Analysis of the Cod Stock in Divisions 2GH
by
S. Gavaris and C.A. Bishop

Fisheries Research Branch
Department of Fisheries and Oceans PO Box 5667
St. John's, Newfoundland AIC 5XI

This series documents the scientific basis for fisheries management advice in Atlantic Canada. As such, it addresses the issues of the day in the time frames required and the Research Documents it contains are not intended as definitive statements on the subjects addressed but rather as progress reports on ongoing investigations.

Research documents are produced in the official language in which they are provided to the Secretariat by the author.

Cette série documente, les bases scientifiques des conseils de gestion des pēches sur la côte atlantique du Canada. Comme telle, elle couvre les problèmes actuels selon les échéanciers voulus et les Documents de recherche qu'elle contient ne doivent pas être considérés comme des énoncês finals sur les sujets traités mais plutôt comme des rapports d'ëtape sur les ētudes en cours.

Les Documents de recherche sont publiēs dans la langue officielle utilisēe par les auteurs dans le manuscrit envoyē au secretariat.

## Abstract

Catches from this stock have ranged from $94,000 \mathrm{t}$ in 1966 to 300 t in 1973. Since the introduction of a TAC in 1974 ( $20,000 \mathrm{t}$ ) this level has not been exceeded. The 1973-75 year-classes were dominant in the commercial catch in 1982, as has been previously observed. Recent management advice has indicated that fishing mortalities were below the $\mathrm{F}_{0.1}$ level.

Résumé
Les prises effectuées dans le stock dont il est question ici ont varié de 94000 t en 1966 à 300 t en 1973. Depuis 1 'instauration de TPA ( 20000 t ) en 1974, ces dernières n'ont pas êté dépassées. Les classes d'âge 1973-1975 dominaient dans les prises commerciales de 1982, phēnomène qui avait déjã été observé précédemment. Selon les rêcents conseils de gestion, la mortalitè due à la pêche était inférieure au niveau de $F_{0,1}$.

Catches from this stock have ranged from $94,000 \mathrm{t}$ in 1966 to 300 t in 1973. The recommended TAC has been maintained at $20,000 \mathrm{t}$ since its introduction in 1974. Except or 1982, catches have been less than half this level, as indicated below:
$\begin{array}{llllllllll}1974 & 1975 & 1976 & 1977 & 1978 & 1979 & 1980 & 1981 & 1982 & 1983\end{array}$
$\begin{array}{lrrrrrrrrrr}\text { TAC } & \left(000^{\prime} t\right) & 20 & 20 & 20 & 20 & 20 & 20 & 20 & 20 & 20 \\ & 20\end{array}$ Nom. catch

apreliminary

Commercial cataches, by country and month, are shown in Table 1 and the sampling coverage is indicated in Table 2 for Div. $2 H$. Only 3 t were reported from Div. 2G. Using this data the catch at age, average length at age, and average weight at age were estimated for 1982 (Table 3). The percentage discrepancy between calculated catch weight and reported catch weight was $4 \%$. Ages 7-9 dominated the catch and the 1973 year-class (age 9) appears strong as it has in previous years (Table 4). The catch at age for years 1962-71 was presented by Wells (1973) and used in a virtual population assessment. The level of sampling during 1972-77 was very low, consequently, no age distribution of catch was obtained.

Catch rates, obtained through the Foreign Co-operative Research Program (Table 5), show wide fluctuations.

Recent management advice for this stock has indicated that fishing mortalities were below $F_{0} \cdot \frac{1}{}$ from a stock which has a MSY catch of $40,000 \mathrm{t}$. Although fishing activity in this area increased in 1982, the TAC was not taken.
