stores in operation. No information is available to show the extent to which firms going out of business have been replaced by new stores of a similar nature. The natural tendency of the method is to underestimate the extent of the decline in business during a period of recession and likewise to underestimate the extent of the recovery when the cycle turns upward once more. This factor is of chief importance in certain kinds of business dealing chiefly in durable or luxury lines of merchandise such as automobile dealers, furniture stores, radio and music stores. In spite of the limitations attending the methods of calculation, it is believed that a fair degree of accuracy attends the results for the total retail trade as a whole and for most of the individual lines of business for which figures are shown.

(1) Figures for years subsequent to 1930 have been estimated on basis of gallongage data and retail gasoline prices.

(2) Due to changes in method of reporting exact comparisons of figures for various years are not valid.

NOTE: The number of stores is shown only for 1930. Sales figures for later years are calculated from the sampling principle. The total number of stores for these years is not known.

C O U N T I E S A N D C E N S U S D I V I S I O N S

There being no fixed political divisions in Manitoba, Saskatchewan, Alberta and British Columbia corresponding to counties in Eastern Canada, it has been found advisable to divide the western provinces for statistical purposes into census divisions. These census divisions maintain their identity irrespective of political changes and thus permit of comparisons being made of statistical data for different periods. A map showing the boundaries of counties and census divisions, as organized at the Census of 1931, follows.

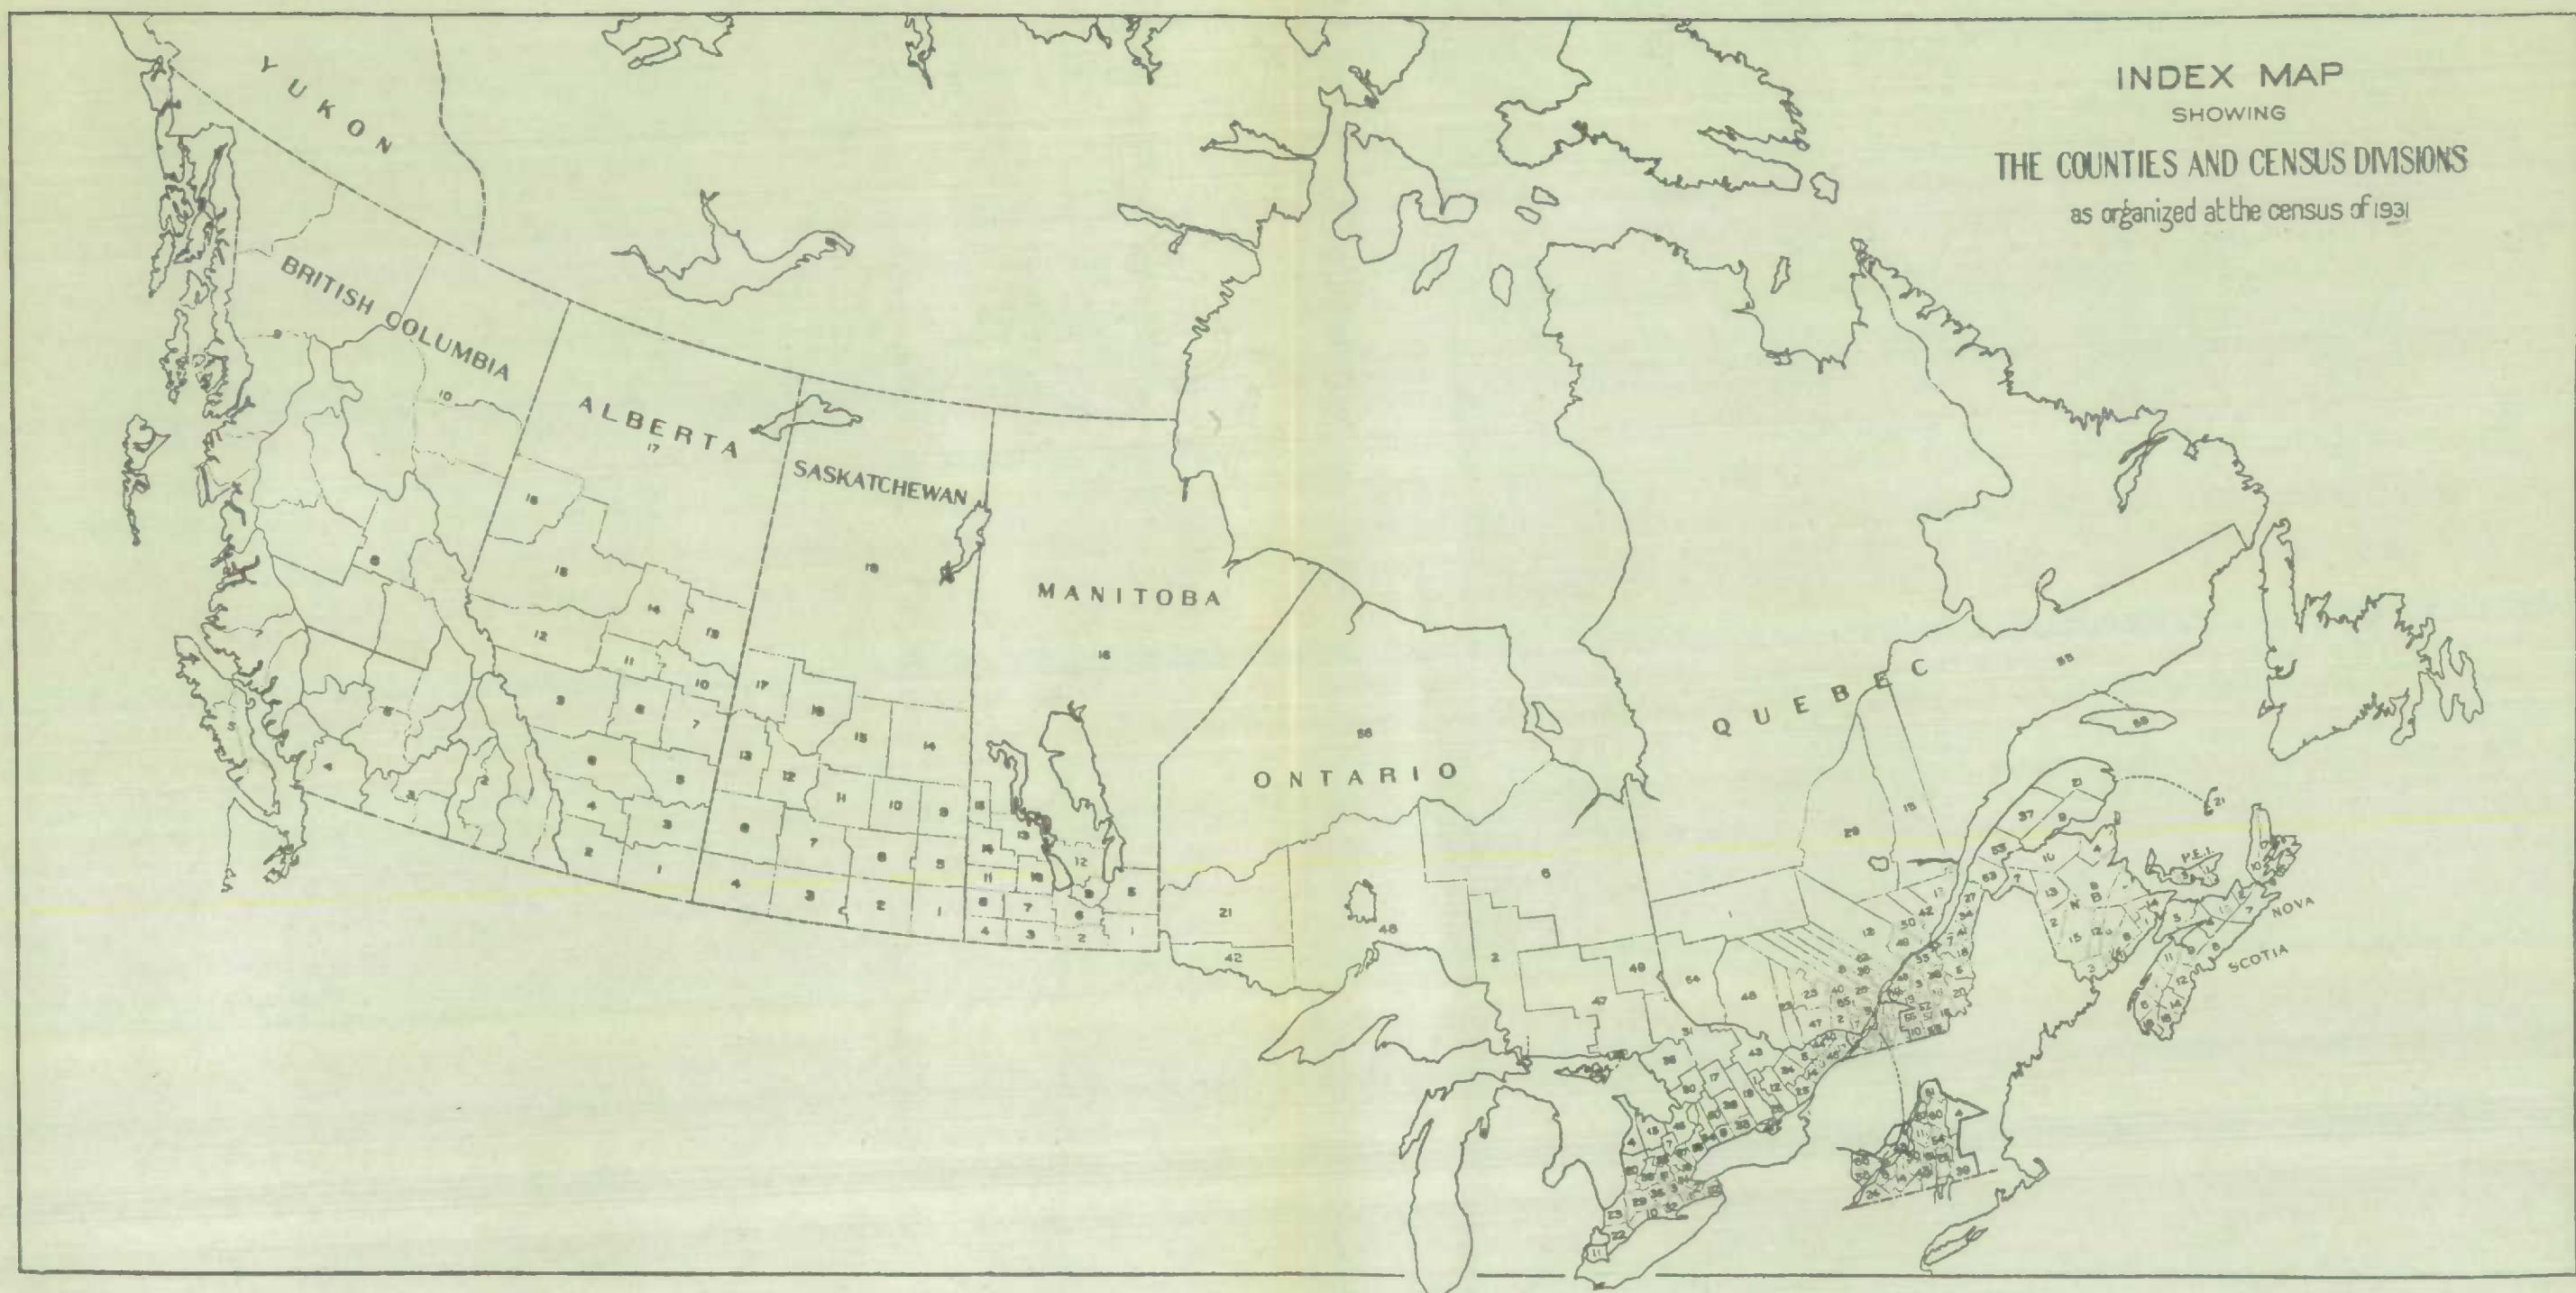

CENSUS OF CANADA, 1931
