Management Perspective

Quality assured analytical results are critical when transforming environmental analytical data into useful scientific advice. In the area of water analysis, the NLET branch of NWRI provides a variety of QA products and services geared to assisting EC labs provide quality assured analytical results. One of the most valuable QA services provided is the performance evaluation (PE) studies. The PE studies conducted by NLET fill a parameter and concentration gap not covered by any other PE or proficiency testing (PT) program. Participant labs find the NLET PE studies very useful to improve the quality of their analytical processes, while project leaders use the results of these studies to enable them to better compare data generated from different laboratories, in both the private and public sector. These studies are provided to EC laboratories, affiliate institutions in Canada and the US, and other public and private laboratories for a cost recovery fee.

The PE studies are created using many water types of natural waters and their associated parameter groups as the raw material. The availability of so many different water types in Canada is ideally suited to the preparation of test samples spanning the complete range of available water matrices. Waters range from very soft natural rainwaters, to soft waters found in Ontario, Quebec and British Columbia and to hard surface waters found in the Prairies and Canadian groundwaters. The chemical composition of the natural waters are diverse, and include 50 different parameters for nutrients, minerals and trace elements. Special studies are provided for Total Phosphorus and ambient Mercury.

Evaluations of laboratory performance are timely and complete. Laboratories receive a preliminary report which discloses systematic bias and precision. The final reports, which are also scheduled, provide a complete listing of current and historical performance. Individual performance appraisals indicate areas and parameters where remedial action is required to improve performance. In this way, the PE studies are effective for improved performance of laboratories.

Methodologies and approaches in analytical laboratories change as research and monitoring programs evolve. The PE studies, while large in terms of the number of laboratories being assessed, are flexible enough to respond to these changing requirements. Feedback from laboratories is solicited and assessed on a regular basis, and changes to the studies are implemented to meet these new needs. One recent example of this change is the development of a customised PE study to assess trace elements in natural sediments for the Metals in the Environment (MITE) Program being conducted by Canadian universities. This study is being added to the PE program in the 2000-01 fiscal year.

Perspective de gestion

Il est crucial de disposer de résultats d'analyse ayant subi une assurance de la qualité (AQ) lorsqu'on transforme des données analytiques environnementales en conseils scientifiques utiles. Dans le domaine de l'analyse de l'eau, le LNEE de l'INRE offre une gamme de produits et de services AQ visant à aider les laboratoires d'EC à produire des données d'analyse dont la qualité est assurée. Parmi les services AQ les plus valables figurent les études d'évaluation de la performance (EP) interlaboratoires. Les études EP réalisées par le LNEE combinent une lacune. Aucun autre programme EP ou de vérification de la compétence (VC) n'avait permis de recueillir des données sur les paramètres et les concentrations. Les laboratoires participants estiment que les études EP du LNEE sont très utiles pour améliorer la qualité de leurs processus d'analyse. Les chefs de projet utilisent les résultats de ces études pour les aider à comparer des données provenant de laboratoires différents, privés ou publics. Ces études sont en effet réalisées pour des laboratoires d'EC, des institutions affiliées du Canada et des États-Unis et d'autres laboratoires publics et privés selon la formule de recouvrement des coûts.

Pour les études EP, on utilise comme échantillons bruts de nombreux types d'eau naturelle et leurs paramètres associés. Le grand nombre de types d'eau qui existent au Canada permet de préparer suffisamment d'échantillons d'essai pour couvrir l'éventail complet des matrices d'eau disponibles, allant des eaux de pluie naturelles très douces que l'on trouve en Ontario, au Québec et en Colombie-Britannique aux eaux superficielles dures des Prairies et aux eaux souterraines. La composition chimique des eaux naturelles varie et comporte 50 paramètres différents sur les nutriments, les minéraux et les éléments traces. Des études spéciales portent sur le phosphore total et le mercure ambiant.

Les évaluations de la performance des laboratoires sont exécutées au moment opportun et de façon exhaustive. Les laboratoires reçoivent un rapport provisoire indiquant le biais systématique et le niveau de précision. Les rapports finaux, dont la date de livraison est également fixée, contiennent toutes les données sur la performance tant actuelle qu'antérieure. Les évaluations individuelles de la performance indiquent les secteurs et les paramètres envers lesquels il faut prendre des mesures correctives pour améliorer la performance. Les études EP s'avèrent ainsi efficaces pour améliorer la performance des laboratoires.

À mesure que les programmes de recherche et de suivi évoluent, les méthodologies et les approches utilisées par les laboratoires d'analyse se transforment. Les études EP, bien que vastes, compte tenu du nombre de laboratoires évalués, sont suffisamment souples pour tenir compte des changements. Pour ce faire, on invite régulièrement les laboratoires à communiquer leurs commentaires et on s'en sert pour modifier les études. À titre d'exemple de changement, mentionnons la conception sur mesure d'une étude EP pour évaluer les éléments traces dans les sédiments naturels aux fins du programme Métaux dans l'environnement mis en oeuvre par des universités canadiennes. Cette étude s'ajoute au programme EP au cours de l'année financière 2000-2001.

Abstract

Performance evaluation studies are an important part of assuring the accuracy and integrity of analytic results. NLET provides these PE studies as part of its mandate. The branch provides this service to all EC laboratories and to many affiliated institutions in Canada and the US. Such a wide range of institutions and laboratories, in turn, provides a diversity of data which gives greater credibility to data analysis and laboratory performance statements.

Evaluation of the analytic results is the most visible aspect of PE studies. All results are evaluated for the two important aspects of data - systematic bias and precision. The former is extremely important for comparability of data sets from different origins and the latter, precision, is a measure of the reliability of the data. For the NLET PE studies, systematic bias is tested with the non-parametric method of Youden, and precision is tested against precision functions developed by the quality assurance staff. Both evaluations are totalled to give a performance rating for each laboratory.

Performance ratings for laboratories are given in relative terms. Laboratories are ranked from the best performance to the lowest (the least flagged results to the most flagged). In real terms, good laboratories have few flagged results and the laboratories with poor performance may have half their results flagged. These results are summarised in individual laboratory appraisals which are sent to the lab managers in a timely, expedient manner. This objective, third party performance rating is valued by the laboratory managers and data users alike.

Evaluations include historical listings of performance. With these historical listings laboratories may track their previous performance and see the effectiveness of their remedial action. This unique and highly developed tool helps many laboratories generate more reliable and accurate data.

Résumé

Les études d'évaluation de la performance (EP) constituent un volet important de l'assurance de l'exactitude et de l'intégrité des résultats d'analyse. Dans le cadre de son mandat, le LNEE offre ce service à tous les laboratoires d'EC et à ses nombreuses institutions affiliées du Canada et des États-Unis. En raison de leur grand nombre, ces institutions et laboratoires fournissent en contrepartie des données diversifiées qui ajoutent à la crédibilité des analyses et des énoncés sur la performance des laboratoires.

L'évaluation des données d'analyse est l'aspect le plus visible des études EP. Elle porte sur deux aspects importants – le biais systématique et la précision. Le premier aspect est essentiel à la comparaison d'ensembles de données de sources différentes; le second aspect permet de mesurer le degré de fiabilité des données. Aux fins des études EP du LNEE, on teste le biais systématique par la méthode non paramétrique de Youden, et la précision, au moyen de fonctions sur la précision mises au point par le personnel chargé de l'assurance de la qualité. Les deux évaluations sont combinées pour coter la performance de chaque laboratoire.

La performance des laboratoires est cotée en termes relatifs. Les laboratoires sont classés du plus performant au moins performant. En termes réels, les laboratoires performants ont un faible nombre de résultats marqués tandis que les laboratoires peu performants peuvent avoir la moitié de leurs résultats marqués. Les évaluations remises dans un délai raisonnable aux gestionnaires de laboratoire contiennent un résumé des données. Cette évaluation objective par une tierce partie est utile tant pour les gestionnaires que pour les utilisateurs des données.

Comme les évaluations contiennent des données sur les performances antérieures, les laboratoires peuvent comparer leur performance avant et après la prise de mesures correctives. Cet outil exceptionnel et perfectionné aide nombre de laboratoires à produire des données plus fiables et plus exactes.

NWRI Performance Evaluation Quality Assurance Studies

NWRI's performance evaluation quality assurance (QA) studies support a core group of government labs and various environmental programs. The QA program also addresses health issues such as toxic metal (lead, manganese and mercury) contamination of drinking water. US government agencies as well as the Canadian Metals in the Environment (MITE) program participate in the semi-annual studies along with many global participants. More than 200 labs are invited to participate, with approximately 60 labs completing analyses of the various study matrices.

The primary feature of these studies is the quality of data produced by the participating labs. Lab performance is ranked in terms of the number of biased parameters (systematic bias) and flagged results (precision measurement). The reports produced from the client data provide a powerful tool for the diagnosis of problem areas within labs, as well participation quantifies lab performance and data quality.

These NWRI studies are an independent client driven QA service with consulting on all aspects of the program. The format of this report has been revised by eliminating the duplication of Appendix A, which is available in any previous report. We expect this information to be on our website in the near future at www.cciw.ca/nwri/nlet/nlet.html.

NWRI studies run on a voluntary and cost recovery basis, which leads to ongoing interest in study design and sample requirements by lab and program managers. Proposals for specialised studies are welcomed.
