## INTRODUCTION

A projected increase in the utilization of coastal areas as effluent receiving waters has resulted in scientific effort towards the understanding of the complex transport and dispersion mechanisms characteristic of these zones. Attempts at identifying and quantifying significant flow regimes and mixing processes require, at least initially, an extensive data base from long term observational programs at various coastal sites. From such information, semi-empirical relationships can be formed and deterministic or stochastic models developed. The process of generalization of site-specific results to an overview of coastal physical processes requires that a series of representative sites be studied and the results intercompared and evaluated. With this objective in mind, CCIW has undertaken a series of long-term observational programs at selected sites in the Great Lakes to provide a detailed data base on important coastal areas. At present, extensive data is available for Douglas Point in Lake Huron, Bronte and Oshawa in Lake Ontario, and near Byng Inlet in Georgian Bay. Based on a joint observational program with Ontario Hydro, the Douglas Point study has been reported (Bull, J. and Farooqui, R. et al, 1976) as the first of a series of climatological summaries for the coastal zones. This present report for Bronte is the second of a series.

These reports are designed:

- (1) To provide documentation of and visual display of the experimental data set for each of the coastal sites investigated; and,
- (2) To provide easily accessible reference material for decision-making purposes.

#### Experimental Program

During the period June 1973 to March 1974, the Basin Investigation and Modelling Section (BIMS) at CCIW undertook an extensive field study at Bronte on the NNW corner of Lake Ontario (Figure 1). The program was designed to provide time-series current and temperature measurements in the nearshore zone over the entire time period. These data were to be supplemented by meteorological time-series available at the CCIW site and from A.E.S. Toronto.

The basic layout of the experiment is shown in Figure 2. The current meters were moored on a line approximately perpendicular to the local shoreline with the first mooring placed 1.8 km offshore for reasons of operational depth limitation. Horizontal spacing was of the order of 0.5 km for the summer period increasing to 1 km for the winter. Each mooring consisted of two current meters, one located at 10 metres depth and the second at approximately 2 metres off the bottom. During the summer period, all instruments were

Plessey Model M021 (Roberts' Rotor Type) while for the second period, the lower current meters were Geodyne Model 920 (Savonius Rotor Type). Instrument specifications and typical mooring configurations are given in Appendix F. Figure A1 in Appendix A gives a bar chart summary of the current meter data available for this study. In addition, a more complete tabular summary is also presented.

#### Data Presentation

The data available from this study is presented in a format similar in organization and content to the Douglas Point Report. The data summaries are organized by calendar month in plotted displays given in 4 appendices as follows:

- (1) Appendix B shows a monthly meteorological summary followed by the set of six hourly averaged current and wind vector plots for the corresponding month, plus a statistical summary for that month. This display set is then repeated month by month for the entire period.
- (2) Appendix C gives temperature and current speed with direction plots filtered so as to retain the frequency band 0.0 to 0.2 cph. and organized by month and mooring respectively.
- (3) Appendix D contains progressive vector diagrams (PVD's) displaying the shallow meter measurements opposite

to the PVD's from the deeper instruments on a monthly basis. In these displays, the mean scalar speeds are averaged over a one hour time interval, and geographical direction is orientated with shore-parallel, land to the right flows pointing at the right hand side of the page.

- (4) Appendix E displays the current vector data as alongshore and onshore components subdivided into displays showing the shallow and then the deeper instrument measurements. A digital filter has been applied to remove periods less than five hours from the component time series.

More detailed descriptions of the contents and data handling procedures for (1) and (2) above are given in Reference 1. Displays (3) and (4) are unique to this report and reflect summaries that we have found useful in preliminary digestion of the data. Both are standard techniques for summarizing time-series data of this type.

**APPENDIX F: INSTRUMENTATION SPECIFICATION AND  
MOORING CONFIGURATION**

Time Constant: Approximately 30 seconds without radiation shielding

Exposure: Mounted in a naturally aspirated Thaller type radiation shield<sup>2</sup>

WATER TEMPERATURE

Sensor: YSI No. 44030 Precision Thermistor installed in a 2.5 cm DIA x 15 cm plexiglass housing

Range: -2 to +35°C

Accuracy: 0.1°C with individual calibration

Time Constant: Approximately 5 minutes

---

<sup>2</sup>Thaller, M., 1970. Practical considerations in instrument design. In *Meteorological Monographs*, 11(33):211-236, American Meteorological Society, Boston, Mass.

INSTRUMENTATION SPECIFICATION: METEOROLOGICAL SYSTEM<sup>1</sup> (CCIW)

Recording System: Plessey Electronics, Hymet Model MM-1

Recording Medium: 6.35 mm (1/4 inch) magnetic tape reel to reel, 183 metre at 4.3 mm/sec

Parameters Recorded: Windspeed, wind direction, air temperature, and water surface temperature

Word Size: 10 bit

Storage Capacity: 55,000 words

Sampling Rate: 10 minute

Operational Temperature Range: -10°C to 40°C

WIND SPEED SENSOR

Anemometer: 3 cup (Beckman and Whitley; Model 170-41) geared to a single continuous turn potentiometer through a 11106.46:1 speed reducer

Sampling Method: 10 minute average

Accuracy: ±2% above 200 cm sec<sup>-1</sup>

Static Torque: 0.36 gram-cm max

WIND DIRECTION

Sensor: Single flat-plate vane coupled to an oil-damped magnetic compass

Sampling Method: Instantaneous position read on command every 10 minutes by solenoid clamping of the compass

Accuracy: ±5 degrees

AIR TEMPERATURE

Sensor: YSI No. 44005 Precision Thermistor in a copper heat sink

Range: -10 to +40°C

Accuracy: ±0.1°C with individual calibration

---

<sup>1</sup> Elder, F.C. and Brady, B.P., 1972. A meteorological buoy system for Great Lakes studies. Environment Canada, IWD Technical Bulletin No. 71.

Word Size: 10 bits

Tape Capacity: 55,200 words

Speed Sensor: Propeller with magnetic coupling and reduction gearing driving a potentiometer.

Speed Range: 5.0 to 250 cm/sec

Speed Threshold: Rated at 3 cm/sec but depends on mechanical condition of propeller bearings.

Speed Accuracy: 3% or 3 cm/sec whichever is greater

Direction Sensor: Instantaneous position read on command every scan by solenoid clamping of the compass.

Direction Resolution: 2 degrees compass

Time: Calculated by start time and time per record; no independent clock.

## INSTRUMENT SPECIFICATIONS: CURRENT METERS

### 1. Geodyne Model 920 Current Meter (CCIW)

Recording Medium: 6.35 mm (1/4 inch) endless loop magnetic tape,  
120 metres (390 ft.), 2 track, 512 BPI at 6.4  
bits/second

Format: Serial digital

Word Size: 16 bit, 12 used for reference, time and temperature,  
14 bits used for identity and compass-vane words

Tape Capacity: 180,000 words

Speed Sensor: Savonius rotor with magnetic coupling, 16 counts per  
revolution measured over 4.375 secs per reading

Speed Range: 2 cm/sec to 360 cm/sec

Speed Threshold: Rated at 2 cm/sec but depends on bearing condition  
and rotor balance

Speed Accuracy:  $\pm 2.5$  cm/sec below 50 cm/sec,  $\pm 5$  cm/sec above  
50 cm/sec

Direction Sensor: Compass-vane system of two seven bit optical code  
discs, measured simultaneously, and recorded as  
14 bits.

Direction Accuracy:  $\pm 10$  degrees compass

Time: Linear continuous rotation potentiometer driven at 1 revolution-  
per day to control a transducer controlled oscillator (TCO).  
The frequency of this TCO is counted for 1.875 seconds to give  
a timeword.

Time Accuracy: Maximum cumulative error of 10 sec/day based on the  
system clock accuracy.

Temperature Sensor: Resistance of a thermistor is used to control a  
TCO in a manner similar to the timeword.

Temperature Accuracy:  $\pm 0.1^\circ\text{C}$

Temperature Range:  $-2^\circ\text{C}$  to  $+35^\circ\text{C}$

### 2. Plessey Model M021 Current Meter (CCIW)

Recording Medium: 6.35 mm (1/4 inch) reel to reel magnetic tape.

Format: Serial digital
