This is one of a series of studies that have been prepared for the Royal Commission on Taxation. Although these studies are published under the auspices of the Commission, this does not necessarily imply that the Commission agrees with the views expressed.

PREFACE

This monograph is the third of four companion studies which supplement and provide documentation for the estimates presented in Volume 6 of the Report of The Royal Commission on Taxation of the effects on aggregate tax revenues and on the incidence of changes in direct taxes which would result from the Commission's recommendations. A description of the programs and data used in making these estimates is contained in Study 25, entitled A General Income Tax Analyzer. Estimates of the incidence of these changes on different classes of resident individuals are presented in Study 26, entitled Who Benefits and Who Pays: The Incidence on Different Income and Occupation Groups of Income Tax Changes Resulting from the Commission's Recommendations. The purpose of this monograph is to provide detailed estimates of the incidence of these changes in direct taxes upon various types of income accrued by resident individuals. Estimates of the changes in the tax base allocable to different classes of resident individuals are presented in Study 29, entitled Components of Taxable Income for Resident Individuals.

The estimates reported in this monograph are the result of applying the programs described in A General Income Tax Analyzer to a sample of 411,500 tax returns (unidentified as to taxpayer) supplied to the Commission by the Department of National Revenue. The results reported in this monograph could not have been obtained without the contributions which have been acknowledged in that study.

The estimates have been substantially revised since the publication of the Commission's Report, and their accuracy has been

correspondingly increased as a result of numerous useful suggestions received from readers of earlier drafts. I cannot adequately acknowledge all the contributions from which this study has benefited. I should, however, like to acknowledge the special contributions made to this study by L. Cseh of the Institute for Policy Analysis, by J. F. Helliwell of the Bank of Canada and University of British Columbia, and by J. Kuiper, A. Raynauld, and L. Read of the Department of Finance.

While this study is the third of the four companion studies in the order in which the original versions were written, this study is the last of the four to be printed by the Queen's Printer. Before sending it to press, I should like to pay tribute to the care with which all four studies have been handled in the process of converting them from typescript to print. The reader as well as the author is in considerable debt to Mrs. A. Lamb of the Commission's staff, whose conscientious and skilful editing has eliminated a number of errors and improved the readability of the studies. Reader and author must also be greatly indebted to the staff of the Queen's Printer, and particularly to A. Beauchamp and F. Presseau, for the accuracy with which text, titles, and computer output have been assembled and printed.

Needless to say, I alone am responsible for any errors that remain.

INTRODUCTION

The incidence estimates reported in Chapter 36 of the Report of the Royal Commission on Taxation and presented in revised form in the companion study (Number 26) entitled Who Benefits and Who Pays provide overall data on the incidence of the more important direct tax changes resulting from the Commission's recommendations and attributable to resident individuals. However, these estimates do not provide sufficient data to enable an analyst to examine the economic effects of these changes. To analyze the effect of these changes upon decisions made by resident individuals, it is necessary to examine their impact on the taxation of income accrued by (or currently attributable to) these individuals from different sources. The purpose of this monograph is to present such estimates of "economic incidence", based upon data obtained from tax returns filed for 1964.

Throughout this monograph, current taxes are defined in accordance with income tax law enacted as of December 31, 1966, as modified by the change in old age security tax announced in the Supplementary Budget of December 19, 1966.

The importance and implications of these estimates have been discussed in Chapter 37 of the Report, and need only be outlined here. The primary purpose of the estimates presented in this study is to provide basic data needed for an examination of the effects of tax changes which would result from implementation of the tax reforms proposed by the Commission on the average rates of return earned by various types of economic activity—whether involving investments of monetary capital or

investments of human capital. These estimates were not available in time to be incorporated into the text of Chapter 37, so that quantitative discussions in the Report of the effect of changes in the effect of average and marginal rates of tax on different components of income had to be based on the examples generated for employment and corporate source income in appendices to Volumes 3 and 4 of the Report. Such estimates are provided in this study to provide data for further quantitative analysis of the likely effect of the Commission's reforms on asset prices and on the allocation of capital and labour effort.

The data, assumptions, and analyses underlying these estimates have also been described elsewhere. 1/ The estimates are derived from an analysis of a sample of 411,500 tax returns. 2/ Such a large sample was used because of the high degree of heterogeneity among individual taxpayers with respect to the composition of assessable income, and because of the similarly high degree of non-linearity in the relationship between components of income accrued by individuals and the corresponding components of assessable income currently reported. The tax returns were classified into 19,370 groups according to income, age, sex, occupation, family status, number of dependants, and tax-paying status when the return was filed in 1964. The changes in taxable income, resultant changes in gross taxes, and changes in tax credits which resulted from the more important proposals of the Commission were then estimated for the average individual in each of these groups. Taxes under the Commission's proposals were calculated simply by applying the proposed rate schedules to the comprehensive base taxable income estimated for the average individual in each group of tax returns and

then deducting the amount of tax credits estimated to be applicable to that individual. Aggregate estimates were obtained by multiplying the results obtained for such average individuals by the number of resident individuals in the corresponding group, and then summing over groups. 3/

Definition of Direct Tax Changes Estimated

As in the Commission's Report, the term "direct taxes" is used to include corporation income taxes, personal income taxes, and gift and estate taxes. It is necessary to consider all three taxes together, for the Commission's proposals would abolish gift and estate taxes and move their impact into personal income taxes, while the integration of personal and corporation income taxes would make it impossible to obtain meaningful comparisons of the incidence of each separate tax under the current tax system and under the Commission's proposals. 4/

A total of 32 major reforms proposed by the Commission which affected the direct taxation of resident individuals were evaluated in the analysis presented in this study; these reforms are listed in Table 1. The reforms listed in Table 1 are described in more detail in Chapter 35 of the Report. 5/ With three exceptions (described below), all major proposed changes in direct taxes are reflected in the estimates presented in this study.

The 32 reforms listed in Table 1 do not include two important proposed changes which have been ignored in all incidence calculations because of the lack of underlying data needed to estimate their effects for particular taxpayers. One excluded change, the income-averaging provisions recommended by the Royal Commission on Taxation, would result

TABLE 1LIST OF REFORMS EVALUATED IN ESTIMATING
CHANGES IN EFFECTIVE TAX RATESChanges in Tax Rates

1. Lowering the rate schedule for all taxpayers to the proposed schedule for individuals.
2. Additional reduction in the rate schedule for families.
3. Use of a tax credit rather than an exemption to allow for the first child in each family.
4. Use of credits rather than exemptions to allow for additional dependent children.

Taxation of the Family as a Unit

5. Effect of elimination of taxes on transfers of wealth between members of a family unit.

Changes in the Taxation of Corporate Source Income

6. Integration of corporation and personal income taxes (excluding the effect of bringing unreported dividends into the tax base).
7. Widening the corporation tax base.
8. Taxation of capital gains and allowance of capital losses on corporate stock.
9. Disallowance of shareholder depletion deductions.
10. Deferment of taxes on cash distributions out of untaxed surplus.
11. Inclusion of unreported dividends.

Changes in the Taxation of Other Business and Property Income

12. Taxation of capital gains and allowance of capital losses of unincorporated businesses.
13. Acceleration of capital cost allowances for unincorporated businesses.
14. Extension of loss carry-over provisions for unincorporated businesses.

15. Extension of reporting controls to bring unreported interest into the tax base.
16. Attribution of life insurance policyholder investment income.
17. Attribution of participating dividends paid by credit unions, co-operatives and mutual life insurance companies.
18. Taxation of non-business capital gains and allowance of non-business capital losses.

Changes in the Taxation of Employment Income

19. Liberalization of the definition of deductible employment expenses.
20. Optional standard expense allowance.
21. Attribution of employee benefits.
22. Working mother credit.
23. Deductibility of unemployment insurance.

Other Changes Resulting from Adoption of the Comprehensive Tax Base

24. Inclusion of gifts and bequests.
25. Inclusion of family allowances.

Changes in Concessionary Allowances

26. Elimination of the old age exemption.
27. Changed definition of medical expenses.
28. Improvements in the control of charitable donations.
29. Change in the standard deduction.
30. Provision of additional educational allowances in the form of tax credit.
31. Allowance of credits rather than exemptions for dependants other than dependent children.
32. Extension of tax credits to dependants not now eligible for exemptions.

in a lowering of taxes for a number of taxpayers. The other excluded change, the aggregation of taxpayers into family units as described in Chapter 10 of the Report, would raise taxes for some taxpayers and lower them for others. The net aggregate effect of both changes combined has been estimated as a net reduction of \$15 million in tax revenue. 6/ In this respect, the definition of direct taxes allocated over individuals is the same as in the incidence estimates presented in Study 26 (Who Benefits and Who Pays) and Study 29 (Components of Taxable Income for Resident Individuals).

The allocation of taxes to individuals which underlies the estimates reported in this study excludes the effect of one additional important reform: namely, the effect of the deferment of tax on income accumulated in Registered Retirement Income Plans. The effect of this deferment has not been included, in part because the income from which it arises is not included in the definition of total income used in this study, and in part because (unlike the effect of concessionary allowances) it can not properly be prorated over all other sources of income. In this respect, the estimates of total direct taxes presented in this study accord with those presented in Study 29, but not with those in Study 26. As estimated in the Report of the Royal Commission on Taxation, the aggregate effect of this deferment is to reduce taxes eventually if not currently attributable to resident individuals by \$50 million. 7/

The total amount of direct taxes allocated in this study to different components of income accrued by resident individuals is

\$3,715 million under the current (1967) tax system, and \$3,695 million under the Commission's recommendations.

A summary of the estimated tax changes for resident individuals in each income class is presented in Table 2. The income classes are defined in Table 3. The total direct taxes displayed in Table 2 and used as the basis for tax burden analyses in this study are estimates of the revenue yield of the current tax system as defined under the tax law and proposed amendments thereto existing as of December 31, 1966, and of what the recommended tax system would have raised from resident individuals and their agents in 1964, had it been previously in force so that transitional effects could be ignored. This definition of taxes as including only the long-term effects of the proposals of the Royal Commission on Taxation is consistent with the analyses presented in Chapters 35 and 36 of the Report and in Studies 25, 26 and 29. An estimate of total revenue loss resulting from transitional effects is presented in Table 35-16 in Volume 6 of the Report. 8/

The estimates presented in this study have been computed using double-precision arithmetic for the aggregation of results computed for each group of tax returns, while those presented in Studies 25, 26 and 29 have been computed in single-precision arithmetic. The estimates provided in this study are marginally more accurate; the additional accuracy can be measured by comparing Table 2 with Table H-5 in Appendix H to Study 25 (A General Income Tax Analyzer).

TABLE 3

CLASSIFICATION OF TAXPAYERS BY INCOME

<u>Class</u>	<u>Income</u>		
1	Less than \$1,000		
2	1,000	-	1,999
3	2,000	-	2,999
4	3,000	-	3,999
5	4,000	-	4,999
6	5,000	-	5,999
7	6,000	-	7,999
8	8,000	-	9,999
9	10,000	-	11,999
10	12,000	-	14,999
11	15,000	-	19,999
12	20,000	-	24,999
13	25,000	-	34,999
14	35,000	-	49,999
15	50,000	-	74,999
16	75,000	-	99,999
17	100,000	-	149,999
18	150,000	-	199,999
19	200,000	-	299,999
20	300,000 or more		

Note: Income is defined as comprehensive income less proposed concessionary allowances; this definition of income for classificatory purposes is identical with that used in the Commission's Report and in Studies 25, 26, and 29. This definition is used rather than one based on total accrued income in order to reduce within-class differences in the estimated effects of the Commission's proposals; cf. reference 1 to Chapter 36 of the Report.

Definition of Accrued Income

Consistent with what has just been said concerning the allocation of direct taxes to individuals, income has been defined to exclude income accumulated on behalf of resident individuals in Registered Retirement Income Plans. This income has been excluded because it is not attributed to individuals until paid out as retirement income. Certain other forms of income (such as investment income attributable to life insurance policy-holders) are assumed to be currently attributable to resident individuals to whom they are allocated. In this regard, the definition of income is the same as the definition of assessable income under the comprehensive tax base proposed by the Royal Commission on Taxation, and is the same as that used in Study 29. 9/

Because it is desired to show tax changes relative to total income accrued by individuals rather than relative to individuals' comprehensive-base taxable income, the notion of "income" used in this study differs from that used in Studies 25, 26, and 29. Specifically, income in this study has been defined to include categories of income on which tax would be deferred or avoided under both the current (1967) tax system and that proposed by the Royal Commission on Taxation. The relationship between income assessable under the Commission's proposals in 1964 and total income accrued by resident individuals who filed tax returns in 1964 is shown in Table 4.

It should be emphasized that all estimates of total income presented in this study are of totals for all resident individuals who filed tax returns in 1964 and so exclude income received by individuals who did not file returns. As a result, the incidence estimates presented

TABLE 4

RELATIONSHIP BETWEEN CURRENTLY ASSESSABLE INCOME, INCOME ASSESSABLE UNDER
 THE COMMISSION'S RECOMMENDATIONS; AND TOTAL ACCRUED INCOME FOR ALL
 RESIDENT INDIVIDUALS WHO FILED TAX RETURNS IN 1964
 (millions of dollars)

Income assessable under current (1967) tax law	27,050
Recommended changes in the tax base:	
Income currently taxed at corporate level which would be added to the personal income tax base as a result of integration	1,465
Gifts and bequests from outside the family unit, currently partly taxed to donors	1,200
Income currently not taxed	2,728
	5,393
Less: additional deductions to be allowed	856
	4,537
INCOME ASSESSABLE UNDER THE COMMISSION'S PROPOSALS	
	31,587
Additional accrued income not taxable to the individual under the Commission's proposals:	
Corporate income on which tax would be deferred:	
Difference between capital cost allowances claimed and reported depreciation	129
Effect of incentives proposed by the Commission for companies in the extractive industries	14
Effect of proposed incentives for new and small corporations	73
Other corporate retained income on which tax would be deferred	51
Unallocated corporate retentions of taxed income	266
	44
Income of unincorporated businesses on which tax would be deferred:	
Current deferments	120
Additional proposed deferments	56
	176
Unrealized accrued goodwill gains:	
On common stock	212
On assets of unincorporated businesses	95
On real estate	69
On fixed-income securities	26
	402
TOTAL INCOME ACCRUED BY RESIDENT INDIVIDUALS WHO FILED TAX RETURNS IN 1964	
	<u>32,475</u>

Note: Income under all headings is shown net of expenses incurred in the obtaining of that income. Elements of corporate source income accrued at the corporate level are shown as the shares of the totals accrued by corporations which are attributable to resident individuals owning shares in Canadian companies. Corporate income on which tax is deferred is shown net of dividends which are paid out of untaxed surplus arising from such deferments and which are realized for tax purposes because of the disposition of shares; the effect of such realization of otherwise-untaxed dividends is prorated over the elements of corporate income on which deferments arise.

Source: Estimated total income assessable under the Commission's recommendations is obtained from J. Bossons, *A General Income Tax Analyzer*, Table 7 and Appendix H. Elements of additional accrued income not included in income assessable to individuals under the Commission's proposals are estimated as indicated in lines 2370 through 2540 of the listing of subrouting BASADJ presented in *A General Income Tax Analyzer*, Appendix A.

in this study and in Studies 26 and 29 exclude certain classes of people and certain types of income. In particular, welfare payments of material importance primarily for individuals not filing returns are excluded.

The relationship between accrued income, total income assessable under the current and proposed tax systems, and taxable income as defined under each tax system is shown in Table 5. This table serves as a basis for identifying the components for which major differences exist between taxable income or rather assessable income under current tax law and under the Commission's proposals and on the other hand between the comprehensive tax base as defined by the Commission and accrued income for each income component. As the table indicates, total accrued labour income is less than taxed labour income under the current tax law in spite of the attribution of currently untaxed benefits to employees, self-employed professionals, and unincorporated businessmen. The reason for this is the restricted deductibility of expenses accrued in the obtaining of labour income under the current tax law. All other categories of income are substantially greater when measured on an accrual basis than when defined in accordance with what can be assessed under the current tax system. Moreover, there are significant forms of income in each of these components on which taxes would be deferred even under the comprehensive tax base, as indicated earlier in Table 4. These forms of income may be identified by comparing columns 1 and 3 of Table 5.

It should be noted that certain types of income are shown as identical amounts on both an accrual basis and an assessable income basis, even though these components include income on which deferrals are possible

TABLE 5

		<u>13,735</u>	<u>1,581</u>
TOTAL TAXABLE INCOME		<u>13,315</u>	<u>30,005</u>

Note: The figures shown in this table are obtained from Table 6 and from Appendix L to J. Bossons, A General Income Tax Analyzer. Negative figures are enclosed in parentheses. Some figures do not add to totals because of rounding.

under both the current tax law and the proposed comprehensive tax base. These areas are notably foreign investment income (item 14) and insurance proceeds (item 18), the latter being excluded from the comprehensive tax base under the Commission's recommendations even though recommended for possible subsequent inclusion. Certain components of income (such as farming and fishing income) are also shown on the same basis for all types of income because differences are not material in the aggregate. With one exception (foreign investment income), all the sources of deviations between assessable and accrued income that are important from the point of view of the allocation of human and monetary resources are included; differences for foreign investment income have been ignored because of difficulties of estimation. In any case, the tax changes suggested by the Report are relatively minor for most categories of foreign investment income directly received by individuals.

It must be emphasized that the definition of accrued income used in this study and reflected in Tables 4 and 5 is of total monetary income accrued by resident individuals. By defining accrued income in this monetary sense, that is, as total accrued net change in financial wealth before consumption, various forms of income included in the National Accounts are excluded in spite of the fact that they reflect "real" income and output of individuals. Because such income (which would have to be imputed to recipients, as is done in computing national income) is not affected as a result of the Commission's recommended introduction of the comprehensive tax base, its omission is not of material significance for the purpose of this study. 10/

The existence of imputed income not included in the definition of accrued income reflected in Tables 4 and 5 has the following effects:

(1) Accrued income as defined for this study does not include such imputations, and so does not correspond to the share of national income defined on an accrual basis which is allocable to resident individuals filing tax returns. (2) Evaluations of the effects of the Commission's proposals on allocation of human and monetary capital which can be derived from the estimates presented in this study are limited essentially to the allocation of resources which are presently valued in market terms.

Estimates of the total accrued income attributable to resident individuals in each income class are presented in Table 6, for income classes defined as in Table 3. This table provides summary data on the distribution over income classes of each type of income shown in Table 5.

Description of Estimates

The estimates presented in this study are organized into seven self-contained units, presented as appendices to this monograph. Three of these appendices provide data for 20 income components defined so as to show the effect of reforms affecting particular types of income; these income components are the same as those shown in Tables 5 and 6 above. Another three appendices provide data for seven more aggregated components of income, defined so as to approximate major categories of income earned through personal labour or from investments. The seventh appendix provides supplementary estimates for a particular type of corporate source income. In virtually all cases, data is provided for resident individuals classified by comprehensive-base taxable income; the income classification is defined in Table 3.

Appendices A, B and E provide data for the 20 income source types defined so as to show the effect of reforms affecting particular types of

income. Appendix A simply provides data for all resident individuals on the current tax status of amounts which would be added to the personal income tax base from different income sources as a result of the Commission's recommendations. Two other appendices (Appendices B and E) present data on average and marginal tax rates under the current and proposed tax systems on each type of income defined in Appendix A for resident individuals classified by the income classes defined in Table 3. Estimates of the income accrued from each source by resident individuals in each income class are presented in Table 6.

Appendices C, D, and F provide data for seven major components of income closely approximating income from Canadian sources arising from major types of economic decisions made with regard to work effort and asset composition by individuals. The relationship between the seven income components used in Appendices C, D, and F and the 20 income categories used in Appendices A, B, and E is shown in Table 7. As this table indicates, the totals shown for these seven components account for almost 94 per cent of total income accrued by all individuals. Resident individuals are classified in more detail in Appendices C, D, and F; not only are they classified by income class as defined in Table 3, they also are classified into groups reflecting the importance of the particular income source to each individual. 11/ The reason for this latter classification is to reflect the likely lesser effect of given tax changes on a particular income source which is relatively unimportant to the recipient. Appendix C contains estimates of total (comprehensive) income from each source component received by or attributable to resident individuals in each income and source importance class; Appendices D and F present estimates of average tax rates and average marginal tax rates on this income.

TABLE 7

RELATIONSHIP BETWEEN INCOME SOURCES
DEFINED IN DIFFERENT APPENDICES
(millions of dollars)

<u>Income Source Types as Defined in Appendices A, B, and E</u>	<u>1964 Total</u>	<u>Income Source Categories as Defined in Appendices C, D, and F</u>	<u>1964 Total</u>
1. Wages and salaries	22,383		
2. Employment expense deductions	(804)	I. Income from employment	21,973
3. Professional income	686		
4. Commission income	411	II. Income from self-employment	1,185
5. Attributable benefits	530		
6. Farming and fishing income	601	III. Income from farming and fishing	635
7. Dividends from resident companies	471		
8. Retained corporate income	1,898	IV. Unincorporated business income	1,502
9. Capital gains on common stocks	683	V. Corporate source income	3,047
10. Unincorporated business income	1,449		
11. Rental income	274	VI. Fixed investment income currently reported	740
12. Other Canadian investment income	1,647		
13. Non-business capital gains	113		
14. Foreign investment income	40	VII. Other Canadian investment income	1,285
15. Deductions from investment income	(31)		
16. Gifts and bequests	1,200		
17. Transfer payments received	834		
18. Insurance proceeds	—		
19. Alimony received	19		
20. Miscellaneous income	68		
TOTAL	32,475	TOTAL	30,367

Note: Income category I is drawn from income types 1, 2, and 5; category II from types 3, 4, and 5; category III from type 6; category IV from types 5 and 10; category V from types 7, 8, and 9; category VI from types 12 and 15; category VII from types 11, 12, 13, and 15. Totals shown for income categories are not strictly comparable to totals shown for income source types since individuals with non-positive total assessable income are excluded from the tabulations shown in Appendices C, D, and F. Total income shown as arising in certain categories for this subset of individuals may thus be greater than the corresponding total obtained from the data shown in the left-hand side of the table for all resident individuals who filed tax returns. Some figures do not add up to totals because of rounding. Negative figures are enclosed in parentheses.

Appendix G presents data similar to that in Appendices D and F for income derived from different types of corporations. Because the additional allocation assumptions underlying the data in this appendix are less reliable than those used to generate the estimates presented in the first six appendices, the results presented in Appendix G should be used with some caution.

REFERENCES

- 1/ The changes in direct taxes analyzed in the study have been described in Chapter 35 of the Report; the assumptions underlying estimates of the effects of these changes have been stated in general terms in Appendix A to Volume 6 of the Report and are defined precisely in J. Bossons, A General Income Tax Analyzer (Study 25 published by the Royal Commission on Taxation). The computer program and data used in making these estimates have been described in A General Income Tax Analyzer.
- 2/ The sample consisted of unidentified tax returns for 1964 supplied by the Department of National Revenue to the Royal Commission on Taxation. The sample is the same as that used to produce the data presented in 1966 Taxation Statistics: Part 1, (Queen's Printer, 1966) and is described in ibid., page 97. The classification and processing of the samples is described in Chapter 3 and Appendix B of A General Income Tax Analyzer.
- 3/ The number of resident individuals falling in each group was estimated by summing the reciprocals of the sampling rates governing the selection of each tax return falling within the group. Details on the calculation and aggregation of estimates obtained from each tax return group are provided by the program listings presented in Appendix A of A General Income Tax Analyzer.
- 4/ This is obviously not to say that it is not important in the case of changes in the corporation income tax to examine separately the resultant changes in corporate income and cash flow. Estimates of these changes are presented in Tables 37-2 and 37-3 of the Report. Such changes will affect corporate investments in real assets both because of their effects on the availability of internal funds and because of their effects on variables other than profits accrued by stockholders which may be included in managerial objective functions. The point of the statement in the text is to say that the effect of the Commission's proposals on after-tax income accrued by a shareholder can be measured only by taking account of the combined change in both personal and corporation income taxes.
- 5/ One of the Commission's proposals (number 10 in the list presented in Table 1) was not evaluated in Chapter 35 of the Report, but is included explicitly in the estimates presented in this study and in Studies 25, 26, and 29 because of its material effect on the changes in taxes on corporate source income. In making the estimates presented in Chapter 35 of the Report, it was assumed that there would be no net deferment of tax on distributions out of untaxed surplus; cf. Note 22 in Appendix A to Volume 6. The effect on total tax revenues of the deferment is in any case relatively minor; as shown in Table 9 of A General Income Tax Analyzer, the total estimated effect on revenue of this deferment is only \$9 million. The tax deferment arises because under the Commission's recommendations cash distributions out of un-taxed surplus would be regarded as a "return of capital" (thus resulting

merely in a reduction of the cost basis of the recipient's shares) rather than as a taxable partial realization of accrued goodwill gains. Such cash distributions would consequently be subject to tax only on final disposition of the shares.

- 6/ See Chapter 35 of the Report, Table 35-13.
- 7/ Cf. Note 20 in Appendix A of Volume 6 of the Report and the discussion in Volume 6, page 27.
- 8/ As has been noted above, this total excludes the effect of several recommendations. Estimates of the effects of these excluded reforms are presented in Table 35-13 of the Report and in Table 9 of A General Income Tax Analyzer.
- 9/ It should be noted that the estimates of taxable income used in this monograph and in Studies 25, 26, and 29 differ in several respects from those presented in Chapter 35 of the Report. The major changes in these estimates arise from more accurate assumptions made in the studies with respect to the attribution of benefits, the effect of unreported dividends, the average lag in the realization of accrued goodwill gains, the relationship between allocated taxed corporate income and dividends, and the allocation of policyholder investment income. The effect of these changes in assumptions on the aggregate revenue yield and overall incidence of the proposed tax system is described in Chapter 3 of A General Income Tax Analyzer.
- 10/ The major categories of imputed income thus excluded are the rental income imputable to owner-occupied property and the value of farms output consumed by producers. For virtually all of these components of income, the nature of the necessary imputation process is identical to that of defining income consumed in the enjoyment of services from consumer durables. It is of course possible to measure the value of the services thus obtained in terms of their opportunity cost. However, since most individuals enjoying imputed income are presumably doing so because they are intermarginal with respect to the choice between that particular form of income and the form of monetary income which would be reflected in such opportunity costs, an opportunity cost definition of income does not very adequately measure the monetary value to recipients of the services enjoyed.
- 11/ It should be noted that individuals with non-positive total assessable income are excluded from the tabulations shown in Appendices C, D, and F; total income from each major source component as shown in Appendix C consequently differs from the totals shown for all residents in Appendices A and H.

ERRATA IN STUDY 25

Two errors in the computer programs listed in Appendix A to Study 25 were not caught prior to publication of the study. These errors do not affect results published in other studies, but had to be corrected to produce the output presented in this study. The errors are corrected by inserting the following cards in the place defined by the card numbers shown, and by removing all cards with the same numbers in the original version listed in Appendix A to Study 25. The following insertion is required in subroutine COMSET:

OBAS = BASE(4) + BASE(34)

CMST1541

The following substitution is required in subroutine CSITAB:

DO 3001 J = 1,9

CSTB0420

In addition to these changes in the programs, some assumptions are incorrectly shown in the tables presented in Appendix C to Study 25.

The correct assumption values are as follows:

<u>Table</u>	<u>Parameter Number</u>	<u>Correct Assumed Value</u>	<u>Value Shown</u>
C-1	94	\$80 million	\$60 million
C-3	54	1.9748	1.764
C-3	88	0.05	0.2

The incorrect value shown for assumption 94 in Table C-1 does not affect results presented in other studies. The two erroneous values in Table C-3 are inconsistent with the corresponding values shown in Table C-1; the purpose of this correction is to indicate that the Table C-1 values are correct.

APPENDIX A

CURRENT TAX TREATMENT OF COMPONENTS OF THE COMPREHENSIVE TAX BASE

The purpose of this appendix is to provide estimates showing the source of changes in each component of the comprehensive tax base for all resident individuals who filed tax returns in 1964. In so doing it provides further documentation for Table 35-8 in Chapter 35 of the Report. These estimates are presented in Table A-1 on the same basis as Table 35-8 and in Table A-2 on a basis consistent with the estimates presented in Studies 25 and 29.

As can be seen from these tables, the total comprehensive base for most income components is equal to the total current base plus the base now exempt from tax. The total current base is defined as the total base taxed in some form (and in some cases more than once) under the current tax system, and is in turn divided into base taxed at full personal rates, base taxed at corporate rates, and base now taxed at other rates. Because of the reduction in tax rates arising from the dividend tax credit, dividends are classified both under "corporate rates" and under "other rates". Some dividends are exempt from tax under "other rates" as a result of the offsetting of stockholder depletion deductions against certain dividends; as a result not all dividends are "double taxed". Gifts and bequests are also taxed under "other rates". The amount of gifts and bequests currently taxed in this manner is substantially larger than the amount included in the comprehensive tax base because of the exclusion of intra-family gifts from the proposed comprehensive base. The difference between the current and comprehensive tax base on gifts is not entered in the "exempt" column.

At the bottom of each table, total current taxes on each type of base are shown, along with effective tax rates. For comparison, total current taxes are also shown under the comprehensive base and an effective average rate of tax on comprehensive base computed. All computations relating to the preparation of these tables are described in detail in the programs listed in Appendix A of A General Income Tax Analyzer, Study 25 published by the Royal Commission on Taxation. The calculation of the numbers shown in the tables in this appendix from the basic tax and base changes estimated for each taxpayer is detailed in subroutines BASCOM and BASTAB.

A comparison of Table A-2 with Table A-1 provides a means of summarizing some of the salient differences between the revenue and incidence estimates presented in Volume 6 of the Commission's Report and those presented in this study and in Studies 25, 26, and 29. The reader is referred to Chapter 3 of A General Income Tax Analyzer (Study 25) for a detailed discussion of these differences. Among other things, it should be noted that all corporate income allocable to resident individuals in 1964 was allocated to individuals who filed tax returns in the calculations underlying Table A-1, thus ignoring certain amounts properly allocable to resident individuals who did not file tax returns in 1964. The estimates reported in Table A-2 reflect both (1) a better allocation of unreported accrued income between individuals who did and did not file tax returns and (2) an improved set of assumptions regarding the total amounts and incidence of elements of the current and comprehensive tax bases.

APPENDIX B

CHANGES IN THE TAXATION OF EACH DETAILED CATEGORY OF INCOME FOR RESIDENT INDIVIDUALS IN EACH INCOME CLASS

The purpose of this appendix is to show the effect of the Commission's reforms on the effective rate of tax attributable to each component of income accrued by resident individuals in each of 20 income classes who filed tax returns in 1964.

Because of the effect of changes in the personal income tax base upon the marginal rate of tax applicable to a taxpayer, it is not possible to allocate taxes among income components without specifying which component of income is "marginal". Any such specification is arbitrary when applied uniformly to 6.7 million individuals, and it has in this case been arbitrarily assumed that all components of income are equally "marginal"—or in other words that no component of income is more marginal than any other. Personal income tax (before credits applicable to income) has consequently been allocated among income components in proportion to the amount of each component which is or would be taxed. (In other words, it is distributed over components in proportion to total assessable income arising in each component under the tax system analyzed.) Credits applicable to specific components of income have then been deducted from taxes prorated to that component, while direct taxes other than the personal income tax attributable to the taxpayer have simply been added to the personal income taxes (if any) prorated to the components taxed under the other taxes. Foreign tax credits have been allocated exclusively to foreign investment income. These calculations are done for each taxpayer; aggregate taxes falling on

each income component are obtained by adding together the results of the calculations for each taxpayer. The calculations are detailed in the listings of subroutines BASCOM and MARTAB presented in A General Income Tax Analyzer.

The calculations underlying the tables in this appendix are similar to those underlying Appendix C in Volume 6 of the Report in that they are concerned with the proration of income tax over elements of the tax base. They are, however, different in that in this appendix we are concerned with the proration of total taxes over total taxable income under the current and proposed tax system, rather than with the proration of changes in taxes in the tax base.

The average effective rate of tax on each income component for each group of individuals is computed as the ratio of the total tax falling on an income component (estimated as described above) to the total income accrued in the form of that component. Individuals' effective tax rates are thus weighted by income in computing average effective tax rates.

As in the tabulations presented in Volume 6 of the Report, taxpayers are classified into 20 income classes based on comprehensive income less concessionary allowances. The classification has been described in Table 3 above. The results for each income class are shown in Tables B-1 to B-20; for all Canadian residents combined who filed tax returns, similar results are shown in Table B-21. All dollar amounts are shown in thousands of dollars. Some figures do not add to totals because of rounding.

APPENDIX C

INCOME FROM MAJOR SOURCE COMPONENTS FOR RESIDENT INDIVIDUALS CLASSIFIED BY INCOME AND BY IMPORTANCE OF SOURCE

The purpose of this appendix and Appendices D and F is to show the Commission's proposals upon the taxation of income derived from various major economic categories of income sources. The income components analyzed are the following:

1. Income from wage and salary employment. Included in this category are benefits attributable to employees as well as wage and salary income, less employment expenses allowable under the Commission's proposals.
2. Income from self-employment. This component includes professional and commission income arising from self-employment, as defined on tax returns. Income is defined as net of all expenses except those deemed to be attributable to taxpayers as personal benefits under the Commission's proposals.
3. Income from farming and fishing. As defined under current tax law.
4. Unincorporated business income. This type of income is defined to be the sum of net income from unincorporated businesses as reported in 1964, estimated capital gains realized by such businesses, and expenses estimated to be attributable to taxpayers as personal expenses, less an estimate of the combined effect of the acceleration of capital cost allowances for new and small businesses and of the extension of loss carry-over provisions.

5. Corporate source income. This component of income is defined to be the sum of dividends, retained currently taxed corporate profits, taxable corporate income currently paid out in taxes, currently untaxed corporate income added to the tax base by the Commission's proposals, and capital gains on corporate stock realized by individuals. It is in other words equal to before-tax corporation income as defined under the comprehensive tax base, plus the sum of goodwill gains and reported net income not taxed when accrued under the Commission's proposals. No investment expenses have been allocated against corporate source income; all such expenses have been offset against fixed investment income currently reported (and other Canadian investment income if all such expenses cannot be offset against currently reported fixed investment income alone).
6. Fixed investment income currently reported. Annuity income, interest, and estate income (exclusive of dividends), as defined and reported under current tax law, less investment expenses deducted (exclusive of stockholder depletion allowances).
7. Other Canadian investment income. This category includes net rental income, capital gains on real estate in excess of exemptions for homeowners, life insurance investment income attributable to policyholders, participating dividends, capital gains on fixed-income investments and Canadian investment income from additional sources.

Each component of income is measured on an accrual basis to the extent possible; such measurement requires estimation both of the extent to which 1964 assessable income would have been changed by the adoption of the

comprehensive tax base proposed by the Commission and of the extent of income accrued beyond what would be assessable under the proposed comprehensive base. The estimates of such changes are defined in programs listed in A General Income Tax Analyzer; each component of income is defined in subroutine COMSET.

Estimates of income accrued in each component by all resident individuals filing tax returns in 1964 are presented in Tables C-1 to C-7. Individuals are classified both by income (defined as comprehensive-base assessable income less proposed concessionary allowances) and by the ratio of their income from the component analyzed in the table to their total income. Income classes are as defined in Table 3 above. Individuals with non-positive total accrued income are excluded from the tabulations.

Incomes are shown in thousands of dollars. Some figures do not add to totals because of rounding.

APPENDIX D

CURRENT AND PROPOSED AVERAGE RATES OF TAX ON INCOME FROM MAJOR SOURCE COMPONENTS FOR RESIDENT INDIVIDUALS CLASSIFIED BY INCOME AND BY IMPORTANCE OF SOURCE

This appendix presents data on the ratio of average direct taxes paid by resident individuals on major income components to average income from each component, both under the current tax system and under the tax system proposed by the Commission. Source components are defined as in Appendix C. Income is defined as accrued income.

As in Appendix B, direct taxes attributable to each income component are estimated by prorating personal income taxes before tax credits over currently assessable income, and then deducting tax credits and adding other taxes as appropriate.

Average current tax rates for resident individuals classified by comprehensive income less concessionary allowances and by importance of income from each component are shown in Tables D-1 to D-7. Average tax rates under the proposed tax system are shown in Tables D-8 to D-14. All average tax rates are defined as ratios of direct taxes to accrued income from the stated source. The income classification is as defined in Table 3 above.

APPENDIX E

AVERAGE MARGINAL TAX RATES ON EACH DETAILED INCOME COMPONENT FOR RESIDENT INDIVIDUALS IN EACH INCOME CLASS

The tables in this appendix provide data on the average rates at which marginal incomes are taxed for resident individuals in each of 20 income classes who filed tax returns in 1964. Average marginal tax rates are presented for each component of income, with components being defined as in Appendices A and B. In all cases, average rates are computed by weighting each individual's marginal tax rate on a given income component by the amount of accrued income which that taxpayer derives from the component.

The marginal tax rate on a given income component for a taxpayer is defined for most income components as the personal income tax rate applicable to the last dollar of the taxpayer's taxable income, multiplied by the fraction of accrued income which is typically assessable under the tax law analyzed. Under the Commission's proposals, the only exceptions to this statement are foreign investment income, on which it is necessary to deduct foreign tax credits, and wage and salary income carried by a working mother, on which it is necessary to deduct the tax credit for working mothers if applicable to marginal income. Under the current tax system, on the other hand, the following adjustments are required in addition to deduction of the foreign tax credit: on dividends, deduction of dividend tax credits and addition of marginal corporate tax; on retained corporate income, addition of the marginal corporate tax; on gifts, substitution of the separate gift tax.

The calculations are detailed in the listings of subroutines BASCOM and MARTAB presented in Appendix A of A General Income Tax Analyzer.

Tables E-1 through E-20 present average marginal rates for all Canadian taxpayers falling into each of the 20 income classes described in Table 3 above. For all resident individuals combined who filed tax returns in 1964, similar results are shown in Table E-21. Accrued income is stated in thousands of dollars.

APPENDIX F

CURRENT AND PROPOSED AVERAGE MARGINAL TAX RATES ON INCOME FROM MAJOR SOURCE COMPONENTS FOR RESIDENT INDIVIDUALS CLASSIFIED BY INCOME AND BY IMPORTANCE OF SOURCE

The tables in this appendix provide data on average marginal tax rates on income from major source categories. Marginal tax rates are calculated as in Appendix E; it is assumed in computing marginal rates on a given source component that a marginal dollar of income obtained from that source has the same composition (that is, comes from the same combination of specific sources) as total income obtained from that source in 1964. Source components are defined as in Appendix C.

Average current marginal tax rates in each major source component are shown in Tables F-1 to F-7 for resident individuals who filed tax returns in 1964, classified by comprehensive income less concessionary allowances and by importance of income from the component. The income classification is as defined in Table 3 above. Average marginal rates under the proposed system (as estimated from the assumptions made) are shown in Tables F-8 to F-14.

All marginal rates (both current and proposed) are computed as a fraction of accrued income from the source. Average marginal rates are computed by weighting each individual's marginal tax rate on a given income component by the amount of accrued income which the individual receives from the component.

APPENDIX G

CHANGES IN AVERAGE AND MARGINAL TAX RATES ON INCOME ATTRIBUTABLE TO RESIDENT INDIVIDUALS FROM DIFFERENT TYPES OF CORPORATIONS

The purpose of this appendix is to provide an indication of the difference between average changes in the effective taxation of income from large companies affected by industry-specific reforms, from small companies not in such industries, and from all companies that are affected by industry-specific reforms. The estimates presented in this appendix may be compared with the average changes in the effective taxation of all corporate source income for which estimates have already been presented in Appendices C, D, and F. "Small" companies are defined as companies reporting 1964 taxable profits of less than \$100,000.

In making these calculations, it has been assumed that no change would occur in the tax base of these companies, that the ratios of retentions and realized goodwill gains to dividends would be the same as for the Canadian average, and that roughly 47 per cent of the stock of large firms is owned by resident individuals. It is also assumed that the portfolio composition of resident individuals (that is, the fraction of corporate source income received from corporations of different types as well as the fractions of income accrued as dividends or in other forms such as goodwill gains) is uncorrelated with income, and that it is therefore safe to estimate average tax changes by assuming the composition of investors' portfolios to be uniformly that defined by the relationship among 1964 aggregates for all Canadian individuals combined. Estimates of the aggregate components of corporate source income attributable to individuals and taxable under the current (1967) and proposed tax systems is presented in Tables G-1 and G-2.

It should be noted that Tables G-1 and G-2 provide data on amounts allocable to all resident individuals, including some individuals who did not file tax returns in 1964. Estimates presented in G-1 and G-2 are thus not strictly comparable to those presented in Tables 4 and 6 and Appendix C alone though consistent with them. Further details regarding assumptions and a description of the specific calculations underlying the attribution of these components to individuals is presented in A General Income Tax Analyzer, Study 25 published by the Royal Commission on Taxation.

Estimates of accrued revenue from each corporate source attributable to resident individuals with positive income in each income class are presented in Tables G-3 to G-5.

Estimates of the average effective tax rates imposed on corporate source income derived from each type of corporation are presented in Tables G-6 to G-8 for the current tax system and in Tables G-9 to G-11 for the proposed tax system. Estimates of the corresponding effective marginal tax rates are presented in Tables G-12 to G-14 for the current tax system and in Tables G-15 to G-17 for the proposed tax system. These effective rates are calculated as described in Appendices D and F.

Detailed estimates of the components of accrued income allocable to resident individuals in each income class from each type of corporation are presented in Tables G-18 to G-21. These tables provide data on the extent to which the estimated distribution of components of corporate source income deviates from that implied by a straightforward proration

of all corporate source income in accordance with the distribution of currently reported dividend income. As noted above, the estimating techniques used assumed the composition of corporate source income to be independent of income; the deviations from strict prorationing arise primarily because of the non-linear relationship with reported dividends assumed for unreported dividend income and for section 105 capitalizations.

As in other appendices, dollar figures are in thousands except where otherwise noted. Some figures may not add to totals because of rounding.

TABLE G-1

CORPORATE SOURCE INCOME ATTRIBUTABLE TO RESIDENT INDIVIDUALS
IN 1964 AND TAXABLE UNDER THE PRESENT AND PROPOSED SYSTEMS
(millions of dollars)

	Under the present tax system		Under the Carter proposals
Before-tax corporate income.....	2,432	2,432	2,432
Untaxed income.....	<u>470</u>		<u>290</u>
TAXABLE CORPORATE INCOME	<u>1,962</u>		<u>2,142</u>
Corporation income tax	804		1,071
Tax on Section 105 distributions	<u>6</u>	<u>810</u>	<u>1,071</u>
AFTER-TAX CORPORATE INCOME		1,622	1,361
Goodwill gains		683	683
Corporate tax allocated to shareholders		<u>—</u>	<u>1,052</u>
CORPORATE SOURCE INCOME AFTER UNALLOCATED CORPORATE TAX		2,305	3,094
Income not taxed at personal level:			
Unreported dividends	28		—
Section 105 distributions.....	40		—
Unallocated corporate income	171		370
Untaxed goodwill gains	683		212
Stockholder depletion allowed	<u>4</u>	<u>1,926</u>	<u>581</u>
Taxable dividends paid from untaxed income:		379	2,513
Total received	67		45
Less: Effect of proposed deferment	<u>—</u>	<u>67</u>	<u>28</u>
CORPORATE SOURCE INCOME TAXABLE AT PERSONAL LEVEL		<u>446</u>	<u>2,530</u>

Notes and sources:

The basic estimates underlying this table are presented in Volume 6 of the *Report*, particularly in Tables 35-5, 35-6, and 37-3 and in Appendix A. Other estimates are obtained from Appendix L of J. Bossons, *A General Income Tax Analyzer*, Study 25 published by the Commission.

Untaxed corporate income not brought into the corporate tax base under the Commission's recommendations is estimated from data in Table 35-4 of the *Report*. Untaxed goodwill gains under the Carter proposals are gains which are unrealized in the year and on which taxes are consequently deferred; such unrealized gains are assumed to be the equivalent of 31 percent of goodwill gains accrued during the year. The assumed relative importance of goodwill gains is based upon data presented in J. Bossons, *Rates of Return on Canadian Common Stocks: Dividends, Retentions, and Goodwill Gains*, Study 27 published by the Commission. Dividends paid out of untaxed income are treated as a return of capital under the Carter proposals and so similarly benefit from the deferment of tax; net deferments are assumed to be the equivalent of 60 percent of the total of such dividends. Estimates of unreported dividends are based on data presented in J. Bossons, "On the Measurement of Unreported Dividends and Corporate Profits in Canada", *IPA Working Paper Series*, October 1967. For other notes, see Appendix A to Volume 6 of the *Report*, and J. Bossons, *A General Income Tax Analyzer*, Chapter 3. Some figures do not add to totals due to rounding.

TABLE G-2

DISTRIBUTION AMONG TYPES OF COMPANIES OF THE TOTAL CURRENT
 TAX BASE, CURRENT CORPORATE TAX, AND PROPOSED CHANGE IN BASE
 ATTRIBUTABLE TO RESIDENT INDIVIDUALS
 (millions of dollars)

	Current Tax Base	Current Corporate Tax	Change in Base
Special industries:			
Extractive industries	109	55	62
Life insurance	2	1	84
Real estate	77	15	15
Trust and mortgage companies	34	13	10
Iron and steel mills	29	11	7
Miscellaneous	<u>10</u>	<u>4</u>	<u>2</u>
	261	99	180
Other industries:			
Small companies (with less than \$100,000 per year in profits)	502	108	(80)
Other companies	<u>1,199</u>	<u>597</u>	<u>80</u>
ALL COMPANIES	<u>1,962</u>	<u>804</u>	<u>180</u>

Notes and sources:

For all special industries, data on changes in the tax base are obtained from Table 37-3 of the *Report*. The corresponding estimates of the current tax base and current corporate tax are obtained from data presented in Table 37-2, using estimates of resident shareholdings in these industries presented in *ibid.*, Volume 6, Note 19 to Appendix A, supplemented by additional estimates for real estate and trust and mortgage companies. In all cases, it has been assumed that the share of the current tax base attributable to residents is essentially the same as the share of the base changes attributable to residents. The non-resident share of ownership of iron and steel companies is estimated to be the same as for all manufacturing. The miscellaneous category is added simply to adjust the total to the total change in base. For small companies, data on the current tax base and on current corporate tax is obtained from *1966 Taxation Statistics, Part Two*, Table 6. The estimated reduction in tax base arising from the allowance of accelerated capital cost write-offs for small companies making a profit of less than \$100,000 per year is estimated from data presented in *ibid.*; cf. Note 16 to Appendix A in Volume 6 of the *Report*. It is assumed that 65 per cent of the current tax base and current tax of such companies is owned by resident individuals. \$125 million was subtracted from the estimate of the current year profit attributable to resident individuals for small companies derived from *1966 Taxation Statistics, loc. cit.*, to reflect prior years' losses deducted in computed taxable income. Estimates for other companies are computed as a residual given the totals attributable to residents, which are derived from those shown in the *Report*.
