#### **MANAGEMENT PERSPECTIVE**

This report is a summary of stream water chemistry and stream hydrology and fulfills NWRI's commitment to provide an updated data base to other individuals/agencies involved in LRTAP research at the Turkey Lakes Watershed. The analytical results, which are stored in NAQUADAT, have been subjected to quality assurance and editing procedures and represent over six years of sampling effort at the calibrated watershed. As only limited interpretation is provided in the report, there are no direct implications for policy or planning operations within Environment Canada.

## PERSPECTIVE - GESTION

Ce rapport porte sur la chimie de l'eau et l'hydrologie du bassin hydrographique des lacs Turkey; c'est le résultat du travail que l'INRE s'est engagé à réaliser afin de mettre à jour la base de données mise à la disposition des individus et organismes participant aux travaux de recherche sur le TADPA. Les résultats des analyses, versés dans la banque NADAQUAT, ont fait l'objet d'une vérification de la qualité et d'une édition; ils représentent plus de six ans d'échantillonnages réalisés dans le bassin hydrographique. L'interprétation présentée étant limitée, elle ne peut avoir d'influence directe sur la politique ou sur les opérations de planification d'Environnement Canada.

**ABSTRACT**

This report presents a statistical summary and data listing of the major ion chemistry and instantaneous discharge at six stations (S0 to S5) located along Norberg Creek In the Turkey Lakes Watershed. The period of study extends from January 1980 to May 31, 1986. In addition, recent major ion data for a stream influent to Turkey Lake (S4a) are presented. The sampling, analytical and data processing methods are briefly discussed.

(i)

## RÉSUMÉ

On présente un résumé statistique ainsi que la liste des données recueillies sur la chimie des principaux ions et sur le débit instantané dans six stations (de S0 à S5) situées sur le ruisseau Norberg dans le bassin hydrographique des lacs Turkey. Les travaux ont commencé en janvier 1980 et se sont terminés le 31 mai 1986. On présente aussi des données récemment recueillies sur les principaux ions dans un affluent du lac Turkey (S4a). On décrit brièvement les méthodes d'échantillonnage, d'analyse et de traitement des données utilisées.

## INTRODUCTION

This report presents the major ion chemistry and instantaneous discharge data from six sites along Norberg Creek in the Turkey Lakes Watershed from the beginning of sampling in 1980 through May 31, 1986. Chemical data is also presented for a sampling station located on a relatively small stream influent to Turkey Lake and operational only since September, 1985. The chemical and hydrological information updates that presented in an earlier report (Jeffries and Semkin, 1983) and extends the stream data base from two to six water years. A water year has been defined as the period from June 1 to May 31 for purposes of mass balance calculations and modelling. All physical and chemical data have been stored in the NAQUADAT data base at the National Water Research Institute in Burlington, Ontario and have been subjected to a systematic editing procedure to correct and/or remove erroneous values. Details of the sampling and analytical methodology as well as data processing are given below.

## SAMPLING LOCATION

The Turkey Lakes Watershed (TLW) is an undisturbed, forested basin located approximately 50 km north of Sault Ste. Marie, Ontario. Basin characteristics are documented by Jeffries and Semkin (1982) and

Jeffries et al. (submitted). The TLW contains a chain of four lakes, namely (from highest to lowest elevation) Batchawana, Wishart, Little Turkey and Turkey Lake. The outlets from these lakes are designated stream stations S0, S2, S3 and S4, respectively (Figure 1). Stream Station S1 is situated between Batchawana and Wishart Lakes. A significant portion of the discharge at S1 originates from the southeast side of Batchawana mountain in addition to that from the Batchawana Lake Basin. Station S5 is located approximately half way between the Turkey Lake outflow and the Batchawana River and represents the exit from the TLW. S4a is on a small stream influent to Turkey Lake and originates in a headwater lake at the southernmost end of the watershed (Figure 1). Site elevation and drainage area for the respective stream sites are recorded in Table 1.

#### SAMPLING AND ANALYTICAL METHODS

With the exception of site S0 which was consistently monitored only from 1982, all stations along Norberg Creek have routinely been gauged and sampled since the initiation of the study in early 1980. Station S4a is a recent addition to the network with samples first being collected in September, 1985.

The streams were sampled on a weekly basis over most of the study period (i.e. since 1982). Deviation from this schedule occurred during spring melt when daily sampling was often conducted to coincide with rapid fluctuations in the stream hydrographs.

Stream water was collected in grab samples usually at the mid-point in the stream channel. Field samples were taken in an acid-washed, 2-litre, polyethylene bottle which was rinsed at least three times with the stream water.

Concomitant with sampling, measurements of water temperature and water level, or stage, were taken at each of the stream sites. On most sampling occasions, instantaneous stream discharge was also measured with a current meter (Price or Pygmy models). Weirs have been constructed at stations S0, S1 and S4a, primarily to allow for the measurement of low stream discharges during the summer months. In these instances, the discharge was recorded by a bucket measurement over a known time interval.

Stream samples were kept at 4°C and in the dark to preclude sample deterioration prior to chemical analysis in Sault Ste. Marie. Field personnel determined pH, conductivity and alkalinity as soon after sampling as possible; other analyses were generally completed within two weeks of collection following methods prescribed by the Department of the Environment (1979).

#### DATA STORAGE AND LISTING

Data for major ion chemistry and stream discharge were recorded on coding forms (Jeffries and Semkin, 1982) and entered into the NAQUADAT data base at the Canada Centre for Inland Waters in Burlington. Once stored, the data were subjected to a systematic

reviewing procedure to correct and/or delete erroneous values. This editing process has been described by Jeffries and Semkin (1983).

Data retrieved from NAQUADAT for the period January 1980 to May 1986 have been reformatted for presentation in this report. Appendices I to VII contain the instantaneous stream discharge and major ion chemistry for stations S0 to S5.

#### **STATISTICAL DATA SUMMARY**

Statistical summaries of instantaneous discharge and major ion chemistry at the monitoring stations are provided in Tables 2 to 13. Box plots (Figures 2 through 14) are used to display the distribution of major ions at a given stream station and to allow for intersite comparisons.

#### **ACKNOWLEDGEMENTS**

The authors acknowledge the excellent field support provided by members of the Technical Operations Division at the Canada Centre for Inland Waters in Burlington, Ontario. Equal gratitude is extended to the analytical staff in the LRTAP Laboratory at the Great Lakes Forest Research Centre, Sault Ste. Marie, Ontario. F. Norouzian assisted in the computer processing of data for NAQUADAT.

C = Coefficient of Variation =  $s/\bar{x}$

$$C_{s(m)} = \text{Moment Coefficient of Skew} = \frac{n}{(n-1)(n-2)} \sum_{i=1}^n (x_i - \bar{x})^3$$

**Fig 1 Location of Stream Stations in the Turkey Lakes Watershed**

**Fig 2 Box Plot Schematic for Interpretation of Data  
from the Turkey Lakes Watershed**

**Notes:**

1. IQR = Interquartile Range =  $Q_{75} - Q_{25}$
2. Outliers: ◊ values between  $Q_{75} + 3(\text{IQR})$  and  $Q_{25} - 3(\text{IQR})$   
◆ values outside the above limits
3. Notch Range: If notches between adjacent box plots do not overlap, then a significant difference is indicated at a "rough 95% level".
