## Canadian Data Report of

Fisheries and Aquatic Sciences 1328

## Canadian Data Report of Fisheries and Aquatic Sciences

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of the series reflects the broad interests and policies of Fisheries and Oceans Canada, namely, fisheries management, technology and development, ocean sciences, and aquatic environments relevant to Canada.

The correct citation appears above the abstract of each report. Each report is abstracted in the data base Aquatic Sciences and Fisheries Abstracts.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and Environment, Fisheries and Marine Service Data Reports. The current series name was changed with report number 161.

## Rapport statistique canadien des sciences halieutiques et aquatiques

Les rapports statistiques servent de base à la compilation des données de classement et d'archives pour lesquelles il y a peu ou point d'analyse. Cette compilation aura d'ordinaire été préparée pour appuyer d'autres publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et politiques de Pêches et Océans Canada, notamment la gestion des pêches, la technologie et le développement, les sciences océaniques et l'environnement aquatique, au Canada.

Le titre exact figure au haut du résumé de chaque rapport. Les rapports à l'industrie sont résumés dans la base de données Résumés des sciences aquatiques et halieutiques.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement d'origine dont le nom figure sur la couverture et la page du titre.

Les numéros 1 à 25 de cette série ont été publiés à titre de Records statistiques, Service des pêches et de la mer. Les numéros 26-160 ont été publiés à titre de Rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom de la série a été modifié à partir du numéro 161 .

#### Abstract

Beaumaster, R., Chateauvert, A., Anderson, L., Linnansaari, T., and Jones, R.A. 2020. Counts of fish captured from upstream fish passage facilities at Beechwood and Tobique dams, New Brunswick, 1990-2019. Can. Data Rep. Fish. Aquat. Sci. 1328: iii + 23 p.

This report summarizes the upstream migratory fish catches at the Beechwood and Tobique Narrows dams on the Saint John, also known as Wolastoq River of New Brunswick, Canada. Both dams have hydroelectric generating stations that are owned and operated by New Brunswick Power (NBP). Fisheries and Oceans Canada (DFO) and NBP have an agreement to record and count (or estimate) all fish captured and passed upriver of the Beechwood Dam, while DFO Science monitors and records all fish captured at a trap operated within the pool and weir fishway at the Tobique Narrows Dam. Annual data sets for Beechwood and Tobique Narrows dams are presented for the various fish species captured over a 30-year period from 1990-2019.

## RÉSUMÉ

Beaumaster, R., Chateauvert, A., Anderson, L., Linnansaari, T., and Jones, R.A. 2020. Counts of fish captured from upstream fish passage facilities at Beechwood and Tobique dams, New Brunswick, 1990-2019. Can. Data Rep. Fish. Aquat. Sci. 1328: iii + 23 p.

Le présent rapport résume les captures de poissons en montaison réalisées aux barrages Beechwood et de Tobique Narrows, qui sont situés sur le fleuve Saint-Jean (Wolastoq), au Nouveau-Brunswick (Canada). Les deux barrages sont associés à des centrales hydroélectriques qui sont détenues et exploitées par la Société d'Énergie du Nouveau-Brunswick (Énergie NB). Pêches et Océans Canada (MPO) et Énergie NB ont conclu une entente visant à consigner et à compter (ou à estimer) tous les poissons qui sont capturés au barrage Beechwood et qui migrent en amont de celui-ci, tandis que les Sciences du MPO suivent et consignent tous les poissons capturés dans un piège installé dans la passe migratoire en gradins du barrage de Tobique Narrows. Le rapport présente les ensembles de données annuelles concernant les diverses espèces de poissons capturées aux barrages Beechwood et de Tobique Narrows pendant une période de 30 ans, soit de 1990 à 2019.

## BACKGROUND

The Saint John River is approximately 673 km long and located in the provinces of New Brunswick and Quebec as well as the U.S. state of Maine (Figure 1). The river drains an area of approximately 55,000 square kilometres, of which slightly more than half is located in New Brunswick (Marshall et al. 2014). The river flow in New Brunswick is regulated by hydro electric power dams located at Mactaquac, Beechwood, Tobique Narrows and Grand Falls (Figure 1).

Annual upstream fish migrations in the Saint John River are monitored at the Beechwood and Tobique Narrow dams. Both dams have hydroelectric generating stations that are owned and operated by New Brunswick Power (NBP). Fisheries and Oceans Canada (DFO) and NBP have an agreement to record and count (or estimate) all fish captured and passed upriver of the Beechwood Dam, while DFO monitors and records all fish captured at a trap within the pool and weir fishway at the Tobique Narrows Dam.
The history of the dams, their location, size, and power generation are described in Chateauvert et al. (2018). Construction of the Beechwood Dam began in 1955 and the dam started generating power in 1957. The dam is 18 meters high and has a hydraulic head of 21.5 meters and a power generating capacity of 113 megawatts. Its upstream reservoir has a relatively small capacity (Ingram 1981). The Tobique Narrows Dam is situated upstream of the Beechwood Dam on the Tobique River (Figure 1). Construction began in 1950 and the dam started generating power in 1953. The dam is 6 m high and has a capacity of 20 megawatts (Francis 1984).

Figure 1. Major power dams and adult salmon release sites on the Saint John River System, New Brunswick (Figure taken from Ingram and Ensor 1990).

## METHODS

The Beechwood Dam has a fish elevator that helps migrating fish circumvent the height of the dam (Figure 2), and the hoist is normally lifted four times a day around 08:30, 10:30, 13:30, and 16:30 hours. When the fish runs are very active, evening lifts are sometimes necessary, however, in the late fall when runs are nearly finished, only two lifts a day (08:30 and 16:30) are required. The skip hoist is designed to work with an operator (or attendant) at the controls to automatically lift and dump fish directly into the reservoir; as a result of monitoring requirements for various fisheries, fish counts and observations are recorded prior to releasing the fish into the reservoir. Here, an attendant records each fish species (Appendix 1), checks for marked or tagged fish (particularly salmon), and carries out any necessary sampling. The floor of the fish trap is divided lengthwise into four smaller parallel compartments to make it easier for the attendant to carry out the necessary recording. Sea-run adult salmon are categorized into grilse (or small salmon; generally $<63 \mathrm{~cm}$ ) and salmon (or large salmon; generally $>=63 \mathrm{~cm}$ ), based on visual observation from the upper deck (see Appendix 2 for distinguishing features of each category). The fishway operates annually from June $1^{\text {st }}-$ November $15^{\text {th }}$, however, these dates fluctuate slightly from year to year.

Figure 2. Site plan of the Beechwood Hydro Dam and upstream fish passage facilities, showing fish collection gallery, resting pool and fish hopper (Figure from Ingram 1981).

A fish ladder at the Tobique Narrows Dam allows migrating fish to circumvent the head of the dam (Figure 3). The fishway passage facilities consist of a collection gallery at the base of the dam and a pool and weir fishway extending to the reservoir above the dam (Figure 3). Within the ladder is a series of partitions, or baffles, to break the force of the water flow and assist fish in their ascent. The fishway has four large holding, or resting, pools situated in each of the four turns. A metal counting trap is located in the top resting pool below the fishway exit, which is fished by elevating the entire unit with a manual winch, supported above the trapping area. The trap is fished daily, according to the intensity of the run. After each check and count, the fish are released directly into the upstream area of the resting pool so that they can continue their migration through the remaining portion of the fishway and into the headpond. The fishway operates annually from approximately June $15^{\text {th }}$ until November $15^{\text {th }}$, with slight yearly fluctuations.

## DATA

The annual counts for fish captured at the upstream fish passage facilities at the Beechwood Dam are summarized from 1990-2019 (Table 1). Catches prior to 1990 have been previously published (Smith 1979, Ingram 1981, Ingram 1987). When possible, fish were identified by species (Appendix 1) and by life stage for Atlantic salmon (Appendix 2) by the NBP fish lift operators. The start and end dates for the operation of the upstream fish passage facility has varied over the 30-year time-series (Table 2). Dates or time periods when the fish lift was not operated due to high water in the tailrace, or for mechanical repairs, has not been recorded in Table 2. Sea-run adult salmon counts have been divided into salmon and grilse based on visual observations by the fish lift operators. It is important to point out that captive-reared salmon (Jones et al. 2004) may have been released at Woodstock, downstream of the Beechwood Dam, between 2003-2019, and that NBP attendants would not be able to distinguish these from the returning sea-run salmon. The annual counts since 1990 are presented in Figure 4. The 30 year time-series of annual catches for American eel (Figure 5), (unspecified) Bass (Figure 6), Landlocked salmon (Figure 7), Suckers (Figure 8), Whitefish (Figure 9), Alosa species (Figure 10), Esox species (Figure 11), Perch (Figure 12), and Trout (Figure 13) are also presented. Note that the Y axis values for these figures vary among species. Handling of individual fish was generally not done, and therefore, some catches were not distinguished to the species category; i.e. suckers, perch, gaspereau, whitefish, bass and trout (Table 1).

Table 1: Annual counts for fish (by species and life stage) captured at the upstream fish passage facilities at the Beechwood Dam from 1990-2019. All numbers in shaded grey cells should be considered minimum numbers captured for that specific year. Captive-reared salmon may have been released at Woodstock, downstream of the Beechwood Dam, between 2003 -2019, which cannot be distinguished from the sea-run returns by NBP attendants. Two fish captured and recorded as lake trout in 2003 were moved into "Trout (unspecified)" category.

Figure 9. Annual counts of Whitefish at Beechwood Dam from 1990-2019.

Figure 10. Annual counts of Gaspereau (Alewife and Blueback Herring combined) and American Shad at Beechwood Dam from 1990-2019.

Figure 11. Annual counts of Muskellunge and Chain Pickerel at Beechwood Dam from 1990-2019.

Figure 12. Annual counts of Perch (unspecified), White Perch, and Yellow Perch at Beechwood Dam from 19902019.

Figure 13. Annual counts of Trout (unspecified), Brook Trout, Brown Trout, and Rainbow Trout at Beechwood Dam from 1990-2019.

Table 3 summarizes the annual counts for fish captured in the counting trap within the pool and weir fishway at the Tobique Narrows Dam from 1990-2019. Catches prior to 1990 have been previously published (Smith 1979, Francis 1984). The fishway was seasonally operated from 1984 to 1988 but was not monitored. When possible, fish were identified by species (Appendix 1) and by life stage for Atlantic Salmon (Appendix 2) by Fisheries and Oceans Canada (DFO) and Tobique First Nation Science staff. DFO Science and Tobique First Nation have partnered together to monitor the fish counts at the fishway since the early 1990's as a collaborative project through the Aboriginal Fisheries Strategy program. The start and end dates for operation of the trap and monitoring of the fishway have differed over the 30 year time-series (Table 4) depending on available human resources. Dates or time periods when the fishway was not operational due to mechanical repairs are not documented in Table 4. In 2009, the fishway was not operated due to a non-fisheries related dispute between Tobique First Nation and NB Power. In most cases, data collected on sea-run adult salmon captured in the trap has been reported as either Salmon and Grilse based on actual measurements and/or visual observations by Science staff. In most years, adult salmon were also categorized into wild-, hatchery- or captive reared-origin based on fin clips and/or fin erosion. The annual adult salmon counts since 1990 are presented in Figure 14. The 30 year time-series of annual catches for American Eel (Figure 15), (unspecified) Bass (Figure 16), Landlock salmon (Figure 17), Suckers (Figure 18), and Trout (Figure 19) are also presented.

Table 3: Annual counts for fish (by species and life stage) captured at the upstream fish passage facilities at the Tobique Narrows Dam from 1990-2019. Fishway was operated but not monitored for the 2009 season

## CONCLUSIONS

This data report compiles 30 years of biological and catch information collected by staff from the Tobique First Nation, New Brunswick Power and Fisheries and Oceans Canada since 1990.This report continues the time-series of upstream fish counts at the Beechwood and Tobique Narrows dams previously published by Smith (1979), Ingram (1981, 1987) and Francis (1984) and is an example of successful collaboration between an indigenous community, federal government, industry, and academia. Staff from the Canadian Rivers Institute, University of New Brunswick assisted in compilation of the data because of their interest in fish passage at the various hydroelectric dams on the Saint John River system.

The data have been presented in a simple format to create interest in further data analyses. These could include examining run timing data in relation to tailrace discharge and nearby water temperatures. Ensuring appropriate training in fish species identification for various staff is important to ensure detailed recording of catches with only minimal additional effort.

## ACKNOWLEDGEMENTS

Thank you to Claude Fitzherbert for his dedication to maintaining and keeping excellent catch records of all fish caught during his daily monitoring of the trap at Tobique Narrows Dam. We would like to express our appreciation for the assistance received from all Tobique First Nation technicians (including Maurice Sacobie, Thomas Moulton, Tony Nicholas, John (Jake) Moulton, Tim Paul, Houston Bear and others) hired through the Aboriginal Fisheries Strategy Program to monitor catches at the Tobique fish trap. A huge thank-you to the many fish lift operators at the Beechwood Dam, but in particular: Philip Lang, George Kelly and more recently Tim Maskell for taking time out of their busy day to record fish counts for DFO.

## APPENDICES

Appendix 1: List of various fish with common name and (Scientific name) captured at the Tobique Narrows and Beechwood dams on the Saint John River from 1990 to 2019:

Atlantic Salmon (Salmo salar).
American Eel (Anguilla rostrata)
American Shad (Alosa sapidissima),
Brook Trout (Salvelinus fontinalis)
Brown Bullhead (Ameiurus nebulosus)
Brown Trout (Salmo trutta)
Burbot (Lota lota)
Chain Pickerel (Esox niger)
Creek Chub (Semotilus atromaculatus)
Gaspereau includes both Alewife (Alosa pseudoharengus) and Blueback Herring (Alosa aestivalis)

Muskellunge (Esox masquinongy)
Rainbow Trout (Oncorhynchus mykiss)
Smallmouth Bass (Micropterus dolomieu)
Striped Bass (Morone saxatilis)
Suckers includes both White Sucker (Catostomus commersonii) and Longnose Sucker (Catostomus catostomus)

Redbreast Sunfish_(Lepomis auritus)
White Perch (Morone americana)
Lake Whitefish (Coregonus clupeaformis)
Yellow Perch (Perca flavescens)

## Appendix 2: The life cycle stages of Atlantic Salmon (Salmo salar).

Figure A1 illustrates the life cycle of salmon migrating between freshwater and marine environments.
Egg - develops from green egg to eyed egg stage, approx. 1 cm in diameter
Sac-Fry/Alevin - approx. 2-3 cm fork length; Fed-Fry-approx. 3-5 cm fork length
Parr - possess 9-11 vertical bands or "parr marks", approx.. 5-9 cm fork length
Pre-Smolt - prior to undergoing osmoregulation and migrating to saltwater, approx..9-13 cm fork length
Smolt - have undergone osmoregulation and is migrating to saltwater, approx. 13-17 cm fork length
Grilse - less than 63 cm in fork length and are those salmon which return to spawn following a single winter at sea and also referred to as one-sea-winter (1SW) Salmon

Salmon - greater than or equal to 63 cm in fork length are referred to as large or multi-sea-winter (MSW) Salmon and include those fish that return following two or more winters at sea and repeat spawners

Captive-Reared salmon were collected from the wild as juveniles, reared at the Mactaquac Biodiversity Facility and then released to naturally spawn upriver of Mactaquac Dam (Jones et al. 2004)

Landlock salmon - have never gone out to sea, but have spent their entire life cycle in fresh water. To differentiate the physical characteristics of landlock salmon from wild sea-run Atlantic salmon: they are generally smaller sized at approximately $50-55 \mathrm{~cm}$ in length and have a lot of black spots on their lateral sides, as compared to the larger and more silvery colored wild Atlantic salmon.

Figure A1. Atlantic Salmon lifecycle (illustration by J.O. Penanen, reprinted with permission from Atlantic Salmon Federation).
