FROST DATA 1941-1970

by G.M. Hemmerick and G.R. Kendall

## GENERAL

The frost data summarized in this publication are based on minimum temperatures as observed in a standard louvered thermometer screen at a height of about 4 feet above ground, using an alcohol-in-glass self registering minimum thermometer.

In this summary frost is said to occur when the minimum temperature is recorded as $32.4^{\circ} \mathrm{F}$ or less, i.e. when the minimum temperature, when rounded to the nearest degree fahrenheit, is $32^{\circ}$ or less.

## AVERAGES AND EXTREMES OF FROST

The tables in this publication include data for most stations which have more than 5 years of observations of minimum temperatures during the standard normal period 1941-1970. The tables show the co-ordinates and elevation of the station, the average date of the last spring frost and the first fall frost and the duration of the growing season, which is the number of days between these two dates. In calculating the frost-free period the dates of the last spring and the first fall frost are days with frost and therefore not counted in the total duration. Averages were computed by changing the dates into year days and averaging these.

Extremes of frost are also listed in the table from the beginning of record to the end of 1970, with the length of record being shown. Values are given for the earliest and latest extreme frost dates along with the longest and shortest frost-free seasons. The range for the last frost is arbitarily taken from January 1 to July 15 , while the first frost is taken from July 16 to December 31. A few stations along the British Columbia coast occasionally experience no frost during the last and/or first frost periods and these are listed as "No Frost" when none occurs.

A previous compilation of frost data were published in Climatic Normals Vol 6. which also contains some notes on the effect of topography on frost occurrence, and the relationship between frost measured in the standard screen and on the surface of the ground.
