Picea mariana – Larix laricina / Rhododendron groenlandicum / Gaultheria hispida / Sphagnum spp.

Black Spruce – Tamarack / Common Labrador Tea / Creeping Snowberry / Peat Mosses

Épinette noire – Mélèze laricin / Thé du Labrador / Petit thé / Sphaignes

Subassociations: none

CNVC Alliance: CA00044 *Picea mariana / Rhododendron groenlandicum – Vaccinium angustifolium / Sphagnum spp.*

CNVC Group: CG0019 Ontario-Quebec Boreal Black Spruce Poor – Intermediate Treed Wetland

Type Description

Concept: CNVC00288 is a boreal wetland coniferous forest Association that ranges from Manitoba to Quebec. It has an open to moderately closed canopy of black spruce (*Picea mariana*) and tamarack (*Larix laricina*). The understory is species poor, with a preponderance of ericaceous species. The shrub layer is well developed, comprising abundant common Labrador tea (*Rhododendron groenlandicum*) and regenerating black spruce, with lower abundance of velvet-leaved blueberry (*Vaccinium myrtilloides*). Speckled alder (*Alnus incana*) can be abundant in the shrub layer. The poorly to moderately developed herb layer commonly includes creeping snowberry (*Gaultheria hispida*), three-leaved false Solomon's seal (*Maianthemum trifolium*), bunchberry (*Cornus canadensis*) and *Carex* spp. The moss layer is continuous and dominated by peat mosses (*Sphagnum* spp.), but feathermosses including red-stemmed feathermoss (*Pleurozium schreberi*), knight's plume moss (*Ptilium crista-castrensis*) and stairstep moss (*Hylocomium splendens*) are common on dry microsites (e.g., peat hummocks). CNVC00288 occurs on wet, nutrient-poor to medium sites in a region with a boreal continental climate that grades from subhumid in the west to humid in the east. Substrates are usually organic soils formed from slowly decomposing *Sphagnum* and other mosses. Although fire can occasionally occur, this is typically a stable condition that is maintained by a persistently high water table and poor to medium nutrient conditions; local hydrology is the main driver of vegetation dynamics.

Vegetation: CNVC00288 is a coniferous forest Association with an open to moderately closed canopy of *Picea mariana* and *Larix laricina*. *Abies balsamea* is occasionally present in the tree layer, especially in the Quebec portion of the range. The shrub layer is well developed but species poor, primarily consisting of abundant *Rhododendron groenlandicum* and regenerating *P. mariana*, with lower abundance of *Vaccinium myrtilloides*. When present, *Alnus incana* (see Comments) can be abundant in the shrub layer. The herb layer is poorly to moderately developed, but *Gaultheria hispida*, *Maianthemum trifolium*, *Cornus canadensis* and *Carex* spp. (e.g., *C. trisperma* and *C. disperma*) commonly occur. Species indicative of greater nutrient status, such as *Rubus pubescens* and *Mitella nuda*, are occasionally present. The continuous moss layer is dominated by *Sphagnum* spp. (particularly *S. capillifolium*, *S. girgensohni*, *S. magellanicum* and *S. angustifolium*). Some of these species form dense hummocks with dry exposed tops that are covered by feathermosses (primarily *Pleurozium schreberi* but also *Ptilium crista-castrensis* and *Hylocomium splendens*).

***Picea mariana – Larix laricina / Rhododendron groenlandicum / Gaultheria hispida / Sphagnum spp.* CNVC00288**

Type Description (cont'd)

Environment: CNVC00288 occurs on peat-accumulating sites with permanently high water tables in a region with a continental boreal climate that grades from subhumid in the west to humid in the east. Organic material thickness over mineral or bedrock substrates is typically > 40 cm. Groundwater flow is adequate to maintain a forest physiognomy with moderately minerotrophic conditions in the rooting layer; nutrient status is poor to medium. Surface microtopography is moderately hummocky; hollows can be in contact with groundwater at certain times of the growing season. CNVC00288 often occurs in a wetland mosaic with CNVC00282 [*Picea mariana / Rhododendron groenlandicum – Kalmia angustifolia / Sphagnum spp.*] and/or CNVC00300 [*Larix laricina – Picea mariana / Alnus incana / Gaultheria hispida / Sphagnum spp.*]).

Dynamics: CNVC00288 is generally a stable condition that is maintained by a persistently high water table and poor to medium nutrient status. Local hydrology is the main driver of vegetation dynamics, although successional replacement of *Larix laricina* by *Picea mariana* can occur over time.

Because of limited groundwater inputs and a cold climate, decomposition is slow, and peat accumulates over time. In the absence of hydrological changes, this process can raise the rooting zone above the water table, which further reduces nutrient availability for tree growth and promotes succession to a less productive, woodland community, such as CNVC00283 [*Picea mariana / Chamaedaphne calyculata – Vaccinium angustifolium / Sphagnum spp.*], and ultimately to an open bog condition (M876 [North American Boreal & Sub-boreal Acidic Bog & Fen]).

Long-term change in the water table (either by anthropogenic activities or natural causes [e.g., beaver dams]) usually results in changes to the vegetation community. A rise in the water table can result in tree mortality and transition to open wetland vegetation. A drop in the water table can sometimes result in the development of more productive feathermoss forests (e.g., CNVC00276 [*Picea mariana / Rhododendron groenlandicum – Vaccinium angustifolium / Pleurozium schreberi (Sphagnum spp.)*]). Enrichment of the rooting layer, typically by groundwater flow, can stimulate development of more productive wetland forest conditions (e.g., CNVC00300) by increasing supplies of oxygen and macronutrients, and by reducing acidity.

Although fires occur on peatlands, they are infrequent and of limited extent because these sites are so wet. When a fire does occur, both *Larix laricina* and *Picea mariana* can regenerate from seed under favourable conditions (e.g., suitable seedbed), *L. laricina* typically by wind-dispersed seeds from trees in the surrounding area and *P. mariana* from semi-serotinous cones. *L. laricina* is a pioneer species that grows more rapidly than *P. mariana*, but *P. mariana* is more shade tolerant and better able to regenerate in the absence of fire (usually by vegetative layering), so it can become dominant on these sites over time, forming CNVC00282 [*Picea mariana / Rhododendron groenlandicum – Kalmia angustifolia / Sphagnum spp.*]. Stands of CNVC00288 tend to be long lived and multi-aged, with trees up to or exceeding 200 years.

Larch sawfly (*Pristiphora erichsonii*) can cause extensive mortality to *L. laricina* stands if heavy defoliation occurs successively for 6 to 9 years.

Range: CNVC00288 occurs in the boreal region of Quebec and Ontario and likely extends into southeastern Manitoba as far west as Lake Winnipeg. In Quebec, it ranges east to the Gaspé region.

Related Concepts

Similar CNVC Associations:

CNVC00282 [*Picea mariana / Rhododendron groenlandicum – Kalmia angustifolia / Sphagnum spp.*] occurs on similar sites in the same range but lacks codominance of *Larix laricina* (see Environment and Dynamics).

CNVC00298 [*Picea mariana / Alnus incana / Gaultheria hispida / Sphagnum spp.*] occurs on wet, nutrient-medium to rich sites in the same range but lacks codominance of *Larix laricina* and has greater abundance of *Alnus incana* in the shrub layer (see Environment).

CNVC00289 [*Larix laricina – Picea mariana / Ilex mucronata / Sphagnum spp.*] occurs on similar sites in the temperate region of Ontario, Quebec, New Brunswick, Nova Scotia and Prince Edward Island. It has temperate indicator species such as *Acer rubrum*, *Ilex mucronata* and *Viburnum nudum*.

CNVC00300 [*Larix laricina – Picea mariana / Alnus incana / Gaultheria hispida / Sphagnum spp.*] occurs on boreal sites with richer nutrient status in Quebec. It has abundant *Alnus incana* in the shrub layer.

CNVC00326 [*Larix laricina / Alnus incana / Rubus pubescens*] occurs on boreal sites with richer nutrient status in Ontario. It has *Larix laricina* dominant in the canopy, *Alnus incana* dominant in the shrub layer and greater constancy of more nutrient-demanding species such as *Cornus stolonifera*, *Rubus pubescens* and *Mitella nuda*, as well as more *Carex* spp., with less *Sphagnum* spp.

CNVC00327 [*Picea mariana – Larix laricina / Vaccinium vitis-idaea – Mitella nuda*] occurs on boreal sites with richer nutrient status in Saskatchewan and western Manitoba. It has lower abundance of ericaceous species and higher constancy of more nutrient-demanding species such as *Mitella nuda* and *Rubus pubescens*, as well as more abundant *Vaccinium vitis-idaea* and *Carex* spp., with less *Sphagnum* spp.

CNVC00335 [*Picea mariana / Kalmia angustifolia / Pleurozium schreberi – Sphagnum capillifolium*] occurs on similar or slightly poorer sites on insular Newfoundland. It lacks codominance of *Larix laricina* and has a shrub layer with greater *Kalmia angustifolia*, *Ilex mucronata* and *Viburnum nudum*.

Relationships with Other Classifications:

Comments

Alnus incana here refers to ssp. *rugosa* (speckled alder).

CNVC00288 is consistent with the concept of a coniferous treed swamp in the Canadian Wetland Classification System.
