

# March 3 to March 9, 2019 (Week 10)

## **Overall Summary**

- At the national level, most indicators of influenza activity remained similar, or increased slightly, compared to the previous week.
- Influenza activity continues to be reported in almost all regions in Canada but is circulating at higher levels in eastern regions.
- Influenza A(H1N1)pdm09 has been the predominant subtype to date this season.
- Detections of influenza A(H3N2) have been steadily increasing since mid-January and accounted for 56% of subtyped influenza A detections this week.
- There is currently very little influenza B circulation compared to previous seasons.

# Influenza/Influenza-like Illness (ILI) Activity (geographic spread)

During week 10, the following influenza activity levels were reported (Figure 1):

- 17 regions reported localized activity: in Alta.(1), Ont.(5), Que.(2), N.S.(4), N.B.(3), and N.L.(2).
- 30 regions reported sporadic activity: in B.C.(5), Alta.(4), Man.(4), Ont.(2), Que.(4), N.B.(3), N.L.(2), P.E.I.(1), Nvt.(3), Y.T.(1) and N.W.T.(1)
- Three regions: in Man.(1), N.B.(1) and N.W.T.(1) reported no activity.

### Figure 1 – Map of overall influenza/ILI activity by province and territory, Canada, week 2019-10

## Laboratory-Confirmed Influenza Detections

In week 10, the following results were reported from sentinel laboratories across Canada (Figures 2 and 3):

- The percentage of tests positive for influenza continued to increase slightly to 21.3%.
- A total 1,803 laboratory detections of influenza were reported, of which 96% were influenza A.
- Influenza A(H3N2) accounted for 56% of subtyped influenza A detections.
- Detections of influenza A(H3N2) have been steadily increasing, from 93 detections in week 4 (mid-January) to 308 this week.

To date this season, 36,124 laboratory-confirmed influenza detections have been reported:

- 98% have been influenza A.
- Among the 12,329 influenza A viruses subtyped, 85% have been A(H1N1)pdm09.
- Influenza B often circulates later in the season in Canada (Feb-Apr). Fewer influenza B detections have been reported this season compared to recent seasons at this time of year.

To date this season, detailed information on age and type/subtype has been received for 28,283 laboratory-confirmed influenza cases (Table 1):

- 84% of all influenza A(H1N1)pdm09 detections have been reported in individuals younger than 65 years of age.
- 60% of all influenza A(H3N2) detections have been reported in adults 65 years of age and older.

For more detailed weekly and cumulative influenza data, see the text descriptions for <u>Figures 2 and 3</u> or the <u>Respiratory Virus Detections in Canada Report</u>.

The shaded area indicates weeks where the positivity rate was at least 5% and a minimum of 15 positive tests were observed, signalling the period of seasonal influenza activity.

Figure 3 – Cumulative numbers of positive influenza specimens by type/subtype and province/territory, Canada, weeks 2018-35 to 2019-10

Table 1 – Cumulative numbers of positive influenza specimens by type, subtype and age-group reported through case-based laboratory reporting, Canada, weeks 2018-35 to 2019-10

	Cumulative (August 26, 2018 to March 9, 2019)						
Age groups (years)	Influenza A				В	Influenza A and B	
	A Total	A(H1N1) pdm09	A(H3N2)	A (UnS) <sup>1</sup>	Total	#	%
0-4	5829	1617	69	4143	83	5912	21%
5-19	4104	1337	131	2636	113	4217	15%
20-44	5506	1802	220	3484	81	5587	20%
45-64	5531	1723	203	3605	59	5590	20%
65+	6816	1241	905	4670	161	6977	25%
Total	27786	7720	1528	18538	497	28283	100%

<sup>1</sup>UnS: unsubtyped: The specimen was typed as influenza A, but no result for subtyping was available.

## Syndromic / Influenza-like Illness Surveillance

#### Healthcare Practitioners Sentinel Syndromic Surveillance

In week 10, 1.3% of visits to healthcare professionals were due to influenza-like illness (ILI) (Figure 4). The percentage of visits for ILI is low compared to previous seasons.

### **Figure 4 – Percentage of visits for ILI reported by sentinels by report week, Canada, weeks 2018-35 to 2019-10** Number of Sentinels Reporting in Week 10: 95

The shaded area represents the maximum and minimum percentage of visits for ILI reported by week from seasons 2013-14 to 2017-18

#### **Participatory Syndromic Surveillance**

In week 10, 2,112 participants reported to FluWatchers, of which 65 (3.1%) reported symptoms of cough and fever (Figure 5).

Among the 65 participants who reported fever and cough:

- 20% consulted a healthcare professional;
- 78% reported days missed from work or school, resulting in a combined total of 134 missed days of work or school.

### **Figure 5 – Percentage of participants reporting cough and fever, Canada, weeks 2018-40 to 2019-10** Number of Participants Reporting in Week 10: 2,112

## Influenza Outbreak Surveillance

In week 10, 30 new laboratory-confirmed influenza outbreaks were reported: long-term care facilities (LTCF) (12), acute care facilities (11) and other settings (7).

To date this season, 540 laboratory-confirmed influenza outbreaks have been reported (Figure 6):

- 314 (58%) outbreaks were in LTCF, 29 were in schools, 83 in acute care facilities, and 114 were in other settings.
- Among the 481 outbreaks for which the influenza type was available, 98% (473) were associated with influenza A.
- Among the 206 outbreaks for which the influenza A subtype was available, 56% (116) were associated with influenza A(H1N1)pdm09;

To date this season, 119 ILI outbreaks have been reported; 64 occurred in LTCF, 51 in schools, and four in acute care facilities.

# Figure 6 – Number of new outbreaks of laboratory-confirmed influenza by report week, Canada, weeks 2018-35 to 2019-10

## Severe Outcomes Influenza Surveillance

### Provincial/Territorial Influenza Hospitalizations and Deaths

To date this season, 2,351 influenza-associated hospitalizations have been reported by participating provinces and territories<sup>1</sup>.

### Hospitalizations (Table 2):

- 99.1% (2,329) were associated with influenza A
- The highest estimated rate of hospitalization is among children under 5 years of age.

### Intensive Care Unit (ICU) cases and deaths:

- To date this season 429 ICU admissions and 109 deaths have been reported.
  - o 43% (185) of reported ICU admissions were in adults aged 45-64 years.
  - o All but three ICU admissions were associated with influenza A.
  - All but one of the deaths were associated with influenza A.

# Table 2 – Cumulative number and estimated rate of hospitalizations by age-group reported by participating provinces and territories<sup>1</sup>, Canada, weeks 2018-35 to 2019-10

Age Groups	Cumulative (August 26, 2018 to March 9, 2019)						
(years)	Influenza A	Influenza B	Rate per 100,000 population				
0-4	333	8	71.64				
5-19	199	6	14.77				
20-44	306	1	10.79				
45-64	635	2	29.27				
65+	856	5	70.77				
Total	2329	22					
	99.1%	0.9%					

<sup>1</sup>Influenza-associated hospitalizations are reported by Alberta, Manitoba, New Brunswick, Newfoundland and Labrador, Northwest Territories, Nova Scotia, Prince Edward Island and Yukon. Only hospitalizations that require intensive medical care are reported by Saskatchewan. The cumulative rate of hospitalizations is calculated using the total population by age-group in participating provinces and territories.

### Pediatric Influenza Hospitalizations and Deaths

In week 10, 45 pediatric (≤16 years of age) hospitalizations with influenza have been reported by the Immunization Monitoring Program Active (IMPACT) network (Figure 7).

To date this season, 1,015 pediatric hospitalizations have been reported (Figure 8):

- 68% of cases were in children under 5 years of age.
- 98% (992) of cases have been associated with influenza A.
- Among the 311 cases for which the influenza subtype was available, 286 (92%) were associated with A(H1N1)pdm09.

To date this season, 172 ICU admissions, and 10 deaths have been reported.

- 63% (108) of ICU admissions were in children under 5 years of age.
- All but two of the ICU admissions have been associated with influenza A.
- 80% (8) of deaths occurred in children 2 to 4 years of age.
- All deaths have been associated with influenza A.

# Figure 7 – Number of pediatric (≤16 years of age) hospitalizations reported by the IMPACT network, by week, Canada, weeks 2018-35 to 2019-10

The shaded area represents the maximum and minimum number of cases reported by week from seasons 2010-11 to 2017-18

Figure 8 - Cumulative numbers of pediatric hospitalizations (≤16 years of age) with influenza by age-group reported by the IMPACT network, Canada, weeks 2018-35 to 2019-10

### Adult Influenza Hospitalizations and Deaths

Surveillance of laboratory-confirmed influenza-associated adult (≥16 years of age) hospitalizations by the Canadian Immunization Research Network (CIRN) Serious Outcomes Surveillance (SOS) network began on November 1<sup>st</sup> for the 2018-19 season.

To date this season, 694 hospitalizations, 80 ICU admissions and 32 deaths have been reported (Figure 9):

- 645 (93%) hospitalizations were associated with influenza A.
- A greater proportion of hospitalizations have been reported among adults ≥65 years of age (58%) compared to adults <65 years of age (42%).
- 86% of hospitalized cases reported more than one type of comorbid condition.
- The most commonly reported comorbidity was endocrine disorders, which were reported in 82% of hospitalized cases.

# Figure 9 - Cumulative numbers of adult hospitalizations (>20 years of age) with influenza by age-group reported by CIRN, Canada, 2018-19, weeks 2018-44 to 2019-10

# **Influenza Strain Characterizations**

Since September 1, 2018, the National Microbiology Laboratory (NML) has characterized 1,570 influenza viruses (195 A(H3N2), 1,340 A(H1N1) and 35 B) that were received from Canadian laboratories.

## Genetic Characterization of Influenza A(H3N2):

102 influenza A(H3N2) viruses did not grow to sufficient hemagglutination titer for antigenic characterization by hemagglutination inhibition (HI) assay. Therefore, NML has performed genetic characterization to determine the genetic group identity of these viruses.

Sequence analysis of the HA gene of the viruses showed that:

- 17 viruses belonged to genetic group 3C.2a.
- 82 viruses belonged to subclade 3C.2a1.
- Two viruses belonged to 3C.3a.
- One isolate could not be sequenced.

A/Singapore/INFIMH-16-0019/2016-like virus belongs to genetic group 3C.2a1 and is the influenza A(H3N2) component of the 2018-19 Northern Hemisphere influenza vaccine.

## Antigenic Characterization:

### Influenza A (H3N2):

- 68 influenza A(H3N2) viruses were antigenically characterized as A/Singapore/INFIMH-16-0019/2016-like by HI testing using antiserum raised against egg-propagated A/Singapore/INFIMH-16-0019/2016.
- 25 viruses showed reduced titer with ferret antisera raised against egg-propagated A/Singapore/INFIMH-16-0019/2016.
- A/Singapore/INFIMH-16-0019/2016-like virus is the influenza A(H3N2) component of the 2018-19 Northern Hemisphere influenza vaccine.
- 53 influenza A(H3N2) viruses characterized belonged to genetic group 3C.2a1. 16 viruses belonged to genetic group 3C.2a and 21 to 3C.3a. Sequencing is pending for the remaining isolates.

### Influenza A(H1N1):

- 1,302 A(H1N1) viruses characterized were antigenically similar to A/Michigan/45/2015, which is the influenza A(H1N1) component of the 2018-19 Northern Hemisphere influenza vaccine.
- 38 viruses showed reduced titer with ferret antisera raised against cell culture-propagated A/Michigan/45/2015

### Influenza B:

Influenza B viruses can be divided into two antigenically distinct lineages represented by B/Yamagata/16/88 and B/Victoria/2/87 viruses. The recommended influenza B components for the 2018-19 Northern Hemisphere influenza vaccine are B/Colorado/06/2017 (Victoria lineage) and B/Phuket/3073/2013 (Yamagata lineage).

- Nine influenza B viruses were characterized as B/Colorado/06/2017, which belong to the Victoria lineage and are included as an influenza B component of the 2018-19 Northern Hemisphere influenza vaccine.
- Seven viruses showed reduced titer with ferret antisera raised against cell culture-propagated B/Colorado/06/2017.
- 19 influenza B viruses were characterized as B/Phuket/3073/2013-like, which belongs to the Yamagata lineage and is included as an influenza B component of the 2018-19 Northern Hemisphere **quadrivalent** influenza vaccine.

# **Antiviral Resistance**

### Antiviral Resistance – Amantadine:

372 influenza A (59 A(H3N2) and 313 A(H1N1)) viruses were tested for resistance to amantadine and it was found that:

• All 372 influenza A viruses were resistant to amantadine.

### Antiviral Resistance – Oseltamivir:

961 influenza viruses (93 A(H3N2), 836 A(H1N1) and 32 B) were tested for resistance to oseltamivir and it was found that:

- All 93 A(H3N2) viruses were sensitive to oseltamivir.
- Of the 836 A(H1N1) viruses tested, 833 were sensitive to oseltamivir and three viruses were resistant to oseltamivir with a H275Y mutation.
- All 32 B viruses were sensitive to oseltamivir.

### Antiviral Resistance – Zanamivir:

960 influenza viruses (93 A(H3N2), 835 H1N1 and 32 B) were tested for resistance to zanamivir and it was found that:

• All 960 influenza viruses were sensitive to zanamivir.
