## 1 INTRODUCTION

Scottie Gold Mines Ltd. was operating a 200 ton per day underground gold mine and mill at Summit Lake, approximately 20 miles north of Stewart, B.C.

The mine discharged the tailings into pools on the bottom of Summit Lake at the headwaters of the Salmon River. The lake is subject to a jökulhlaup once a year, emptying in a very short period of time, and flowing below the Salmon Glacier. It is only below the glacier that the salmon species are present.

The purpose of the survey was to document the water quality of the mine discharge and Summit Lake and determine if there were any contaminants such as cyanide and heavy metals.

**2 STUDY AREA**

The mine is located in the Salmon River valley above the tree line. Most of the samples were located in Summit Lake (Figure 1) and below the salmon glacier on the Salmon River (Figure 2). Each of the sites is described in Table 1.

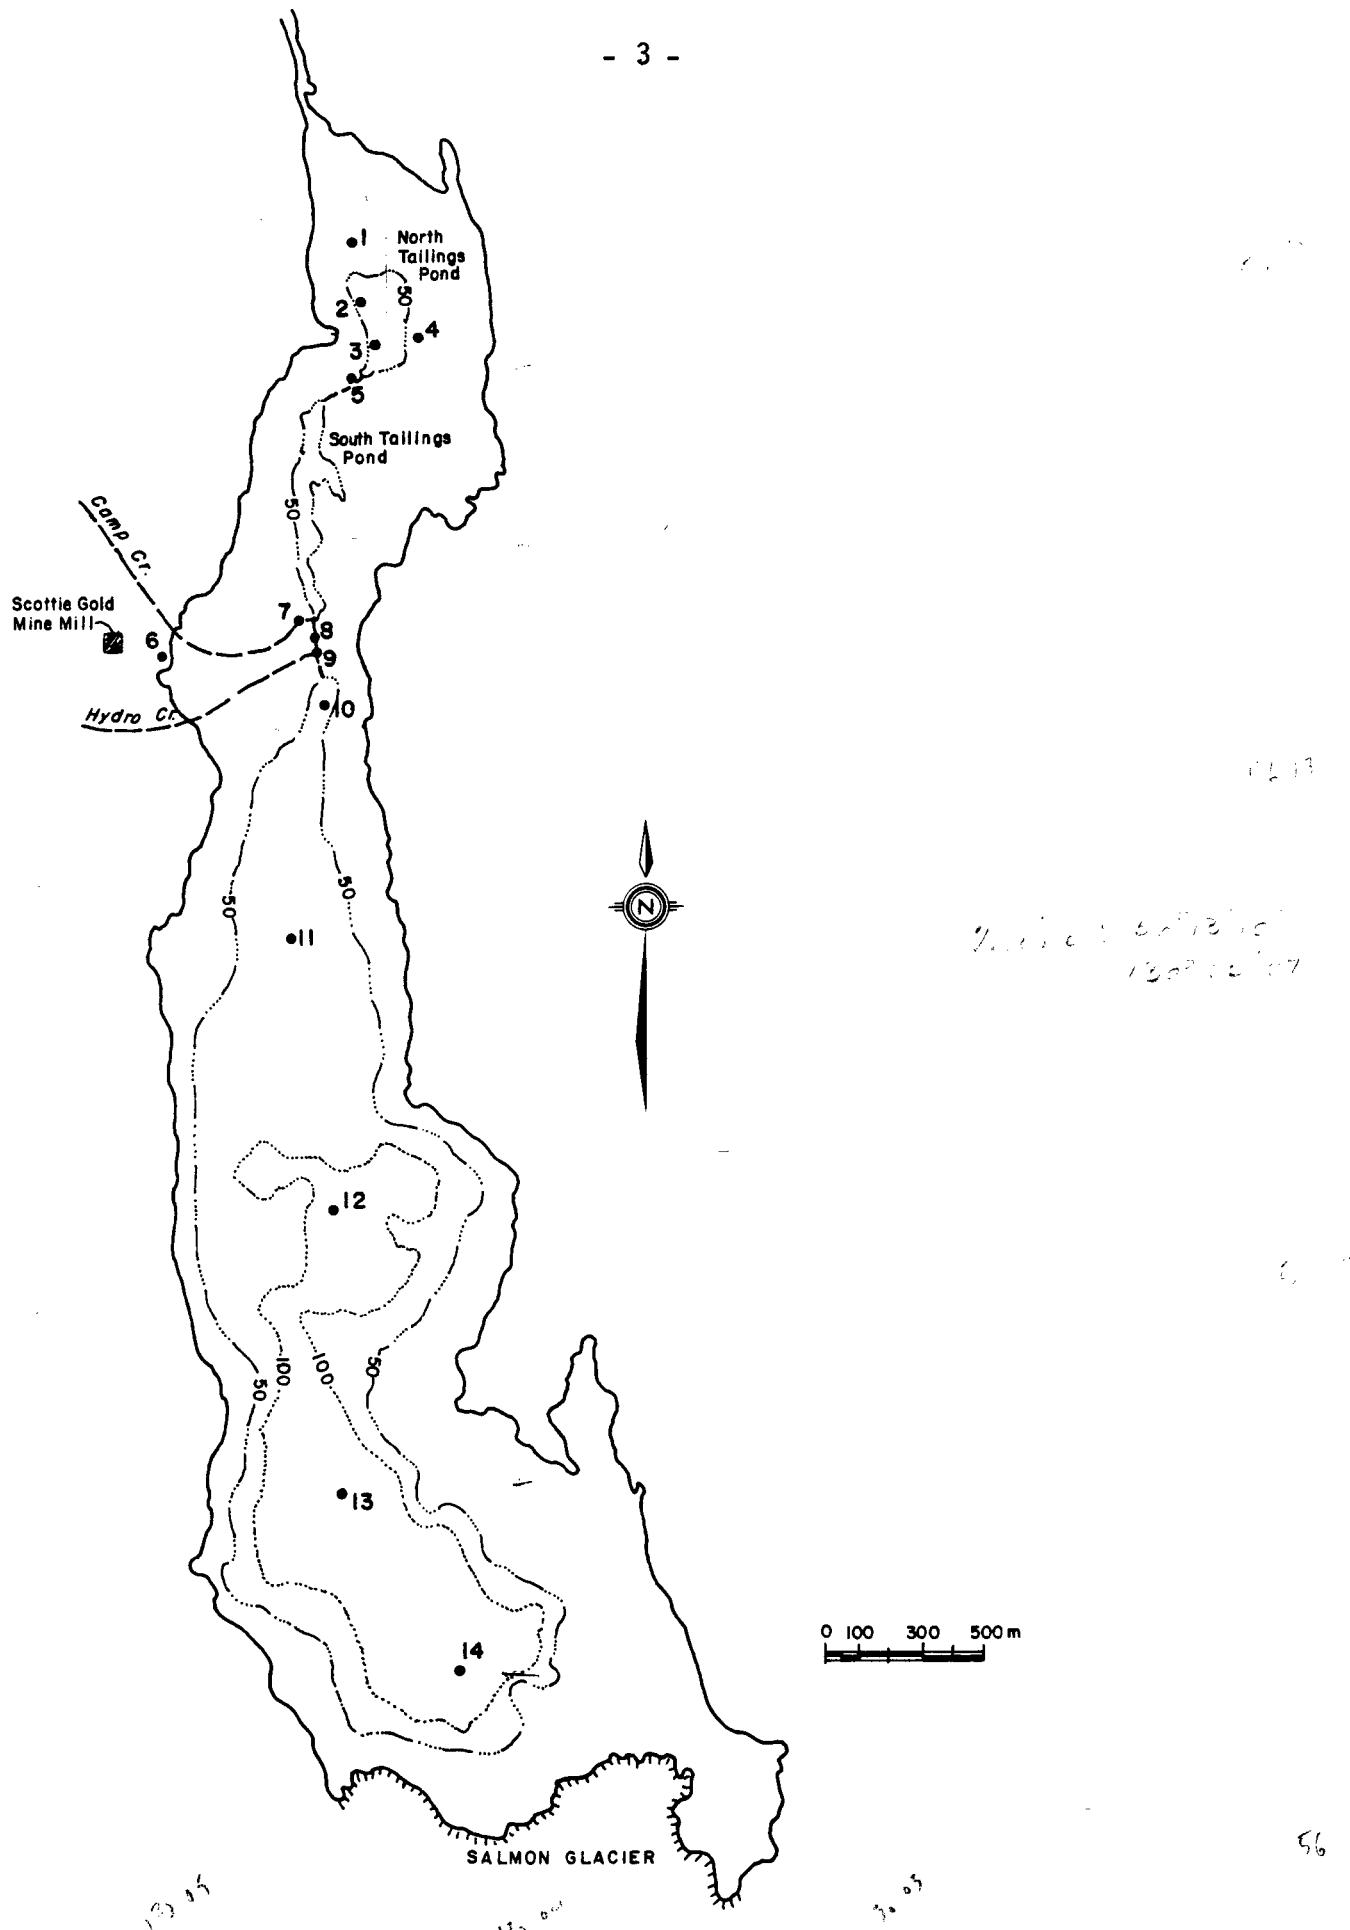

FIGURE 1 LOCATION OF WATER SAMPLING STATIONS IN SUMMIT LAKE

WATER SAMPLING STATIONS IN SALMON RIVER

TABLE 1 SITE DESCRIPTIONS

STATION	LOCATION
1	Tailings depression, northern side.
2	Tailings discharge.
3	Tailings depression, several metres south of the tailings discharge.
4	Tailings depression, eastern side.
5	Overflow from tailings depression.
6	Minewater.
7	Camp Creek mouth.
8	Reclaim barge.
9	Overflow from reclaim barge.
10	Summit Lake 100 m from Camp Creek mouth.
11	Summit Lake, 1000 metres from reclaim barge.
12	Summit Lake, 2000 metres from reclaim barge.
13	Summit Lake, 3000 metres from reclaim barge.
14	Summit Lake, above Salmon glacier.
15	Salmon River at the toe of the Salmon glacier.
16	Salmon River at Mile 20.

### 3 MATERIAL AND METHOD

Receiving water samples were comprised of grab samples collected on May 3, 1982; July 6, 1982; July 26, 27, 28 and 29, 1982; and July 11 and 12, 1983. The samples were analysed for pH, sulphate (except July 6, 1982), total residue, non-filterable residue, ammonia, total cyanide, weak acid dissociable cyanide, thiocyanate, cyanate (except in all July 1982 samplings) and total and dissolved metals. Samples at Station 8 on July 26, 1982 were analysed only for total cyanide, thiocyanate, cyanide weak acid dissociable and total and dissolved metals.

Tailings discharge samples were decanted and then preserved for cyanide and filtered for dissolved metals. No decantation was performed for the total metal sample. Tailings discharge samples were not preserved for heavy metals due to the suspected high cyanide level.

The residues, sulphate, and ammonia samples were kept cool with wet ice until analysed. Total metal samples of 250 ml each were preserved the same day with 1 ml of nitric acid. Dissolved metal samples of 100 ml each were filtered on the same day through a 0.45 micron cellulose nitrate filter and then preserved with 0.5 ml nitric acid. All samples were delivered to the Environmental Protection Laboratory in West Vancouver.

The Inductively Coupled Argon Plasma or ICAP scan, an automatic atomic emissions spectrophotometer, was used for the total and dissolved metal analysis and gave a reading of twenty-six metals. If the copper, lead, or cadmium readings were below the ICAP detection limit, the samples were rerun on the graphite furnace of the atomic absorption spectrophotometer to obtain a lower detection limit.

Total cyanide samples were collected in 500 ml bottles, preserved with sodium hydroxide pellets, and stored in the dark at 4°C. The samples were analysed at EP, West Vancouver lab with the tetracyanonickelate colorimetric method. The detection limit of the analysis is 0.03 mg/l. Thiocyanide samples were complexed with iron and analysed by colorimetric method. The detection limit is 2.0 mg/l. Weak acid dissociable samples were

slightly acidified to pH 4.5 to 6.0 and then analysed by colorimetric method. Detection limit is 0.03 mg/l. Cyanate samples were determined by ammonia analysis before and after hydrolysis of cyanate. The detection limit is 0.005 mg/l.

4 PHYSICAL AND CHEMICAL RESULTS

The reclaim water (Station 8) did not vary much between the morning and afternoon on May 3, 1982. The contaminant level of this site was the highest of the four consecutive samplings performed on July 6, 1982; July 26 and 27, 1982; and on July 12, 1983. The major contaminants were total cyanide with 27.3 and 26.6 mg/l, and total copper which reached 9.0 mg/l. A reduction of cyanide levels was observed on July 6, 1982 with 0.11 mg/l, and less than the detection limit on July 26, and 27, 1982. The detection limit was 0.03 mg/l for the samples in 1982 and 0.01 in 1983. No cyanides were detected in the survey in 1983. A decrease of the copper level was observed on July 6, 1982 with 0.12 mg/l, on July 26 with 0.01 mg/l, July 27 with 0.023 mg/l; on July 12, 1983 the copper level could not be detected.

On July 6, 1982 the copper concentrations ranged from .011 mg/l to 0.145 mg/l at the north end of Summit Lake (Stations 1 to 5). The south part of Summit Lake (Stations 10 to 14) showed levels of 0.044 to 0.046 mg/l, while no copper could be detected below the Salmon glacier (Stations 15 and 16). The total cyanide levels in the north end were 0.13 and 0.19 mg/l, while the concentrations at the south end of Summit Lake ranged between 0.05 and 0.08 mg/l.

The July 27, 1982 sampling showed an increase in heavy metals concentrations near the north end of the tailings pond. The surface water at Site #13 at the southern part of Summit Lake was 0.49 mg/l total copper. The Salmon River Station #15 showed a copper level above the CCREM (Canadian Council of Resources and Environment Ministers) water quality criteria of 0.002 mg/l with a level of 0.011 mg/l. No total cyanides were detected at the south end, while at the north end, levels were 0.11 and 0.12 mg/l.

On July 12, 1983 the water quality of the north end of Summit Lake improved, while the south end still showed copper levels of 0.064 mg/l. Copper concentrations of 0.007 mg/l were found below the Salmon glacier but the dissolved fraction was below the detection limit, with low hardness (21 mg/l), and non-filterable residue of 57 mg/l. No cyanides were detected in Summit Lake, and below the Salmon glacier.

<sup>1</sup> Results in mg/l unless otherwise stated

<sup>2</sup> CNwad - weak acid dissociable cyanide

NOTE: Mercury samples marked with \* have been done in the following method due to high sediment content.

1) Samples were well shaken, poured out, and centrifuged.

2) Liquid portion was then run as regular water sample.

3) Sediment portion was dried and run as sediment sample.

4) Both results were then converted and combined so final result is in mg/l Hg.

<sup>1</sup> Results in mg/l unless otherwise stated

<sup>2</sup> CNwad - weak acid dissociable cyanide

NOTE: Mercury samples marked with \* have been done in the following method due to high sediment content.

- 1) Samples were well shaken, poured out, and centrifuged.
- 2) Liquid portion was then run as regular water sample.
- 3) Sediment portion was dried and run as sediment sample.
- 4) Both results were then converted and combined so final result is in mg/l Hg.
