- Inquiries line 1-800-635-7943
- Fax line 1-800-565-7757

Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner. To this end, Statistics Canada has developed standards of service that its employees observe. To obtain a copy of these service standards, please contact Statistics Canada toll-free at 1-800-263-1136. The service standards are also published on www.statcan.gc.ca under "Contact us" > "[Standards of service to the public](#)."

Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued co-operation and goodwill.

The characteristics of shelter residents

by Sarah McDermott, Adriene Harding, and Jeff Randle

Introduction

Access to safe and affordable housing is an important aspect of Canadian well-being. Unfortunately, some Canadians are unable to secure stable housing situations and find themselves facing homelessness.

There are many facets of homelessness and homelessness statistics, such as the incidence and persistence of homelessness. The characteristics of homeless individuals are also important, and are the focus of this paper. Statistics Canada does not measure every aspect of homelessness. Homeless Canadians are often difficult to reach. However, within the framework of the Census, shelter residents are enumerated and a socio-economic profile of these residents can be created using Census data.

The objective of this paper is to provide a picture of Canadians living at shelters, using the 2016 Census of Population to understand the characteristics of these individuals. This report will also discuss Census properties and attributes particular to shelters and collective dwellings in order to develop an understanding of the Census' role in the analysis of homelessness.

The Census and homelessness

The Census Program provides a statistical portrait of the country every five years. Individuals are enumerated at their usual place of residence which can be a private or collective dwelling. Collective dwellings are defined as dwellings of a commercial, institutional or communal nature. Included in this classification are shelters and, prior to Census Day, Statistics Canada developed lists of shelters to make it easier to distinguish homeless shelters from other types of collective dwellings. Shelters are also subcategorized into three types: shelters for persons lacking a fixed address, hereafter referred to as no fixed address shelters, shelters for abused women and their children, and other shelters and lodgings with assistance, such as halfway houses.

Homelessness can be split into two categories: hidden (concealed) homelessness, and absolute homelessness. Hidden homelessness refers to those who are couch-surfing, living in their car, etc. (Library of Parliament, 2012). Absolute homelessness refers to those who are currently living in a shelter or in a public area and have no designated residence (Library of Parliament, 2012). Census data for the population living in shelters can be used to describe a segment of absolute homelessness.

Counting shelters and the population staying at shelters

Over time, the Census enumeration process for counting those living in shelters has evolved. In the 1941 Census, if someone did not have a home, they were enumerated wherever the enumerator observed them (Statistics Canada, 1941, Instructions to commissioners and enumerators, pg. 15). Then, in 1951, shelters were classified as hotels, along with hotels, YM/YWCAs, university residences, rooming houses, and diplomatic residences with at least one Canadian resident (Statistics Canada, 1951, Ninth Census of Canada, Training Manual). The 1961 Census began classifying shelters in a new category of missions, YM/YWCAs and hostels (Statistics Canada, 1971, Dictionary of the Census of terms, pg. 37). It was not until 1981 that shelters became its own collective dwelling sub-category, and was separated from those living at YM/YWCAs (Statistics Canada, 1981 Census dictionary, pg. 83).

Statistics Canada has also tested different types of enumeration methods in the past to count the individuals who were not living in a dwelling. For example, in the 1940s, the Census counted individuals who were residing at soup kitchens. In 2001, Statistics Canada had enumerators count those living in public spaces such as parks; however, this enumeration method was not found to be successful in collecting accurate counts, and was discontinued.

The 2016 Census enumerated people who spent the night between May 9th and 10th in shelters and similar facilities, which represents an important segment of the absolute homeless population. Data was collected using administrative records or Census forms with the assistance of administrators. This means that many individuals who were counted at shelters were not required to self-enumerate. This procedure was the same for many other

types of collective dwellings, however, unlike other types of collectives, all individuals enumerated at a shelter on Census day were enumerated as usual residents¹.

In previous Censuses, people who were part of the absolute homeless population had the ability to call into the Census to make sure they were counted, and were added into imaginary shelters that were created for this purpose. For the 2016 Census, this procedure was modified such that those who called the Census Help Line were enumerated at nearby (existing) shelters. This practice may have led to population counts at certain shelters being above their physical capacity².

The Census count of the shelter population does not represent the total number of homeless persons since they may have been enumerated in a number of other places such as other types of collective dwellings or private dwellings with family or friends. It should also be noted that while not all homeless individuals stay at shelters, it is also true that not all individuals staying at shelters are necessarily homeless.

Most usual residents were counted at shelters for persons with no fixed address

The 2016 Census counted 995 shelters with a population of 22,190³ usual residents. Almost 7 out of 10 usual residents in shelters, or 15,505 individuals, were enumerated at shelters for individuals with no fixed address. Almost one quarter (5,365) of the population in shelters were counted at shelters for abused women and their children and the remainder (1,320) were counted in other shelters. A historical comparison of the population in shelters shows the total number of usual residents grew by more than 2,500 since 2006 (19,630⁴).

Ontario had the most shelters and residents

Ontario had the highest count of usual residents residing in shelters on Census day, with 8,780 usual residents in all shelter types. Ontario is also the province with the most inhabitants in the country. Alberta followed with 4,235 while British Columbia (4,025) was the only other province or territory with more than 4,000 shelter residents.

The province with the largest percentage of no fixed address shelter residents was Ontario, accounting for 41.8% of the total population for these types of shelters. Ontario also had the largest percentage of usual residents in shelters for abused women and their children at 38.7%. Quebec had the highest percentage of people in other shelters, accounting for 42.4% of all other shelter residents.

Ontario and Quebec had the highest number of occupied shelters on Census day. There were 305 shelters in Ontario that reported having usual residents and another 205 in Quebec. Prince Edward Island was the only province with fewer than 10 occupied shelters. All three territories also had 10 or fewer occupied shelters.

It is worth noting that 20.9% of the total number of usual residents in shelters were in Alberta, which is almost double the share of the total population that lives in Alberta, 11.6%.

Unattached individuals, men most common in shelters

Shelter residents were more likely to be unattached individuals⁵ when compared to the population in private dwellings⁶. For the population aged 15 and over, 89.1% of those living in shelters were unattached. The proportion of the population aged 15 and over in private dwellings who were married or in common-law was 58.4%. The percentage of unattached individuals was similar across all shelters, being above 88% regardless of type.

Men accounted for a greater proportion of the population in shelters when compared to their share of the population in private dwellings. According to the 2016 Census, 60.8% of all usual residents in shelters were men, compared with 49.2% of the population living in private dwellings.

1. Usual resident refers to individuals counted at their usual place of residence. In this case, a usual resident's address is the shelter they stayed at on Census day.

2. According to the maximum occupancy for a shelter reported in the Census or other administrative sources.

3. Counts are rounded and may not always add up to the total.

4. Source: 2006 Census of Population. Catalogue no. 97-554-XCB2006054

5. Unattached individuals in this report refers to all individuals whose marital status was not married or common-law. All shelter residents were assigned a common-law status of 'no' for the 2016 Census.

6. The next sections describe the characteristics of shelter residents as determined by the Census. Readers should be aware of high imputation rates to some of these variables as described later in the Coverage and Data Quality section.

While men represented the majority of usual residents at shelters, this differed by shelter type. Most usual residents in no fixed address shelters (72.8%) and other shelters (89.8%) were male, while usual residents of shelters for abused women and their children were predominantly female (80.9%). Men, however, accounted for 3.8% of usual residents over the age of 14 in shelters for abused women and their children. This could partly be attributed to employees of shelters being enumerated at the shelter if it was their usual place of residence.

Seniors, children less common in shelters

Seniors and children were less common among usual residents of shelters when compared to their shares of the population living in private dwellings. Seniors aged 65 and older accounted for just 5.9% of usual residents living at shelters, while they accounted for 15.9% of the population living in private dwellings.

Children aged 0 to 14 accounted for 13.7% of usual residents living at shelters, while accounting for 16.9% of the population living in private dwellings. Young children aged 0 to 4, however, accounted for 16.3% of the usual residents at shelters for abused women and their children, while they represented just 5.5% of the population living in private dwellings.

Part of the reason we see differences in the shares of children and seniors between the population living in shelters and the population living in private dwellings can be attributed to the availability of collective dwelling types with services that are targeted towards seniors and children. Senior residences and nursing homes are two types of collective dwellings with services for seniors, and residential care facilities that are group homes for children have accommodation services for children.

Shelter residents more likely to earn less income, fall below LIM

The 2016 Census Program, for the first time, gathered income information solely from administrative data sources. The integration of income data from Canada Revenue Agency's tax and benefits records into the short-form census allows for the compilation of income statistics for people in shelters. Users should also note the reference periods and reference dates when analyzing income data with other variables. The reference period for income data is the calendar year 2015, while place of residence, type of dwelling and other demographic variables collected on the questionnaire, such as age and sex, reflect respondent characteristics on Census Day, May 10, 2016.

Low income is commonly analysed at the household level when considering private households and the Low Income Measure (LIM) thresholds are determined by household size. Family formations are not derived for shelter residents, which means collective household⁷ sizes depend largely on the size and capacity of the collective dwelling. For the purpose of this analysis, low income for shelter residents is determined using the after-tax Low Income Measure (LIM) for one-person households in 2015, \$22,133⁸. Of shelter usual residents aged 15 years and over, 84.7% earned an after-tax income that fell below the LIM threshold. In contrast, only 32.0% of one-person households earned an after-tax income which fell below the threshold⁹.

Additionally, the 2015 median after-tax income for shelter residents was lower than that of the population who lived in private dwellings. By comparison, the median after-tax income of residents at no fixed address shelters (\$10,576), shelters for abused women and their children (\$12,599), and other shelters (\$4,848) was well below half the median after-tax income of individuals 15 and older in private dwellings (\$30,866¹⁰).

7. A collective household refers to a person or a group of persons who occupy a collective dwelling and do not have a usual place of residence elsewhere in Canada. Residents who occupy separate rooms within the same collective dwelling are considered to be living in one collective household.

Shelter residents less likely to have employment income, investment income and pensions, more likely to receive social assistance and refundable tax credits

While the income was generally lower in shelters, the sources of income also varied for shelter residents when compared with the population living in private dwellings. In 2015, 85.8% of persons in private dwellings received some form of market income. For residents of shelters, the rate was much lower at 46.9%.

Differences across market income sources are also important. Shelter residents received investment and private pension income about six times less often than persons in private dwellings. For employment income, shelter residents (41.2%) were just over half as likely to have some employment income during the year when compared to persons living in private dwellings (71.3%). The contrast for earnings is more noteworthy than the contrast of private pension income considering there are proportionally more potential earners in shelters between the ages of 15 and 64 years.

Despite having been less likely to earn market income than their counterparts in private dwellings, the situation was reversed for shelter residents receiving government transfers. Over nine out of ten shelter residents (90.4%) received some form of government benefit whereas under seven out of ten (68.9%) persons living in private dwellings were recipients. For social assistance benefits, shelters residents (54.1%) were more than ten times more likely to be recipients than their counterparts who lived in private dwellings (4.6%). Shelter residents (66.4%) were also more likely to have received a 2015 GST/HST tax credit compared to those who lived in private dwellings (37.2%).

Though there are significant contrasts between the income sources of persons living in shelters and those living in private dwellings, the variations were much smaller across different shelter types. The income profile for persons living in shelters for abused women and their children showed the most difference from the two other types of shelters where residents were eight to ten times more likely to be recipients of child benefits. They were also more likely than other shelter residents to have some form of investment income and market income not included elsewhere¹¹.

In general, shelter residents tended to be younger than persons in private dwellings and this factor may have influenced the receipt of Old Age Security pension (OAS), Guaranteed Income Supplement (GIS) as well as benefits from the Canada Pension Plan (CPP) and Quebec Pension Plan (QPP). Shelter residents were less than half as likely as the population in private dwellings to be recipients of these benefits for which eligibility is mainly determined by age and lifetime labour force choices. For the disability component of CPP/QPP benefits; however, shelter residents were more than twice as likely to have received an amount.

Impact of wildfire in Wood-Buffalo, Alberta

On May 1, 2016, a wildfire began southwest of Fort McMurray, Alberta, and on May 3, swept through the community destroying many homes and buildings and forcing the largest wildfire evacuation in Alberta's history. Statistics Canada decided to suspend census data collection (referred to as "field data collection") in the evacuated areas.

Statistics Canada used a set of measures to ensure that residents of the Wood Buffalo census subdivision (referred to as the Specialized municipality of Wood Buffalo) were included in the 2016 Census of Population. Data for the evacuated area were derived from a combination of sources. First, many residents of the area responded online or by returning a paper questionnaire. Then field data collection was performed for a number of households using short- or long-form questionnaires. Lastly, short-form data were derived from a number of administrative data sources for the households residing in dwellings where field data collection was not possible.

It is impossible to know exactly how the wildfires and enumeration process for Wood Buffalo impacted the data vis-à-vis the shelter population in Alberta. It's also possible that displaced Wood Buffalo residents could have been counted at shelters elsewhere in Alberta. According to the 2016 Census, Alberta had the second highest count of people living in shelters, while having fewer shelters than Ontario, Quebec, and British Columbia. Alberta also had the highest per-capita shelter users when compared to the other provinces. Western provinces

11. Market income not included elsewhere includes support payments.

also had more shelter residents per capita compared to Eastern provinces. These trends, in part, could be a result of people being displaced from Wood Buffalo; however, it is also possible that other factors such as the economic downturn in the province during that same time period could also partly account for trends. Another possible explanation could be due to a rental market with limited supply in Calgary. Academic and media reports have presented Calgary's housing market as a driver of homelessness in Alberta suggesting that working individuals who could otherwise afford stable housing are forced into homelessness, or shelters, due to housing supply shortages.

Coverage and Data Quality

The Census is not designed to measure all aspects of homelessness in Canada; however, the Census can provide a reasonable overview of certain homeless sub-populations that are not normally included in the target population of surveys, due to their transient lifestyle.

High imputation rates among usual residents at shelters could raise concerns regarding data quality for certain variables. The item non-response in shelters was higher than that of the general population which led to higher imputation rates for those living in shelters. In 2016, marital status was imputed for 65.5% of shelter residents while only being imputed for 4.3% of the total population. The imputation rates for age and sex of shelter residents were 11.9% and 12.3% respectively, which were almost 10 percentage points higher than those for the total population. The administrative data record linkage rate¹² for shelter residents was 69.0% while for the general population the linkage rate was 94.8%.

In the territories, collective dwelling enumeration is conducted earlier in the year to accommodate people leaving their communities in the spring and summer for traditional activities. Like most other collective dwellings, residents at shelters are enumerated with the help of an employee at the shelter.

Shelters, like other collective dwellings, were out-of-scope for the 2016 Census long-form questionnaire. Data collected using the long-form questionnaire includes additional details such as the highest level of education completed, immigration status, Aboriginal identity and visible minority status. Data gaps associated with Aboriginal identity and immigration status for those living in shelters could be filled through existing administrative linkages, however, this analysis has not been conducted at this time.

Other sources of data to inform homelessness

Other initiatives exist to monitor the homeless who are not in shelters, the federal government has, for the past few years, been collecting information on Canada's homeless population. Employment and Social Development Canada (ESDC) maintains the National Homelessness Information System, which helps facilitate the collection of data from service providers. Statistics Canada also recently began disseminating data from the [Homeless Individuals and Families Information System](#) (HIFIS)¹³ which reports on capacity, bed and shelter counts for shelters in Canada using data maintained by ESDC. In 2016, the Government of Canada also supported a coordinated count of the homeless in communities across the country. For additional information about this count, refer to the Homelessness Strategy [Point-in-Time Count](#) section of the ESDC website.

Two Statistics Canada surveys, the Transition Homes Survey (THS) and the General Social Survey (GSS) – Victimization, also provide statistics related to homelessness. The THS and the GSS - Victimization concentrate on different aspects of homelessness. The THS provides information about the number of beds in shelters for abused women and a point in time count of individuals living in shelters, as well as their experiences with domestic abuse and addiction. The GSS's cycle on victimization asks survey participants about their lifetime experiences with absolute and/or hidden homelessness, as well as other details about their life experiences.

12. 2016 Census (short-form) CRA record linkage rate refers to the proportion of 2016 Census respondents who were linked to a CRA record. For more information on tax record linkage rates, refer to the Income reference guide, 2016 Census of Population. Catalogue no.: 98-500-X2016004
