## OPERATING RESULTS

# AND <br> FINANCIAL STRUCTURE RETAIL FOOD STORES 1952 

(Independent)

Published by Authority of
The Right Honourable C. D. Howe, Minister of Trade and Commerce

DOMINION BUREAU OF STATISTICS<br>Industry and Merchandising Division<br>Merchandising and Services Section

## NOTICE

The annual reports prepared by the Industry and Merchandising Division of the Bureau of Statistics are divided into 3 volumes, as follows: Volume I - The Primary Industries, including mining, forestry and fisheries; volume II-Manufacturing; Volume III Merchandising and Services.

Volume III consists of the following parts with individual trade reports listed under each:

## Part I - Wholesale Statistics

A - Wholesale Trade, 25
*B - Operating Results of Food Wholesalers, $25 \$$
*C - Operating Results of Dry goods, Plece Goods, and Footwear Wholesalers, 25
*D - Operating Results of Miscellaneous Wholesalers, (Automotive parts and accessories, drugs, hardware, plumbing and heating equipment), 25 ¢

## Part II - Retail Statistics

E - General Review, 25
F - Retail Trade, $50 \$$
G - Retail Chain Stores, $50 \Varangle$

* H - Operating Results of Chain Food Stores, $25 \$$
* I - Operating Results of Chain Clothing Stores, $25 \$$
* J - Operating Results of Miscellaneous Chain Stores (variety, drug, furniture), $25 \$$
K - Operating Results of Retail Food Stores, 25 ¢
L - Operating Results of Retail Clothing Stores, $25 \$$
M - Operating Results of Retail Hardware, Furniture, Appliance and Radio Stores, $25 \$$
N - Operating Results of Filling Stations and Garages, $25 \$$
O - Operating Results of Miscellaneous Retail Stores, 25 \$
P - Retail Consumer Credit, 25 \$

## Part III - Service and Special Fields

Q - Laundries, Cleaners and Dyers, 25 d
R - Motion Picture Theatres, Exhibitors and Distributors, $25 \$$
S - Hotels, 25
T - Sales Financing, 25\$
U - Farm Implement and Equipment Sales, 25థ
V - New Motor Vehicle Sales and Motor Vehicle Financing, 25 ¢
W - Advertising Agencies (Memorandum), 25 $\$$
X - Motion Picture Production (Memorandum), $10 \propto$

The reports are punched to permit of filing in a ring binder.

## DEFINITIONS

## Profit and Loss

Net sales - the dollar volume of business done. Allowances and discounts granted to customers and value of goods returned by customers are deducted from gross sales, but sales of meals or lunches provided employees and any goods withdrawn by the proprietor for personal use are included.

Cost of goods sold - determined by adding the beginning inventory to net purchases and deducting the ending inventory.
Gross profit - the difference between "cost of goods sold" and "net sales".
Operating expenses - all costs incurred in the year's operation of a business, except the cost of merchandise. These include:

Salaries and wages (except delivery) - payments to employees before deduction of income tax or unemployment insurance. Proprietors' salaries or withdrawals are included in "net operating profit" (in unincorporated store operations).
Taxes - business, property and water taxes. Taxes collected forremittance to governmental bodies and income tax are not included.

Insurance - annual proportion of premiums for insurance policies carried to protect the business.
Rent - Payments for use of business premises.
Heat, light and power - cost applicable to year's operations.
Delivery - includes salaries paid to delivery men, truck repairs and maintenance, depreciation, licenses and insurance on delivery equipment and supplies used in connection with delivery (gas, oll, etc.).

Repairs and maintenance - costs incurred to keep fixed store assets operating efficiently (excludes capital expenditure).
Depreciation allowances - provision for decrease in the value of fixed store assets.
Store supplies - wrapping paper, office supplies, etc.
Advertising - displays, window dressing and sales promotion.
Net bad debt loss - estimated amount of uncollectable customers' accounts receivable less the amount recovered from former bad debts.
Other expenses - telephone, telegraph, postage, bank charges, legal, auditing and collection fees, etc.

Net operating profit - Is the difference between "total operating expenses" and "gross profit", and includes proprietors' salaries and withdrawals before income tax deductions.
Occupancy - the cost of maintaining and occupying a place of business and includes: rent, business and property taxes, insurance, heat, light and power, repairs and maintenance and depreciation.

## DEFINITIONS

## Balance Sheet

## Assets

Cash on hand or in bank - the amount of cash in the business at the end of the year.
Net accounts receivable - all customers' notes and accounts owing to the business at the end of the year less any reserve for doubtful accounts.

Merchandise inventory - the cost value of merchandise on hand for resale but does not include store supplies on hand.

Other current assets - includes assets which may be converted into cash, if necessary within a reasonably short time, such as Dominion of Canada Bonds and prepaid insurance.

Fixed assets (net) - the book value of land, buildings, furniture, fixtures and equipment less any reserves for depreciation. Separate figures are shown for assets used in the business and those not used in the business.

Other assets - investment of a permanent nature not readily converted into cash and intangibles such as goodwill and organization costs.

## Liabilities and Net Worth

Current liabilities - are obligations which must be paid in the near future and represent accounts payable or any item that may be considered as a direct lien against current assets.

Fixed liabilities - mortgages secured by fixed assets and separated, as are fixed assets, between those used and not used in business.

Other liabilities - long term notes payable, accrued expenses such as taxes due but not yet paid, and prepaid or deferred income.

Net worth - Unincorporated business - the amount invested in the business together with any accumulated profits after proprietor's or partners' withdrawls.

Incorporated business - net worth is shown in two parts: (1) Capital stock, which represents the shareholders' investment of fully paid-up subscribed shares, and (2) Surplus, which represents distributable surplus, capital surplus and earned surplus.

## DEFINITIONS

## Profit and Loss Statement Ratios

Stock Turnover - the number of times in a year that the average merchandise inventory is sold and replaced. The average of the beginning and ending inventories is divided into the cost of goods sold.

Note: Each of the following ratios are expressed as a percentage of "net sales". Consequently, it is permissible to make direct comparisons between these ratios. Each ratio represents a portion of the average net sales' dollar.

Gross Profit Ratio - sometimes referred to as the "gross margin ratio" or "mark-up" represents the difference between "cost of goods sold" and "net sales". It is the portion of the average sales" dollar from which the merchant meets his operating expenses and obtains his net operating profit.

Operating Expense Ratios - each item of expense, as well as "total operating expenses", when expressed as a percentage of "net sales" shows the amounts of the average sales' dollar required to operate the average business.

Net Operating Profit Ratio - the remaining proportion of the average sales" dollar after "cost of goods sold" and "total operating expenses' have been deducted. From this amount, the percentage allowances for both proprietors' salaries and income tax should be deducted in order to determine the percentage to sales of net returns on capital investment.

## Balance Sheet Ratios

Current Ratio - Current Assets $\div$ Current Liabilities - indicates to what extent the business is able to meet its current obligations out of "current assets". Care should be taken to examine the eomponents of current assets because overstocking of inventories and overinvestment in credit sales (accounts receivables) can result in a stronger or more favourable ratio.

Liquidity Ratio - Cash + Accounts Receivable + Government Bonds and Securities * Current Liabilities - sometimes referred to as the "acid test", is similar to the "current ratio" as a test of current credit strength. A ratio of $100 \%$ (or 1) is usually considered favourable.

Working Capital to Net Worth Ratio - denotes the relationship between "working capital" (curtent assets less current liabilities) and a proprietor's equity in the business. That is, the proportion of "net worth" that could be realized readily if liquidation were necessary.

Worth-Debt Ratio - Net Worth * Total Liabilities - if used in conjunction with the "current ratio", would reflect any weakening of the capital structure of a business through large loans which give a high "current ratio".

## Interstatement Ratio

Turnover of Total Capital Employed - Net Sales \& Total Assets used in the business - provides an indication of the degree of management efficiency. However, this ratio should not be used alone because "profits" and not "sales" are the major criterion of efficiency.

# OPERATING RESULTS 

# AND <br> FINANCIAL STRUCTURE RETAIL FOOD STORES <br> 1952 

## INTRODUCTION

The ratios appearing in the operating results bulletins may not constitute an ideal pattern of operations which all retailers should set as a goal, but they do represent a standard by which the retailer may ascertain whether or not his operations are being conducted as effectively, economically and profitably as those of the trade in general. To the merchant whose profits are below average, the operating results summaries may help to disclose the reasons which account for this situation. Reflection and consideration on the part of the merchant make it possible to decide whether his operating methods should be altered or whether the situation is normal in the light of conditions peculiar to the location of his business.

There is growing evidence that indopendent retail merchants are making more advantageous use of the results shown in the biennial operating results bulletins issued by the Dominion Bureau of Statistics. Many accounting firms whose clientele includes retail merchants have shown much interest in these series.

A number of trade papers and business periodicals have reproduced and interpreted the results of previous studies with the object of illustrating to retail merchants the manner in which operating results can be used as a tool in store management. This is a practice the Bureau is pleased to encourage, since it meets with one of the most important objects in maintaining this series, namely the promotion of improved merchandising on the part of retailers.

[^1]proprietors of the true fiscal requirements involved in operating a business and the proper allocation of costs. Where capital is limited, as is often the case in a newly-established store, it would seem that most careful attention should be given to maintenance of proper records and that provision be made to check against some such standard performance as these publications provide.

This report deals with independent retail food stores. Separate figures are given for:

1. Grocery stores
2. Combination meat and grocery stores
3. Meat markets
4. Fruit and vegetable stores
5. Confectionery stores

There are analyses of:

1. profit and loss statements
2. balance sheets

Profit and loss data are shown for owned and rented stores separately, and for various sale-size categories.

Balance sheet data, which was introduced in 1948, is continued in this 1952 study. This information is presented by sales-size and kind of occupancy groups for stores with $\$ 20,000$ or more annual net sales. Where possible, a further differentiation has been pade between businesses in operation less than 10 years and 10 years or more. An important change, introduced in 1950, is the segregation of fixed assets and fixed liabilities between those used in the business and those not used in the business. This makes possible a better relationship between assets used in the business and sales than was possible when all fixed assets of the proprietor were reported as one item.

This year, definitions of the ratios, presented in this bulletin, for comparison and financial statement analysis, are shown on the opposite page.

## COMPARISON OF MAN ITEMS BY TRADES

In relation to sales, the 1952 net operating profit ratios of food stores held firm when compared to 1950 operating results ratios. Grocery and combination store managements operated with a slightly lower gross profit (mark-up) but by trimming expenses, retained the same net operating profit, in relation to net sales. The opposite situation occurred in fruit and vegetable store operations; gross profits, as a relative of sales, remained the same but net operating profits showed a slight decline
from the 1950 ratio. Confectionery stores were operated with a higher mark-up, but a corresponding rise in operating expenses occurted, resulting in a net operating profit ratio identical to that of 1950. Meat markets reported an increase in the average mark-up and only a.portion of this increase was absorbed by greater operating expenses. Therefore meat markets was the only kind of business which experienced a gain in net operating profits.

Average Gross and Net Profits - Historical Summary by Trades

| Year | Grocery |  | Combination |  | Meat |  | Fruit and Vegetable |  | Confectionery |  |

Average Inventories and Stock Turnover - Historical Summary by Trades

1. Times per year.

Comparison with previous survey results indicated that both beginning and end of the year inventories increased in all five types of food retail stores. In all trades except confectionery, the increased inventories resulted in lower rates of stock turnover than were experienced in 1950.

Meat markets, because they stocked the most perishable type of merchandise, continued to show the lowest inventories and the highest annual rate
of stock turnover of 39.1. Conversely, grocery stores which stocked the most stable line of goods of the five trades, maintained large inventories and experienced the slowest stock turnover of 10.1 times per year.

The average inventory figures represent dollar volume and the changes can be attributed to either price or quantity increase, or the combined effect of both.

The chart showing the disposition of the average gross profit dollar for each of the five food trades surveyed, is a valuable standard to which firms within each specific trade might compare their results. Differences arising from such comparisons are more apparent than if percentage ratios of costs and profits to sales were used as the standard or hasis of comparison. However, because the number of gross profit dollars varies considerably between trades, there is no common basis for reliable intertrade comparisons of average gross profit dollar components. As an example, combination stores op-
erated with a larger sales' volume than did confectionery stores thereby requiring a smaller mark-up to obtain a reasonable net profit. By comparisun it can be noted that combination stores retained only 28 cents of their average gross profit dollar as net profit, whereas confectionery stores retained 40 cents. There is no justification to assume from this comparison that confectionery stores realized a greater net profit than did combination stores. Intertrade comparisons should be made with items expressed as proportions of their respective sales.

## FINANCIAL STRUCTURE

Balance sheet information was introduced in the 1948 survey and continued for 1950 and again in this 1952 survey. This information is presented in the form of averages of firms in three sales-size categories and a differentiation is made between firms operated in owned or rented premises. The segregation of both fixed assets and fixed ligbilities into those used in the business and not used in the business, introduced in the 1950 survey, has been continued in the 1952 results. This allows direct comparison
between 1950 and 1952, but the major criterion of this segregation was to allow the presentation of data applicable to trading operations exclusively. The ratios summarized below are therefore unbiased by non-trade factors. These ratios are compiled from the averages of firms reporting in the $\$ 20,000$ and over sales-size categories, and not the over-all trade averages. Ratio definitions appear on page six of this publication.

Balance Sheet Ratios Independent Retail Food Stores Compared as at December 31, 1952

| Item | Grocery stores | ```Combina-``` | Meat markets | Fruit and vegetables stores | Confectionery stores |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | (Average of firms with net sales of \$20,000 and over) |  |  |  |  |
|  |  |  |  |  |  |
| Current ratio ......................................................... | 3.90 | 2.68 | 2.76 | 5.27 | 2.74 |
| Liquidity ratio....................................................... | 1.98 | 1.43 | 2.21 | 3.21 | 1.17 |
| Working capital to net worth................................... | 0.51 | 0.44 | 0.33 | 0.36 | 0.28 |
| Worth debt ratio..................................................... | 3.36 | 2.31 | 3.12 | 4. 76 | 2.49 |
| Turnover of total capital employed ........................ | 3.56 | 4.00 | 3.92 | 4.10 | 3.04 |
|  | Rented |  |  |  |  |
| Curtent Ratio........................................................ | 2.97 | 2.37 | 2.47 | 2.69 | 3.43 |
| Liquidity ratio....................................................... | 1.36 | 1.22 | 2.00 | 1.36 | 1.77 |
| Working capital to net worth .................................. | 0.64 | 0.53 | 0.56 | 0.55 | 0.47 |
| Worth debt ratio..................................................... | 2.19 | 1.67 | 2.15 | 2. 64 | 2.64 |
| Turnover of total capital employed ........................ | 5.41 | 6.23 | 7.53 | 8.23 | 5.40 |

A current ratio of 2 to 1 , that is $\$ 2.00$ of current assets for each $\$ 1.00$ of current liabilities, is generally considered a favourable credit position of a business. The most apparent difference between the current ratios of businesses operated in owned or rented premises occurred in the fruit and vegetable trade, where the "owned" showed 5.27 as opposed to 2.69 for "rented". This difference was not only due to larger average current assets in the owned category, but was accentuated by lower current liabilities for stores in this group.

The liquidity ratio, a test of credit strength of the business, showed that all five trades were in better than standard position with more than $\$ 1.00$ readily convertible assets for each $\$ 1.00$ of current liabilities. Again, marked differences occurred between trades due to their individual financial structural requirements.

A larger proportion of the capital of lesseemerchants, as compared to owner-proprietors, could be realized readily after the satisfaction of their respective current liabilities, as shown by the working capital to net worth ratios. That is, after allowing for the payment of current liabilities out of current assets, the owner-proprietor grocer had only 51 per cent of his capital in the form of current. assets, whereas the lessee-grocer had 64 per cent.

The worth-debt ratio takes on its signifigance when there is a difference derived by comparison of the ratios for consecutive periods. A decline would indicate that the proprietor is more dependent on outside financial assistance. That is, loans by the business may produce a favourable current ratio, but this situation can be counteracted by a decline in the worth-debt ratio of that business. Because this ratio has not appeared in previous operating results bulletins, it is impossible to provide an illustration.

## INDEPENDENT GROCERY STORES

This classification includes stores recognized by the trade as independent grocery stores. The term "independent" is used to mean non-chain or single establishment firms. Fresh meats were stocked by some, but when this item represented more than 20 per cent of annual sales, the store was classified as a combination store. After careful editing of the questionnaires returned, it was possible to use 745 reports of independent unincorporated firms in the tabulation of profit and loss averages and ratios. Results of grocery stores operated in owned or rented premises are presented separately. A further
differention is made within each of these categories to show results of firms within sales-size ranges.

Balance sheet results are shown, in the form of averages, for both owned and rented categories but only for those firms in the sales-size groups commencing at $\$ 20,000$. Returns from a total of 468 stores, comprised of 265 owned and 203 rented, were used to obtain the balance sheet results of grocery stores. To present this information a further segregation of results was made to show averages of firms in operation "under 10 years" and "10 years and over' ${ }^{\prime}$.

## Operating Results

Although identical firm results are not used, a reasonable year-to-year comparison of operating results may be made. Because profits and expenses for each year are expressed as percentages of their respective sales, it is necessary to take into account the change in sales to make a significant interpretation of changes in ratios. As an example, if average sales increased 10 per cent from $\$ 50,000$ in 1950 to $\$ 55,000$ in 1952, and rent showed a proportionate increase from $\$ 600$ to $\$ 660$, the rent expense ratio would be identical for both years. However, if rent remained unchanged, or increased less than 10 per cent, the rent expense ratio would decline. It is therefore necessary to note the changes in net sales in order to interpret a change in ratios correctly.

The average gross profit, expressed as a percentage of average net sales, declined from 14.44 per cent in 1950 to 13.78 per cent in 1952. Operating expenses, with the exception of delivery expense,
also showed decreases which more than offset the reduction in gross profit. Consequently, the net operating profit ratios showed an increase from 5.18 per cent in 1950 to 5.24 per cent in 1952. This increase, logether with greater 1952 average sales, indicates that grocers realized a larger average net operating profit when expressed in dollar value.

Generally, inventories were of slightly higher value at the end of 1952 than at the beginning of the year.

The annual rate of stock turnover ranged from 5.89 in the smaller stores to 14.10 for stores in the largest sales-size category.

Detailed information, with respect to both operating costs and financial position, is presented on the following pages.

Operating Results of Independent Grocery Stores 1950 and 1952 Compared

| Item | 1950 | 1952 |
| :---: | :---: | :---: |
| Average net sales per store .................................................................. \$ | 47.217 | 50.405 |

## INDEPENDENT COMBINATION STORES

This classification includes stores recognized by the trade as independent combination stores. The term "independent" is used to mean non-chain or single establishment firms. Both fresh meats and groceries were sold by stores in this classification and of these two commodity groups the smaller was not less than 20 per cent of annual sales. Profit and loss statements from 723 such stores were used in the tabulation of profit and loss averages and ratios. Results of combination stores operated in owned or rented premises are presented separately. A further differentiation is made within each of these
categories to show results of firms within sales-size ranges.

Balance sheet information was tabulated from results submitted by 561 combination stores, Of these, 324 conducted operations in owned premises and 237 in rented premises. Results are shown separately for each of these groups as well as by annual sales-size ranges commencing at $\$ 20,000$. A further segregation of results was made to present balance sheet information for firms in operation "under 10 years" and "10 years and over".

## Operating Results

Although identical firm results are not used, a reasonable year-to-year comparison of operating results may be made. Because profits and expenses for each year are expressed as percentages of their respective sales, it is necessary to take into account the change in sales to make a significant interpretation of changes in ratios. As an example, if average sales increased 10 per cent from $\$ 50,000$ in 1950 to $\$ 55,000$ in 1952, and rent showed a proportionate increase from $\$ 600$ to $\$ 660$, the rent expense ratio would be identical for both years. However, if rent remained unchanged or increased less than 10 per cent, the rent expense ratio would decline. It is therefore necessary to note the changes in net sales in order to interpret a change in ratios correctly.

The average gross profit, expressed as a percentage of average net sales, declined from 14.88 per cent in 1950 to 14.57 per cent in 1952. Total operating expenses showed a slightly greater net
decline which resulted in a very slight increase in the net operating profit ratio. This increase, together with greater 1952 average sales, indicates that combination stores realized a larger net operating profit when expressed in absolute dollars.

In total, inventories were slightly higher in value at the end of 1952 than at the beginning of the year. However, in five of the eight sales-size classifications, slight declines occurred.

The average annual rate of stock turnover ranged from 8.68 in the smaller stores to 14.92 for stores in the largest sales-size category.

Detailed information with respect to both annual operating costs and financial position as at December 31,1952 , is presented in the following chart and tables.

Operating Results of Independent Combination Stores 1950 and 1952 Compared

## INDEPENDENT MEAT MARKETS

This classification includes stores recognized by the trade as independent meat markets. The term "independent" is used to mean non-chain or single establishment firms. Fresh meats with related lines of poultry, fish and dairy products were sold by stores in this classification. If groceries formed more than 20 per cent of annual sales, the business was classified as a combination store.

The results of 227 unincorporated meat markets, comprised to 102 operated by owner-proprietors and 125 by lessee-proprietors, were used in the tabulation of operating results for this trade. Tabulations
are presented separately for each of these groups and within each group a further detailed presentation is shown for typical sal es-size ranges.

Balance sheet information was tabulated from results submitted by 166 meat markets. Of these, 76 conducted operations in owned premises and 90 in rented premises. Results are shown separately for each of these groups as well as by annual salessize ranges commencing at $\$ 20,000$. A further segregation of results was made to present balance sheet information for firms in operation "under 10 years' 'and '"10 years and over".

## Operating Results

Although identical firm results are not used, a reasonable year-to-year comparison of operating results may be made. Because profits and expenses for each year are expressed as percentages of their respective sales, it is necessary to take into account the change in sales to make a significant in-
terpretation of changes in ratios. As an example, if average sales increased 10 per cent from $\$ 50,000$ in 1950 to $\$ 55,000$ in 1952, and rent showed a proportionate increase from $\$ 600$ to $\$ 660$, the rent expense ratio would be identical for both years. However, if rent remained unchanged or increased less than 10
per cent, the rent expense ratio would decline. It is therfore necessary to note the changes in net sales in order to interpret a change in ratios correctly.

The average gross profit, expressed as a percentage of average net sales, increased from 16.08 per cent in 1950 to 17.54 per cent in 1952. Total operating expenses also increased, but this was a smaller increase than occurred in the gross profit, with the result that net operating profit increased from 5.02 per cent to 6.14 per cent. This increase, together with greater 1952 average sales, indicates that meat markets realized a greater net operating profit when expressed in absolute dollars.

In total, inventories were slightly lower in value at the end of 1952 than at the beginning of the year.

However, this trend was common only to those stores in the large sales-size categories. Slight increases in inventory values were reported by stores in the smaller sales-size categories.

The average annual rate of stock turnover ranged from 18.77 in the smaller stores to 48.41 in the larger sales-size categories. A widespread range such as this is to be expected in this trade where the perishable goods are stocked in comparatively smaller quantities.

Detailed information with respect to both annual operating costs and financial positionas at December 31, 1952 is presented in the following chart and tables:

Operating Results of Independent Meat Markets 1950 and 1952 Compared

## INDEPENDENT FRUIT AND VEGETABLE STORES

This classification includes stores recognized by the trade as independent fruit and vegetable stores. The term "independent" is used to mean non-chain or single establishment firms. The sales of these stores were comprised of not only fresh fruits and vegetables, but also additional commodities such as groceries, tobacco and confectionery. However, if a store which specialized in the sale of fresh fruits and vegetables sold $50 \%$ or more of these additional commodities, it was ommitted from the results appearing in this bulletin. Profit and loss statements from 137 fruit and vegetables stores were used in the compilation of profit and loss averages and ratios. These results are presented for stores operating in owned or rented premises. A further
differentiation is made within each of these categories to show results of firms within sales-size ranges.

Balance sheet information was tabulated from results submitted by 79 fruit and vegetable stores. Of these, 25 conducted operations in owned premises and 54 in rented premises. Results are shown separately for each of these groups, as well as by annual sales-size ranges commencing at $\$ 20,000$. There was insufficient response from firms in this trade to allow the additional segregation of balance sheet results for firms in operation "under 10 years" and "10 years and over".

## Operating Results

Although identical firm results are not used, a reasonable year-to-year comparison of operating results may be made. Because profits and expenses for each year are expressed as percentages of their respective sales, it is necessary to take into account the change in sales to make a significant interpretation of changes in ratios. As an example, if average sales increased 10 per cent from $\$ 50,000$ in 1950 to $\$ 55,000$ in 1952 , and rent showed a proportionate increase from $\$ 600$ to $\$ 660$, the rent expense ratio would be identical for both years. However, if rent remained unchanged or increased less than 10 per cent, the rent expense ratio would decline. It is therefore necessary to note the changes in net sales in order to interpret a change in ratios correctiy.

The average gross profit, expressed as a percentage of average net sales, remained of the same order in 1952 as was determined in our 1950 survey. The total operating expense ratio of $11.93 \%$ for 1952 was only slightly greater than that of $11.58 \%$ for 1950. Consequently, the net operating profit ratio for 1952 was slightly lower than that for 1950. However, because of the increase in the average sales of reporting firms, this slight decline in the net operating profit ratio does not necessarily mean that fruit and vegetable store proprietors realized a
smaller net operating profit when expressed in absolute dollars.

In total, inventories were of slightly higher value at the end of 1952 than at the beginning of the year. However, this trend was common only to the stores in the owned premises category.

The average annual rate of stock turnover varied inversely with sales-size. This condition is the reverse of the results obtained for other trades and is due to the differences in the proportion of fresh fruits and vegetables stocked. That is, the sales of the stores in the smaller sales-size categories are comprised almost entirely of fruit and vegetables. whereas the stores in the larger sales-size categories sell a higher proportion of groceries and other comparatively non-perishable commodities. Consequently, the inventories of the smaller stores, comprised largely of perishable commodities, would be comparatively smaller. This condition would produce a larger stock turnover ratio.

Detailed information with respect to both annual operating costs andfinancial position as at December 31,1952 is presented in the following chart and tables:

Operating Results of Independent Fruit and Vegetable Stores 1950 and 1952 Compared

## INDEPENDENT CONFECTIONERY STORES

This alassification inclutes stores recognized by the trade as independent confectionery stores. The term "independent" is used to mean non-chain or single establishment firms. The primary commodities sold by firms in this classification were candy and confectionery, soft drinks, tobacco, ice cream, fruits, newspapers and magazines. Light lunches in some instances also formed part of the sales, but results of firms in which this item exceeded 50 per cent of the sales were not used in the tabulations.

Profit and loss statements of 185 independent confectionery stores were used in the tabulation of
profit and loss averages and ratios. Results of stares operated in owned or rented premises are shown separately. A further differentiation is made within each of these categories to show results of firms within typical sales-size ranges.

Balance sheet information, suitable for tabulation, was submitted by 76 confectionery stores most of which were in the $\$ 20,000$ to $\$ 49,999$ annual sales range category. Therefore, the detailed information for firms in business "under 10 years" and "10 years and over' is presented for this sales-size classification only.

## Operating Results

Although identical firm results are not used, a reasonable year-to-year comparison of operating results may be made. Because profits and expenses for each year are expressed as percentages of their respective sales, it is necessary to take into account the change in sales to make a significant interpretation of changes in ratios. As an example, if average sales increased 10 per cent from $\$ 50,000$ in 1950 to $\$ 55,000$ in 1952, and rent showed a proportionate increase from $\$ 600$ to $\$ 660$, the rent expense ratio would be identical for both years. However, if rent remained unchanged or increased less than 10 per cent, the rent expense ratio would decline. It is therefore necessary to note the changes in net sales in order to interpret a change in ratios correctly.

The average gross profit, expressed as a percentage of average net sales, increased slightly in 1952 when compared to the 1950 results. The total operating expense ratio increased to a greater ex-
tent, resulting in a slight decline in the net operating profit ratio. However, because of the increase in the average net sales, this decline does not necessarily mean that confectionery store proprietors realized a smaller net operating profit when expressed in absolute dollars.

Inventories were of slightly higher value at the end of 1952 than at the beginning of the year for all sales-size calegories except the smallest.

The average annual rate of stock turnover ranged from 6.03 in the smaller stores to 16.83 for stores in the largest sales-size category.

Detailed information with respect to both annual operating costs and financial position as at December 31. 1952, is presented in the following chart and tables.

Operating Results of Independent Confectionery Stores 1950 and 1952 Compared

[^0]:    * Biennial reports - not issued for 1952.

[^1]:    Statistics derived from other sources have shown that the mortality rate of business is much higher among new entrants into the field of retailing than among those established for five years or more. There are many reasons for this, some of them associated with the natural incompetence of the initiate retailer which could not be completely overcome by means of operating statement analysis. It seems reasonable to suppose, however, that failure in many cases is the result of inadequate knowledge on the part of new
