Association CNVC00305

Populus tremuloides / Alnus viridis (Rosa acicularis)

Trembling Aspen / Green Alder (Prickly Rose)

Peuplier faux-tremble / Aulne vert (Rosier aciculaire)

Subassociations: 305a *Alnus viridis*, 305b *Acer spicatum*, 305c *Hylocomium splendens*

CNVC Alliance: CA00024 *Populus tremuloides / Rosa acicularis / Aralia nudicaulis*

CNVC Group: CG0011 Central Boreal Mesic-Moist Trembling Aspen – White Spruce Forest

Source: D. Downing

Type Description

Concept: CNVC00305 is a boreal hardwood forest Association that occurs in Manitoba and Ontario. It has a closed canopy of trembling aspen (*Populus tremuloides*), sometimes with paper birch (*Betula papyrifera*) as a companion species. The shrub layer is usually dense, often with a tall shrub layer of green alder (*Alnus viridis*) or mountain maple (*Acer spicatum*) in addition to regenerating black spruce (*Picea mariana*) and lower abundance of paper birch or trembling aspen saplings and squashberry (*Viburnum edule*). Prickly rose (*Rosa acicularis*) and the heath species velvet-leaved blueberry (*Vaccinium myrtilloides*) and common Labrador tea (*Rhododendron groenlandicum*) are common in the low shrub layer, although northern bush-honeysuckle (*Diervilla lonicera*) can dominate this layer where present. The usually well-developed herb layer typically includes bunchberry (*Cornus canadensis*), twinflower (*Linnaea borealis*), wild lily-of-the-valley (*Maianthemum canadense*), wild sarsaparilla (*Aralia nudicaulis*), northern starflower (*Lysimachia borealis*), yellow clintonia (*Clintonia borealis*), dwarf raspberry (*Rubus pubescens*), stiff clubmoss (*Lycopodium annotinum*) and fireweed (*Chamerion angustifolium*). Where the forest floor cover is mainly broad-leaf litter, the moss layer is virtually nonexistent. In areas with less leaf litter, red-stemmed feathermoss (*Pleurozium schreberi*), stairstep moss (*Hylocomium splendens*) and knight's plume moss (*Ptilium crista-castrensis*) can form a well-developed, often thick, moss layer. CNVC00305 is an early seral condition that typically establishes after fire or harvesting. It occurs in a region with a subhumid continental boreal climate, usually on mesic, nutrient-medium to rich sites. Three subassociations are distinguished: *Alnus viridis*, *Acer spicatum* and *Hylocomium splendens*.

Vegetation: CNVC00305 is a hardwood forest Association with a closed canopy of *Populus tremuloides*, sometimes with *Betula papyrifera* as a companion species. The shrub layer can be dense with a tall shrub layer comprising abundant *Alnus viridis* and/or *Acer spicatum*. Regenerating tree species, especially *Picea mariana*, but also *B. papyrifera*, *P. tremuloides* and sometimes *Abies balsamea*, are also consistent components of the tall shrub layer in addition to *Viburnum edule*. Low shrubs typically include *Rosa acicularis* and the heath species *Vaccinium myrtilloides* and *Rhododendron groenlandicum*. *Diervilla lonicera* can be abundant where present. The herb layer is usually well developed and commonly includes *Cornus canadensis*, *Linnaea borealis*, *Maianthemum canadense*, *Aralia nudicaulis*, *Lysimachia borealis*, *Clintonia borealis*, *Rubus pubescens*, *Lycopodium annotinum* and *Chamerion angustifolium*. Where the forest floor cover is predominantly broad-leaf litter, the moss layer is virtually nonexistent. In areas with less leaf litter, *Pleurozium schreberi*, *Hylocomium splendens* and *Ptilium crista-castrensis* can form a well-developed moss layer.

The *Alnus viridis* and *Acer spicatum* subassociations have dense tall shrub layers with abundant *A. viridis* or *A. spicatum* respectively. The *Acer spicatum* subassociation sometimes has patches of *A. viridis* or *Alnus incana* and has abundant *D. lonicera* in the low shrub layer. The *Hylocomium splendens* subassociation lacks the abundance of tall broad-leaved shrubs found in the other subassociations and has a well-developed, often thick, moss layer with abundant *P. schreberi* and *H. splendens*, and minor cover of *P. crista-castrensis*, *Dicranum polysetum* and *Rhytidadelphus triquetrus*.

Canadian National Vegetation Classification (CNVC) Classification nationale de la végétation du Canada (CNVC)

<http://cnvc-cnvc.ca>

***Populus tremuloides / Alnus viridis (Rosa acicularis)* CNVC00305**

Type Description (cont'd)

Environment: CNVC00305 occurs in a subhumid continental boreal climate where regional fire cycles are intermediate (100-270 years). It is most frequently found on mesic, nutrient-medium to rich sites. Stands are usually on level sites or gentle slopes with soils of variable textures that have developed in deep morainal or lacustrine materials. Humus forms are typically mors, which can be very thick on moist or cool sites.

Site conditions vary among subassociations. The *Alnus viridis* subassociation is more common on sandy, lacustrine deposits. The *Acer spicatum* subassociation is more frequently found on warmer, south or west-facing aspects. The *Hylocomium splendens* subassociation occurs more frequently on cooler, north or east-facing aspects and on middle-slope topopositions. Thick humus layers are common in this subassociation.

Dynamics: CNVC00305 is an early seral condition that typically establishes after stand-replacing fire or harvesting. *Populus tremuloides* is a pioneer species adapted to disturbance. Following any disturbance that does not kill its roots, it can reproduce vegetatively from root suckers. It also produces abundant, light, wind-dispersed seeds that can readily colonize mineral soil seedbeds exposed by disturbance. *P. tremuloides* grows rapidly in full-light conditions but is intolerant of shade so does not replace itself in a stand without further disturbance. If seed sources are available, shade tolerant conifers (e.g., *Abies balsamea*) can become established in these stands and may grow into the canopy as the *P. tremuloides* decline. After about 120 years, a mid-seral mixedwood Association could develop.

Acer spicatum and *Alnus viridis* can form dense thickets in canopy openings, sometimes significantly delaying conifer ingress. Their deep roots can survive even high-severity fires and they respond quickly after disturbance by suckering. Being semi-shade tolerant, these tall shrubs persist as the canopy closes, limiting the light available for plants beneath them.

Forest tent caterpillar (*Malacosoma disstria*) and *Armillaria* root disease (*Armillaria* spp.) can have significant impacts on *P. tremuloides*. Defoliation by the caterpillar can reduce growth, cause dieback and sometimes lead to mortality. *Armillaria* spp. can weaken or kill individual or small groups of trees. Canopy openings that result from insect or pathogen disturbance can promote forest succession by enhancing the growth of understory trees, such as *P. mariana* and *A. balsamea*.

Range: CNVC00305 is described from the boreal region of northwestern Ontario, with sample plots ranging from north of Lake Nipigon west to the Manitoba border. It likely extends into Manitoba.

Conservation Status (NatureServe)

Global Conservation Rank: no applicable rank

National Conservation Rank: not yet determined

Similar CNVC Associations:

CNVC00088 [*Populus tremuloides / Vaccinium myrtilloides / V. vitis-idaea*] ranges from western Manitoba to Alberta, and occurs on drier, poorer sites. It has less regenerating *Picea mariana*, lower cover of tall shrubs and more *Vaccinium vitis-idaea*.

CNVC00238 [*Populus tremuloides (Betula papyrifera) / Diervilla lonicera*] ranges from southeastern Manitoba to Quebec and occurs on boreal sites that are not as rich. It has more *Abies balsamea* but lower cover of tall shrub species and more *Vaccinium angustifolium* and *Eurybia macrophylla*.

CNVC00239 [*Betula papyrifera (Populus tremuloides) / Acer spicatum / Clintonia borealis*] ranges from southeastern Manitoba to Quebec and occurs on comparable boreal sites. It has higher constancy of *Betula papyrifera* and *Abies balsamea* in the tree and shrub layers, less *Viburnum edule*, *Rosa acicularis* and *Rhododendron groenlandicum* in the shrub layer and more *Dryopteris* spp. in the herb layer.

CNVC00306 [*Populus tremuloides – Betula papyrifera / Acer spicatum (Rosa acicularis)*] occurs in eastern Saskatchewan and western Manitoba on comparable boreal sites. It has a more open canopy and lacks *Picea mariana*, *Diervilla lonicera*, *Rhododendron groenlandicum*, *Clintonia borealis* and *Lycopodium annotinum* in the understory.

CNVC00333 [*Populus tremuloides – P. balsamifera / Alnus incana – Cornus stolonifera*] occurs on moister, richer sites in the same range but has abundant *Alnus incana* and/or *Cornus stolonifera* in the shrub layer.

CNVC00347 [*Populus tremuloides – Picea mariana – Pinus banksiana / Acer spicatum (Rosa acicularis)*] is a similar mixedwood Association that occurs in the same range on comparable sites.
