Black Spruce / Speckled Alder / Red-stemmed Feathermoss
Épinette noire / Aulne rugueux / Pleurozie dorée

Subassociations: 295a *Alnus incana*, 295b *Mitella nuda*, 295c *Larix laricina*

CNVC Alliance: CA00016 *Picea mariana* / *Alnus incana* – *Rhododendron groenlandicum* / *Pleurozium schreberi*

CNVC Group: CG0008 Ontario-Quebec Boreal Moist Black Spruce – Trembling Aspen – Balsam Fir – Paper Birch Forest

Source: Natural Resources Canada - Canadian Forest Service

Type Description

Concept: CNVC00295 is a boreal coniferous forest Association that ranges from Manitoba to Quebec. It has an open to moderately closed canopy dominated by black spruce (*Picea mariana*). The shrub layer is moderately developed to dense and commonly includes black spruce and balsam fir (*Abies balsamea*) regeneration, speckled alder (*Alnus incana*), common Labrador tea (*Rhododendron groenlandicum*) and velvet-leaved blueberry (*Vaccinium myrtilloides*). Speckled alder sometimes forms dense thickets. The herb layer is moderately developed and usually includes bunchberry (*Cornus canadensis*), creeping snowberry (*Gaultheria hispida*), goldthread (*Coptis trifolia*) and twinflower (*Linnaea borealis*), along with low abundance of several other species. The moss layer is well developed to continuous. Red-stemmed feathermoss (*Pleurozium schreberi*) is dominant, but knight's plume moss (*Ptilium crista-castrensis*) and stairstep moss (*Hylocomium splendens*) are also present, sometimes with discontinuous patches of peat mosses (*Sphagnum* spp.). CNVC00295 occurs in a region with a continental boreal climate that grades from subhumid in the western portion of its range to humid in the east. It is found on mesic to wet, nutrient-medium to rich sites. Stands typically recolonize after fire and are self-replacing over time. Three subassociations are distinguished: *Alnus incana*, *Mitella nuda* and *Larix laricina*.

Vegetation: CNVC00295 is a coniferous forest Association with an open to moderately closed canopy of *Picea mariana*. The shrub layer is usually well developed but can vary from moderately developed to dense depending on the patchiness of shrubs. It typically includes regenerating *P. mariana* and *Abies balsamea*, along with *Alnus incana* (see Comments), *Rhododendron groenlandicum* and *Vaccinium myrtilloides*. The herb layer is moderately developed and usually includes a large number of species, all with low cover; *Cornus canadensis*, *Gaultheria hispida*, *Coptis trifolia* and *Linnaea borealis* are the most common. The forest floor is covered by a well-developed to continuous layer of feathermosses, predominantly *Pleurozium schreberi*, with lower cover of *Ptilium crista-castrensis* and *Hylocomium splendens* and small patches of *Sphagnum* spp.

The *Alnus incana* subassociation has a dense tall shrub layer with abundant, often thicket-forming, *A. incana*. The ericaceous species *Rhododendron groenlandicum*, *V. myrtilloides* and *V. angustifolium* are also more abundant in this subassociation. The *Mitella nuda* subassociation has lower overall cover in the tree and shrub layers and higher constancy of more nutrient-demanding herbs such as *Rubus pubescens*, *Mitella nuda* and *Petasites frigidus*. The *Larix laricina* subassociation also has greater constancy of nutrient-demanding herbs, compared to the *Alnus incana* subassociation, but is primarily characterized by codominance of *L. laricina* in the tree layer.

***Picea mariana* / *Alnus incana* / *Pleurozium schreberi* CNVC00295**

Type Description (cont'd)

Environment: CNVC00295 occurs in a continental boreal climate that is subhumid in the western part of its range, becoming increasingly humid farther east. It usually occupies the ecotone between upland and wetland *Picea mariana* forests on moist to wet (sometimes mesic), nutrient-medium to rich sites. Stands are usually small in extent. They are often on level sites where organic materials sometimes exceed 40cm over fine-textured, glaciolacustrine or lacustrine mineral soils. Less frequently, stands occur in linear bands along lower or toe-slope topopositions on coarse-textured soils derived from morainal or glaciofluvial parent materials. The medium to high nutrient status of these sites is maintained by cation-rich mineral substrates (e.g., fine loams, silts and clays) or from nutrient-rich seepage or groundwater fluctuation. Even in the subhumid climate of the western part of the range, these soils retain enough moisture to support *Alnus incana*, a shrub that fixes nitrogen, thereby further enriching the soil nutrient status. Mor humus forms are common, with peatmors developing on wetter sites.

Within the range of CNVC00295 regional fire cycles are intermediate (100-270 years), long (270-500 years) or even very long (>500 years). However, these stands often occur where there are natural fire breaks (e.g., water bodies) and are less prone to fire because of their moisture status and thick moss layer. Where the regional fire cycle is intermediate, stands are less likely to burn than the surrounding landscape.

Dynamics: CNVC00295 can recolonize after fire or succeed earlier seral Associations in which pioneer species are dominant. *Picea mariana* has thin bark and rarely survives even low-severity fires, but its semi-serotinous cones open when heated by fire and disperse seeds. Its seeds can germinate on a variety of substrates, and seedbeds are usually improved by a fire that reduces the organic matter and exposes mineral soil. Fire can also reduce competing vegetation and help to release nutrients from the organic matter. Maximum seed release for *P. mariana* can therefore coincide with optimal conditions for seedling establishment, survival and growth. Over time, *P. mariana* is self-replacing because it is tolerant of shade and able to regenerate in the absence of fire.

Sometimes pioneer species play a greater role in the initial post-fire stand. The *Larix laricina* subassociation can describe younger stands. Likewise, CNVC00294 [*Pinus banksiana* – *Picea mariana* / *Alnus incana* / *Pleurozium schreberi*] is an earlier seral post-fire stand. Unless the time between successive fires is short (<100 years), these early seral conditions are likely to succeed to CNVC00295 as the slower growing, longer lived and more shade tolerant *P. mariana* becomes dominant and self-replaces over time.

Range: CNVC00295 occurs in the boreal region of western Quebec and Ontario and likely extends into southeastern Manitoba as far west as Lake Winnipeg. In Quebec it is most common north of Lake Abitibi on the Clay Belt but extends east to the Upper North Shore of the Saint Lawrence River near Baie-Comeau and occurs in the Gaspé region and on Anticosti Island. CNVC00295 occurs sporadically in the northern temperate region, usually on sites that are cooler than normal for that region. The *Alnus incana* subassociation is described from Ontario and Quebec. The *Mitella nuda* and *Larix laricina* subassociations are described only from Ontario.

Related Concepts

Similar CNVC Associations:

CNVC00208 [*Picea mariana* – *Pinus banksiana* / *Vaccinium angustifolium* / *Pleurozium schreberi*] occurs on mesic, medium sites in Ontario and has a less-developed shrub layer without *Alnus incana*.

CNVC00211 [*Picea mariana* / *Rhododendron groenlandicum* – *Kalmia angustifolia* / *Pleurozium schreberi*] occurs on mesic, medium sites in northeastern Ontario and Quebec and has a shrub layer with abundant ericaceous species and little to no *Alnus incana*.

CNVC00276 [*Picea mariana* / *Rhododendron groenlandicum* – *Vaccinium angustifolium* / *Pleurozium schreberi* (*Sphagnum* spp.)] occurs in the same range on sites that are not as rich. It has little to no *Alnus incana* in the shrub layer and often has greater cover of *Sphagnum* mosses.

CNVC00294 [*Pinus banksiana* – *Picea mariana* / *Alnus incana* / *Pleurozium schreberi*] occurs on comparable sites in western Quebec, but *Pinus banksiana* is dominant or codominant in the overstory (see Dynamics).

CNVC00296 [*Picea mariana* – *Abies balsamea* / *Alnus incana*] occurs on comparable sites in the same range, but *Abies balsamea* is codominant in the overstory.

CNVC00298 [*Picea mariana* / *Alnus incana* / *Gaultheria hispidula* / *Sphagnum* spp.] typically occurs on organic soils (i.e., wetter sites) in the same range and has a moss layer dominated by *Sphagnum* spp. rather than feathermosses.
