> "At first, it appeared that nonresident-controlled brokerage firms existing before July 1971 were granted grandfather status enabling them to continue to engage in a full range of securities activities within Canada. However, it has come to the Committee's attention that Canadian industry authorities now are taking an increasingly hard line on such activities. For example, there is some discussion about whether the grandfather status is transferrable through sale of the business or not. The Committee is concerned about these recent Canadian actions and believes the Canadian situation bears close watching by the securities industry and the U.S. authorities."[132]

G. BROKER FAILURES AND INSURANCE

In Canada there have not been enough failures of brokerage firms to cause alarm and protection of investor-customers has been left almost entirely to the securities industry.[133] The National Contingency Fund was established in 1968 by the Montreal, Canadian, Toronto and Vancouver stock exchanges, and the In-

132 *Id.* at 425.

133 This discussion summarizes *Honsberger*, ch. V, at n. 285.

vestment Dealers Association. The fund and its sponsors have made no promises and undertaken no obligations but the purpose of the fund is to protect customers of members of the sponsors from losses in case of member bankruptcy. A total of $1,895,000 has been paid out in connection with four bankruptcies.

The Quebec Securities Commission has established the Contingency Group Fund for protection of customers of firms not members of one of the sponsors of the National Contingency Fund and a corresponding fund is maintained by the securities industry in Ontario.

In the United States the stock exchanges for some years maintained contingency funds but brokerage failures and financial problems in the late 1960s prompted Congress to enact the Securities Investor Protection Act of 1970. (The New York Stock Exchange Fund paid out about $100 million from 1968 through 1976.) The act established the Securities Investor Protection Corporation (SIPC), a nonprofit organization of which all registered broker-dealers and members of stock exchanges must be members. (At the end of 1976 membership was 5,168.) Assessments are made on members, based on gross securities business, at a rate in 1977 of 0.5%. The fund balance of the corporation had reached $137 million at the end of July 1977. When the balance reaches $150 million, the corporation may reduce the assessment rate. The SIPC protects customers of insolvent members up to a limit of $50,000 per customer with a limit of $20,000 in the case of claims for cash.

Through the end of 1976, 121 members of SIPC had failed, 103,000 customer claims had been satisfied, and $52.8 million had been advanced from the SIPC fund in connection with these liquidations.

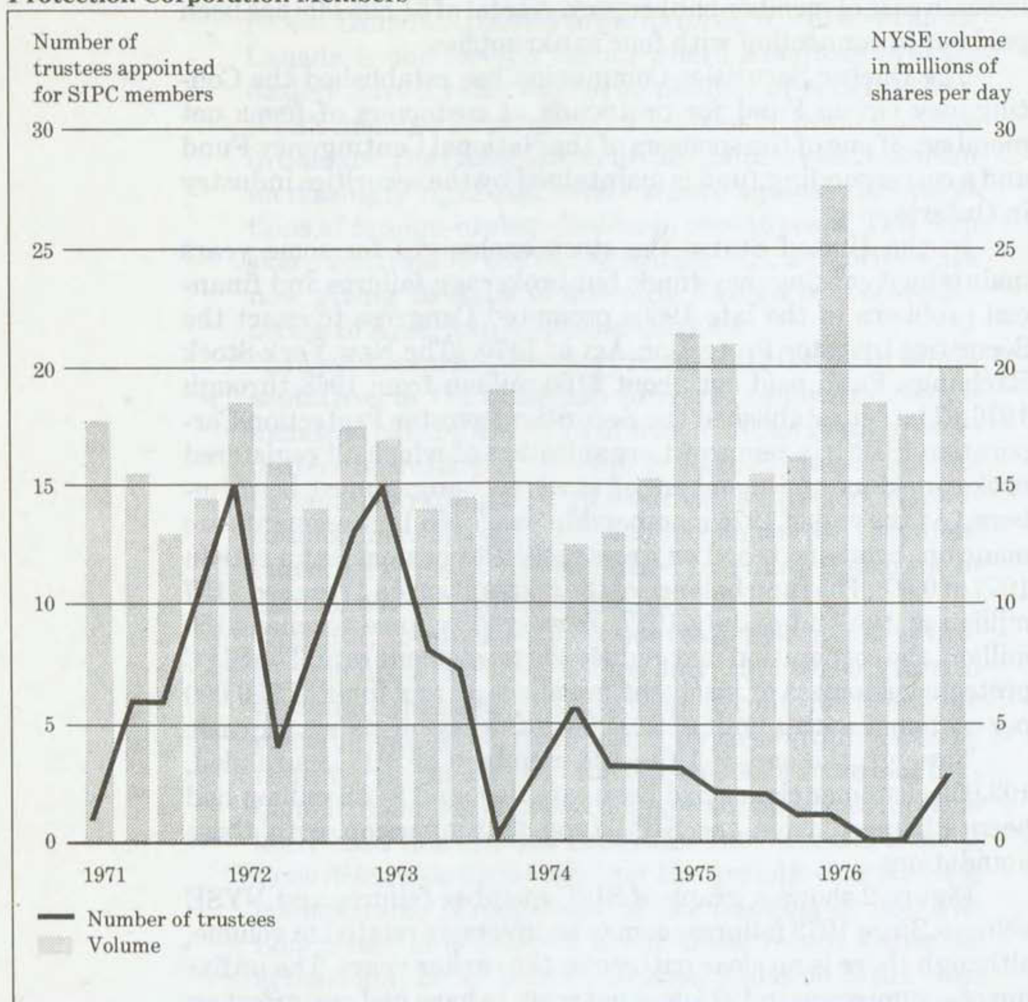
Figure 2 shows a graph of SIPC member failures and NYSE volume. Since 1973 failures seem to be inversely related to volume, although there is no clear pattern in the earlier years. The unfixing of commissions in 1975 does not seem to have had any effect on the number of failures.

H. CONCLUSIONS AND POLICY IMPLICATIONS

Self-regulatory organizations in the securities industry confront a regulatory commission with a number of difficult choices. The first concerns the autonomy of the organizations and the second, closely related to the first, concerns the division of regulatory responsibility between the organizations and the commissions.

The Canadian tradition, like that in the United States, has been to delegate a great deal of regulation to these organizations

Figure 2
New York Stock Exchange Volume and Bankruptcies of Securities Investor Protection Corporation Members



and to give them a great deal of freedom. It was not until the late 1960s that the SEC faced up to the fact that some of the regulatory rules and activities of the stock exchanges in the United States were devoted to investor protection, while others were devoted simply to restraining competition in order to protect the economic interests of the members. Since then both the United States Congress and the SEC have undertaken systematic suppression of anticompetitive activities of the exchanges. Access to membership on an exchange is a matter that has not yet been fully resolved, with the New York Stock Exchange itself in the process of establishing easier and cheaper access for those who are not now members.

In Canada there has been a more subtle recognition of the need to curb anticompetitive self-regulation. The proposed amendments to the Combines Investigation Act and some official commentary on access by foreigners to the Canadian securities market reflect this. But as yet, neither Parliament nor the securities commissions have gone nearly as far as have the United States Congress and the SEC.

As the securities industry in Canada moves closer to a Canada-wide market, access to this market, probably through some self-regulatory organization, will become a critical issue. The regulatory commission with jurisdiction over this market will have to decide whether access is to be controlled by a "private club", or whether it is to be open to all qualified applicants.

With respect to investor protection, substantial delegation of authority to the self-regulatory organizations seems to have worked very well, but there may be some question about leaving the National Contingency Fund and the protection of customers of bankrupt securities firms entirely in the hands of the industry.

A third issue related to self-regulatory organizations concerns competition among them. The current view in the United States seems to be that competition among all marketplaces, exchanges and over-the-counter markets is beneficial. It is not so clear that the form that competition between the Toronto and Montreal Stock Exchanges has taken is beneficial to the securities industry or to its customers. So long as regulation of the stock exchanges remains at the provincial level there is probably not much that can be done to bring about enough uniformity of rules and practices to eliminate unproductive kinds of competition. But a national regulatory commission might want to undertake this.

A fourth issue concerns permissible activities of securities firms, access to these activities and the degree of concentration in them. The range of activities has been left pretty much to the discretion of the self-regulatory organizations, subject, of course,

to statutes limiting entry to a number of activities such as banking. Diversification is an area over which a regulatory commission might want to exercise some jurisdiction. Permissible diversification of firms in the securities industry can hardly be separated from access to the securities industry by firms not outside it. Money management is a good example of this interrelationship. If securities firms are to be permitted to manage money, then should money management firms be permitted to acquire memberships on a stock exchange? This question now confronts the SEC, and has proved to be extraordinarily difficult to answer.

There seems to be some evidence that underwriting is highly concentrated in the Canadian securities industry. Although there may be good reason for this, there may also be some undesirable anticompetitive arrangements that tend to keep the business concentrated. A regulatory commission may wish to take some action here, although the matter can perhaps be left to competition legislation.

Although it appears that concentration is substantial in underwriting, it is hard to be precise simply because the data that would indicate the degree of concentration in all aspects of the securities industry are either nonexistent or treated as highly confidential by the self-regulatory organizations and their members. At the least, a regulatory commission needs to know what the degree of concentration is. And this knowledge is only the beginning of the information gathering that is so crucial to setting policy. The regulatory commissions at present know very little about the economics of the securities industry, something to be discussed in chapter III.

The capital needs of the securities industry constitute one aspect of the economics of the industry that will probably call for some decisions before long. There appears to be evidence that the Canadian securities industry would be stronger and certainly less fearful of foreign competition if it were better capitalized. The rules of the self-regulatory organizations at present stand in the way of substantially increased capitalization and a regulatory commission may simply have to interfere.

Foreign ownership, capitalization, and competitive strength are all closely bound together. Ontario and Québec are the two provinces that have taken some initiative in establishing rules about foreign ownership. The rules, at least in Ontario, have conflicted with the preferences of the Canadian-owned firms. Differences between the attitudes of the two provinces are easily understandable, given the dominance of the Ontario-based firms in the industry. A clear federal policy on this subject, administered by a national regulatory agency, would be very helpful.

Chapter III
Commission Rates and the Economics of the Canadian Brokerage Business

Careful analysis of the economics of the brokerage business began in the United States only in 1968 when the Department of Justice challenged the fixed minimum commission rates of the New York Stock Exchange. In Canada the process began in 1974 when the Quebec Securities Commission asked the Montreal Stock Exchange to explain why its rates should not be competitive. It was intensified in 1976 when the Ontario Securities Commission questioned fixed minimum rates on the Toronto Stock Exchange.

Fixed rates were abolished on the New York exchange in May 1975 and the analysis that preceded that decision has been replaced by evidence on the consequences of the switch to negotiated rates. In Canada the arguments of the stock exchanges persuaded the Ontario commission to continue with fixed minimum rates and the Quebec commission has gone along with that decision. In 1977 the analysis undertaken by the TSE was directed not to continued justification for fixed minimum rates but to support a particular fixed rate structure.

Since the issue of fixed commission rates is still alive in Canada, although it has been settled in the United States, it may be useful to review briefly the economic arguments and analysis that were presented in the United States before the switch to negotiated rates in 1975, as well as the reports on the consequences of abandoning fixed rates there.

A. THE UNFIXING OF COMMISSION RATES IN THE UNITED STATES

In the course of a general review by the SEC in 1968 of commission rates on the New York Stock Exchange, the United States Department of Justice issued a direct challenge to the concept of fixed minimum rates. The rates at that time were those shown in table 35. The New York Stock Exchange responded to the challenge largely by way of an economic study prepared for it in 1970 by the consulting firm National Economic Research Associates.[134] But in August 1968, two years before this report was completed, the exchange published a defence of fixed minimum commission rates in terms of the dire consequences it believed

134 NATIONAL ECONOMIC RESEARCH ASSOCIATES, INC., REASONABLE PUBLIC RATES FOR BROKERAGE COMMISSIONS (2 vols. 1970) (Report to the Cost and Revenue Committee of the New York Stock Exchange).

Table 35
New York Stock Exchange Minimum Brokerage Commissions (Non-Member Rates)

Before May 1, 1975

On first 1,000 shares (per round lot)		On excess over 1,000 shares (per round lot)	
Money involved	Commissions	Money involved	Commissions
First $400	2% plus $3	$100–2,800	1/2% plus $4
Next $2,000	1%	$2,800–3,000	same as $2,800
Next $2,600	1/2%	$3,000–9,000	1/2% plus $3
Above $5,000	1/10%	Above $9,000	1/10% plus $39

would follow from competitive rates.[135] The exchange argued that the quality of the central auction market – that is, the New York Stock Exchange market – would deteriorate because of a loss of incentive for brokers to belong to the exchange. Economists not associated with the exchange replied to this argument that there was no reason to believe that the quality of the marketplace itself would deteriorate, but that the value of a seat on the exchange might well decline. This decline would, of course, be unwelcome to the exchange membership, but need not be a matter of concern to the investing public or to a regulatory authority. Indeed, some economists argued that price competition among brokers might well lead to lower commission rates and an increased volume of trading on the NYSE, as it became more competitive with the third market (the over-the-counter market in listed stocks).[136]

The exchange made a second argument to the effect that various services to investors, including research, advisory and communication services would probably decline if commission rates became competitive and fell below the fixed minimum levels. The answer that came from various economists was simply disagreement with this conclusion; if the services mentioned are truly valuable to investors, then investors will buy them one way or another.

A third argument raised by the exchange was to the effect that with competitive rates large investors would probably be treated better than small investors. The economists' reply to this argument was that under fixed commission rates large investors were discriminated against. Their trades were more profitable to brokers than were the trades of individual investors and this discrimination might be expected to disappear with broker price competition. This argument differed somewhat from the first two in that it went to the policy question whether the commission rate structure should be deliberately designed to favour individual investors over institutional investors, as the fixed commission rate

135 NYSE, ECONOMIC EFFECTS OF NEGOTIATED COMMISSION RATES ON THE BROKERAGE INDUSTRY, THE MARKET FOR CORPORATE SECURITIES, AND THE INVESTING PUBLIC (August 1968).

136 Chris McEvoy has discussed the effects of fixed minimum commissions and declining competition among jobbers on the London Stock Exchange. In 1974, financial institutions in the U.K. set up their own computer-based block trading system known as ARIEL (Automated Real-Time Investment Exchange Ltd.). This system is analogous to the Instinet System in the United States, which is largely responsible for the "fourth market" in that country, the institution-to-institution market that makes no use of securities firms. McEvoy suggested that in view of the predictions that in the 1990s, 70% of the equity in U.K. companies will be held by institutions, the ARIEL system may divert substantial trading from the stock exchange. *See* McEvoy, *Economic Efficiency and the Stock Exchange*, 2 MANAGERIAL FINANCE 330 (1976).

structure on the New York Stock Exchange and the old fixed commission structure on the Toronto Stock Exchange almost certainly were. The question of relative value of institutional trading and individual trading to the quality of the marketplace, and whether one should be required to subsidize the other is discussed later.[137] Briefly, there is no clear-cut reason for a subsidy.

Finally, the NYSE raised the argument of probable destructive competition if commission rates were to be unfixed. The exchange predicted that large, diversified firms would cut prices drastically and eliminate their small competitors, regardless of the efficiency of the latter. It was the prospect of destructive competition that the New York exchange seemed to rely on most in its defence of fixed rates. And it was this same argument that the TSE pushed hardest in 1976 in defence of its own fixed rates. In fact the predicted destructive competition has not taken place in the United States in the three years since fixed commission rates were abandoned, but that does not prove that it cannot take place at some time in the future. Volume on the exchange has been substantial since May 1975 and destructive competition would be expected to take place only in periods of very low volume. So it is still worth reviewing briefly the case that was made for its dangers.

First, the very term "destructive competition" suggests something "bad". Indeed, for the victims within the industry – the firms that are forced into failure or mergers – destructive competition is "bad". But it is not so clear that destructive competition is bad for the customers of the industry, or so bad that price-fixing is a preferred alternative. Destructive competition is usually seen as taking the form of price-cutting until all or most of the firms in an industry are selling their product below total cost for an extended period of time, long enough to bring about a number of failures. It may be argued that customers are injured in this process because they are permanently deprived of the services of the firms that fail. This argument has some merit for an industry into which entry is extraordinarily expensive or otherwise difficult. The railroad industry might be an example. Steel or cement might be others. But the brokerage industry is characterized by relative ease of entry. Firms that fail in recessions are easily replaced in better times. The capital needs for starting a brokerage firm are not extraordinary and the employees of firms that fail are probably available to work for new firms. It is unlikely that the disappearance of any firm in the brokerage industry, particularly

137 In ch. V *infra*.

a financially weak firm, will result in a permanent loss of service to the investing public.

A second unattractive consequence of destructive competition may be wide fluctuations in the price of the brokerage service. In times of very low trading volume one might expect drastic price-cutting with substantially higher charges for brokerage services during periods of high volume. The impact of commission costs on the investing public, including the elasticity or response of trading volume to changes in commission rates, is still largely unknown. But both the New York and Toronto stock exchanges have expressed the opinion that the elasticity is quite low and that investors are not very much affected by the level of commission rates.

Finally, it can be argued that destructive competition will lead to the failure of the financially weak firms, even though these firms may be efficient suppliers of services to the investing public, and to increased concentration of the brokerage business in a few well-financed firms. This was the consequence emphasized most by the New York and Toronto exchanges. Neither exchange demonstrated why increased concentration would necessarily be detrimental to the interests of the investing public but it is certainly plausible that this would be the case.

The elements of destructive competition and the conditions under which price-fixing is in the public interest have been carefully set out by F.M. Scherer.[138] Destructive competition begins with fluctuating total demand in an industry where fixed costs are high, and variable costs low. The New York Stock Exchange said that around 50% of the total costs incurred by member firms in their commission business were fixed. Suppose the average cost of handling a brokerage transaction is $60, half of which represents fixed costs (office rent, lease of a computer and so forth), while the other half represents variable cost, the out-of-pocket expense for a transaction. Then as industry volume declines, a firm is tempted to sustain its own volume by reducing price to somewhere between $30 and $60, say $40. At this price the firm will cover its out-of-pocket expense and earn $10 towards fixed costs.

In cutting price, of course, the firm has to consider whether it is more profitable to do a small volume at, say, $50, or a larger volume at $40. But if the cost structure of our firm is characteristic of the entire industry, there will not be much choice. In a fight to stay in business all firms will cut prices to something not much above $30 and there may be virtually no volume available at $50.

138 *See* F. SCHERER, INDUSTRIAL MARKET STRUCTURE AND ECONOMIC PERFORMANCE 192-206 (1970).

It is at least better to earn $10 towards fixed costs than nothing at all. But if these conditions continue for long and the firm is simply unable to cover all of its fixed costs, its resources may be exhausted.

Scherer went a little further to see whether the danger of destructive competition justifies price-fixing. If the securities industry were affected in the manner described above in times of low volume, then we would expect firms to raise their prices in times of high volume to make up for their losses. The question is whether the public is better served by high prices in good times and low prices in bad times or by the same fixed prices at all times.

Scherer concluded, first, that highly inelastic marginal costs argued in favour of fixed prices. Highly inelastic marginal costs mean that as volume declines so does the out-of-pocket expense for each transaction, and Scherer saw this as quite likely to happen in an industry with high costs, operating close to capacity. One might imagine this marginal out-of-pocket cost as including some overtime, and other extraordinary expenses, when the firm is at or close to capacity. As volume subsides so do these extraordinary expenses. The result is that the price can fall even more sharply than in the scenario above. The marginal cost may drop to only $25 from $30. So the price might drop to $35 rather than $40. This price would still leave a $10 contribution to fixed costs, so the firm is no worse off. But Scherer pointed out that in *good times* this firm must raise its prices in order to achieve a satisfactory average profit and that the combination of the high price in good times and the low price in bad times would tend to be *higher* than a constant fixed price. So highly inelastic marginal costs argue in favour of fixed prices.

Next, Scherer pointed out that the elasticity of demand is an important element in a justification of price-fixing. A low elasticity of demand means that customers do not respond to price cuts by increasing their purchases. In the brokerage industry it means that investors and traders do not respond to commission rate cuts by increasing their trading. The result is that as brokerage firms cut their commission rates seeking increased volume, they can only take business away from one another. A low demand elasticity encourages destructive competition. But there is more to it. If elasticity *increases* as volume declines, and some economists argue that this is likely, the combination of high prices in good times and low prices in bad times will be no worse than fixed prices. If the elasticity does not increase, and particularly if it decreases, then fixed prices are more likely to be preferable.

We have already seen that the New York Stock Exchange in making its case for the dangers of destructive competition claimed that about 50% of the costs of commission business are fixed. The

exchange went through two analyses, the first of which simply involved the allocation, as fixed or variable, of all of the member firm costs associated with commission business. The second analysis took the form of a multiple regression in which the dependent variable was total cost of commission business and the independent variables were number of transactions handled by each firm and six categories of firm size. From this analysis the NYSE study concluded that the marginal cost for a transaction was $20.65 and the fixed cost varied from about 25% of total costs for the largest firms to something over 50% for the smallest firms. For most of the firms, fixed cost was about 50% of total cost. H. Michael Mann, applying a better regression analysis to the same data, came up with a marginal cost of $26.76 per transaction and fixed costs ranging from about 20% for the largest firms to a little over 40% for the smallest firms.[139] But as Mann pointed out, the whole exercise is somewhat suspect because the cost of a brokerage transaction varies a great deal from one transaction to another. It just is not plausible that the same marginal cost applies to all transactions of all brokers. In any case, the exchange continued its regression analysis to deduce a long-run marginal cost per transaction of $31.34 – $(2.16 \times 10^{-6}) \times$ the number of transactions per year which is a slightly decreasing function of the number of transactions indicating some economies of scale, that is, large firms have an inherent advantage over small firms. But Mann, performing a similar regression analysis, concluded that the long-run marginal cost was $25.57 and did not change with increased volume.

Harold Demsetz used a slightly different method of analysis to conclude that the average *total* cost per transaction on the New York Stock Exchange declined from about $46 for the firms with the smallest volume (averaging 19,000 transactions per year) to about $28 at a volume of 200,000 transactions per year and then remained fairly constant. His overall conclusion then was very similar to that of Mann, to the effect that economies of scale are not important in the brokerage industry.[140]

A review of the case presented by the New York Stock Exchange and the replies from Mann, Demsetz and other economists, together with the results of some of their own work, convinced R.

139 H. Mann, A Critique of the NYSE's Report on the Economic Effects of Negotiated Commission Rates in the Brokerage Industry, the Market for Corporate Securities and the Investing Public (paper presented to the SEC, 1970). Mann's results are quoted in ch. 5 of R. West & S. Tinic, The Economics of the Stock Market (1971). *See also* Mann, *The New York Stock Exchange: A Cartel at the End of Its Reign*, in Promoting Competition in Regulated Markets 301 (A. Phillips ed. 1975).

140 Statement of Harold Demsetz before the SEC, August 1969, *quoted in* R. West & S. Tinic, *supra* note 139.

West and S. Tinic in 1971, four years before the abolition of fixed minimum commission rates on the NYSE, that negotiated rates would probably lead to a "shake-out" in the brokerage business but not to destructive competition and domination of the industry by a few giant firms. They said "the kinds of economies of scale necessary for this simply do not appear to exist".[141]

1. *Consequences of Negotiated Rates*

Fixed minimum commission rates were abolished in the United States on May 1, 1975, and the SEC monitored the consequences of that event through early 1977. The fifth and concluding report of the commission to Congress[142] answers some of the questions that were raised back in 1968. It does not answer them all. The conditions that might give rise to destructive competition simply have not arisen since May 1975. There has indeed been vigorous price competition but not in the context of very low volume.

Some observations by Greenwich Research Associates in 1977, however, do bear on the question of destructive competition. They reported:

> "In the short run, brokers are striving to build market share by competing simultaneously on two fronts: price and value (or cost). With increasing costs and decreasing revenues, brokers' profits have been under great pressure. So far, most firms have responded solely by striving even harder to increase market share – by increasing costs even more or by reducing the prices of their services even more. And this explains why research and liquidity have both been improving.
>
> "Is it sustainable? Certainly not. Supply cannot long continue to exceed demand, and the supply of research and agency execution services now significantly exceeds the demand for these services. But this anomaly can continue during the near term so long as major firms are fighting for market position and market share....
>
> "Over the next year or so, we expect the number of suppliers to be reduced by several firms merging or closing. The intriguing question is whether this reduction in the number of suppliers will be so great as to create a

141 R. West & S. Tinic, *supra* note 139, at 139.

142 Securities and Exchange Commission, Fifth Report to Congress on the Effect of the Absence of Fixed Rates of Commissions (May 26, 1977). The economic analysis of the brokerage industry was carried forward to the end of 1977 in SEC Staff Report on the Securities Industry in 1977 (May 22, 1978).

situation in which the demand for service exceeds supply, because only then will brokers' prices and margins increase."[143]

The New York Stock Exchange had predicted that brokers and trading would leave the exchange and that the quality of trading would decline. The SEC reported that the share of trading in New York-listed stocks handled on regional exchanges and in the third market showed no significant change following the introduction of negotiated rates. Although these two markets held a slightly smaller fraction of total trading in 1976 than they held in 1974 and earlier years, there was no significant difference between their share early in 1975 when rates were still fixed and in 1976 when rates were competitive. The quality of the exchange market, as measured by stock price volatility, did not change significantly over the period of unfixing commission rates. Liquidity generally improved after rates became negotiable but this was largely the result of an increase in the volume of trading.

The SEC did not report on services to investors,[144] but did discuss the emergence of "discount" brokers offering executions without other traditional services. These firms are generally not members of the exchange, but deal through correspondents. Most have a single office and do not employ registered representatives or solicit orders except through media advertising. A sample of twenty such firms accounted in 1976 for under 0.4% of commission revenue of NYSE members doing a public business. Over 96% of their revenue was from commissions and margin interest and they were quite profitable with average returns on equity of 60.2% and on total capital of 42.6%. (Their capital was 17.2% of total assets compared to 10.2% for NYSE members.)

Commercial advisory services appeared to be flourishing in 1976 and 1977 and the Value Line Investment Survey has directed advertising specifically to investors who have chosen to do business with discount brokers. Banks are also reported to be paying cash for research services.[145]

Greenwich Research Associates commented in 1977:

"Services provided to institutions by brokers have actual-

143 Greenwich Research Associates, Fourth Annual Report on Institutional Brokerage Services at i-ii (1977).

144 But a Quebec Securities Commission Task Force reported in June 1976 that a substantial number of U.S. firms had increased the number of their analysts, although some firms had closed. On the whole, research services seemed unimpaired. Quebec Securities Commission Task Force, Commission Rates in the Securities Industry 25-26 (June 1976). This report was updated in Quebec Securities Commission Task Force, Updated Report on Commission Rates in the Securities Industry (December 1976).

145 Securities Week (New York), April 19, 1976, at 5-6.

ly increased significantly over the past two years. Liquidity has improved in every sector of the stock and bond markets, and the quantity and quality of research services have both increased for the second straight year."[146]

The New York Stock Exchange had predicted that institutions would benefit from competitive rates at the expense of individual investors. The greatest reductions in commission rates have certainly been achieved by institutions. For them, commissions on all trades dropped from an average of 26¢ per share in April 1975, to 13.3¢ per share in December 1977, a decline of 49%. But for individuals there was also a decline, although a smaller one. The average commission on all trades dropped from 30¢ per share to 24.5¢, a decline of 18%. Expressed as a percent of principal value rather than in terms of cents per share, institutional commissions declined from 0.84% in April 1975 to 0.45% in December 1977, a drop of 46%. For individuals the decline from 1.73% to 1.45% was 16%.[147]

For small trades, however, institutions received a more substantial decrease in commission rates than did individuals. For transactions involving less than 200 shares institutional commissions declined from 60¢ per share to 40.4¢, a drop of 33%. For individuals commissions fell from 50¢ per share to 48.7¢, a decline of 3%. For very large transactions on the other hand – 10,000 or more shares – institutional commissions declined from 15¢ per share to 8.9¢ per share, while individual commissions declined from 9¢ per share to 5.7¢ per share.

One discount broker doing business with individuals advertises commission rates of 40¢ per share on odd lots and the first 100-share round lot, plus 30¢ per share on the second 100 shares, plus 20¢ per share on the third 100 shares, plus 10¢ per share on the balance of an order. In addition, the rates guarantee a discount of 30% from the old New York fixed rates, subject to a $25 minimum. Table 36 shows the commissions for different share prices and different order sizes.

Overall then, institutions appear to have derived more benefit from price competition than individual traders. But individual traders saw their commission rates decline. And individuals could achieve substantial savings by turning to discount brokers.

The SEC conclusions are consistent with what can be observed in the securities markets. Commercial banks have increasingly put up their commission business for bids and for large banks these bids appear to have reached 9¢ or 10¢ per share, with a few at 8¢,

146 Greenwich Research Associates, *supra* note 143, at i.

147 SEC Staff Report, *supra* note 142, exhibit 14. The report noted, at 17, that

and some, for index funds, at 4.5¢. (The bids and the rates paid by large banks are regularly reported in *Securities Week.* In November 1977, *Securities Week* also reported pressure by the Comptroller of the Currency on banks in the south, apparently smaller banks, to seek lower commission rates. South Carolina National Bank, with only about $100 million in equity trust assets, put its commission business for orders under 1,000 shares up for bids. Merrill Lynch won, with a rate between 6¢ and 6.4¢ per share.) For large mutual fund groups executions at 5¢ per share seemed feasible in August 1977 when the Fidelity Funds group worked out an arrangement at this rate with Loeb Rhoades and some independent floor brokers. Subsequently, a number of large money management organizations have achieved a 5¢ target. Early 1978, however, saw a halt to the slide in rates, and some firms began to implement small increases, especially on retail business.

For the brokerage industry the period of price competition was one of high volume of trading with a high level of securities commissions and income. Brokerage commission revenue in 1976 was just 2% below revenue under fixed rates in 1972, a very good year, and 1977 revenue was off 11% from 1976. Institutional firms were the ones most affected by price competition. They showed a decline in securities commission revenue in the second quarter of 1975 following the unfixing of commission rates. All other categories of firms experienced an increase in securities commissions during this quarter. But after that second quarter of 1975 through 1977, the institutional firms held their share of commission revenue. These firms were more profitable than the brokerage industry as a whole when commission rates were fixed but since rates became negotiated their profits have trailed the industry average. Table 37 shows a measure of the impact of negotiated rates on the commission revenue of four classes of firms for the fourth quarter of 1976. Rates of return on equity capital for seven categories of firms for 1976 and 1977 are shown in table 38. Interest expense was a major factor in the 1977 decline.

Concentration of trading, as measured by the percent of securities commission revenue accounted for by the ten largest firms, increased somewhat after commission rates became negotiated (see table 39). But there had already been a steady increase in concentration from as far back as 1972. There was no evidence that the abandoning of fixed commission rates changed this trend.

Commission rate competition has been associated with a high rate of mergers among U.S. brokerage firms in the last year or so.

individuals probably paid even lower commissions in 1977, because the figures quoted do not reflect the rates of "discount brokers".

But the mergers have generally been in response to increased competition of all kinds and in anticipation of still more competition to come with a National Market System (discussed in Williamson, *Capital Markets*[148]), rather than as a result of negotiated commission rates as such. A few mergers have been aimed at rescuing failing firms but most have reflected a conviction that the major firm of the future must be well capitalized and strong in three operating areas: underwriting, trading and distribution. Recent years have seen the giant retailer, Merrill Lynch, develop strength in underwriting, and the leading underwriter, Morgan Stanley, build and acquire strong trading and distribution operations. Some of the most significant mergers in late 1977 have involved firms particularly strong in only one or two of these three areas.

B. ONTARIO SECURITIES COMMISSION HEARINGS, 1976

During the summer of 1976 the Ontario Securities Commission held hearings on fixed minimum commission rates on the Toronto Stock Exchange. The TSE brief contained a number of opinions to the effect that fixed rates should continue but offered almost no economic analysis.[149] The exchange expressed fears that commission rate competition would lead to financial institutions overshadowing brokerage firms, to fewer brokerage firms and therefore fewer independent sources of research, to reduced services for small investors, and to lack of uniformity in commission rates charged to institutions and individuals. All but the first of these are certainly quite likely, especially in view of the United States experience. But what is doubtful and unsubstantiated is that they are harmful to the investor or the marketplace.

The exchange also argued, as had the NYSE, that price competition would lead to destructive competition and shrinkage of the industry. The TSE went further, predicting that this shrinkage would particularly affect the financing of small companies in Canada because of a reduction in broker research.

But if the TSE pinned its defence of fixed rates on any one claim, it was the claim that commission rate competition would accelerate a trend toward institutional dominance of the ex-

148 *See, Williamson, Capital Markets*, ch. IV. The SEC reported that for May 1, 1975, through 1977, 93 firms left the New York Stock Exchange and 62 were admitted to memhership. Of the 93, 24 remained in business as NASD members and 36 disappeared in mergers; SEC STAFF REPORT, *supra* note 142, at 13-15 and exhibit 11.

149 TSE, In the Matter of the Securities Act, R.S.O. 1970, ch. 426, and, In the Matter of the Toronto Stock Exchange (June 18, 1976) (submission of the Toronto Stock Exchange to the OSC).

change marketplace. Exactly the same argument had been made by the New York Stock Exchange in defence of fixed commission rates. And as we shall see,[150] institutional participation is far more substantial in New York than it is in Toronto. In both markets the institutional share of trading appears to have leveled off in the last five years or so and what is particularly interesting is a comparison for New York between trading in 1974, when commission rates were fixed, and in 1976, when they were negotiated. Individuals accounted for 23% of total dollar volume on the NYSE in both years, with a slight increase in their proportion of share volume from 31% in 1974 to 33% in 1976. Institutions maintained their proportion of share volume at 44.5% but increased their share of value traded from 51% to 54% at the expense of trading by member firms.[151] This suggests that the shift to negotiated rates on the New York exchange has not led to increased dominance by institutions. Whether such an increase, should it take place, would be detrimental to investors and the marketplace is another question. The answer seems to be no but the question is dealt with in some detail later on.

In the absence of open price competition, service competition is bound to border on price-cutting. This was true in the United States before May 1975 and it appears to be true in Canada. The Quebec Securities Commission Task Force referred to the problems the Montreal Stock Exchange has had with "junkets, payment of subscriptions to business magazines or newspapers, rental of equipment or facilities"[152] and described the allocation of commission business by banks as based on reciprocity.[153] More examples were provided in the task force update of its report.[154] A substantial amount of what looks like price competition makes it likely that open and legitimate price competition would not greatly alter the economics of the industry.

1. *The Potter Submission*

Only three careful analyses of revenues and costs useful for analyzing commission rates in the Canadian brokerage business have appeared to date. One, analogous to the studies described above for the New York Stock Exchange, is that by Calvin Potter. This analysis appeared in his submission to the Ontario Securities

150 In ch. V *infra*.

Commission in the course of the 1976 hearings.[155] He dealt specifically with the argument by the exchange that negotiated rates would lead to destructive competition and relied for his Canadian data on the submission of the TSE to the OSC in November 1975 requesting continuance of a 10% surcharge on commission rates.[156] That submission contained fairly extensive cost and revenue data for five classes of members for six- and twelve-month periods through 1973 and 1974 and up to September 30, 1975. He used comparable U.S. data from the first report of the Securities and Exchange Commission to Congress on the effects of the absence of fixed commission rates, covering the period May 1 to August 31, 1975.[157] (The TSE has also published a cost study covering twelve months to March 31, 1975, and twelve months to March 31, 1976,[158] and another covering calendar 1976.[159] Unfortunately, these more recent studies do not provide any breakdown of data by category of member firms.) The categories of firms were those devised by the Toronto Stock Exchange. Potter's definitions are given in table 40.

Potter began with a comparison of the revenue mix of U.S. and Canadian securities firms. His general conclusion was that the two were remarkably similar, at least for the total industry on both sides of the border. For the Canadian industry for April 1 through September 30, 1975, 54.7% of total revenue came from commission income. For the U.S. firms for May 1 through August 31, 1975, commission revenue accounted for 52.3% of total revenue. (The most recent SEC report shows that for the fourth quarter of 1976 the ratio in the United States had dropped to 40%. For twelve months ending March 31, 1976, the ratio for the Canadian firms was down to 50%.)

Potter found that category A, national full-line firms in Canada, were already less dependent on commission revenue than were their U.S. counterparts, but that category B, local firms with a high value per trade (which Potter treated as analogous to American institutional firms) and category D, local firms with medium to low value per trade, derived a very large proportion of their

revenues from commissions, over 90% in fact, well above the ratios for the U.S. firms. (A detailed breakdown of revenue sources, based on more recent data, was given in chapter II.)[160]

If the firms most dependent on commission revenue are the most vulnerable to price competition, then these are the local firms.[161] However, Potter went on to calculate commission revenue as a percent of trading and found that for category B, the local institutional firms, this percent was relatively low. So these firms were already, presumably because of the tapered rate structure, charging below-average commission rates.

Potter also found that for all of the Canadian firms the commission as a percent of the value traded was considerably higher than the percent charged on individual trading in the United States and of course far higher than the percent charged on institutional trading in the United States. The average for all of the Canadian firms was 2.2%. (More recent data from the Toronto Stock Exchange give an average rate of 1.45% for the April–June 1976 quarter. For trades under $5,000 the average was 2.25%.)[162] In the United States, as we have seen, by February 1977 the percentage had reached 1.58% for individuals, down a little from the 1.7% quoted by Potter, and the rate for institutions had reached 0.47%, down from the 0.6% quoted by Potter. Canadian rates were apparently well above American rates.

Potter drew some conclusions with respect to percentage profit margins in Canada compared with those in the United States. For the six months from April to September 1975 Canadian firms showed a lower margin than U.S. firms but for the three fiscal years ending March 31, 1973, 1974 and 1975 the Canadian firms were considerably more profitable. The more recent data indicate that for the twelve months ended March 31, 1976, the margin for American firms was 15.1% while the margin for Canadian firms was 13.3%. For the twelve months to March 31, 1976, the return on capital before income tax was 29% for the American firms and 25% for the Canadian firms. The "profit" measure is a doubtful one at best, since it is calculated *after* salaries to partners

160 *See* table 18 in ch. II *supra*.

161 The Commission Rate Committee of The Toronto Stock Exchange predicted that half of the category B firms would close if commission rates were unfixed. TSE Commission Rate Committee, Paper No. 3, Consensus of Views of the Commission Rate Committee as to the Likely Consequences of a Move to Unfixed Commission Rates in Canada, at 2 (February 3, 1976).

162 Toronto Stock Exchange, *RAMA [Revenue and Market Analysis] Results for the April–June 1976 Quarter*, Notice to Members No. 1387 (October 21, 1976). The average rates in the RAMA studies are generally lower than the rates given by the cost studies, such as that cited in note 158 *supra*. The exchange relies on the RAMA studies.

and directors. The report of the Securities Ownership Committee of the Ontario Securities Commission describes the dramatic effect on reported profits of substantial changes in partners and directors' compensation.[163] Data are included in the SEC's fifth report to permit adjustment for this compensation.

The most interesting of Potter's conclusions is probably that presented in table 41. Fixed costs range from 27% of total costs for category D, to 53% for category C, to over 70% for the other three categories.

These ratios of fixed costs are high by U.S. standards but lower than the TSE's own estimates which are shown in table 42. Potter found, when he allowed for different types of firms, that the marginal cost was $\$30.29 - (65.58 \times 10^{-6}) \times$ the number of transactions per year.[164] This result differs from the New York results and particularly from Mann's results by demonstrating a much greater increase in economy of scale with transaction volume. (This difference could, of course, be due to inaccuracies in estimating transaction volume.) The allocations of fixed and variable costs derived by Potter were for the most part not very different from the Toronto Stock Exchange allocations.

For the industry as a whole Potter found high fixed costs but constant returns to scale. The latter meant that large firms did not enjoy lower marginal costs than small firms. But taking account of categories of firms, he found that within these categories there were increasing returns to scale, that is, larger firms did have an advantage. His explanation for the apparently conflicting conclusions was that there are distinct markets for different kinds of brokerage. As table 41 shows, relative advantages in the form of low total cost, low marginal cost, and high margin between revenue and cost tend to offset one another. So it is not surprising that different categories of firms have developed different products or sets of services within the brokerage business that coexist at different costs and revenues.[165] Potter went on to justify the expectation that this coexistence would continue under competitive rates. And this coexistence appears to be about what has happened in the United States, with some shifting in the costs,

163 OSC, REPORT OF THE SECURITIES INDUSTRY OWNERSHIP COMMITTEE, *supra* note 20, at 55-56, 61-62.

164 Shaw and Archibald asked 16 firms what was the minimum commission that returned a profit to the firm. The median response was $26. The range was from $9 to $65. 7 D. SHAW & R. ARCHIBALD, *supra* note 28, at 46 (The Securities Firm in the Canadian Capital Market).

165 This is borne out by the estimates of profitable commissions referred to in note 164 *supra*. Two of the three highest estimates came from institutional firms and the three lowest came from retail firms.

prices and sets of services (including the innovation of the execution-only service).

2. *The Ontario Securities Commission Decision in 1976*

In a split decision the Ontario Securities Commission approved in 1976 the continuation of fixed rates with a requirement that the TSE submit a new schedule of rates. There was little reasoning in the majority opinion; about all it conveys is a message that the majority did not feel compelled to take an uncomfortable step.[166]

C. THE QUEBEC SECURITIES COMMISSION TASK FORCE REPORT

Reference has already been made to the Quebec Securities Commission Task Force report[167] and the appendix to this paper reproduces chapter II of the report, which describes the U.S. and Canadian commission rate structures up to early 1976. The task force collected data on fifty brokers registered with the Quebec commission and responsible for 96% of the 1975 value of trading on the Montreal exchange. For the whole group, 1975 commission revenue ($139.9 million) was 44% of total revenue ($320 million). This fraction compares with 54.7% for the TSE firms in the TSE and Potter analyses.

Of a total of $140 million in brokerage commissions, 35% was from institutions and 65% from retail customers. For the seven firms deriving over half their commission revenue from institutions[168] institutional commissions were over 80% of the total but these specialized firms accounted for only 17% of institutional commissions. The nine firms deriving over half their commissions from retail customers[169] averaged 60% retail business but still did twice the volume of institutional business done by the seven institutional firms.

Total underwriting revenue for the fifty firms was $67.6 million. The seven firms for which over half of total revenue was derived from underwriting[170] earned 42% of this amount. So

166 *In re* pt. XV of the by-laws of the Toronto Stock Exchange, [1976] OSC Bull. 289 (November). The decision is carefully reviewed in Connelly, *Fixed Versus Negotiated Commission Rates on The Toronto Stock Exchange*, 2 CAN. BUS. L.J. 244 (1977).

underwriting was a good deal more concentrated than institutional commission business.

Revenues of all firms fluctuated substantially from month to month in 1975 but apparently the fluctuations were not significantly greater for the firms most dependent on commissions (twenty-six firms derived over half their total revenues from commissions). These firms, however, showed more months of losses. The analysis concluded that fixed costs are substantial but did not attempt to quantify this conclusion.

It appeared that the institutional firms were consistently more profitable than the retail commission firms through 1975, confirming the TSE and Potter conclusions. The underwriting firms were much more profitable than those dependent on commission revenue and this, too, confirmed the other studies' conclusions. Profitability declined steadily for the commission firms over the four quarters of 1975 but the report suggested no reason for this. Figure 3 shows the relationship between MSE volume and rate of return on capital for three classes of firms for 1975.

Table 43 applies U.S. experience to the Canadian industry to forecast the revenue reductions that might result from competitive commission rates.

A good deal of the QSC task force analysis was directed at the differences between Québec-controlled and other brokerage firms. (The seven firms with the largest total revenue, aggregating 45% of revenues of all fifty firms, were controlled outside Québec.) Concentration was another element of interest. Figure 4 shows concentration by various kinds of revenue. Underwriting shows relatively large concentration, while institutional commission business shows relatively little (half as much as underwriting) and retail commission business lies between. Concentration in underwriting revenue correlated highly with concentration in capital; but the heavily capitalized firms did not dominate the commission business.

D. COMPETITION BETWEEN U.S. AND CANADIAN MARKETS

As we have seen, one of the issues raised in the U.S. deliberations over fixed or competitive commission rates was the competition among the New York Stock Exchange, the regional stock exchanges, and the "third market". The New York exchange had hoped that Congress or the SEC might eliminate the third market by legislation or by rule but that wish was not granted.

In Canada no significant "third market" has ever developed and although there is competition between Toronto and Montreal, the commission rates are identical on the Toronto and Montreal

exchanges. But there is vigorous competition between Canadian and U.S. markets in interlisted stocks. The shares of about seventy-nine Canadian corporations are listed for trading on stock exchanges or on NASDAQ in the United States as well as in Canada. Eighteen are listed on the NYSE, forty-two on the AMEX, sixteen on NASDAQ and three on the Pacific Coast Exchange. These stocks present an unusual opportunity for a Canadian investor to seek better trading conditions in the United States. They are also important stocks in terms of the Canadian marketplace. Forty percent of the value of trading on the TSE in the first five months of 1977 was in these interlisted issues.

The Toronto Stock Exchange has said that "there is an active dealer market in the U.S. in a significant number of TSE stocks which are *not* listed in the U.S., but trade via NASDAQ and the U.S. OTC market – in effect a 'third market' in TSE stocks....In certain stocks, including Moore Corporation, Denison Mines, Falconbridge Nickel Mines, such trading is substantial".[171]

Tables 44 and 45 show a rough comparison between U.S. and Canadian commission rates at mid-1976.[172] (The appendix to this paper contains graphical comparisons for institution size orders taken from the Quebec Securities Commission Task Force report.)

The SEC presents data for different sizes of orders broken down by number of shares rather than by value, while the TSE breaks down orders by value. Table 44 shows the SEC statistics with size of order estimated by assuming an average price of $25 per share. It seems safe to say that for Canadian trading, institutions account for almost all of the orders from $100,000 up, and the 0.73% rate of commission was high compared to the American institutional rates on large trades. (As of the end of 1977 the U.S. institutional rate was down from the 0.4% shown in table 44 to about 0.3%.) Since even on the smallest orders the average American institutional rate was only 1.05%, it seems clear that in general the U.S. trading was cheaper for institutions.

An interesting comparison of commission rates in Canada and in other countries, as of mid-1976, is shown in table 46 taken from a submission to the Ontario Securities Commission by Swiss Corporation for Canadian Investments Ltd.[173] Tables 47 and 48 from the

submission of Burns Fry Limited, give a more direct Canada-United States comparison.[174]

The submissions to the Ontario Securities Commission in the summer of 1976 reflected an awareness of the competitive threat of U.S. markets with some confidence that there was little to worry about. In its submission, the Montreal Stock Exchange reported that for interlisted issues, total 1975 U.S. volume was about 43.9% of the total Canada and American trading. There had been a downward trend in the percentage trading in the United States, from a high of 70.5% in 1969 to a low of 43.9% in 1975, although throughout this period Canadian commission rates were somewhat higher than rates in the United States. There had been, however, a wide variety among the stocks in terms of the percent of trading done in the United States and the trend in that percent.[175]

The Montreal exchange reported some evidence that Canadian financial institutions had shifted orders for some stocks to the United States market and the shift was particularly noticeable in the case of the stocks of four widely-held corporations: Alcan, Canadian Pacific, International Nickel, and Massey-Ferguson. For Alcan and International Nickel most of the total trading is done in the United States while for the other two most is done in Canada. The exchange concluded that the trading statistics, particularly those reflecting the American and Canadian shares of trading following the freeing of commission rates in the United States on May 1, 1975, indicated that a differential in commission rates between the United States and Canada was not likely to lead to a substantial outflow in trading in interlisted issues.[176] But the exchange was sufficiently concerned about such a shift that it advocated that Canadian brokers be forbidden to pass on to Canadian customers the benefits of lower commissions on U.S. transactions in interlisted stocks.[177]

Some Canadian institutions indicated in their briefs to the OSC that they had shifted trading from Canada to the United States to take advantage of lower commission rates there.[178] Other

institutions indicated that they were content with the Canadian marketplace, while still others expressed some surprise that Canadian institutions had not pursued the lower rates available in the United States more aggressively. One submission noted that Canadian bank stocks trade over-the-counter in the United States at somewhat lower transaction costs than are found in Canada.[179]

In discussing the potential for a shift of trading from Canada to the United States, some of the submissions stressed the importance of the quality of the market, particularly its liquidity, observing that a lower commission rate might well be offset by the disadvantage of a poorer market. However, no evidence was presented to indicate that the U.S. market for any of the interlisted stocks was significantly lower in quality than the Canadian market.

In early 1977 the complacency disappeared and the Toronto Stock Exchange became alarmed at the shift of trading from Canada to the United States. Two committees of the exchange, the Market Functions Committee and the Joint Industry Commission Rate Committee, brought some distressing statistics to the attention of the membership and the public. Table 49 shows the percentages of total agency trading and total principal transactions of members of the TSE in interlisted Canadian stocks that were executed in the United States. There was a significant increase in agency trading in the United States, but the actual "slippage" could have been even greater since these figures do not include transactions for Canadian customers by U.S. brokers who are not members of the TSE. Nor do they include American trading over-the-counter in stocks that are not interlisted. In 1977, however, U.S. agency trading dropped a little, principal trading was up a little, and total U.S. trading seemed to have leveled off.

The Market Functions Committee acted first, recommending a reduction from $400,000 to $100,000 in the minimum size trade that may be handled by a member firm as a principal transaction. The proposal was accepted by the membership and ultimately by the Ontario Securities Commission.[180] The committee produced a rather more detailed analysis than is shown in table 49 in order to show that trading in interlisted issues is more concentrated in large orders than is trading in all issues and that a high percentage of large orders (over $50,000) are transacted in the United States. The commission rate proposal came next.

Source: Toronto Stock Exchange. Data through December 1976 appeared in: Joint Industry Commission Rate Committee, *Presentation of Proposed Commission Rates* (April 4, 1977).

E. THE 1977 COMMISSION RATE PROPOSAL

The Joint Industry Commission Rate Committee proposed a new fixed commission rate structure based on the value of each 100 share lot traded. Commissions would be 3% of the first $500, 2% of the next $1,000 and 1% of the balance, with a discount for large transactions - nothing off the first $5,000, 10% off the next $15,000 and 20% off the next $20,000. On amounts beyond $40,000, the commission would differ according to whether the stock price was less than or greater than $10. Below $10 the rate would be 1% of value; above $10 it would be 10¢ per share. Beyond $1 million rates would be negotiable. (Under the existing rate schedule, negotiation began at $500,000.) Individual traders would be given a 50% discount on "reversal" sales, at the broker's discretion where the purchase and sale of the same stock were executed through the same broker within forty-five calendar days. (This rule has apparently introduced some rate competition.) Finally, a five-day accumulation rule would allow consolidation, for purposes of determining the commission, of orders filled within five consecutive trading days where the total value is at least $100,000. The membership approved on April 19, 1977 (by a vote of seventy-eight to fifteen), and this rate scale was put before the Ontario Securities Commission in June 1977.

The exchange's 1977 submission disclosed the dilemma in which the industry found itself. On the one hand, the recession of 1973–74 had reduced profits and led to attrition in the number of salespeople employed so that firms were eager to increase commission rates. On the other hand, the substantially lower commission rates in the United States were taking institutional trading in Canadian interlisted stocks away from the Toronto market. The task was to produce a rate scale that was attractive to member firms, yet competitive with U.S. rates. These conditions precluded a "flat" rate, one based solely on the value of a transaction. That rate would have to be either too low to satisfy the members or too high to be competitive, and since costs of executing a transaction are almost certainly not directly proportional to the value of the transaction, there is little reason to aim at a flat rate.

In defending the proposed rates the exchange said that "there is a relatively high cost per trade which must be met, regardless of the trade value, and the incremental costs arising from the value of the trade or the number of shares involved is a smaller percentage of the total cost".[181] This conclusion follows

181 Toronto Stock Exchange, Submission to the Ontario Securities Commission regarding the Proposed Commission Rate Schedule, at 20 (May 16, 1977).

from the 1976 data described above and from Potter's analysis. But the cost study commissioned by the TSE for the 1977 hearings provided little support.[182] Clarkson,Gordon & Co. explicitly disclaimed any attempt to separate fixed from variable costs, and in fact expressed doubt that a separation was even practical.[183] We can be fairly sure from the earlier data, discussed above, that fixed costs are substantial (although, as Clarkson Gordon suggested, it is very hard to say just how "fixed" these costs are – leases, after all, can be terminated, computers relinquished, research staffs cut back). And there almost certainly is some minimum marginal cost for a transaction. But how these costs may vary from firm to firm and from category to category of firm the exchange did not say.

Institutional trading was expected by the exchange to involve chiefly shares priced above $10, which was chosen as the dividing point for rates on the portion of a transaction beyond $40,000. For higher priced shares these large transactions were expected to be competitive with trading in the United States. Table 50 compares old and proposed TSE rates with old NYSE rates. Since institutional brokerage firms in the United States were on average charging rates 33% below the "old" New York rates in the fourth quarter of 1976 and institutional customers were achieving discounts of 30% to 40%,[184] the current NYSE commissions can probably be taken to be about two-thirds of the "old" rates. The TSE rates do appear competitive on these very large trades.

1. *The Clarkson Gordon Cost Study*

The Clarkson Gordon study is disappointing in that it makes no attempt to separate fixed and variable costs or at least to identify the minimum cost that might be associated with an execution. Even though this identification is difficult, the proposed rate structure is based on the proposition that there is such a minimum cost and that rates should at least approximately reflect it. The study is also disappointing in that it identifies very different average total costs per transaction for different categories of firm, as did Potter, but makes no attempt to explain the differences. The TSE proposal offers only a distinction between "retail" and "institutional" trades but there must be much more significant differences.

Table 51 analyzes transaction costs for commission transac-

tions. The thirteen firms whose data are represented handled 30.5% of the value of TSE trading in 1976.

The substantial differences among the categories of firm in average cost and average profitability suggest significant differences among the products offered. Bearing in mind that for the thirteen firms commission revenue was only 39.4% of total revenue in 1976, we can easily surmise that joint products and joint costs may differ greatly among the firms. (This percentage is low even for diversified firms. See table 18.) So for decision-making purposes – whether management decisions within firms or rate structure decisions by the commission – the data in table 51 are probably not very helpful.

The study traces total revenue and commission revenue for the sample of thirteen firms over a decade. Figure 5 shows the close correlation between exchange volume and commission revenue. (The commission rate structure was modified in 1973 and a 10% surcharge was in effect for 1975.) The study furnished data on rates of return for the total business (including commission business) of the diversified, retail and institutional firms. These do not tell us much about the commission business except to suggest that despite the costs of non-price competition, the institutional firms have been more profitable than the retail firms and probably this difference reflects the commission rate structure. Table 52 summarizes some comparisons of the study.

On June 30, 1977, the Ontario Securities Commission accepted the TSE proposed rate schedule (after the exchange modified it to restore the $500,000 level at which rates become negotiable rather than moving to $1 million) to be effective September 1, 1977, and to continue for two years. The OSC had the benefit of its own staff position paper, which had estimated rates of return for different segments of the industry under the proposed schedule. It concluded that the rates would not produce unreasonable profits, at least from agency business, and approved them for a two-year period.[185]

The Quebec Securities Commission, which had already given notice of a preference for competitive rates and of its intention to ask for legislation to make rates competitive,[186] tacitly agreed to go along with the Ontario decision, as did the Vancouver exchange.

185 *In re* the Securities Act and Part XV of the By-Laws of The Toronto Stock Exchange, [1977] OSC Bull. 157 (July).

186 8 QSC Bull., No. 16 (April 26, 1977).

2. *The Ontario Securities Commission Staff Position Paper, 1977*

The third of the three careful analyses of revenues and costs in the Canadian industry was the Ontario Securities Commission staff position paper[187] prepared for the commission in the summer of 1977 during proceedings on the TSE proposal for a new set of rates. The author of the paper was Calvin Potter and its conclusions are significant not simply in terms of a particular rate structure (one that was approved by the OSC) but in terms of the whole logic behind rate structures – the purposes they are to serve and the means to achieve those purposes. It seems all too clear that throughout the 1976 and 1977 deliberations the industry and the commission had no very clear set of purposes in mind but were guided by a vague objective of "fair and reasonable" rates, subject to fear of the effects of competition.

Potter points out early in his paper the unsatisfactory nature of a "fair and reasonable" standard without much more specific tests.[188] In effect, the OSC was taking a few faltering steps toward a public utility rate regulation standard. But the standards for this kind of regulation go far beyond "fair and reasonable". They go to cost of capital of the regulated institution and determination of a reasonable rate of return. The commission was unwilling to take this step, yet it agreed with the principle of fixed rates, subject to its approval.

It is interesting that, as Potter noted, the TSE implicitly endorsed competitive commission rates as "fair and reasonable", since its justification for the new fixed rates on both large and small trades was that these rates were comparable to or lower than the competitively established New York rates.[189] In fact, what the TSE had done in large part was to construct a set of fixed rates that roughly matched the New York rates. Potter observed that if the match were a close one, he would have to conclude as an economist that the result was bound to be "fair and reasonable" since it simply duplicated the effects of free competition.

But the match was not perfect and the TSE rates presented two major difficulties. First, as the exchange conceded, since its rates were to be fixed while the New York rates were not, even though the two sets of rates were close, those firms dealing in the New York market would have some flexibility to underprice the Toronto competition. Second, as Potter pointed out, in trying to meet New York competition and at the same time keep revenues

187 Ontario Securities Commission, Toronto Stock Exchange Commission Rate Schedule Hearing, staff position paper (June 7, 1977) (prepared by C.C. Potter).

188 *Id.* at 5 (summary).

189 *Id.* at 5-7.

as high as possible the exchange had come up with a structure that was internally inconsistent.

The exchange had said that there is a substantial fixed cost associated with a trade (although it offered no evidence on this because the Clarkson Gordon study furnished none). This conclusion is undoubtedly correct. The exchange also said that "it does not cost substantially more to trade high-priced shares than low-priced ones".[190] This conclusion is almost certainly correct as well, although there are no data available to prove the point. But the new rate structure follows these principles only for large transactions where NYSE competition is most significant. It does not follow them for small transactions.

Consider the commission on a $60,000 trade compared to the commission on a $40,000 trade. Both are essentially large "institutional" trades. The commission on the $40,000 trade should have covered the fixed costs and so the extra commission in moving to a $60,000 trade should reflect only the extra, or marginal cost, of handling more shares. And if it costs no more to handle 100 shares of a $40 stock than it does to handle 100 shares of a $20 stock, the extra commission should be strictly a function of the number of shares required to bring the trade from $40,000 to $60,000. This is in fact exactly the case. The extra commission is 10¢ per share, regardless of share price, if the price is at least $10. In fact, as the description of the rate schedule easily shows, once a trade exceeds $40,000, the commission for every extra round lot is $10 for any share price above $10.

But for small trades the relationship is very different. Consider the extra commission in going from a $10,000 trade to a $20,000 trade. For a $10 stock the extra charge is 22.5¢ per share. For a $20 stock it is 36¢ per share. And for a $40 stock it is 56.8¢ per share. Potter pointed out that this pricing is not consistent with the exchange's own statement about costs and imposes a discrimination against individual trading of high-priced, "quality" stocks. This discrimination is particularly surprising, since the exchange itself had expressed fears that competitive rates would favour institutions. We seem to have found a fixed rate structure that emphatically favours institutions just in terms of the extra commission charged for each extra round lot traded!

There is a third defect in the new set of Toronto rates. They fail to reflect differences in the kinds of brokerage services offered by different firms and the kinds of services wanted by different customers. We have already seen the emergence of discount bro-

190 TSE, Submission to the OSC regarding the Proposed Commission Rate Schedule, *supra* note 181, at 27.

kers in New York offering a no-frills, execution-only service to individuals many of whom may prefer to obtain their investment advice from a commercial adviser. These low-rate firms exist side-by-side with the long-established retail wire houses that charge significantly higher rates and offer the traditional line of services. The TSE rates were claimed to be below the U.S. wire house rates on individual trades but although the TSE was well aware of the discounted rates, it did not expect that Canadian brokers would meet them.[191] The investor in the Toronto market, then, is simply not given the choice of buying only executions from a broker at a low rate and obtaining investment advice elsewhere.

But quite apart from execution-only service is the matter of accommodation to the variety of services already offered. The exchange itself refers to this variety[192] but makes only limited provision in the rate structure for variations in commissions to accompany variations in service. Instead, brokers are left to adapt service to fit price, something that has long been an unattractive feature of the institutional market; it continues in the individual market in Toronto. Since the extra commission per round lot rises steeply with share price, brokers will find it profitable to encourage individuals to trade in high-priced stocks. Probably the encouragement will take the form of a research emphasis on these stocks, precisely the opposite to the emphasis the TSE has said is needed by the economy.

The staff position paper drew some important conclusions on the profitability of brokerage and "other" activities of member firms. The TSE had said that brokerage was not sufficiently profitable and that retail firms, in particular, needed higher rates. What Potter found was that for the industry as a whole (represented by forty-four firms) brokerage was marginally unprofitable and "other business" was profitable. That is, the marginal cost of increasing brokerage revenue was greater than the revenue itself, while the marginal cost of increased other business was lower than the increased revenue. But for the nondiversified firms, those doing a primarily commission business, the opposite was true for both institutional and retail firms. This conclusion did not prove the firms were profitable, since the analysis did not incorporate fixed costs. But it showed that for these firms commission business at a sufficiently high volume was profitable.[193] It seemed quite possible that the supply of brokerage services was simply too large for the demand – that the industry was too large

191 *Id.* at 33-34.
192 *Id.*
193 *Id.* at 47-55.

to be profitable. This conclusion for the U.S. industry was suggested above.[194]

F. CONCLUSIONS AND POLICY IMPLICATIONS

A fundamental policy issue, of course, is whether commission rates are to be fixed or competitively determined. The United States experience can only lend support to competitive rates but one may argue that something can still go wrong.

Fixed rates that duplicate competitive rates – rates established in a comparable market that does allow competition – will have almost the same effect as competitive rates and are almost automatically "fair and reasonable". But since these rates cannot reflect all possible kinds and levels of services, they deny to both broker and customer the opportunity to match rates and services that exist in a free market. The new (1977) TSE rates do differentiate between low-value and high-value trades and between speculative and investment quality stocks. But even these differentiations can have perverse results. We have seen that small transactions in investment quality stocks have been made expensive for customers and therefore profitable for brokers. The fixed rates also penalize the Canadian industry relative to the U.S. industry, since firms in a competitive market can always cut rates, or "repackage" services and rates to attract business.

If the fixed rates do not duplicate competitive rates, then the regulatory commission will have to assume the powers and responsibilities of a public utility rate regulator – something neither the SEC nor the OSC has ever wanted to do. This kind of regulation calls for a set of standards, almost inevitably involving cost of capital or the "appropriate" rate of return for a brokerage firm. And this in turn calls for cost and revenue allocations that go far beyond anything that the OSC has demanded or that the TSE has provided.

It is difficult to achieve even a fixed and variable cost allocation, although the TSE studies used to do just that. But as Potter has pointed out, the real difficulties arise because of joint costs. The same expenses support both underwriting and commission business. And revenues may be joint too. Success in underwriting may call for a substantial retail operation. Together, the two activities may be profitable. Taken separately, one may appear profitable and the other unprofitable, but this is of no particular importance to the firm which undertakes both together.

We still do not have the cost studies that could demonstrate

194 In the quotation in text accompanying note 143 *supra*.

whether price-fixing is justified and if so, what the appropriate rates would be. The case for destructive competition has not been proven, although the data may exist that would prove it. The TSE suggests that with variable rates the large firms would drive out the small. Potter's analysis, on the other hand, indicates that for the large, diversified firms brokerage is marginally unprofitable, while for the smaller commission-oriented firm it is marginally profitable.

The TSE actually has and collects on a regular basis a substantial amount of cost and revenue data. It should be possible to analyze these data to establish, first, whether rates should be fixed or competitive. If they are to remain fixed, then it should be possible to monitor the industry to see that the fixed rates are kept appropriate. If they are to become competitive, it should be possible to monitor the industry to see that competition is, indeed, working.

But there are further reasons for collecting and analyzing data. So long as self-regulation is considered an important part of a regulatory scheme, the adequacy of incentives and capability for self-regulation is worth continued study. Adequacy of capital in the securities industry and access to capital beyond the resources of employees is a matter of concern at present and calls for continuing economic analysis. The extent to which foreign competition should be encouraged or discouraged, the importance of centralizing trading in a single marketplace, the choice between agency trading and principal trading, and the value of individual trading as opposed to institutional trading all involve policy choices that a regulatory commission will have to deal with sooner or later and all require economic analysis of the brokerage business.

Experience in the United States may be useful here as a guide to what to avoid, as well as to what to do. The SEC has undertaken an enormous amount of data gathering, far more than has ever been attempted in Canada where the work has been left to self-regulatory organizations whose tendency is to keep data highly confidential and who, understandably, prefer to use the data in their own best interests. However, relatively little economic analysis has emerged from the SEC and some testimony given in early 1977 suggested that the agency was completely overwhelmed by data. The moral is that without a clear idea of what is to be done with the data, its collection may be an expensive and unproductive exercise.

From the analysis that has been done it seems almost inevitable that Canadian commission rates will become competitive or substantially competitive. Just how the change is brought about may be important to the securities industry and the capital mar-

ket. The diversified firms have the least to fear because most of their business is other than commission business and this other business appears to be quite profitable. If the firms that are not diversified have a cost advantage, as Potter suggests they have, and if they believe they have this advantage, then they have every reason to continue specializing, realizing that competition may become more intense but that they are in the best position to compete.

If, on the other hand, the nondiversified firms believe they are threatened by diversified firms, they may seek diversification. To do so is not necessarily sound, since the diversification event itself – the entry into new fields – may be very expensive. Many U.S. firms seem to be caught in the same dilemma. The largest have chosen the fully diversified route and are using mergers as probably the least risky and least expensive method to achieve it. The smaller firms (the major regional firms, for example) are looking for ways to remain somewhat specialized and profitable.

Which way firms in the industry move and whether their moves are in their own best interests and the best interests of the industry and the market may depend on the signals given by regulatory commissions.

Chapter IV
Securities-Related Activities of Banks and Trust Companies

There are significant parallels between the debates in the United States – in Congress, the courts and the marketplace – over the appropriate role of banks in securities markets, and the debates taking place in Canada largely involved in the decennial revision of the Bank Act but also as a part of the whole process of regulation of securities markets. The U.S. debate is informative so far as Canada is concerned, partly because of obvious similarities between American and Canadian financial institutions and securities markets and partly because American practices frequently find their way into Canada. In addition, a fair amount of research has been done in the United States and the results can be useful for Canadian planning purposes. Further, some policies and practices that have been proposed for Canada have already been tried out in the United States, and it may be possible to draw some conclusions as to their probable effects in a Canadian setting.

Competition between the banking and brokerage industry in Canada and in the United States has so far consisted almost entirely of banks engaging in activities traditionally associated with investment banking or brokerage. But in June 1977 Merrill Lynch (in the United States) announced a plan that appeared to be

the first venture by a brokerage firm into deposit taking. Merrill Lynch would offer customers automatic investment of their cash balances in a money-market mutual fund with daily interest. At the same time customers would be able to use these balances through VISA cards and cheques on the City National Bank & Trust of Columbus, Ohio. Since the interest rate charged by Merrill Lynch on securities loans was to be lower than rates charged on usual credit card borrowing, the plan offered significant competition to bank-sponsored credit cards.

The competition between commercial banking and investment banking has also become more intense in the United Kingdom, although it is difficult to document just what has happened. The commercial banks – "clearing banks" in British terms – seem to be replacing the investment banking firms – "merchant banks" or "accepting banks" – in underwriting syndicates in both the British domestic market and the Euro-currency market.

The following discussion deals with a number of activities of banks and trust companies in the securities markets including what they do, what they are forbidden to do, what they would like to do, and what others would like them to cease doing. Canadian banks and trust companies are discussed first, followed by American banks. Since banks in the United States are permitted to conduct a trust business, while Canada has separated commercial lending from trust activities giving the first to the chartered banks and the second to the trust companies, we must compare American banks to both Canadian banks and trust companies.

In recent years commercial banks in the United States have found a number of profitable ways in which to expand their securities-related activities. Already equipped with substantial money management facilities in their trust departments, they have looked for ways in which to reach a wider clientele for these services. Their extensive data processing facilities have suggested an opportunity to serve small investors through such things as dividend reinvestment plans that are simply not available from securities firms.

Before turning to the detailed activities of the banks, it may be worth reviewing the attitudes of some of the regulatory authorities with respect to this expansion of bank activities. Jeffrey M. Bucher, a member of the Board of Governors of the Federal Reserve System, testified in December 1975 before Senator Harrison Williams' Subcommittee on Securities. He said:

> "As a general matter, the Board believes that, within limits, commercial banks in securities-related activities can play a constructive role in serving the public, strengthening competitive forces, helping to enhance

individual participation in capital markets, and insuring efficiency in the allocation of investible funds. At the same time, the need for adequate safeguards for the public and the banks must be given appropriate attention. Each securities-related activity will tend to raise issues of its own, but an overview of the nature of the benefits and risks of the services will help provide a perspective of the Board's position on bank involvement in new service areas."[195]

Bucher described a number of public benefits from the offering of securities-related services by banks. First, banks are already offering a number of services not readily available elsewhere, such as automatic investment plans and dividend reinvestment plans, beneficial chiefly to small investors and generally not available from brokerage firms because of the high cost. The banks through their data processing facilities are able to achieve substantial economies in handling these transactions. Bank services have also drawn new investors into the equity markets which should be helpful in providing necessary equity financing to industry. (Charles W. Buek, president of U.S. Trust Co., also appeared before the subcommittee and stressed the importance of bank data processing equipment in making services available.)[196]

Bucher identified three risks related to bank participation in securities-related activities. The principal one involves the potential for conflicts of interest, but he suggested that bank examiners should be able to take care of this. A second is the potential exposure of bank capital, something that will inevitably accompany any extension of securities underwriting by banks. A third risk concerns the possible concentration of securities activities in banks and ultimate reduction of competition. Bucher was doubtful that this risk posed a real danger.

Specifically, he said the board believed that dividend reinvestment services and automatic investment services are appropriate activities for commercial banks. The board also believes that the potential benefits of investment advisory services outweigh foreseeable risks. However, he commented that the board had not yet reached a judgment as to whether to recommend amendment of the Glass-Steagall Act to permit commingled managed agency accounts, an activity now forbidden to commercial banks by a Supreme Court interpretation of the act.[197] The board is also

197 Discussed in the text accompanying note 318, *infra*.

apparently satisfied to have banks or affiliates of bank holding companies serve as advisers to real estate investment trusts and closed-end investment companies. Bucher noted that the board has since 1967 supported a change in legislation to permit commercial banks to underwrite municipal revenue bonds. But he said that the board would not reaffirm its position on this subject until it had reviewed recent developments in the municipal securities markets.

Edwin H. Yeo, testifying before the same committee on behalf of the Department of the Treasury, expressed a general approval from the Treasury for the securities activities of commercial banks.[198] He said that appropriate legislation and supervision by bank authorities should take care of conflicts of interest in money management, and he concluded that agency and brokerage-oriented services would benefit investors and capital markets by providing convenient, low-cost services to investors and encouraging greater participation by small individual investors in securities markets. He did, however, express some concern about the possibility of concentration of investment in a few favoured stocks.

Roderick M. Hills, then chairman of the Securities and Exchange Commission, restated the advantages and risks that had already been discussed by the previous two witnesses[199] and suggested a further risk, that banks might be able to tie securities services to banking services, something that competing securities firms would be unable to do. By and large, Hills did not support or oppose the securities-related activities of commercial banks; he indicated that the SEC was studying their potential.

James E. Smith, Comptroller of the Currency, also testified before the Senate committee. He not only was enthusiastic about the present securities-related activities of commercial banks but supported two specific changes in legislation, to permit banks to offer commingled agency accounts and to permit them to underwrite revenue bonds.[200]

As one might perhaps expect, the bank regulators are generally enthusiastic about expansion of banks into profitable activi-

199 *Id.* at 88-168.

200 *Id.* at 168. According to the Investment Company Institute, the growth of bank securities and money management activities has been particularly rapid since Congress transferred regulation of fiduciary activities of national banks from the Federal Reserve Board to the Comptroller of the Currency in 1962; *id.* at 307. *See also Financial Institutions and the Nation's Economy (FINE) "Discussion Principles": Hearings before the Subcomm. on Financial Institutions Supervision, Regulation and Insurance of the House Comm. on Banking, Currency and Housing,* 94th Cong., 1st and 2d Sess., pt. 3, at 2436-38 (December 1975 and January 1976).

ties, while the SEC is concerned about the survival of the securities industry.

A. TRUST ACTIVITIES

1. *Canada*

There is a strong tradition in Canada against permitting any single institution to offer trustee services and simultaneously engage in commercial lending. The chartered banks engage in commercial lending but are not permitted to operate trust departments. The trust companies are not permitted to engage in commercial lending, although the chartered banks have complained that some trust company commercial lending is going on.[201] The reason for the separation of activities is essentially the threat of a potential conflict of interest between an institution that on the one hand is lending money to a business and on the other hand is in a position to invest funds in that business. Commercial loans might be made to unsound corporations to support the market for their securities or trust assets might be invested so as to protect the loans. The 1976 federal government *White Paper*,[202] the banks and trust companies, and the Economic Council of Canada[203] have all endorsed the principle and recommended continued separation of the two functions. The president of one trust company, however, has suggested that the conflict problem could be resolved and trust companies allowed to enter banking.[204]

There is little information available on the details of trust activities within the trust companies. The Economic Council of Canada commented that "few statistical data are available on the fiduciary operations of trust companies".[205] The report of the Registrar of Loan and Trust Corporations for the province of Ontario shows that the thirty-eight reporting trust companies were administering a little over $32 billion in assets at the end of 1975.[206] And a breakdown of this total by cash, bonds, stocks, mortgages, guaranteed fund deposits, and real estate is available

for the aggregate of the thirty-eight companies and for each of them. No information is available, however, on specific holdings in trust accounts and it is not possible to draw any conclusions on the extent of control or potential control over Canadian industry. This lack of information has been of great concern in the United States, as we shall see, and has led to quite detailed reporting requirements in recent years. W. Grover and J. Baillie, in their paper in this volume, suggest that similar requirements may be appropriate in Canada.[207]

In the course of submissions to the Ontario Securities Commission in 1976 on the subject of fixed commission rates much was made of the concentration of stock ownership in the trust holdings of a few trust companies. This subject is discussed in chapter V.[208] It appears that the percentage of common stocks owned through trust companies in Canada is not very different from the percentage owned by commercial bank trust departments in the United States. Trust ownership in the United States, however, is spread over something like 1,500 commercial banks with one or two hundred holding a substantial portion of the total assets. In Canada the ownership is spread over fewer than fifty trust companies with a half-dozen managing about 90% of total trust assets.

Trust companies are exempt from registration as investment advisers in Ontario,[209] and the exemption would continue in the new legislation contained in Ontario Bill 30,[210] although Bill 30 would require a trust company to register as a management company in order to manage a mutual fund for compensation under a contract.[211]

Trust companies are "exempt" purchasers of securities, and the issuer of securities sold exclusively to exempt purchasers need not register under the Ontario Securities Act and no prospectus is required. Furthermore, trust companies are "exempt" purchasers even when purchasing on behalf of trust accounts.[212] The implication of this specific statutory provision is that other financial institutions do not qualify a purchase as exempt when they are buying for a managed account, and Grover and Baillie suggest that other institutions should have the same opportunity. [213] The

207 *Grover & Baillie* at n. 318.

208 In text accompanying note 460 and following.

209 Ontario Securities Act, s. 18(a). In any case, the definition of "advising" probably does not cover the management of trust accounts. The other provinces grant the same exemption.

210 Ontario Bill 30, s. 33(a).

211 Ontario Bill 30, s. 24(I)(e).

212 Ontario Securities Act, s. 58(1a) says that a trust company is "deemed to be acting as principal when it trades as trustee for accounts fully managed by it".

213 *Grover & Baillie*, text following n. 362.

trust companies may have an advantage over investment counsel under the Ontario Act, since a substantial amount of new issue financing is done by way of the exempt purchaser route. (A second advantage, so long as broker commission rates are fixed, lies in the ability of trust companies but not investment counsel to pool purchases for several accounts in order to take advantage of reduced commission rates.)[214] Professor L. Loss, in his notes to the American Law Institute's draft Federal Securities Code, says of an exemption for purchases by "institutional investors":

> "It is implicit...that banks and insurance companies are institutional investors whether buying for their own accounts or for accounts under their investment managements. This would have been made explicit, except that it might have created a negative implication with respect to the clients of certain investment advisers. Obviously it would not be realistic to treat all clients of all investment advisers as institutional investors...it is contemplated that rules...will make appropriate distinctions among investment advisers, and will not discriminate, so far as clients are concerned, between banks and insurance companies on the one hand and those investment advisers that deserve similar treatment on the other hand."[215]

Ontario Bill 30 does not alter the exemption for purchases by trust companies on behalf of trust accounts[216] but it does alter the ability of a trust company to dispose of securities acquired in an exempt purchase. Under the present Ontario Securities Act, no formalities accompany such a resale (although the trust company must have purchased the securities originally "for investment only and not with a view to resale or distribution" which implies some restraints on turnover), because a prospectus is required only for a "distribution to the public",[217] and distribution to the public is defined to include sales by controlling shareholders and sales to the public of securities "not previously distributed to the public".[218] The Ontario Securities Commission has taken the position that securities acquired by an institution in an exempt purchase have been distributed to the public (the institution being part of the "public") and therefore the trust company (unless it happens to be a controlling shareholder or could be considered to be an underwriter) is free to resell without a prospectus.[219]

214 Commission rates are discussed in ch. III *supra*.

215 ALI Federal Securities Code, Tent. Draft No. 1, at 29-30.

216 Ontario Bill 30, s. 73(2).

217 Ontario Securities Act, s. 35.

218 *Id.* s. 1(1)6b.

219 *Grover & Baillie* at n. 288. Baillie has argued that this interpretation is wrong.

But Bill 30 puts some limits on resales. The issuer of the securities will have to be a "reporting issuer", the trust company will have to have held the securities for six, twelve, or eighteen months depending on whether they are legal for life insurance companies or listed stocks, and a report must be filed with the commission.[220] This limitation may introduce some difficulty in terms of a tradeoff between the opportunities for trust accounts in exempt purchases and the "lock-in" or expense of a prospectus on resale.

Grover and Baillie point out the "all or nothing" resale provisions of Bill 30 mean that the trust company may sell its entire holding free of a prospectus if it meets the conditions described above but not one share if it does not. They recommend the same "trading transaction exemption" they would give issuers for a small volume of resales with the full prospectus requirement for large sales.[221] But a trust company, having decided that an issue is no longer appropriate for some accounts, may well decide it is inappropriate for any, and want to sell out completely. And there may be unfair treatment of accounts vis-à-vis one another at the time of sale, if only a small portion of total holdings may be sold. The Bill 30 proposal is somewhat similar to proposals in the United States for limitations on sales by institutions, and raises some of the same objections.[222]

2. *United States*

The Comptroller of the Currency reported to Senator Lee Metcalf's subcommittee in 1974 that of the 4,600 national banks in the country, 1,900 were authorized to exercise trust powers and 1,600 actually exercised them. There are at least 300 commercial bank trust departments managing assets of $100 million or more.[223] In 1975 United States commercial banks managed approximately $400 billion in trust assets,[224] 41% of them in employee trust and agency accounts.[225]

225 SEC, FINAL REPORT ON BANK TRUST ACTIVITIES 125 (July 1977).

As already noted, Canada has taken the position that there is an inherent conflict of interest if one financial institution carries on both a commercial lending and a trust business. There is an awareness of this conflict in the United States and there has been a good deal of testimony on the subject before congressional committees in recent years.

The *Hunt Commission Report,* in dealing with bank trust departments, recommended that there be a "wall" between the commercial banking and trust departments of banks with trust assets over $200 million, that brokerage commissions not be used to attract deposit or loan business, that inside information not be used in the trust department, and that banks establish procedures to review the uninvested cash in trust accounts.[226] The Comptroller of the Currency has been sufficiently sensitive to the issue to insist that the commercial banks set up some sort of system to ensure that commercial lending departments do not communicate with trust departments and the result has been what some bankers call a "Chinese wall" between commercial lending and trust activities, and the comptroller has proposed explicit regulations to prohibit the use of inside information in making investment decisions for trust accounts.

There are those who are not satisfied by the comptroller's action or by the apparent responses of the banks, and who argue that commercial lending and trust activities should be separated as they are in Canada.[227] But there does not seem to be very much support for this position and there certainly seems to be no disposition on the part of Congress to dismember commercial banks, although there are proposals before Congress to give trust powers to other institutions.

An interesting discussion of conflicts in trust departments appears in the record of congressional hearings on financial institutions in December 1975. Professor Edward S. Herman, who had prepared a study on the subject for the Twentieth Century Fund, observed that abuse of inside information is not the principal difficulty and indeed in their efforts not to use inside information trust departments may be failing to use public information and therefore failing to do their best for trust accounts. (Apparently

226 REPORT OF THE PRESIDENT'S COMMISSION ON FINANCIAL STRUCTURE AND REGULATION (December 1971) [hereinafter HUNT COMMISSION REPORT].

227 A former member of the Federal Reserve Board has suggested that some banks might find it advantageous to separate the two activities into two institutions; *Securities Activities of Commercial Banks: Hearings before Subcomm. on Securities, supra* note 195, at 9.

sales of Penn Central stock as the company was failing were unfortunately inhibited.)[228] The more important conflicts involve the use of trust cash balances and unequal treatment of trust accounts. Herman also argued that bank regulatory authorities were much more concerned with depositor protection than with the protection of trust clients.[229]

It is interesting that some congressional committees in asking bank trust departments about commercial lending to companies whose stocks are held in trust accounts have perhaps unintentionally brought about breaches in the "wall". Indeed, some bank trust departments declined to respond to a congressional questionnaire for just this reason.[230] At the same time, it is hard to understand how a bank trust department could do a thorough security analysis of a company and not discover that the bank's commercial department was a major lender to the company. Some trust departments simply steer clear of companies for which their bank is a major lender, and some simply avoid stock interests in any but the soundest companies.

Another area of conflict has to do with the use of brokerage commissions, paid ultimately by the beneficiaries of trusts, to purchase services that may be of considerable benefit to the bank trust department. Until brokerage commission rates became competitive on May 1, 1975, the issue was somewhat academic. Bank trust departments were generally unable to obtain executions for less than the fixed minimum commissions (although there were some opportunities to do so in the so-called "third market"), so that

228 It would be interesting to know what bank trust departments were doing with New York City bonds in 1974 and 1975. One report suggests the banks were selling the bonds out of *their own* portfolios on the basis of inside information; *see* NEW YORK STATE ASSEMBLY OFFICE OF LEGISLATIVE OVERSIGHT, THE BANK AND THE MUNICIPAL CRISIS: PUBLIC RESPONSIBILITY AND PRIVATE PROFIT (November 15, 1976). The SEC confirmed this suggestion in August 1977, but at least one bank claimed the SEC was wrong; *see* SUBCOMM. ON ECONOMIC STABILIZATION OF THE HOUSE COMM. ON BANKING, FINANCE AND URBAN AFFAIRS, 95TH CONG., 1ST SESS., SEC STAFF REPORT ON TRANSACTIONS IN SECURITIES OF THE CITY OF NEW YORK (Comm. Print 1977); and *see e.g.* Morgan Guaranty Trust Co., *Morgan Guaranty Trust Reports on "Transactions in Securities of the City of New York"*, The Wall Street Journal, September 12, 1977, at 9, col. 1 (advertisement).

229 *Financial Institutions, Hearings before Subcomm. on Financial Institutions, supra* note 200, pt. 1, at 329-35 (December 1975). *And see* E. HERMAN, CONFLICTS OF INTEREST: COMMERCIAL BANK TRUST DEPARTMENTS (the Twentieth Century Fund 1975).

230 SUBCOMM. ON FINANCIAL MARKETS, SENATE COMM. ON FINANCE, 94TH CONG., 2D SESS., BANK TRUST STOCK HOLDINGS: RESPONSES TO FINANCIAL MARKETS SUBCOMMITTEE QUESTIONNAIRE (June 1976). It was reported in 1975 that most banks prohibit disclosure of broker deposits to trust departments or traders, so that choice of broker cannot be a function of deposits. *See* STANFORD RESEARCH INSTITUTE FOR THE TRUSTEES OF THE BANKING RESEARCH FUND, ASSOCIATION OF RESERVE BANKERS, THE TRUST ACTIVITIES OF THE BANKING INDUSTRY 11, 50 (1975).

if commissions purchased not only the executions required by the trust accounts but also research services that were of value to the trust department itself, the beneficiaries could hardly complain. But with the unfixing of commission rates it is not quite so clear that bank trust departments are entitled to use commissions paid by the trusts to purchase research services. Congress anticipated the problem, and included in the Securities Reform Act of 1975 a new section 28(e) of the Securities Exchange Act of 1934, which provides:

> "No person...in the exercise of investment discretion with respect to an account shall be deemed to have acted unlawfully or to have breached a fiduciary duty under State or Federal Law unless expressly provided to the contrary by a law...solely by reason of his having caused the account to pay a member of an exchange, broker, or dealer an amount of commission for effecting a securities transaction in excess of the amount of commission another member of an exchange, broker, or dealer would have charged for effecting that transaction, if such person determined in good faith that such amount of commission was reasonable in relation to the value of the brokerage and research services provided...viewed in terms of either that particular transaction or his over-all responsibilities with respect to the accounts as to which he exercises investment discretion."

This section authorizes what is known as "paying up", that is, paying more than the minimum going rate for transaction services alone, in order to obtain further services, generally research services. The conflict of interest issue arises because the bank trust department already has an obligation to provide management for trust accounts and the research necessary for this management might well be regarded as the responsibility of the trust department paid for by trust department fees charged to the individual trust accounts.

Section 28(e) has been subject to a good deal of criticism. The Securities and Exchange Commission has warned that the section does not authorize "paying up" for services that are generally available for public purchase.[231] And the commission has promulgated proposed regulations calling for the disclosure of broker selection policies and the use of commissions to purchase re-

231 *See* Commissioner J.R. Evans address before the *National Trust Conference, American Bankers Association* (February 7, 1977) ("An SEC Perspective on Bank Trust Departments"). On this topic *see also, Connelly.*

search.[232] Since the SEC does not have jurisdiction over bank trust departments, however, the proposed regulations would not apply to them. The position is that account beneficiaries should know what benefits, if any, they are receiving in addition to executions for the brokerage commissions their accounts are being charged.

Apart from the conflict issue, the chief concern in the United States has been with possibly excessive concentration of corporate control in bank trust departments. The Hunt Commission recommended that banks publish annual reports showing the twenty largest stock holdings, excluding any holdings worth less than $10 million and not constituting 1% of outstanding voting shares of the issuer, reporting holdings that constitute 5% or more of an outstanding registered voting stock issue, dollar values with respect to listed holdings broken down by sole, shared and no voting responsibility, interlocking directors, officers or senior employees and cases in which the bank voted against management or against a management recommendation.[233]

There has been considerable concern in recent years in Congress about the need for fuller disclosure of the ownership and particularly voting power in U.S. corporations. Senator Metcalf, whose subcommittee held extensive hearings on the subject in 1974,[234] has stressed a special need to know who owns and controls regulated corporations. And he has spoken of the dangers of foreign influence on major American corporations including defence contractors. Finally, he has talked of the dangers of economic concentration through institutional control of corporations and industries.

A representative of a large New York bank testifying before Senator Metcalf's subcommittee in 1974 suggested that the disclosure form used by federal agencies in the United States could be substantially improved and that nominees and corporations could be required to provide more useful information.[235] He suggested that ownership reporting would be improved if nominees were required to make it easy for an issuer to identify multiple nominees of a single institutional investor and that corporations in their own reporting should be required to aggregate and treat as one all the various nominee holdings of a single institution. All of this pertains to ownership but not necessarily to voting power. The wit-

232 SEC, Securities Exchange Act of 1934 Release No. 13024, November 30, 1976, [1976-1977 Transfer Binder] CCH FED. SEC. L. REP. ¶ 80,815.

ness suggested that separate disclosure of voting power could be required but that some standard definitions would be needed to account for different kinds of voting power possessed by institutions.

Professor David L. Ratner, another witness before Senator Metcalf's subcommittee, stressed the need to have information available in consistent form in a single place.[236] Many kinds of corporations, particularly regulated corporations, already report significant holdings of their shares. But apart from the use of nominees, which makes much of this reporting useless, the fact that they report to different agencies on different forms makes it difficult to pull together ownership patterns. And from the institutional investors' side, bank trust departments did not report anything.

In general, there seemed to be no reporting at all that would indicate the concentration of ownership of *debt* securities in financial institutions. The subcommittee itself had solicited information from twenty-five institutions with assets of $5 billion or more. The Interstate Commerce Commission produced some figures showing that about 25% of the composite debt of the fifteen largest railroads in the United States was held by banks in 1973.[237] The chairman of the Federal Power Commission expressed his regret to the committee that he could not tabulate by lender the major debt holdings in electric utilities and natural gas pipeline companies,[238] and he conceded that bond holders may have a significant influence over management.

A representative of the General Accounting Office reported that his office was reviewing the gathering of information by federal regulatory agencies and had proposed regulations for uniform and more useful data.[239]

The chairman of the Federal Trade Commission testified on a study by the commission's Bureau of Competition of the financial relationship between institutions, particularly banks, and energy corporations.[240] The concern was that the interlock between the institutions and the corporations might lead to an indirect interlock between corporations competing in the energy industry.

A.A. Sommer, a commissioner of the Securities and Exchange Commission, testified on the impact of institutional trading on the securities market.[241] He referred to the proposals of Senator Lloyd

Bentsen that would restrict the holdings of some institutions,[242] but these comments were incidental to his discussion of the issue that concerned the committee, concentration of ownership and voting power. Sommer discussed the disclosure of ownership that is required by the SEC and the problems the commission had encountered in trying to discover ownership behind nominee names.

The Comptroller of the Currency had recently required for national bank common trust funds and for pooled funds annual reporting of portfolio assets, including identification of equities by issue. Proposed regulations would require annual reporting for trust departments administering assets in excess of $100 million on all trust assets, including identification of equity issuers for all holdings in excess of 10,000 shares. The 10,000-share cutoff corresponds to approximately $500,000 on average. The regulations were still being commented on in August 1974. He reported that the same proposed regulations included provisions requiring all national banks operating trust departments to establish policy procedures designed to assure that trust department investments do not utilize nonpublic financial information.[243]

In anticipation of the hearings data were gathered by the staff of Senator Metcalf's subcommittee on some trust department holdings of large banks.[244] For example, as of 1972 the Chase Manhattan Bank held 2% or more of the stock of forty-six of eighty-nine corporations that had furnished data to the committee. Morgan Guaranty Trust and First National City Bank held 2% or more of the stock in twenty-nine and twenty-eight of the corporations, while Bankers Trust held 2% or more in twenty-one corporations. Holdings in certain industries were more concentrated. The Chase Manhattan Bank trust department held between 9% and 6.9% of the stock in each of four airlines and between 8.3% and 5.3% of the stock in each of six railroads. The combined holdings of several banks were quite substantial. The trust departments of six banks plus one brokerage firm and the New York Stock Exchange Clearing Corporation together held 20% or more of the stock of a number of corporations.

These statistics reflected ownership rather than voting power. It was impossible to translate them into voting power

242 *See, Stockholders Investment Act of 1974: Hearings on S. 2787 and S. 2842 before Subcomm. on Financial Markets of the Senate Comm. on Finance*, 93d Cong., 2d Sess. (February 5 and 6, 1974).

because the right of a bank trust department to vote shares held by it varied among trust accounts and the right of the stock clearing corporation and of a brokerage to vote shares depends upon client arrangements. For certain industries, including broadcasting corporations, details on voting power held by institutional investors were available because they are collected by the Federal Communications Commission. As of 1972 the ownership of broadcasting companies by the trust departments of large New York City banks ran as high as 14%; eleven banks combined had 38% of the voting rights in Columbia Broadcasting System, Inc. and eight banks held in the aggregate 34% of the voting rights in American Broadcasting Companies Inc.[245]

Some of these statistics apparently gave rise to alarm but none of the testimony demonstrated that harm had actually been done through institutional ownership or voting power. There simply seemed to be a rather vague fear of what trust departments might do.

Fresh statistics on stock holdings of institutions were reported to Senator Metcalf's subcommittee in the spring of 1976.[246] The first part of the report was prepared by Professor Robert M. Soldofsky and was largely based on stock holdings as of the end of 1974 reported by national banks to the Comptroller of the Currency. The comptroller had initiated this reporting as of December 31, 1974,[247] and required classification of all holdings according to whether the bank held full voting rights, partial voting rights or no voting rights. Soldofsky made use of commercially published data on investment company and insurance company stock holdings but was unable to obtain information on pension fund holdings. His report covered common stock holdings by bank trust departments, investment companies, and insurance companies in 146 corporations. For 1974 the New York Stock Exchange estimated institutional holdings in the aggregate at 33% of the value of all listed stocks. For the 146 corporations there was more than 40% institutional ownership in eight cases and 30%

to 40% ownership in twenty-seven cases.[248] Where institutional ownership was high, regulated investment companies generally accounted for at least 50% of this ownership.[249] Bank trust departments held up to 25% of the voting power of a few corporations.[250]

The second part of the report to Senator Metcalf's subcommittee was prepared by the Library of Congress and was based on a survey of sixty-six banks, including custodial, corporate trust and corporate agency accounts. Holdings reported were as of the end of 1974. The banks were those that reported trust assets in excess of $1 billion as of the end of 1973. The chief finding of the report was the great difficulty banks had in responding to requests for specific information. Data were compiled, however, for holdings in trust accounts, custodial accounts, and corporate trust and agency accounts classified by voting rights and some analysis was offered.[251]

One outcome of the hearings in 1974 was a significant change in public reporting requirements. The Securities Reform Act of 1975 added section 13(f) to the Securities Exchange Act of 1934. This new subsection requires reporting by all institutional investment managers (including bank trust departments) exercising discretion over accounts holding stocks aggregating more than $100 million. The SEC is authorized to reduce this value cutoff to as little as $10 million. The SEC may also establish the reporting period which may not be less than one quarter or more than one year. The report must show for each listed stock held at the end of the reporting period the name of the issuer, the class of the stock, the CUSIP identification number, the number of shares held and the aggregate fair market value. The SEC is authorized to require a separate listing of the number of shares held with respect to which the manager possesses sole or shared voting authority, the aggregate purchases and aggregate sales during the reporting period of each security, and rather more substantial disclosure for any transaction or series of transactions having a market value of $500,000 or a lower cutoff value established by the SEC. The SEC estimated that this reporting requirement will apply to about 300 institutions holding approximately 75% of all institutional equity securities.[252]

When the reporting requirement was first proposed in 1974,

the Treasury Department strongly opposed the reporting of institutional transactions. The general counsel to the Treasury said that such reporting would introduce unfairness by placing at a disadvantage investors who use institutions to manage their funds. The Treasury also saw as one purpose for the disclosure the provision of information to the SEC so that the commission could decide whether there should be statutory restrictions on institutional trading. The Treasury Department said it "firmly believes that regulation of institutional trading is unnecessary and also contrary to the public interest". Serious proposals had been made to restrict both the extent of institutional ownership of securities and institutional trading in them.[253]

Despite enthusiasm for disclosure from almost every part of the securities and investment industry and of course from the SEC and Congress, few sensible suggestions were offered as to just how the information might be used. Proposals that trust department clients would be better able to judge which bank to go to were quickly discarded as implausible. There was, however, general agreement that investor "confidence" would be enhanced by the disclosure.

The chairman of the SEC said that he saw two chief reasons for continued study and analysis based on a good flow of data from institutional investors. One was simply the need for a continuous review of securities markets and the second was the need for verifying or disproving claims that institutions are interfering with the proper operation of the markets. He described the kinds of studies that could be made if the disclosure statute were enacted. One category would deal with effects of institutional holdings and trading and would include parallel trading of institutions and related price effects, block trading and market liquidity, competition in the brokerage community, and so on. The second general category would have to do with performance of different investment managers.[254]

Enthusiasm for disclosure was not unanimous. The comments of Dean Miller, Deputy Comptroller of the Currency for Trusts, are interesting:

"I think it should be recognized that the only way we are

going to get this man of modest means into the stock market is through the device of the no-load mutual fund – that and indirectly through his pension fund.

"Our governmental concern should be toward the effectuation of a system which permits as many as possible choices of such funds to him, including some administered by banks. He is not going to invest directly in the stock market more if he knows that there is a massive bin somewhere in this country containing detailed minutia of the investments and transactions of everybody who has more money than he.

"To be more specific, increased disclosure of bank trust department holdings is going to be of no benefit at all to him. Neither will the implementation of a few more government agencies and a few additional cost burdens upon banks. They will only redound to his detriment."[255]

As of late 1977, at least one congressional subcommittee was impatient not only with the SEC's slowness in implementing the data collection but also with the lack of progress in deciding what to do with it.[256]

Grover and Baillie, who suggest that section 13(f) disclosure might be appropriate in Canada, offer a number of purposes to be served. Probably the best is "to reinforce the public acceptability of existing societal institutions by providing the information to refute charges of unacceptable behaviour".[257] One might add that the data disclosed may require substantial analysis – such as correlating institutional sales and holdings with market behaviour – to establish the refutation.

Banks in the United States, as in Canada, are generally subject to banking laws and not to securities legislation even with respect to securities-related activities. Trust activities of banks are generally exempt from federal securities laws but regulation 9 of the Comptroller of the Currency provides for licensing of trust departments of national banks and deals with bonding, fiduciary records, audits, restrictions on holding trust assets uninvested, prohibitions on self-dealing activities, segregation of assets and public disclosure of trust assets. Regulation 9 permits "crossing" orders for both agency and trust accounts, and requires that the

trade be "fair to both accounts".[258] Banks may be found liable under Rule 10b-5 of the Securities Exchange Act of 1934 for misuse of inside information in managing portfolios.[259]

The securities industry says record-keeping and audit requirements under the federal securities laws are stricter.[260] And the SEC says regulation 9 is not as comprehensive or protective of investors as the Investment Company Act.[261] The banks are rather defensive about this. Citibank inaugurated its Investment Management Group annual report in 1970 as a device to insure public disclosure of trust activities. A review by Arthur Young and Company of the bank's policies and procedures was published in the 1975 hearings before Senator Williams' Subcommittee on Securities and dealt with commissions, executions, use of "inside" information, uninvested cash, voting of proxies, allocation of purchases and sales among trust accounts and independence of trust and lending activities.[262] BankAmerica Corporation, the holding company for the Bank of America, the largest U.S. commercial bank, published a voluntary disclosure code in 1976.[263]

The SEC has said that trading personnel in bank trust departments are often ignorant of federal securities laws and that this ignorance leads to recurring violations.[264]

B. BANK UNDERWRITING OF SECURITIES

1. *Canada*

Canadian chartered banks are permitted to "deal in" securities and they have traditionally engaged in some aspects of underwriting. The Bank Act prohibits the naming of a chartered bank in a prospectus for corporate securities[265] perhaps because of a potential conflict of interest between the bank's possible position as a lender to the corporation and its promotion of the corporation's securities or perhaps just because of a fear that *any* reference to a bank inspires too much confidence. A few banks have partici-

pated in corporate underwriting banking groups but most banks participating in new issues of corporate securities have acted as agents, only taking orders for the securities. At the same time chartered banks have traditionally participated in the underwriting of new issues of the Government of Canada, provinces, municipalities and some international agencies.

The underwriting function seems to have originated in bank loans to finance investment-dealer underwriting with banks subsequently becoming regular participants in underwritings for all provinces, some municipalities and some corporations. Underwriting in Canada still reflects long-standing relationships among issuers and members of an underwriting group, including bank members, and the investment dealers are somewhat ambivalent about the banks' role. On the one hand, a traditional relationship with an issuer may be strengthened by the presence of a bank in the group. In the case of a municipal issuer, for example, the traditional willingness of the bank to take up the short maturities helps to reduce risk in the underwriting. On the other hand, there is a real fear of the bank as a true competitor rather than an ally and the dealers would be most comfortable with the status quo – no expansion of bank underwriting. The "official" view of the Investment Dealers Association, however, is opposed to the banks underwriting any but Canadian government issues.

It seems probable that the banks have a cost advantage over the investment dealers and brokers in distributing new issues of securities to individuals and quite likely to institutions as well, and probably the capital markets would be best served by allowing them to exploit that advantage. But the securities industry argues that the result would be to squeeze out the brokers and dealers, to lessen competition and in the end to reduce the efficiency of the market. It also argues that banks do not offer sufficient protection and expertise to customers who presumably do not recognize this deficiency or if they do, do not care about it.

The government *White Paper on the Revision of Canadian Banking Legislation* proposed that banks could be named in corporate prospectuses, but would not be permitted to participate in the underwriting of corporate issues.[266] Nor would they be permitted to participate as agents in the arrangement of private placements. The potential conflict of interest referred to above was given as the reason for both of the new rules. However, banks would be explicitly authorized to participate in selling groups for new issues and would be allowed to advertise their participation. The *White*

266 White Paper on the Revision of Canadian Banking Legislation, *supra* note 202, at 34-35.

Paper concluded that these rules would adequately protect investment dealers from the competition of chartered banks but would also give purchasers of corporate securities access to new issues through chartered banks without their having to pay a commission on top of the offering price. The reaction of the securities industry has been enthusiasm for the prohibition on corporate underwriting but protests over the permitted selling group activities.[267]

The *White Paper* proposals would continue chartered bank underwriting of government issues, including issues of provinces, municipalities and some international agencies. The securities industry has urged a ban on provincial and municipal underwriting by chartered banks.[268]

In its report on the government's proposals, the Senate Banking, Trade and Commerce Committee approved putting specific provisions in the act to define permitted securities activities of the chartered banks. But it did not clearly state its preferences for which activities should be permitted and which prohibited. It merely suggested that banks should not be permitted to underwrite corporate securities or to act as agents for private placements and that banks should be allowed to underwrite federal, provincial, municipal, and international agency securities and to distribute corporate securities as members of a selling group.[269]

Until 1966 the Ontario Securities Act (and the acts of six other provinces) provided an exemption from prospectus requirements for securities issues underwritten by banks. In 1966 Ontario eliminated this exemption and a number of provinces have followed.[270] But Grover and Baillie suggest that some financial institutions at least have in effect underwritten public distributions by purchasing by way of an "isolated purchaser" exemption and then reselling to the public so that no prospectus was ever filed.[271]

Although a bank underwriting cannot confer an exemption on an issue not otherwise exempt, the bank itself need not register as an underwriter under the Ontario Securities Act.[272] A member of a selling group (as opposed to a banking group) does not seem to

267 Joint Committee of the Canadian Securities Industry, Memorandum on the Securities-Related Aspects of the White Paper on Canadian Banking Legislation, at 13-15 (October 14, 1976). be an "underwriter" within the meaning of the act[273] but in any case banks and trust companies are not required to register to trade in securities generally.[274] Ontario Bill 30 would narrow the underwriter exemption for banks. "Underwriters" seem to include selling group members, and banks would be exempt from registration only with respect to issues of government or municipal bonds, securities guaranteed by a bank, loan or trust company or insurance company, or securities issued by a trust company pooled fund or common trust fund.[275]

2. *United States*

Section 16 of the Glass-Steagall Act of 1933 prohibits commercial banks in the United States from underwriting securities, except for obligations of the United States and general obligations of any state or political subdivision.[276] This prohibition reflected a very strong policy decision to separate commercial from investment banking. But the exception for general obligation state and municipal bonds is quite important, and there is a substantial amount of bank underwriting of these bonds. What has been of great interest in recent years is the question of whether commercial banks should be permitted to underwrite municipal revenue bonds, which are not backed by the full faith and credit of a state or municipality.

For a variety of reasons, sometimes having to do with general obligation debt limits and sometimes having to do with the tax advantages of municipal bonds, there has been a substantial increase in recent years in the issue of municipal revenue bonds. Representatives of the banking industry have urged that banks should be permitted to underwrite these bonds. And indeed, there are some exceptions in the Glass-Steagall Act to permit bank

276 Banking Act of 1933, 12 U.S.C. s. 24 (1970). The act does not apply to foreign activities of United States banks, however, and underwriting in the Eurobond market is substantial for some United States banks (as it is for some Canadian banks). The act defines the powers of national (federally incorporated) banks. A number of the largest United States banks are state chartered and not directly subject to the act. But almost all of these are subsidiaries of bank holding companies which in turn are subject to the federal Bank Holding Company Act of 1956. The Federal Reserve Board has interpreted this act as imposing on subsidiary banks the limitations of the Glass-Steagall Act; *see* 12 C.F.R. s. 225.125(b)(1977).

The Securities Industry Association would like Congress to restrict the securities activities in the United States of organizations affiliated with foreign banks, just as it would like the activities of United States banks curtailed. *See* Securities

underwriting of public housing authority bonds and obligations issued by a state or municipality for housing, university or dormitory purposes which are at the same time eligible for purchase by a national bank for its own account. At one time the Comptroller of the Currency classified a number of bond issues that had been regarded as revenue bonds as eligible for bank underwriting. But this classification was later reversed.[277]

Representatives of the investment banking industry are of course bitterly opposed to the underwriting of revenue bonds by commercial banks.[278] There is some evidence, based upon careful research, that the participation of commercial banks in the underwriting of general obligation state and municipal bonds, and the exclusion of the banks from the underwriting of general revenue bonds, has reduced the cost to issuers of the general obligation bonds relative to the revenue bonds. In other words, the increased competition in underwriting general obligation bonds because commercial banks as well as investment bankers are eligible has benefitted issuing states and municipalities and these benefits are not present for revenue bonds.

In a 1971 article[279] Reuben Kessel analyzed spreads and reoffering yields for tax exempt general obligation bonds, revenue bonds, and so-called Saxon general obligation bonds (bonds that were reclassified from revenue to general obligations by Saxon when he was Comptroller of the Currency). The overall conclusion was that the prohibition of bank competition in the underwriting of revenue bonds has led to fewer bids for these bonds and higher underwriting costs. The revenue bonds that were of high quality, short maturity, and offered when business conditions were poor (all conditions that favour bank participation) were particularly disadvantaged.

An increased number of bids had two effects, both a higher reoffering price and a lower spread. The saving due to bank

278 *See e.g. Securities Activities of Commercial Banks: Hearings before Subcomm. on Securities*, *supra* note 195, at 268. The Investment Company institute supports this position, too; *id.* at 323-34. Further arguments can be found in *Financial Institutions: Hearings before Subcomm. on Financial Institutions*, *supra* note 200, pt. 3, at 2010-14, 2050, 2068-73 (December 1975-January 1976); *id.* pt. 4, 222-27, 585-87 (1976) (apps. A, B). Underwriting by affiliates of foreign banks was objected to (and statistics were cited) by New York Stock Exchange representatives in *The Financial Reform Act of 1976: Hearings before Subcomm. on Financial Institutions Supervision, Regulation and Insurance of the House Comm. on Banking, Currency and Housing*, 94th Cong., 2d Sess., pt. 2, at 671-74 (March 1976).

279 *See* Kessel, *supra* note 277.

underwriting effects on reoffering yields might be around thirteen basis points, while a saving of about 48¢ in underwriting spread might be achieved. Kessel argued that each bidder brings some unique information about his customers and therefore the greater the number of bidders the greater the representation of customers who will pay a high price for the new issue. In effect, the issuer is buying information about purchasers when it solicits bids.

Kessel explains why the absence of banks as underwriters is significant in view of the fact that no other financial entities are barred from the underwriting of revenue bonds. Commercial banks do bring some unique characteristics as underwriters, and investment and commercial bankers are complementary resources that benefit the issuers of general obligation bonds, but not the issuers of revenue bonds.

Legislation to allow banks to underwrite state and municipal revenue bonds was introduced in the House of Representatives as early as 1955. Further bills were discussed in 1963, 1965 and 1967.[280] In 1968 legislation was enacted authorizing commercial banks to underwrite and deal in investment quality housing, university, and dormitory revenue bonds. In 1974 the Senate Committee on Banking, Housing and Urban Affairs reported Bill S. 3838 which would have allowed banks to underwrite revenue bond issues eligible for purchase by national banks, subject to a number of conditions: underwritten bonds could not be sold to trust accounts; disclosure of underwriter status would have to accompany sales to depositors, borrowers or correspondent banks; and there would be limits to the size of positions taken and on transfers from underwriting to investment accounts.[281]

In its report, the committee noted that in 1940 only 12.6% of all new municipal bonds were in the revenue bond category and amounted to $188 million. By 1973 the percentage had grown to 44.1% and the dollar amount to $10 billion. The committee was impressed at the quality record of revenue bonds and the evidence that the competition from commercial banks in underwriting might be expected to reduce the cost to the issuing governments.

The Comptroller of the Currency testified in 1975 before Senator Williams' Subcommittee on Securities and Representative St. Germain's Subcommittee on Financial Institutions in favour of a change in the Glass-Steagall Act to permit bank underwriting of

280 *See Securities Activities of Commercial Banks: Hearings before Subcomm. on Securities, supra* note 195, at 211.

281 FINANCIAL AMENDMENTS ACT OF 1974, REPORT OF THE SENATE COMM. ON BANKING, HOUSING AND URBAN AFFAIRS, TO ACCOMPANY S. 3838, S. REP. No. 93-1120, 93d Cong., 2d Sess. (August 21, 1974).

municipal revenue bonds.[282] The American Bankers Association has urged the change and so has the Bank Commissioner of the State of Connecticut and the ad hoc Rhode Island Financial Institutions Committee.[283]

With respect to the supervision of bank securities activities by state securities regulatory authorities, the Bank Commissioner of the State of Connecticut offered some rather interesting testimony in 1976 before Senator Williams' subcommittee.[284] The Connecticut banking commissioner not only regulates banks but is responsible for the supervision of investment advisers and broker-dealers. He said that in Connecticut any banks engaging in the underwriting of municipal securities are required to register as broker-dealers. Personnel are required to take the same examination given by the National Association of Securities Dealers (NASD) and they are supposed to benefit from the same training. He said four banks were registered in Connecticut as broker-dealers of which one was a national bank. In commenting on the statement that it would be difficult to have bank employees register, as broker-dealer employees do, he said "I don't believe our experience indicates that at all". With respect to municipal underwriting he said that his office was in the process of revising its procedures to coincide with the new rules promulgated by the Municipal Securities Rule Making Board and the Securities and Exchange Commission.

The commissioner also noted that American banks undertake the underwriting of corporate securities on a very large scale overseas, and he could not see that this was doing any harm to the U.S. commercial banking industry. He questioned the argument that underwriting within the United States is too risky for commercial banks, when it does not appear to be too risky overseas. He also said that he regarded the entry of commercial banks into the dividend reinvestment area as an extension of their corporate trust activities. He said that he could see no harm to the public.

Some opinions of bank customers on the subject of commercial bank participation in underwriting may be of interest. Greenwich Research Associates reported in 1976 that most corporate execu-

tives (60% of those interviewed) do not think that their banks should be allowed to offer investment banking services. However, the executives were evenly divided on the question of whether investment bankers were more able to handle their company's sophisticated financial needs then were their bankers.[285]

No legislation has been enacted to permit banks to underwrite revenue bonds but in 1975 Congress did remove the exemption from registration with the SEC of banks underwriting general obligation municipal bonds. These banks must now register as "municipal securities dealers".[286]

C. MONEY MANAGEMENT SERVICES OF BANKS AND TRUST COMPANIES

1. *Canada*

Canadian chartered banks are not permitted to operate trust departments. Some, however, do manage mutual funds, generally through a subsidiary. The 1976 government *White Paper* proposed[287] changes to prohibit this practice, but banks would be permitted to continue to act as sales agents for mutual funds managed by others. The reason for the proposed prohibition is the potential conflict of interest between the bank as lender to a corporation and as manager of a fund able to purchase the corporation's securities. The banks did not seem to object and the Senate Committee on Banking, Trade and Commerce approved the prohibition.[288]

Some banks also serve as advisers to real estate investment trusts (REITS) and to mortgage investment companies (MICS), which are very similar to mutual funds but invest primarily or exclusively in mortgages. Since banks are not permitted to operate trusts directly, the three banks that have established REITS have set up trusts with individual bank officers acting as trustees and the bank itself has served as adviser. The *White Paper* recognized the same potential for conflicts here as in the case of bank-managed mutual funds but it also saw the bank-managed REITS

286 Securities Exchange Act of 1934, ss. 3(a)(30), 15B. And *see*, *Securities Activities of Commercial Banks: Hearings before Subcomm. on Securities*, *supra* note 195, at 160. Another recommendation for bank underwriting of municipal revenue bonds was put forward in 1976; *see* HOUSE COMM. ON BANKING, "FINE", *supra* note 223, at 10.

287 WHITE PAPER ON THE REVISION OF CANADIAN BANKING LEGISLATION, *supra* note 202, at 36.

288 *Standing Senate Comm. on Banking, Trade and Commerce*, *supra* note 2, at 44:13,

and MICS as important vehicles for providing residential mortgage loans.[289] So the proposal was to continue to allow chartered banks to serve as advisers to REITS and MICS.

Bank-managed REITS do not enjoy any immunity from provincial securities regulation, at least in Ontario. In 1972 following the filing of preliminary prospectuses by Ontario's first two REITS, policy 3-25 was published by the Ontario Securities Commission setting out the conditions under which REITS (which were classified as "finance companies") would be permitted to issue securities.[290]

The bank as adviser is free of a registration requirement because banks need not register as advisers.[291] With respect to conflict of interest, the policy states:

> "[N]either the adviser nor any affiliate of the adviser shall engage in any business that would bring it in real or apparent conflict with the interests of the issuer [REIT]....[292]
>
> "[This] requirement may be waived in whole or in part by the Director where the adviser is a well established federal or provincial government supervised financial institution, *e.g.*, a bank, insurance company, loan or trust company."[293]

The waiver is critical since banks are in the mortgage business. Furthermore, mortgage funds organized by banks purchase their mortgages from the sponsoring bank and the transaction is hardly at "arms length". At the same time there is no significant secondary market in conventional mortgages in Canada that might serve to identify a "fair" price. The Ontario Securities Commission has had some difficulty with this conflict situation agreeing in one case that a spread up to 1/4% between the lending bank's yield and the investor fund's yield was reasonable but indicating that the subject was under review.[294]

44:69. The committee did favour permitting banks to act as advisers to mortgage-based mutual funds.

Registered Retirement Savings Plans and Registered Home Ownership Savings Plans are tax deferral arrangements designed to promote individual saving for retirement and home ownership. In both cases a trust is required and of course chartered banks may not manage trusts. However, banks may and do handle the sales and administration for these plans and some banks have set up mutual funds to serve as an investment vehicle for the trusts. The *White Paper* concluded that there is no reason why these plans should not be able to maintain deposits in banks and recommended that the trust requirement be abandoned. But the same potential for conflict of interest is present where banks invest money from these plans in bond and stock portfolios. So the *White Paper* proposed[295] that the banks not be permitted to accept any new clients for funds invested in stocks and bonds except where the management of the fund is independent of the bank. The securities industry has protested that the banks should not be permitted even to continue operating mutual funds for existing plan clients.[296]

So far as general portfolio management, investment counseling and securities advising activities are concerned, the *White Paper* proposed that only the management of REITS and MICS be allowed, plus casual securities advising in the course of serving bank customers.[297] The securities industry has expressed enthusiasm for the limitation but objects to the banks being able to offer casual securities advice.[298]

Under the present Ontario Securities Act, banks and trust companies are exempt from registration as advisers[299] which permits them to manage mutual funds without registration. There is no exemption from the Ontario prospectus requirements for mutual funds managed by banks or trust companies, although a fund offering only obligations guaranteed by a bank or trust company is exempt.[300] Bill 30 would continue the exemption for bank and trust company advisers[301] but would introduce the need to register as a management company in order to provide investment

advice to a mutual fund for compensation under a management contract.[302] The "contract" suggests that the management company and the mutual fund must be separate legal entities and therefore a bank or trust company would not have to register to manage a mutual fund that is part of the same bank or trust company. Mutual funds, however, will require registration under Bill 30,[303] except for trust companies offering securities of an account solely to service a Registered Retirement Savings Plan, a common trust fund, or a pooled account for which they do not solicit participations.[304] Banks do not qualify for this exemption which would not be necessary if the *White Paper* proposals are implemented. Grover and Baillie approve the exemption for trust companies because they are subject, in managing RRSPS, to the Ontario Pension Benefits Act.[305]

In acquiring securities for a pooled trust account a trust company presumably has the advantages of its exempt purchaser status and the potential problems under Bill 30, discussed above for regular trust accounts,[306] will apply.

The exemption for common trust funds will cover trust funds set up to service regular trust accounts but not the mutual funds operated by trust companies. Regular mutual funds operated by trust companies do not enjoy any exemptions from prospectus requirements nor would they under Ontario Bill 30. It appears that a fund set up entirely within the trust company would require the company to register as a management company. Trust company mutual funds are all "no-load" funds, so there is no "underwriting" and therefore no need even under Bill 30 for underwriter registration. Banks selling mutual fund shares would be subject to the underwriter registration requirement described above[307] but would not have to register to sell securities issued by a trust company for an RRSP account or a pooled account with no solicitation.[308]

Banks also offer miscellaneous administrative services that have to do with portfolios. These include the collecting of interest and dividends, custody of certificates, and periodic reports on portfolios. The *White Paper* saw nothing wrong in these activities because they do not pose any potential for conflicts of interest.[309]

2. *United States*

We have already seen the substantial nature of the trust and agency activities carried on by U.S. banks. In managing a trust account a bank is managing funds to which it has legal title. An agency account involves the bank in money management or investment advisory activities with respect to assets that are not placed "in trust". Sometimes these advisory activities are carried out by subsidiaries of a parent bank holding company rather than by the bank itself. This form of money management is usually only practical for rather large accounts and a great deal of private pension fund money is managed in this way. Some banks have begun offering portfolio management services to small accounts (under $100,000). Charles Buek, president of U.S. Trust Co., described the economics of portfolio management to Senator Williams' subcommittee suggesting $200,000 as the minimum size for a separately managed account. But some "automatic" plans are feasible for much smaller accounts and of course commingled accounts offer economies for small accounts.[310] (The SEC found that 54% of the 290,000 separately managed personal trust accounts of the top 115 banks were under $100,000.)[311]

Individual Portfolio Management Service is an advisory service offered by some banks to individuals with portfolios as small as $10,000. Recommendations are sent by the bank to the customer who, if he accepts the recommendations, signs the form and sends it to his broker. Accounts are not pooled; the assets of an account may be held by the customer, the broker or the bank. At least one bank executes trades itself, thus offering some commission saving.[312]

Pension funds qualified under section 401 of the Internal Revenue Code, including Keogh plans for the self-employed and Individual Retirement Accounts under section 408, require trusts or custodial accounts with commercial banks, although the Secretary of the Treasury is authorized to designate non-bank trustees or custodians for IRAS.[313] Some Keogh plans and IRAS simply involve savings accounts but others give investment discretion to the bank. The section 401 pension plans and Keogh plan trusts are exempt from registration under the Securities Exchange Act of 1934 and Investment Company Act of 1940 and so are collective

313 *Id.* at 202-06.

trusts for these plans.[314] Keogh plans, however, and collective trust funds for Keogh plans are subject to the registration requirement of the Securities Act of 1933. The SEC may grant an exemption from this requirement and has done so by way of "no action" letters where the funds are invested in mutual funds for which a prospectus has been issued.[315] In many cases the bank makes use of the intrastate offering exemption under the Securities Act.[316]

IRAS are a little different. As in the case of the section 401 pension and Keogh plans, banks are authorized by the Internal Revenue Code to pool these accounts but there is no exemption from the registration requirements of the Investment Company Act of 1940 or the Securities Act of 1933. The SEC has issued "no action" letters contingent on there being no pooling of IRA accounts and the assets of an account being invested either in a savings account or in specific mutual funds, with no discretion on the part of the bank.[317]

Banks are permitted to pool regular trust accounts in so-called common trust funds, which can make it more economical to manage on a day-to-day basis the assets of fairly small trust accounts. (Pooled funds at the end of 1975 amounted to $18 billion.)[318] And these pooled funds are exempt from the Investment Company Act of 1940. But for investment management accounts, those that are not trust accounts, pooling is forbidden. At one time the Comptroller of the Currency authorized commingled agency accounts, which were in effect mutual funds. The SEC insisted that the common fund be registered as an investment company. But in 1971 the United States Supreme Court said that this practice constituted underwriting in violation of the Glass-Steagall Act.[319] Many commercial banks would like this decision changed by legislation and in fact the two legislative changes the American Bankers Association has been pushing hard for (and which the Comp-

314 Section 3(c)(11) of the Investment Company Act of 1940 exempts any collective trust maintained by a bank, consisting solely of assets of pension, bonus, and profit-sharing trusts qualified under s. 401 of the Internal Revenue Code.

319 Investment Company Institute v. Camp, 401 U.S. 617 (1971). The decision affirmed, however, the right of a national bank to manage the portfolio of an individual customer. The SEC position is that a commingled agency fund would not be exempt under the Investment Company Act of 1940; *see, Securities Activities of Commercial Banks: Hearings before Subcomm. on Securities, supra* note 195, at 154, 165. For a discussion of the events leading to the decision, *see* 2 INSTITUTIONAL INVESTOR REPORT at 447-50.

troller of the Currency endorses)[320] would give banks the power to operate commingled agency accounts and the power to underwrite revenue bonds.

In addition to offering financial advisory services to individual non-trust accounts, a number of banks have begun to serve as investment advisers to both open-end and closed-end investment companies.[321] Sometimes the bank serves as the adviser but in most cases bank holding companies form separate investment advisory subsidiaries.

Banks themselves are exempt from registration under the Investment Advisers Act of 1940 but they are not excluded from the definition of "investment adviser" in the Investment Company Act of 1940. So they must register under the latter in order to manage investment companies.[322] And advisory subsidiaries of bank holding companies are not exempt from either act.[323] The SEC has raised a number of conflict of interest questions concerning banks that serve as custodian and transfer agent for closed-end investment companies that they also sponsor and manage but no action has ever been taken.[324]

The Board of Governors of the Federal Reserve System amended regulation Y in 1972 to allow bank holding companies and their affiliates to serve as advisers to registered closed-end investment companies and real estate investment trusts. The Investment Company Institute filed a petition with the Federal Reserve Board for reconsideration of this regulation. The request was denied and the institute filed a lawsuit which has not yet been decided on the merits.[325] While regulation Y does permit banks to advise investment companies, there are some restrictions imposed by the Federal Reserve Board of Governors that limit the activities of the banks to something less than what nonbank investment

advisers may do. And bank holding companies are prohibited from sponsoring, organizing or controlling an open-end investment company or mutual fund.

The significant issue here is whether banks should be permitted to organize their own mutual funds. Many banks have substantial investment management staffs handling trust accounts and performing advisory services for large nontrust accounts. The kind of investor for whom mutual funds are likely to be most beneficial is probably foreclosed from making use of bank talent because it is not economical to open a trust account for a small investor. Besides, the banks are forbidden to solicit trust accounts in the expectation that the trust assets will be placed in a pooled trust fund.

Although investment companies are subject to the Investment Company Act of 1940, there is no comparable statute covering REITS. A bank holding company may organize a REIT investment management company as a wholly-owned subsidiary and the subsidiary will in turn organize the REIT as a separate company that offers shares to the public.[326] The SEC says it has no authority to regulate transactions between REITS and creditor banks but that federal disclosure requirements for bank holding companies and REITS apply to these "loan swaps".[327]

D. FINANCIAL ADVISORY SERVICES AND PRIVATE PLACEMENTS

In the preceding section we dealt with the provision of investment advice or investment advisory services by banks. Here we are concerned with financial advice to corporate customers.

1. *Canada*

The government *White Paper* of 1976 did not mention advisory activities of chartered banks, but proposed that the right of a bank to act as an agent in the private placement of corporate securities would be withdrawn.[328] The securities industry appar-

326 *Securities Activities of Commercial Banks: Hearings before Subcomm. on Securities, supra* note 195, at 201-02; and *see id.* at 140, 144, 153.

327 *Id.* at 165-66. There are those who argue that a serious regulatory gap exists here or at least that the relationship between the bank and the REIT poses serious risk to the bank; *see, Financial Institutions: Hearings before Subcomm. on Financial Institutions, supra* note 200, pt. 1, at 496-99, 507-16 (December 1975).

328 WHITE PAPER ON THE REVISION OF CANADIAN BANKING LEGISLATION, *supra* note 202, at 35. The banks have generally accepted a proposed prohibition of underwriting corporate activities but do want to continue private placements; CANADIAN BANKERS' ASSOCIATION, *supra* note 297, at 10.

ently feels there may still be too much freedom for banks to help their customers arrange private placements.[329]

Even if the bank's role as agent in a private placement constitutes "trading" within the meaning of the Ontario Securities Act, there is an exemption from registration.[330] Bill 30 would remove this exemption but almost certainly the placement would be to "exempt purchasers" and therefore exempt.[331]

2. *United States*

Financial advisory services are essentially management consulting services and are usually provided through a separate nonbank subsidiary of a bank or its holding company. The service may be on the basis of a long-term contract or may be provided to customers for specific projects.[332]

There seems to be no claim that these services are prohibited by the Glass-Steagall Act. However, there is apparently some uncertainty about giving advice to corporate clients in mergers and acquisitions and with respect to private placements which may involve the issue of securities.[333] At some point the advisory services may become underwriting. The Securities Industry Association claims that even syndicating long-term bank loans is suspect.[334] The Comptroller of the Currency is concerned that the penalties for violation of the Glass-Steagall Act may inhibit legitimate financial advisory services and would like to see those penalties removed.[335]

Rendering advice on private placements of long-term securities is an activity that has sparked an especially sharp debate

333 Two letters from the Deputy Comptroller of the Currency in 1974 and 1975 describing permissible private placement activities are reproduced as apps. IIA and IIB, in Securities Industry Association, Memorandum for Study and Discussion on Bank Securities Activities (August 1976).

334 *Id.* at 10.

335 U.S. DEPT. OF THE TREASURY, *supra* note 321, at 24-25, *reprinted in Securities Activities of Commercial Banks: Hearings before Subcomm. on Securities*, *supra* note 195, at 172. There was a brief flurry over private placements in early 1977 when the Federal Reserve Board ordered First Arabian Corp., a bank holding company, to divest its interest in Bates North America, a broker-dealer, because of the latter's activity in private placements. The Federal Reserve replied to inquiries that this decision was quite unrelated to questions of bank activities under the Glass-Steagall Act.

between the banks and the securities industry. Representative Henry Ruess, chairman of the House Banking, Currency and Housing Committee, asked the Federal Reserve Board in December 1976 for a study of private placement activities of commercial banks. The Securities Industry Association prepared a memorandum to the board[336] arguing that commercial banks are prohibited by the Glass-Steagall Act from advising on private placements and that dangers of reciprocal practices and conflicts of interest make the banks' activities undesirable. The New York Clearing House Association also prepared a memorandum[337] defending the legality and propriety of the activities.

The Federal Reserve Board *Staff Study* concluded that there was "no evidence of significant legal or public policy problems associated with commercial bank private placement activities".[338] The study reported (quoting the SEC) that there were twenty-two commercial banks that in the five years from 1972 to 1976 had assisted in more than an incidental way in private placements; there were eighteen banks active in private placements in 1976 and five banks accounting for almost 90% of the bank advisory activity.[339] All of the banks accounted for 7% of $16 billion of assisted private placements in 1976 and although the percentage was up from 2% in 1972, it had remained fairly constant for 1975 and 1976.[340]

The study saw little chance of banks displacing investment bankers as the dominant intermediaries (the top ten investment banks in terms of private placement activities had 67% of the advisory business in 1976 and the leading commercial bank was in thirteenth place).[341] Commercial banks did tend to specialize in lease financings, a field of U.S. bank expertise, and in 1976 participated in 15% of assisted lease financings.[342] On the other hand, banks participated in relatively few of the very large private placements (such as those of Hydro Québec, Ontario Hydro and B.C. Hydro).[343] Bank assisted private placements seemed to be of

generally high quality and the average fee charged in 1976 was 0.8%.[344]

If the bank makes use of a subsidiary to provide financial advisory services, then the Comptroller of the Currency must approve the creation of that subsidiary. The comptroller has explicitly authorized national banks to provide such advisory services.[345]

Investment banking firms see the bank activity as competitive and frequently unwelcome. There is also a claim that the banks through their commercial lending activities are already direct competitors with underwriters who might handle public offerings. If they also provide the advice that might help a client choose between bank loans and publicly offered securities, the banks may be in a very powerful position and there are possibilities for conflicts of interest.[346] The SEC says that provision of these financial services would call for registration as a broker-dealer were it not for the exclusion of banks from the definitions of "broker" and "dealer" in the Securities Exchange Act.[347] The commission does not argue against this exclusion but it has argued that bank personnel engaged in corporate financing services should be required to pass tests of competence.[348]

A number of banks offer advice on mergers, acquisitions and divestitures. Thirty-three banks responding to the SEC questionnaire indicated that they were engaged in this activity during 1972 to 1976, although seven had discontinued it and only seventeen reported fees or collections for the first nine months of 1976.[349] The number of transactions reported by banks never exceeded 3% of the total number of transactions reported by the Federal Trade Commission for 1972 to 1975.[350]

E. AGENCY AND BROKER SERVICES

1. *Canada*

Canadian chartered banks appear to be free to offer brokerage services but none of the banks hold stock exchange member-

ships or own broker-dealer firms. Apart from transactions that can be completed among their own customers, they appear to make use of regular broker-dealers even when they serve as brokers. However, they do serve as agents in the sale of commercial paper for corporate customers. The *White Paper* proposals would leave the banks free to act as brokers and also to advertise this function. The securities industry has protested and urged a ban on the solicitation of brokerage business by banks. The securities industry would also like to see a requirement that the banks would be required to use a registered securities firm even for unsolicited orders.[351] And the industry has urged that banks be prohibited from soliciting sales of corporate commercial paper.[352] The banks, on the other hand, would like their right to deal in securities to be made clearer, and they oppose any requirement that they be subject to provincial registration requirements.[353]

Although chartered banks act as market-makers in some bonds, usually those on the head office "approved list", there is apparently not much interest in equity market-making.

Banks and trust companies are not required to register under the Ontario Securities Act in order to act as brokers or dealers[354] but Bill 30 would drastically narrow this exemption. Registration would not be required for a trade involving only the placing of an unsolicited order to purchase or sell with a bank for execution through a registered dealer.[355] The handling of unsolicited orders, of course, is precisely the kind of bank activity of which the securities industry approves and is what makes up almost all the bank brokerage function according to the banks' own testimony.

Like anyone else, of course, the banks are free to act as brokers and dealers without registration in government and municipal securities and securities guaranteed by banks, trust and loan

354 Ontario Securities Act, s. 19(1)(3). The other provincial acts contain the same exemption. In a puzzling decision in 1974, however, the Ontario Securities Commission made an order that the registration requirements of the act would not apply to banks that might act as selling group members in a nation-wide offering by the Canada Development Corporation. The commission does not refer to the statutory exemption and suggests that the activity it is authorizing is quite unusual. This particular underwriting aroused rather strong feelings within the investment industry which did not welcome bank participation (and in the end the banks did not participate). The order was granted at the request of CDC and it seems likely it was requested to head off any attempt to have the commission deny use of the exemption which it was empowered to do under section 19(5); *In re* Canada Development Corporation, [1974] OSC Bull. 76-80 (April).

355 Ontario Bill. 30, s. 35(1)10(b).

companies and insurance companies.[356] Ontario Bill 30 preserves this exemption.[357]

2. *United States*

Banks in the United States offer a number of agency services giving customers access to securities markets. So far banks have not undertaken to conduct a retail brokerage business on a significant scale, although it is not entirely clear whether they are permitted to do so under the Glass-Steagall Act.[358] But there is evidence that banks are seeking closer relations with particular brokerage firms and these relationships coupled with the unfixing of commission rates in the United States can probably accomplish anything that a bank might seek to accomplish through providing brokerage services directly.

Banks provide customers with custodial services; indeed the usual custodian of an institutional portfolio will be a commercial bank. The custodial account differs from the trust account in that custodianship simply involves safekeeping and the transfer of securities into and out of the custodial account. There is no investment management on the part of the bank. A custodial account can involve collection of income by the bank and quite possibly reinvestment of this income in short-term funds. The bank may simply deliver and accept securities on the customer's instructions or it may buy and sell securities at the direction of the customer or his investment adviser. The purchases and sales will be undertaken by the bank acting as an intermediary between the customer and a broker or dealer. Custodial arrangements do to some extent involve competition with the securities industry but there appears to be little resentment over them on the part of brokers and dealers and there have been no obvious efforts to have them curtailed.

At least one bank has provided a voluntary investment plan. A broker-dealer would refer customers with small accounts to the bank. The bank would establish a custodial account for each customer and arrange for a monthly purchase of securities chosen by the customer from a list of recommendations from the broker-dealer. The customer would pay a fee based on the size of his

356 Ontario Securities Act, s. 19(2).

Securities Industry Association, Memorandum for Study and Discussion on Bank Securities Activities, at 5 (August 1976).

investment account, and the fee would cover all commissions and bank service charges. Part of the fee would be rebated to the broker-dealer.[359]

Automatic investment plans are a somewhat similar service offered by banks but in this case the bank rather than the broker-dealer takes the initiative in soliciting customers and it is the bank that offers a list of the stocks of the twenty-five largest corporations in Standard & Poors Industrial Index from which the customer makes a selection. The plan involves monthly purchases through transfers from the customer's checking account and a service fee is charged for each transaction. The bank is able to pool customer orders to reduce commission costs. The monthly service charge is 5% of the amount invested with a maximum of $2 or $3 a month per stock purchased plus brokerage. Usually there is no custodial account; securities are held in a bank nominee name and are transferred to the customer on request.[360]

Automatic investment plans have generally been regarded by the SEC as not requiring registration under the Investment Company Act of 1940 or the Securities Act of 1933,[361] and the Comptroller of the Currency has said they do not violate the Glass-Steagall Act.[362] The New York Stock Exchange and the Investment Company Institute failed in an attempt to have automatic investment plans declared in violation of the Glass-Steagall Act.[363] Legislation was introduced in 1974 to bring these plans under SEC regulation but nothing was enacted.[364] The number of banks and customers participating in these plans has declined since 1974 and in late 1976 only eighteen banks were offering plans with some 4,500 participants.[365]

Another service offered by many banks is the dividend reinvestment plan. Through this plan shareholders of a participating corporation direct that their dividends be paid to a bank which aggregates all the dividends received and purchases shares of the corporation's common stock, sometimes directly from the corporation but more often in the market. (Direct purchases sometimes benefit by a discount from market price.) Such plans have apparently grown substantially in recent years, as corporations have

365 SEC, INITIAL REPORT, *supra* note 347, at 54, 63.

become enthusiastic. The SEC reported in 1977 that sixty-eight banks offered these plans with over 1.8 million participating shareholders in 727 corporations and assets of $1.2 billion.[366] It is also possible in most of these plans for the shareholder to add additional funds to purchase more shares and the additions commonly amount to about five times the reinvested dividends. Service fees usually range from 4% to 5% of the investment but are sometimes less and there is usually a maximum of $2 to $3.[367] Sometimes the corporation pays both the service fee and commissions.[368] The plans are apparently not profitable for the banks offering them nor for Merrill Lynch which also offers them.[369]

Dividend reinvestment plans, whether offered by banks or by others, have generally been considered by the SEC as not subject to registration under the Investment Company Act of 1940 or the Securities Act of 1933 because they do not involve separate securities.[370]

Employee stock purchase plans (ESPPS) are a further bank service. They operate much as do dividend reinvestment plans with a pooling of participants' funds to purchase shares in large quantities. Although they were first offered by banks before dividend reinvestment plans, they are much smaller in the aggregate. The SEC reported in 1977 that fifty-nine banks were offering 105 ESPPS with 165,000 participants and $121 million in assets.[371] Some brokers also offer ESPP services and the SEC concluded that large banks and brokerages have a competitive edge over small banks and brokerages. But banks in general do not have the competitive advantage over brokerages that they enjoy with respect to dividend reinvestment plans.[372] Total direct costs of bank administered ESPPS were probably a little under 3%, while the cost of the plans administered by Merrill Lynch was 1.87%.[373]

The banks argue that in operating dividend reinvestment plans and automatic investment plans they simply function as

373 *Id.* at 53.

agents of their customers, while the securities industry claims they go beyond permissible dealing "and may violate the ban on underwriting".[374] The securities industry also argues that customers of dividend reinvestment plans and automatic investment plans are not protected by the "suitability requirement", and that neither Securities Investor Protection Corporation, nor Federal Deposit Insurance Corporation insurance applies.[375] Of course, the so-called "discount" brokerage firms offer customers an execution-only service with no recommendations or assurance of suitability. The witnesses representing the brokerage community before congressional committees have generally expressed no opinion about the propriety of this kind of operation.

Bank personnel are not required to demonstrate knowledge of securities laws or be registered by the NASD or SEC.[376] Standards of record-keeping, executions, and confirmations are less strict for banks. And advertising is said to be subject to less control.[377]

The voluntary investment plan, automatic investment plan, and dividend reinvestment plan have been subject to a great deal of criticism from the brokerage industry. The real fear seems to have been that this channeling of transactions through banks will lead to reduced commissions to regular brokers. But it also appears that these services are not widely available to small investors through brokers so that the banks are serving a genuine need.[378] The arguments advanced against these bank practices and in favour of legislation to prohibit them include the familiar claim that investment will be concentrated in a few favourite stocks with the others left to languish. The conflict of interest argument that has been raised in connection with trust activities of commercial banks has also been raised in connection with these three investment and reinvestment plans. It has also been argued that the handling of customer accounts in these plans is not necessarily in the best interest of the customer; the use of cash balances may not be in the customer's best interest; he may or may not get the best execution available; and there may be conflicts involving

374 *Id.* at 126-28. A wish to avoid obvious competition with brokers apparently is the source of upper limits of $1,000 per month or $3,000 per quarter usually imposed by the banks on optional additional cash payments from customers; *id.* at 19. In any case, 90% of the secondary market purchases were executed by brokers; *id.* at 28.

375 *Id.* at 109, 152, 162-63.

376 *Id.* at 110.

377 *Id.* at 111-13.

378 There is some difference of opinion here. Some say bank-sponsored dividend reinvestment plans have been very successful because brokers do not offer the same service. Merrill Lynch has argued the banks enjoy unfair competitive advantages;

those very executions when the bank has many customers to consider including its own trust department clientele. There is also the argument that the securities business, if it becomes substantial for the banks involved, may significantly increase the risk of the entire banking operation.[379] It seems unlikely that any commercial banks are anywhere near this point at the present time but some critics clearly fear that so long as banks are engaging in these securities activities it may be increasingly difficult to keep them out of underwriting and ultimately a full-scale securities business.

There seems to be some evidence that these plans are channeling savings into common stock investments[380] and that genuine cost savings are being achieved by the individual investors, particularly with respect to the reinvestments of dividends; without these plans the cost of reinvestment might be almost prohibitive. However, the total value of orders effected by banks for these services is estimated by the SEC as only 0.9% of all transactions on national stock exchanges and new equity raised is estimated at only 4.4% of new equity financing.[381] Overall, the SEC has concluded:

> "Banks dominate the DRP [dividend reinvestment plan] market and have achieved rapid growth in this area in recent years. Banks have a secondary role in the administration of ESPPS [employee stock purchase plans]; moreover, growth of this service has been relatively modest. Banks offering the AIS [automatic investment service] have declined in absolute terms from twenty banks in 1974 to eighteen banks in 1976, reflecting a lack of demand for this type of service whether offered by banks or broker-dealers. Information obtained from staff interviews with a number of bankers involved in the CTS [brokerage services for customers] suggests little or no growth of this informal service over the past two years."[382]

Table 53 shows the magnitude of the bank activities.

Banks are explicitly excluded from the definition of "broker"

and "dealer" in sections 3(a)(4) and 3(a)(5) of the Securities Exchange Act of 1934 and therefore need not register as such. Section 16 of the Glass-Steagall Act permits national banks to deal in securities upon the order and for the account of customers. There appears to be substantial doubt as to the precise limits of the permissible dealing. The securities industry believes the intent of the act was to permit banks to "accommodate" regular customers. The banks, on the other hand, contend that section 16 was intended to facilitate such activities as automatic investment services.[383]

Banks have traditionally offered an agency service to customers buying or selling securities by transmitting their orders to a broker-dealer. The SEC study said of this service:

> "Customer transaction service is not, however, a formal bank service like the bank services discussed in earlier chapters [dividend reinvestment, employee stock purchase, automatic investment plans]. Indeed, with the exception of a service presently being tested by Chemical Bank, discussed below, customer transaction service is a distinctly informal service provided as an accommodation to bank customers...is rarely mentioned in bank literature, and, viewed separately, is uniformly unprofitable to the bank. Nonetheless, the responses to the Bank Study Questionnaire show that more banks offer this informal service than all of the formal bank services combined."[384]

Bank service fees ranged from $15 to $25 per transaction but may be reduced or even waived for regular banking customers. Small transactions may cost less when placed through a bank than when placed directly with a broker-dealer.[385]

In September 1976, the Chemical Bank announced that it would offer to its customers a stock brokerage service at cut-rate commissions. Customers would be able to buy and sell listed securities and most unlisted securities at commission rates well below those being charged to individual investors by major brokerage houses. Chemical would act as agent with the actual execution of orders handled by Pershing & Company,[386] a widely known execu-

383 *Id.* at 124-26. And *see*, *Financial Institutions: Hearings before Subcomm. on Financial Institutions*, *supra* note 200, at 2079-83; and *see id.* pt. 5, at 226-27, 588-91 (apps. A, B).

384 SEC, INITIAL REPORT, *supra* note 347, at 78.

385 *Id.* at 87-88.

386 Chemical Bank stressed the use of a member firm. Neff, testifying on behalf of the bank before Senator Williams' subcommittee, said that "[t]he bank will not be executing brokerage transactions or in any way usurping the traditional broker-

tion firm, able since the change in the fixed minimum commission rule in May 1976 to negotiate inter-broker transaction costs. The relationship between Pershing and Chemical was probably an "omnibus" account which means that Pershing would treat Chemical as a single customer. Customers joining the program would be charged a flat $30 annual membership fee. Each purchase or sale up to 500 shares of any price stock would carry a $35 commission. Trades beyond 500 and up to 1,000 shares would carry a $55 charge. Trades above 1,000 shares would be subject to negotiation. The saving would be greatest on higher-priced shares and the Chemical Bank service would be more expensive for small orders of low-priced shares. The fees would not include safekeeping and research.

The Securities Industry Association reacted to the Chemical Bank plan with public denunciation and apparently undertook to approach the Federal Reserve for help in stopping the new plan. At the same time SEC commissioner John Evans said that the best way for the individual investor to achieve significant discounts in execution costs is through grouping arrangements like the proposed Chemical Bank plan where the broker-dealer is guaranteed a substantial flow of small orders. He said the cost savings did not depend on individual orders being held to make up block transactions but that the guarantee of a flow of small orders was enough to achieve the low commission rate.

The combination of the Chemical Bank and Pershing & Company put executions in the hands of a member firm that had an excellent reputation for good executions at low cost and the processing and reporting in the hands of a bank that could use monthly checking account statements to report all aspects of securities transactions. Custodial services would of course be available to customers at some fee. There was at least the potential here for a very efficient brokerage service.

The plan was apparently not successful enough in attracting business to justify the political struggle it precipitated and it was dropped in February 1977. In the fall of 1977, however, Citicorp, the holding company for the First National City Bank (and the largest bank holding company in New York city) disclosed the formation of a broker-dealer affiliate. Initially this firm was to sell Citicorp securities to investors but it was apparent that a broker activity was planned.

The securities industry has steadily maintained that bank securities activities present unfair competition to broker-dealers

---

dealer function"; *Brokerage and Related Commercial Bank Service: Hearings before Subcomm. on Securities*, *supra* note 369, at 217.

because the banks are subject to less strict regulation and that bank regulation does not provide adequate investor protection. In its second report to Congress on bank securities activities, in February 1977, the Securities and Exchange Commission compared the regulation of banks offering money management services with the regulation of broker-dealers.[387] Both banks and broker-dealers are subject to the anti-fraud provisions of the federal securities laws, in particular the provisions of the Securities Exchange Act of 1934. By and large these provisions deal with fraud in the purchase and sale or offering of securities and not with the offering of securities-related services. Periodic investment plans that involve the issue of new securities will be subject to the Securities Act of 1933 including its limitations on advertising and sales literature. Apart from these requirements, however, banks are free from the regulation of advertising that is imposed on broker-dealers.

The stock exchanges require that members submit advertising for approval before publication and that market letters and research reports be cleared in advance by a qualified employee of a member firm. Literature of member firms must also comply with specific standards of truthfulness and good taste established by the exchanges.[388] The NASD has its own rules applying to the publication of advertising material and market letters and requires that they be approved by a qualified supervisor in the firm and comply with substantive standards relating to their content.[389] The SEC still has not established rules for broker-dealers who are not members of an exchange or the NASD and the SEC does not review their advertising apart from the sales literature of investment companies. The SEC has said, however, that they too should comply with all of the NASD substantive guidelines.[390]

Banks are subject to very little regulation with respect to advertising their services. Regulations of the Comptroller of the Currency prevent banks from promoting collective investment funds to attract new business and the Federal Reserve Board prohibits bank holding companies from distributing advertising materials for investment company shares.[391] There is also a difference between the regulation of banks and the regulation of broker-dealers with respect to the "know your customer" or "suitability" rule. Within the broker-dealer community the rule is not

uniform. The stock exchanges impose an obligation on members to know their customers but have not adopted the detailed suitability requirements that are imposed by the NASD on its members (except for transactions on stock exchanges) and by the SEC on broker-dealers who are neither NASD nor stock exchange members. The NASD and SEC rules both require that the broker-dealer take pains to determine that a recommendation be suitable for a customer.[392] There is some question whether the periodic investment plans, whether sponsored by banks or by broker-dealers, involve any "recommendation". And there is certainly a question whether it makes sense to demand the suitability investigation in connection with these services. In any case, these suitability rules are not applied to banks in the operation of their periodic investment plans. The Comptroller of the Currency has expressed the opinion that the suitability requirement probably does not mean much anyway and in any event should not apply to periodic investment plans.[393]

There are some differences between the treatment of broker-dealers and banks with respect to regulation concerning the character, competence and supervision of employees handling securities-related activities. In both cases there are checks on honesty and good character. For the broker-dealers these are found in the Securities Exchange Act and the policies of the exchanges and the NASD.[394] For the banks the Federal Deposit Insurance Corporation (FDIC) prohibits the employment by an insured bank of any person who has been convicted of a criminal offence involving dishonesty or a breach of trust.[395] Broker-dealers seem to be somewhat more tightly regulated than banks in terms of responsibility for the supervision of employees engaged in securities activities. The Securities Exchange Act of 1934 spells out a responsibility to supervise; the exchanges also require that appropriate personnel be designated to exercise supervisory responsibility; and the NASD not only requires the designation of supervisory officers but also requires written supervisory procedures and specific periodic review of the work of registered representatives.[396] The Comptroller of the Currency, the Federal Reserve Board, and the FDIC all direct examiners to look generally at personnel policies, adequacy of staff, and adequacy of supervision but there appears to be nothing analogous in their regulation to the specific direc-

tions of the Securities Exchange Act, the stock exchanges and the NASD.[397]

On the subject of competence of employees the NASD requires that principals and representatives pass appropriate qualifying examinations; the New York Stock Exchange and American Stock Exchange require experience, training, and examinations; and the staff of the SEC is currently considering what uniform minimum standards should be established for the entire broker-dealer industry in compliance with the 1975 revision to section 15(b) of the Securities Exchange Act.[398] Banks do not appear to be subject to any specific regulation with respect to the competence of employees engaged in securities activities and the SEC has said that it does not believe that specific competency and examination standards should apply to bank officers and employees dealing with the public.[399]

The Securities Exchange Act rules on record keeping are much more specific than any banking laws or rules, but as a practical matter bank examination procedures appear to call for record keeping that the SEC would regard as adequate for securities-related activities.[400] Broker-dealers are subject to more specific rules with respect to fidelity bonding of employees than are banks, but bank employees are covered by bonding.

A broker-dealer is able to use customer cash balances to finance transactions in customer margin accounts, to finance fail-to-delivers, and to finance short sales by customers.[401] Banks may be able to hold such balances as regular deposits but can do no more with them.[402] Broker-dealers are in many instances able to pledge as security for their own borrowing securities purchased by their customers on margin. Banks, on the other hand, are not free to pledge or otherwise use customer securities.[403]

The SEC report concluded that with respect to the execution of customer orders the standards imposed by regulation on banks do not differ from the standards imposed on the broker-dealers, except that stock exchange rules prohibit broker-dealers from completing a transaction in listed securities as an in-house cross. Banks are permitted to cross orders in formal brokerage plans in accordance with customer agreements.[404]

404 *Id.* at 107.

Confirmations of transactions to customers by banks include brokerage commissions as part of the price per share, so that customers cannot identify the commission paid and compare it with commissions charged by brokers, whereas confirmations from broker-dealers show separately the brokerage commissions paid. Otherwise, the SEC study found no significant difference between broker-dealer confirmations and bank confirmations.[405] The SEC has urged more complete disclosure in bank confirmations so that customers can compare transaction costs.[406]

In September 1977 the commission completed proposed legislation to implement its recommendations. The legislation would not bring bank securities activities under SEC jurisdiction but would require the bank regulatory agencies to establish rules and regulations.[407]

F. CONCLUSIONS AND POLICY IMPLICATIONS

In both Canada and the United States the question of the participation of financial institutions in the securities markets is complicated by divided jurisdiction. Financial institutions and the securities industry are governed by different statutes and regulated by different agencies. In Canada the picture is further complicated by a significant division between federal and provincial regulation. In the United States, banking is substantially under federal control and so is regulation of the securities markets and the securities industry.

The Bank Act determines essentially the permissible activities of the Canadian chartered banks. The policies underlying this act are heavily influenced by the Department of Finance. The securities industry and securities markets are at present regulated under provincial statutes and by provincial securities commissions. So while the Bank Act establishes *what* banks may do with respect to securities activities, *how* they do it is left to provincial regulation. Yet even this distinction is not entirely clear, and the banks argue that the provinces do not have jurisdiction to regulate their activities. A federal regulatory commission having jurisdiction over securities markets and the securities industry might help to clarify the position of the banks and might offer some hope for a consistent position on what banks are permitted to do and how they are to do it.

Whether bank securities activities including underwriting,

405 *Id.* at 112-13.

406 SEC, FINAL REPORT, *supra* note 225, at 32-33.

407 Letter from the SEC to the Speaker of the House of Representatives (September 20, 1977).

brokerage, and dealing in bonds should come under the direct regulation of a federal securities agency or whether they should remain under the jurisdiction of the Department of Finance is another question. In the United States even the SEC has recommended that all regulation of banks remain with the bank regulatory authorities rather than with the SEC. And this recommendation was made despite evidence that the banking authorities had never been particularly interested in the kind of regulation that is appropriate to a securities business.

The trust companies present still a different case. Some are provincially incorporated and some come under federal regulation. So far no serious conflicts seem to have emerged between trust company legislation and the regulation of the securities markets and the securities industry.

A difficult policy choice, one that has appeared before in this paper, is the choice between open competition and regulation. On the one hand, substantial participation by banks in the securities industry has a good deal to offer to the efficiency of Canadian capital markets and to economic growth. Banks in Canada have been successful in underwriting, in providing a secondary bond market, and in furnishing incidental brokerage services to customers. They have both the talent and the widespread branch network that should be able to provide more efficiently than anyone else a number of securities market services. We have evidence from the United States that the participation of commercial banks in underwriting tends to make that underwriting more efficient and reduces the cost to issuers.

On the other hand, the Canadian banking industry is highly concentrated so there may be dangers in giving it free rein in the securities market. The trend in recent years in the United States has clearly been toward greater competition and a lowering of barriers that have divided the activities of different kinds of institutions. The same policy is evidenced in the proposed amendments to the Canadian Bank Act, although Canada has not gone nearly as far as the United States.

There is already, of course, a fair degree of concentration in the Canadian securities industry, particularly in underwriting, and there is a question whether the danger of concentrating underwriting in the hands of chartered banks is any greater than the danger of concentrating it in a few major investment dealers. The number of dominant underwriting investment dealers is not very different from the number of major chartered banks.

It would be much easier to reach some of these policy decisions if more information were available. In particular some information on the portfolio holdings of trust companies would be helpful.

The trust and agency accounts of these companies hold some $12 billion in Canadian equities and virtually nothing is known outside the trust companies themselves about these portfolios. There is probably no need to undertake the vast amount of reporting and data collection that has been implemented in the United States but some steps should be taken toward disclosure.

Chapter V
Institutions and Independent Individual Investors in the Stock Market

It is quite clear that in both Canada and the United States a substantial proportion of stock ownership and stock trading has shifted from independent individuals to institutions. The extent of the shift is discussed later in some detail but briefly the most recent data show individuals accounting for 49% of the value of public trading on the Toronto Stock Exchange and 31% on the New York Stock Exchange.

A. REASONS FOR CONCERN ABOUT INSTITUTIONALIZATION

The consequences of institutionalization are important and indeed critical to some basic policy choices among regulatory procedures and ways of structuring the stock market. Regulation and structure have developed over the years in the context of a stock market dominated by individual investors or, more precisely, by investors whose orders are generally for a modest number of shares. The stock exchange auction market and the fixed brokerage commission rates were devised to deal with individual trading. The regulatory system with its concern for investor protection and its allocation of functions among brokers, dealers, banks, trust companies and other financial institutions and intermediaries has evolved over the years to deal with a marketplace of individuals.

In recent years we have begun to find the regulatory system and the structure are not well suited to a market dominated by institutions. One policy course is to adapt the regulation to the market structure. Another is to reverse the institutionalization and try to restore an individual marketplace.

Canada is beginning to experience the contest between these two policies, a contest that began in the United States in the late 1960s and that is still far from over, although the final outcome is probably quite foreseeable. The controversy over fixed commission rates beginning in 1968 was the first stage of the contest. The fixed rates on the New York Stock Exchange were simply quite unreasonable for large institutional transactions. At the same

time and for the same reason a struggle broke out over admission of financial institutions to stock exchange membership that would have given them direct access to trading without paying the fixed commission rates. The stock exchange membership fought long and hard for their fixed rates and against institutional memberships, largely on the ground that it was crucial for the health of the marketplace to encourage and service the trading of individuals even if this meant rules that imposed expense and inconvenience on institutions. The commission rate dispute was resolved with the unfixing of rates charged to the public on May 1, 1975, and the unfixing of intermember rates a year later. The institutional membership issue is still unresolved.

The contest continues, in terms of market structure. The role of the market-maker – the specialist on the New York Stock Exchange and the dealer market-maker in the over-the-counter market and the third market (the U.S. over-the-counter market in listed stocks) – is a current focal point in the argument over the proper form of a national market system. The basic issue is whether the system is to be geared to the many small trades of individuals or to the large transactions of institutions. West and Tinic said in 1974: "The growth of the institutions and the concomitant decline in the relative importance of individual investors have created virtually insurmountable problems for the traditional continuous auction market."[408] They cited data from the SEC *Institutional Investor Report* as evidence that specialist participation decreases with increasing size of institutional transactions.[409] They concluded that the marketplace of the future will feature enhanced competition in the auction market and a close tie between the auction market and a dealer or even institution-to-institution market. That is, the present exchange market with its specialists will become more competitive and will be linked more closely to the third and fourth markets (the dealer market in listed stocks and the institution-to-institution market).

In Canada the Ontario Securities Commission held hearings in 1976 on the fixed commission rate structure of the Toronto Stock Exchange and heard most of the arguments that had been offered to the Securities and Exchange Commission eight years before. The Canadian institutions, however, were less inclined than

408 West & Tinic, *Institutionalization: Its Impact on the Provision of Marketability Services and the Individual Investor*, [1974] J. CONTEMPORARY BUS. 25, 30 (winter).

409 The specialist's role is discussed in *Williamson, Capital Markets*, ch. II. A recent review of the literature and report on empirical work concludes, however, that specialists could be making money on block positioning; *see* F. Reilly & J. Nielson, Specialists and Large Block Trades on the NYSE (Research Paper No. 61, College of Commerce and Industry, University of Wyoming, January 1975).

American institutions had been to press for unfixed rates (just as they had shown less interest in a third market and no interest in institutional membership). The OSC, with two dissents, decided to let the commission rates remain fixed but with a directive to the TSE to come up with an improved set of rates. A new set of fixed rates was approved in 1977.[410]

The market-making function has not yet become a burning issue in Canada, although it is a troublesome one and may call for hard choices if and when the Canada-Wide Trading System is implemented.

Legislators in both Canada and the United States are faced with controversy over the appropriate powers of financial institutions and intermediaries. In Canada revisions to the Bank Act involve questions of bank participation in securities markets and the consequences in terms of the quality of those markets in serving individuals and institutions. At the same time Ontario is still debating amendments to the Ontario Securities Act that would alter the extent of regulation over securities-related activities of financial institutions and the attractiveness of stock markets to institutions and individuals.

So it makes a great deal of difference in planning or modifying a regulatory scheme whether we accept institutionalization of the stock market and work out a system that serves institutions well or whether we try to shift stock ownership and trading back to individuals, perhaps in part by discouraging or penalizing or simply limiting institutional ownership or trading.

B. EFFECTS ON THE QUALITY OF SECONDARY STOCK MARKETS

The economic growth of the nation depends on primary financing – the flow of savings into corporation and government treasuries for investment in real productive assets. But the secondary market – the market in which owners of securities trade them back and forth – is indirectly important because it facilitates a primary market and offers some independent benefits. So we begin with an examination of the *effects* of institutional and individual trading in the secondary market, where they are most obvious, and then turn to consider the primary market.

1. *Opinion on the Effects of Institutional Trading*

One can turn to two sources of information on these effects. The first is a vast body of opinion, conjecture, hypothesis and

410 Commission rates are discussed in ch. III *supra*.

logical reasoning. The second represents empirical research and is quite small.

In 1973, a year of sharp stock market decline, a number of witnesses appeared before the United States Senate Subcommittee on Financial Markets, chaired by Senator Bentsen, to testify on the effects of institutional investment activity.[411] The witnesses could be divided essentially into two groups. One group came from the stock exchanges and from brokerage firms apprehensive about the power of institutions to either drive down commission rates or take over the brokerage function themselves, as well as from corporations whose executives were dismayed at the declining prices of their stocks and saw institutions as the villains. The other group came, of course, from the institutions.

Witness after witness reaffirmed the importance of individual participation in the securities markets. A decline in the number of individual shareholders in the United States was deplored, as was the decline in the percentage of shares owned by individuals and in the percentage of trading on the New York Stock Exchange carried on by individuals. At the same time some mention was made of the increasing dollar value of shares held and traded by individuals. It never became clear in the hearings which statistics were the most significant: dollar value of individual holdings, dollar value of individual trading, number of individual shareholders or traders, or percentage of stock ownership or trading by individuals. No specific evidence was ever presented to demonstrate the contribution made by individual ownership of stocks or trading of stocks to the quality of the securities markets.

James J. Needham, chairman of the board of the New York Stock Exchange, listed a number of benefits one might expect to flow from individual trading: the provision of breadth to trading in many stocks that are not generally purchased by institutions, liquidity that comes from many orders from individuals, and the supply of new equity capital to small and growing companies. And he stressed the advantage of widespread ownership by individual investors in reducing the danger of undue concentration of power in the hands of large institutions.[412]

Needham and others urged the apparent disadvantages of substantial institutional trading, again with almost no evidence of specific harmful effects. The third market and the growth of the regional stock exchanges were substantially due to institutional investors and these markets fragmented the primary market (the

412 *Id.* pt. 1, at 106–07, 127.

New York Stock Exchange) to the apparent disadvantage of individual investors.[413] He and other witnesses claimed that institutions generally acquire stock positions slowly over time but sometimes "dump" their positions in a very short period of time driving down prices to the disadvantage of individuals. A number of specific cases of apparent "dumping" by institutions were described but it was clear that in many if not all of the cases unexpected bad news had led to a rapid decline in price and there was no evidence that institutions drove the prices down further than they should have gone.[414]

The cry of the corporate executives was essentially that the stocks of their corporations were undervalued and that something should be done to force or at least induce investors to put more money into those stocks and bid the prices up.[415] There was a suggestion that institutions had conspired to ignore the stocks of less than first-rate quality. The practical consequences of depressed stock prices, it was explained, are an inability or unwillingness to raise more equity capital for growth, disappointment on the part of recipients of stock options, and attractive opportunities for foreigners to purchase U.S. corporations because they place a higher value on the stocks than do United States investors.[416]

In the course of the hearings a number of interesting suggestions were made for the encouragement of individual ownership and trading of stocks and the discouragement of institutional ownership and trading, particularly in the heavily capitalized corporations. The proposals with respect to institutions had to do with limiting stock ownership and the speed of sale of equities by institutions. (No witness suggested that there should be any limitations on the speed of purchase by an institution.) Among the proposals were a statutory limit on the percentage of stock outstanding of any one corporation that might be held by an institutional investor;[417] a limit on the fraction of the outstanding shares of any particular corporation that an institution would be permitted to sell in a thirty-day period;[418] and increased commission rates to discourage institutions from selling stock.[419] It was also suggested that an improved options market may provide opportunities for institutions to dispose of holdings with less impact on the market through the writing of covered call options.[420]

Witnesses from institutions by and large took refuge in supporting increased disclosure of institutional holdings and trading activities pointing out that they have a substantial fiduciary obligation to do the best for their beneficiaries and in some cases arguing that they were making increased efforts to invest in medium-sized if not small companies.[421]

In testimony presented before a congressional committee in 1976, Professor Roy A. Schotland offered an array of statistics on the percentage of total trading in a number of common stocks accounted for by Morgan Guaranty Trust from 1973 through 1975 and from these figures drew the conclusion that institutional trading, particularly the trading of Morgan Guaranty Trust and a few other very large trust departments, must have a significant and unfortunate effect on stock prices.[422] He offered no evidence to this effect, simply stating that "it defies belief" that the trading would not have at least significant impact and asking "can anyone doubt" that the trading of Morgan is a price-setter?[423] Schotland also argued that large institutions like Morgan are able to create their own superior investment performance records by accounting for a substantial proportion of trading in a number of stocks. He did not explain how it is possible for an institution to bid up the price of a stock beyond any reasonable value and to continue to raise it year after year in order to maintain a superior long-run performance record.[424]

Schotland did not recommend any direct limitations on trading, but he did recommend that a trust department should not be permitted to hold in the aggregate more than 5% of the outstanding shares of any single large corporation.[425]

Professor David W. Miller prepared for Morgan Guaranty Trust, in the summer of 1977, an analysis of Morgan's trading that refuted virtually all of Schotland's conclusions. Much of the testimony in the hearings referred to above was concerned with the "two-tier" market, a phenomenon much discussed in the early 1970s, particularly in 1973 when the stock market had declined but the "top tier" had held up rather well. The theory was that the top tier consisted of the favourites of institutional investors who sup-

423 *Id.* at 212, 214.

424 *Id.* at 219.

425 *Id.* at 221.

ported the prices of these stocks and thereby achieved superior investment performances. The lower tier consisted of stocks that did not have institutional support and therefore declined in price.[426] The theory appealed chiefly to those who saw something diabolical in institutional concentration of investments. With the decline of even the top tier in 1974 and the recovery of many lower tier stocks in 1975 and 1976 the theory was temporarily shelved. And some evidence has been brought forward to show that there have always been "favourites" with changes from time to time in the stocks included in this category.[427]

An interesting variation on the two-tier theory was published in 1975. Frank Reilly suggested that a marketability need, rather than performance manipulation, will inevitably lead institutions to favour a narrow list of stocks.[428] He suggested that of some 9,500 corporations in the United States with publicly traded stock, fewer than 400 have a market value of $400 million and therefore offer the marketability needed by an institution with $1 billion or more to invest in equities (as is the case for the top seventy or so institutional investors). A middle tier, consisting of corporations with a market value from $200 to $400 million, would offer sufficient marketability for most institutions and large individual investors. Reilly estimated that this tier would include about 300 stocks. The bottom tier, then, would contain some 8,800 stocks.

The argument based on marketability is certainly more plausible than one based on performance strategies but there is evidence that casts some doubt on it. In responding to a questionnaire from the Senate Finance Committee in 1976 some of the twenty-nine largest bank trust departments in the United States described investments in companies in Reilly's middle and bottom tier. Morgan Guaranty Trust, which manages over $9 billion of common stocks in employee benefit funds alone, reported a special situation-equities commingled fund with half a billion dollars invested in the stocks of 190 companies with capitalizations below $100 million. A second commingled fund had another half billion dollars invested in 117 companies with capitalizations between $100 million and $500 million.[429] First National City Bank, with

426 The Miller analysis was transmitted to Senator Lloyd Bentsen, chairman of the Subcommittee on Private Pension Plans and Employee Fringe Benefits, of the Senate Finance Committee, by Harrison V. Smith of Morgan Guaranty Trust on August 4, 1977.

428 Reilly, *A Three-Tier Stock Market and Corporate Finance*, 4 FINANCIAL MANAGEMENT 7 (Autumn 1975).

429 SUBCOMM. ON FINANCIAL MARKETS, *supra* note 230, at 6.

over $4 billion in equities in employee benefit funds, also reported two commingled funds, one with half a billion dollars apparently aimed at medium-sized and large companies and a smaller fund directed to small, expanding companies.[430] Harris Trust and Savings (over $1 billion in employee benefit fund common stocks) also reported a collective fund with $103 million invested in seventy small companies,[431] and Crocker National (over $900 million in employee benefit fund equities) referred to investments in companies with market capitalizations as low as $25 million.[432]

All of this does not disprove the likelihood that there will be continued institutional *preferences* following Reilly's logic. But it does seem clear that the largest institutions can accommodate substantial holdings of middle and lower tier stocks. Indeed, many of the responses to the questionnaire indicated increasing diversification in common stock holdings and one might argue that the largest institutional investors are in the best position to assemble thoroughly diversified portfolios of small and relatively high risk companies. And as we shall see, this ability may be important to the primary financing of these companies.

In Canada, too, it has been argued that there is a two-tier market and we do have some evidence of the extent to which institutions, in contrast to individuals, concentrate their trading in "top traded" stocks. The Toronto Stock Exchange has reported as part of the findings of the Revenue and Market Analysis Study (RAMA) that for the quarter April–June 1976 institutions accounted for 43.9% of the dollar value of all trading on the exchange and 55.3% of trading in the "top traders".[433] (The "top traders" were the one hundred stocks most traded in 1974. By 1976 this list had declined to about ninety-five stocks.) However, as of the end of 1975 this set of stocks accounted for 66% of the market value of Canadian stocks on the TSE ($34.0 billion of $51.7 billion),[434] and in 1975 trading in these stocks constituted 66% of total trading in Canadian stocks on the exchange ($2.60 billion of $3.96 billion).[435] So it appears that at least for 1975 trading in the "top traders" was proportional to market value outstanding and small and medium-sized companies do not appear to have been neglected in the secondary market.

2. *Empirical Testing*

A number of empirical studies have explored the impact of institutional trading on the quality of the stock market.[436] One of the first was a part of the *Institutional Investor Report* by the SEC published in 1971, two years before the hearings discussed above. In its overall conclusions, the SEC reported:

> "The preponderance of data collected by the Study on monthly net institutional trade imbalances, on institutional position changes, on block trades and on day-to-day price changes analyzed in Chapters X, XI, XII indicate that institutional trading in the aggregate is related to or coincident with relatively few of the large price changes that occur in the securities market....Other analyses of random large position changes by institutions indicate that, even on an inter-day basis, institutional trading appeared to offset price movements about as frequently as it appeared to contribute to them. Furthermore, from the data on market-makers it appears that during stock months in which institutions were more active, large close-to-close price changes were less frequent....Thus, the Study has not discovered any basis in terms of price stability for imposing generalized limitations on the volume of institutional trading or on the size of institutional transactions."[437]

In 1977 Frank Reilly reported empirical testing using the SEC statistics for stock transactions of major financial institutions annually for 1962 to 1974 and quarterly for 1964 to 1975. He found no evidence of a strong positive relationship between institutional trading and stock price volatility.[438] Other research has found a *negative* relation between block trading (characteristic of institutions) and price volatility.[439]

There have been studies specifically of mutual fund investment behaviour reporting the effects on the market of trading by the funds. In 1970 Friend, Blume and Crockett reported their research on mutual fund investment performance and the appar-

436 The Quebec Securities Commission Task Force cited a number of articles in reaching its conclusion that there is no proof that the leading role played by institutions in European markets has reduced their efficiency; QSC TASK FORCE, *supra* note 144, at 19-20.

438 Reilly, *Institutions on Trial: Not Guilty!*, 3 J. PORTFOLIO MANAGEMENT 5 (winter 1977).

439 Grier & Albin, *Nonrandom Price Charges in Association with Trading Large Blocks*, 46 J. BUS. 425 (July 1973); and F. Reilly, Block Trades and Stock Price Volatility (October 1975) (Faculty Working Paper No. 279, University of Illinois).

ent impact of mutual fund purchases and sales on the stock market.[440] They found that in the late 1950s through most of the 1960s stock buying by mutual funds did seem to accompany a substantial price rise in the stocks purchased, while price declines accompanied stock sales. This pattern could have been due to the ability of mutual fund managers to correctly predict stock price movements and to make use of their predictions or it could have been due simply to the effect on prices of substantial institutional purchases and sales. The authors had already uncovered evidence casting suspicion on the ability of managers to profit from evaluations of common stocks any more than anyone else. And some features of the price performance, notably the recovery of stock prices after a decline that accompanied mutual fund sales, suggested that it was the trading rather than the correct prediction of the market that accounted for the results observed. Overall, however, these three authors were unable to conclude that institutional trading had any significant impact on the efficiency of the stock market.

John Evans reported in a 1975 paper his analysis of the impact of mutual fund trading on the Canadian stock market.[441] He concluded that mutual fund trading over the period from 1965 to 1971 did exert substantial price pressure on the stocks of small companies (those with fewer than ten million shares outstanding). Substantial buying by mutual funds appeared to push up stock prices which subsequently declined as the mutual fund buying slowed or ceased. Selling by mutual funds appeared to push down stock prices and these prices tended not to recover subsequently. Evans attributed this price behaviour to a two-tier market effect with mutual funds simply disposing of their holdings in some small companies and leaving the stocks to languish in a non-institutional market.

An analysis of mutual funds in Spain concluded that funds had increased the efficiency of the Spanish stock market. Mutual funds are the only financial institutions participating in the Spanish stock market and during the period preceding 1966, when funds began operating, the market was noticeably less efficient than in the post-1966 period.[442] It seems likely, however, that it was not the trading activities of the funds but their demands for hitherto unavailable corporate information that led to a better market. This conclusion is not to deprecate the usefulness of insti-

tutional participation in the market; it means that institutional investors can contribute to market quality by forcing better disclosure than individual investors are able to obtain.

There have been a few studies of the effects of large transactions – the kind one would expect for institutions – on stock prices. If there is an impact on the price of a stock, it could be due to price pressure or to information. That is, it may take a price reduction to sell a large block or one may have to pay a premium to buy a large one, or the person initiating a large trade may have inside information and the price adjustment accompanying the trade will simply reflect the information. Some of these studies were reviewed in a paper by Reilly and Drzycimski in 1975.[443]

In a study of the effects of 7,000 block trades (over $1 million each) on the New York Stock Exchange in 1968 and 1969, Kraus and Stoll concluded that for block trades initiated by buyers there were upward adjustments of price due to information and a true increase in the value of the stock.[444] They concluded, however, that most block trades are originated by sellers and that these showed some price pressure effects.[445] Prices would be depressed by the sale, but would recover, usually by about the magnitude of one commission, by the end of the day. They also found that block trades did not lead to increased price volatility. Indeed, another study concluded that block trades reduced price variability.[446]

Analysis has also been carried out on parallel trading by institutions – trading in which several institutions are simultaneously buying or selling. Presumably parallel trading can be significant only if there are individuals on the other side of the transaction – to buy when institutions are selling and to sell when institutions are buying. Parallel trading conflicts with the concept of a tiered market with institutions operating in one tier and individuals in another. Kraus and Stoll, using data gathered for the SEC *Institutional Investor Report* for 1968–69, found that institutions tend to be active in the same stock at the same time but not necessarily on the same side.[447] Banks and investment companies showed evidence of parallel trading in heavily traded NYSE stocks but the two kinds of institution were generally on opposite sides of the market. Bank trust departments were buying

when investment companies were selling and vice versa. On the whole institutions tended to offset each other's trading more than one would expect from pure chance. There were, of course, instances of parallel trading and an imbalance of institutional supply and demand which led to price pressure effects.[448]

An interesting analysis of the effect of large trades in the Canadian stock market was reported in 1975. Nicholas Close used data on secondary offerings and transactions large enough to qualify for volume discounts on brokerage on the Toronto and Montreal Stock Exchanges in 1970 and 1971. He was able to classify accurately the trades as buyer or seller initiated because the classification was noted on the volume discount reports from brokers.[449] The data covered 1,541 buyer-initiated and 1,092 seller-initiated transactions. The price effect of the buys was described as:

> "For buys, days −15 to −1 (the 15 days preceding the trade) indicate that prices preceding block purchases tend to be slightly higher than at any other time in this first period immediately before the block. Days 0 to +4 – the five-day period of actual trading – feature rapid price appreciation of about 1.8 percent, most of which occurs on day 0. From +4 to +15 the index does not drop, indicating that the price changes associated with block purchases are "permanent" in nature, supporting the information effect explanation.
>
> "For sales, the most striking feature is the lack of any impact. Prices are relatively strong from day −15 to −1. Then there is a drop of about 0.5 percent during days 0 and +1. After a seven-day period of no movement, prices tend to recover and by day +15 they are slightly higher than on day −1. These results best support the substitution hypothesis, which predicts little or no impact."[450]

Price impact was found not to be related to the value of a trade which tends to refute a hypothesis of price pressure effects. Perhaps of more interest in the Canadian context where the volume discount is available for aggregate trades over five consecutive trading days, the price impact of sells (which we have seen was virtually non-existent on average) did not differ as the trade was spread over one to five days. But for buys, spreading the trade over

448 Specifically, parallel buying in a $50 stock that produces a $5 million excess of institutional purchases over sales in a month could be expected to bring about a 75¢ increase in the stock price that month with a 53¢ reversal the next month.

449 Close, *Price Reaction to Large Transactions in the Canadian Equity Markets*, 31 FIN. ANALYSTS J. 50 (November-December 1975).

450 *Id.* at 51, 53.

several days did drive up the price temporarily – there was a price pressure effect.

Some further interesting results came from separating the trades in stocks with a high institutional following from those with a low institutional following. For the former (the top ten) there was almost no price impact for buys and for sales a steady price decrease up to and including the trade days, steadying at day +8 at about a 2% discount.

For the stocks with a low institutional following (the bottom fifty), the buys showed a substantial and mostly lasting price increase suggesting information effects. The sells were *also* associated with a permanent price increase of about 6%. Close's explanation is that a price increase triggers block sales and that the sales simply halt the increase. In any case, there seems to be little in the way of price pressure effects, for buys or sells, for institutional or non-institutional stocks.

Further tests of the impact of institutional trading have considered correlation between volatility of stock prices and institutional activity. Reilly and Drzycimski found an increase in volatility from 1965–67 to 1970–73, a period of increasing institutional share of trading.[451] But they also analyzed the variability in a number of economic variables and concluded that "several of these could explain the increase in stock price volatility distinct from any increase caused by institutional trading".[452]

3. *Comparison of Institutional and Individual Trading*

There have been very few studies of individual investor behaviour, largely because it is so difficult to obtain data on individual holdings and trading. One particularly interesting study on the relative merits of institutional and individual trading took the form of a test involving New York listed stocks, of the Capital Asset Pricing Model. A brief description of the model is necessary before reporting the results of the research. According to the model, in an efficient stock market investors will anticipate a rate of return on a particular stock that is proportional to its "market risk" but independent of its "unique risk". The perceived total risk in a stock is thought of as consisting of these two components. The market risk simply reflects the fact that all stocks move more or less with the stock market; some respond sharply to market moves and have a high market risk; others respond less and have a low market risk. But the movement of the

451 F. Reilly & E. Drzycimski, *supra* note 443.
452 *Id.* at 20.

market as a whole does not explain all of the movement in individual stock prices; so each stock has its own unique risk. An investor can anticipate that a stock will move to some extent with the market and he can estimate the market risk. He can also anticipate that there will be independent movement in the price of the stock arising from factors affecting that stock uniquely. And he can make an estimate of the unique risk. The capital asset pricing model assumes that an investor will take risks only if he expects to be paid for them. Hence the greater the expected risk, the greater the expected return the investor will demand when he purchases a stock. But the model also assumes that investors are capable of putting together fully diversified portfolios. And in a fully diversified portfolio the unique risks of individual stocks will cancel out. So for an investor who holds a fully diversified portfolio, the only risk that matters is the market risk. The prices of securities should be such that they offer an expected rate of return that is just proportional to market risk. For an investor whose portfolio is *not* fully diversified, the unique risk in the stocks he owns will *not* be diversified away and he will hope to be compensated for this risk in the expected rate of return on his stocks. If all the investors in a market have poorly diversified portfolios, one would expect securities to be priced in such a way that the expected return on a stock will be proportional to the total risk in that stock, the market risk plus the unique risk.

Now if it turns out that institutional investors tend to hold fully diversified portfolios while individual investors tend to hold poorly diversified portfolios and if there is a class of stocks that might be called "institutional" and another class of stocks that are predominantly held by individuals, then one might anticipate that the institutional stocks will be priced in such a way that their expected return is proportional to their market risk, while the non-institutional stocks will be priced in such a way that their expected return is proportional to their total risk.

Barnea and Logue tested this hypothesis for New York Stock Exchange stocks over the period July 1966 through June 1971.[453] The data used were for 160 stocks, fifty of which were treated as institutional stocks because institutions held anywhere from 20% to 50% of total shares outstanding. The remaining 110 stocks were regarded as non-institutional. Correlations between return and market and unique risk verified the hypothesis put forward above. For the institutional stocks expected return was apparently proportional to market risk, while for the non-institutional stocks

453 A. Barnea & D. Logue, Diversification Costs and Market Equilibrium (unpublished paper, 1975).

expected return was proportional to the sum of market and unique risk. The implications of these results are quite important because they mean that the cost of equity to corporations that are held by institutions is lower than the cost to corporations that are not held by institutions. And this result has nothing to do with the possibility that institutions are deliberately bidding up the prices of their favourites in order to achieve superior performance. It simply has to do with the likelihood that institutions achieve fully diversified portfolios, while individual investors do not.

There does not appear to have been any directly corresponding research on the stock market in Canada. Two authors who examined stocks listed on the Toronto Stock Exchange over the period from 1959 to 1971 concluded that expected returns for the stocks were not proportional to market risk and were presumably dependent on the sum of market and unique risk. However, they made no attempt to distinguish between institutional and non-institutional stocks.[454]

C. EFFECTS ON THE QUALITY OF THE PRIMARY STOCK MARKET

So far as economic activity is concerned the primary securities markets, rather than secondary markets, are what matter. It is by way of primary markets that new capital is supplied to business and government for investment in real, productive assets.

It is generally assumed that the quality of primary markets – the success with which governments and businesses can raise capital at reasonable cost – is closely related to the quality of secondary markets, although there appears to be no empirical research on this point. At the least the secondary market serves to price securities, and we have seen that there is evidence that stocks held by institutions are priced to offer a lower rate of return than stocks not held by institutions.

Much of the alarm expressed over the institutionalization of the secondary market has concerned the concentration of institutional investment in the largest companies. A number of the submissions to the Ontario Securities Commission in the summer of 1976 on the subject of fixed minimum brokerage rates commented that the existence of active secondary markets in a company's stock is critical in enabling that company to raise new equity capital and that institutions are generally not interested in the stock of small and medium-sized companies. Against this we have seen evidence that some very large bank trust departments in the

454 Findlay & Danan, *A Free Lunch on the Toronto Stock Exchange*, 6 J. BUS. ADMIN. 31 (spring 1975).

United States have formed pooled funds to invest in small and medium-sized companies.

D. THE EXTENT OF INSTITUTIONALIZATION

The submissions to the Ontario Securities Commission in the summer of 1976 on the subject of fixed minimum commission rates reflected sharp disagreement over the extent to which the Canadian equity market has actually been institutionalized. The Montreal Stock Exchange, in a report by P. Lortie, presented statistics suggesting extraordinary concentration of equity ownership and trading by Canadian institutions, particularly a few Canadian trust companies.[455] Many of the other submissions accepted the statistics presented in this report and argued from them, generally expressing great concern over institutional concentration. Some submissions, however, challenged the Lortie statistics, arguing that the threat is not nearly as great as he suggested.[456] The *Quebec Securities Commission Task Force Report* also disagreed with Lortie.[457] It is extraordinarily difficult to calculate the percentage ownership by different kinds of investors of the equities *available for trading* in the Canadian marketplace. It is a good deal easier to identify the proportion of the trading itself that is conducted by different classes of investors. Table 55 compares institutional and individual stock trading in the United States[458] and Canada.[459] The table indicates that so far as equity trading is concerned individuals play a much greater role in the Canadian listed stock market than they do in the United States listed stock market. Table 56 shows some institutionalization of the Canadian market over time but also a leveling off of this trend. (The same leveling off has been observed for the New York Stock Exchange.)

Trust companies constitute a special case. The submissions to the OSC, especially those of the stock exchanges, stressed the extraordinary concentration of stock ownership and trading in Canadian trust companies. This concentration was cited as a factor differentiating Canadian from United States securities markets and suggesting special dangers to Canadian markets should trust

companies be free to use their full strength in bargaining over commission rates.

The Toronto Stock Exchange *RAMA Study* reporting trading over the twelve months ending in March 1976 showed trust companies accounting for 12% of all TSE trading.[460] The 1975 *Report of the Registrar of Loan and Trust Corporations for the Province of Ontario* showed trust company estate, trust and agency holdings of common stocks at $12,104 million as of the end of 1975.[461] On the same date the value of all Canadian stocks listed on the TSE was $51,566 million. Trading on the TSE in 1975 was about 70% of trading on all exchanges in Canada and if we assume that TSE listings were worth at least 70% of total listings, then trust company stock holdings were at least 16% of total listed stocks.[462] We can at least say they were between 16% and 23%.[463]

In the U.S., 1974 statistics for bank trust departments show them holding about 21% of all common and preferred stock in trust and agency accounts.[464] So in the aggregate, concentration of holdings in trust departments does not seem very different as between the two countries.

Canadian trust company holdings are quite concentrated in a few companies. Royal Trust, with $5,541 million in stocks at the end of 1974, held 46% of all trust company stock holdings. The top five trust companies, in stock holdings, held 86% of all trust company holdings.[465] In the United States, Morgan Guaranty Trust held 5% of all bank trust assets and the top five banks in trust assets held 21%.[466] But there are 4,000 banks reporting trust assets in the United States and only thirty-eight trust companies reporting to the Ontario Registrar.

Some of the submissions to the OSC expressed the opinion that it is inevitable that independent investors will gradually abandon the stock market to institutions. And representatives of the secur-

466 FDIC REPORT, *supra* note 464.

ities industry itself commented that for many individuals it makes more sense to purchase equities through a mutual fund than to purchase them independently through a broker. (Most of the theoretical literature supports this position simply because the diversification opportunities are so much greater in mutual funds than they are in an individual portfolio.) Some of the submissions indicated an expectation that a reduction in commission rates charged to independent investors or at least a reduction in the gap between the commission rates paid by institutions (on large trades) and those paid by independent investors would encourage the latter to trade more or to refrain from turning their savings over to institutions.[467] On the other hand, some of the submissions indicated that the level of commission rates probably has very little to do with the amount of trading done by individual investors.[468] Several submissions, including some supporting the existing fixed commission rate structure, accepted the proposition that under the existing system institutional trading was subsidizing the trading of independent investors.[469] At least one institution[470] stated that it was perfectly willing to pay the subsidy in order to obtain the benefits of the contribution of the independent investor to market liquidity.

Many of the submissions stressed the importance of services apart from low commission rates to independent investors. Many felt that providing research to independent investors has much to do with encouraging them to trade. Others felt that the number of registered representatives employed by brokerages in the aggregate has a lot to do with the extent of independent investor trading. These conclusions were generally part of an argument for a commission structure that tends to lead to large quantities of brokerage research and the employment of large numbers of registered representatives.

Almost all of the submissions predicted that abandoning fixed commission rates would lead to significant reductions in commission rates for institutions and very little reduction, if any, for independent investors. Some regarded this result as quite appropriate on the grounds that institutions were currently subsidizing independent investors. Others regarded it as entirely inappropri-

467 Several submissions called for lower commission rates and some said that reduced rates would lead to more trading by both individuals and institutions; *see e.g.* Lindsay, McKelvey & Co. Limited, submission to the OSC (May 1976). International Trust Co., submission to the OSC (April 30, 1976), predicted little increased institutional trading if rates were lowered but some increase in trading by individuals.

468 *See e.g.* Canada Permanent Trust Co., brief to the OSC (June 18, 1976).

469 *See e.g.* Vancouver Stock Exchange, brief to the OSC (June 1976); Toronto Stock Exchange, brief to the OSC (June 18, 1976).

470 *See* Manufacturers Life Insurance Co., brief to the OSC (June 28, 1976).

ate because of a perceived need for greater and not lesser participation by independent investors in the marketplace. It is interesting that none of the submissions considered the possibility that freely negotiated commissions might lead to arrangements providing for significantly reduced rates to independent investors. And yet precisely this result is reflected in the discount broker services available in 1977 in the United States.

The New York Stock Exchange in 1972 undertook some research on the importance of commission rates to individual stock investors.[471] In general, investors did not think an increase in rates would reduce their trading. Most did not even know what the rates were; many overestimated the rates; and a large majority had no quarrel with the rates.

In a series of United States hearings in 1976 the New York Stock Exchange contended that the pooling of small orders by commercial banks offering some type of brokerage service would further increase the percentage of volume in large orders and diminish the number of individual small orders which are necessary to provide depth and liquidity. The exchange added the comment that savings in commissions to individual investors brought about by this pooling will drain brokerage revenues from the securities firms that maintain the mechanism and regulation of the auction market.[472]

The rules of the Toronto Stock Exchange deny the benefits of quantity discounts to independent investment counsel who are able to pool transactions for a number of clients, and seem clearly aimed at denying reduced commission rates to investors who have chosen to remain independent. It is interesting that the Ontario Securities Commission endorsed the rule in question on the grounds that if independent investment counsel were able to pool the orders of their clients this might lead to excessive trading by those clients.[473] All of these rules seem to contradict most of the reasoning in the submissions supporting the need for greater independent investor trading.

We are left with conflicting opinions as to the effect of commission rates on individual trading. Those defending fixed rates have argued that high rates do not discourage trading and that there is no need to bring rates down. But then they have argued that competitive rates will draw business to the discounters and

471 A report on the results appears in *Financial Markets: Hearings before Subcomm. on Financial Markets*, *supra* note 41, pt. 1, at 121-22 (July 24-26, 1973).

472 *Financial Institutions: Hearings before Subcomm. on Financial Institutions*, *supra* note 200, pt. 3, at 2084 (December 1975, January 1976).

473 *In re* the Securities Act and the Toronto Stock Exchange and Fiscal Consultants Limited, [1974] OSC Bull. 139 (June).

away from firms offering traditional services. Implicit in this argument is a claim that the services are more valuable than commission savings but that individuals do not realize this.

It is hard to avoid the conclusion that only a free market, one in which brokers can compete freely on a price and service basis, will show what customers really want and what they are willing to pay. In such a market it may become evident that independent individual investors are not willing to pay what brokers must charge to stay in business or it may be that some brokers at least can offer very attractive rates to individuals and still operate profitably. They seem to be able to do so in the United States in 1978.

E. INSTITUTIONAL CONTROL OVER PORTFOLIO COMPANIES

Institutional control is an issue that has been of considerable concern to the United States Congress, as we have seen in connection with bank trust department holdings.[474] It has not been of as much concern in Canada, probably because almost nothing is known about trust company holdings. Other institutions do not seem to interfere much with the companies they hold.[475]

The argument has been advanced in Britain that institutions *should* play an active role. Dobbins and McRae reported that in the United Kingdom institutional investors own 45% of the common stock in quoted companies, and estimated that they will own 50% by 1977.[476] These two authors complained of unwillingness on the part of the institutions to act collectively in the use of their voting strength to influence corporate management. The British institutions appeared to behave much like the American institutions, occasionally exerting some private influence on management but generally simply selling their shares in cases of dissatisfaction. Dobbins and McRae predicted that there would be a change and a consequent improvement in the performance of British companies.

Four kinds of institutional shareholders – insurance companies, pension funds, investment trust companies, and unit trusts – all have their own associations and in 1973 these associations formed the Institutional Shareholders' Committee with the objective of improving the efficiency of industrial and commercial

474 *See* ch. IV *supra*.

475 PORTER REPORT at 194 expressed the opinion that trust companies exert no dangerous influence over portfolio companies.

476 R. DOBBINS & T. MCRAE, INSTITUTIONAL SHAREHOLDERS AND CORPORATE MANAGEMENT (MCB Monograph 1975). And *see* Dobbins, *The Institutional Shareholder*, 2 MANAGERIAL FINANCE 341 (1976).

companies in Britain. The committee was formed with the support of the Bank of England and apparently the purpose was the concerted and effective use of voting power.

While Dobbins and McRae would like to see increasing institutional participation, they do point out that the interests of small shareholders may suffer and that some devices, perhaps the two-tier structure in use in some European countries, may be necessary to preserve true shareholder democracy. They say that the direct intervention by financial institutions in the decision-making processes of industrial organizations is commonplace in Europe. In Germany and France banks in particular have substantial equity holdings in individual companies and are the main source of external financing. While British banks are the main source of external finance for British industrial and commercial companies, they have simply not undertaken to influence company management as have German banks.

F. CONCLUSIONS AND POLICY IMPLICATIONS

A first policy choice for securities legislation or the rules of a regulatory commission has to do with the relative importance of institutions and individual investors. There is a widespread belief that institutional ownership of equities and trading should be restrained and that we should try to entice individuals back into the marketplace. But there appears to be little evidence to favour the contribution of individual trading over that of institutional trading. We have seen in chapter I the importance of institutional holdings of common stocks in Canada. If the institutionalization of portfolio holdings is inevitable, then it may be very damaging to the Canadian economy to attempt a regulatory structure that discourages institutions from buying common stocks.

But the argument remains that institutions favour the stocks of the large, well capitalized companies and that the small and medium-sized companies will not obtain the capital they need in a market dominated by institutions.

The economic case for the small and medium-sized companies has really never been carefully established. Whether the economy benefits more from a dollar of capital invested in a small company than from a dollar invested in a large company is still an open question. But there is such widespread opinion that noneconomic, social factors demand the encouragement of small business that perhaps we can ignore the purely economic question.

Next, there is the question whether small business is at a disadvantage in raising capital because of the structure of the capital marketplace. Many suppliers of capital to small business

claim that there is plenty of capital available but that few small businesses can justify an investment. Essentially, this amounts to a claim that investors, on the one hand, and small business owners, on the other hand, can rarely agree on the terms for financing. The investors, perceiving a high risk in a small business, demand a high expected rate of return and hence a low purchase price for stock. The owners, less impressed with the risk and more optimistic about success demand a high price. In a free market some bargains are struck but many businesses go unfinanced. No deficiency in the market structure, however, stands in the way of financing. There is simply a conflict among judgments and a failure to agree on financing terms.

But we have seen that there are three features of the marketplace that seem to put small companies at a disadvantage. One is the fact that an investor with a well diversified portfolio will find a small company less risky (or perhaps it would be more accurate to say less objectionable on the grounds of risk) than will an investor with a poorly diversified portfolio. Second, the indications are that institutions generally have well diversified portfolios, while individual investors tend to have poorly diversified portfolios. The result is that companies that rely on individuals to buy their stock have a higher cost of capital than those that can sell stock to institutions. Finally, we saw that institutions, for good reason, favour stocks that are marketable – stocks for which there is an active secondary market.

All of this suggests two avenues to reducing the cost and increasing the quantity of financing for small business. One would encourage individual investors to form well diversified portfolios; the other would enhance the marketability of stocks of small companies.

The first might mean bringing down transaction costs to the point where an investor with modest assets is able to spread those assets over a large number of stocks as cheaply as he can invest them in only a few stocks. This might be done by deliberately subsidizing the trading of individual investors. The second might mean easier stock exchange listings for small companies, bringing onto the exchange companies that do not qualify at present.

It is also possible that even for institutions with fully diversified portfolios unique risk is still a matter of concern. Institutions subject to a "prudent man" rule, if that rule is interpreted as requiring that each stock be evaluated on the basis of its total risk, may fear turning to what has hitherto been the non-institutional set of stocks. A change in standards of prudence reflecting the increased tolerance for unique risk in a stock that goes with diversification of a portfolio may be called for.

Whatever the policy choice, it is very difficult to make a case for discouraging institutional investment in stocks. And encouragement of individual investment is only one way and not necessarily the best to deal with structural obstacles to small company financing.

Appendix

This appendix reproduces the text of Chapter II from the Quebec Securities Commission Task Force Study of June, 1976: *Commission Rates in the Securities Industry*. It describes the rates in Canada and the United States, up to 1976, with particular emphasis on the spreads between rates in the two countries.

Chapter II
History and Characteristics of Commission Rates

Fixed commission rates for stock exchange transactions are not recent. In the United States fixed commissions go back to the so-called Buttonwood Tree Agreement of 1792, which provided

> "We, the Subscribers, Brokers for the Purchase and Sale of Public Stock, do hereby solemnly promise and pledge ourselves to each other, that we will not buy or sell from this day for any person whatsoever, any kind of Public Stock at a less rate than one-quarter percent (1/4%) Commission on the Specie value, and that we will give a preference to each other in our Negotiations . . ." (New York, May 17, 1792).

Until 1920 stock exchanges catered to a limited number of individuals. The general public was not involved to any significant extent in exchange trading in equity securities.

After the end of World War I, the public participated with increased frequency in exchange trading in equity securities and the stock market assumed unprecedented importance in the functioning of the economy.

The disastrous events of 1929 gave rise to a movement of reform in the United States which culminated in the enactment of the Act of 1934 and the regulatory authority given to the Securities and Exchange Commission (SEC).

After World War II, the public flocked into the securities markets, and financial institutions increasingly participated in those markets. These circumstances resulted in Congressional and SEC concern as to the adequacy of investor protection.

A first major study was conducted under the auspices of the SEC: "Special Study of Securities Markets", H.R. Doc. No. 95, 88th Congress, 1st Session (1963).

This study included, among other things, probably the first reasonably comprehensive analysis of the nature and structure of commission rates. It pointed out that:

a) the commission rate schedule covered a great variety of services performed by brokers in addition to the execution and clearance of transactions;

b) that the foregoing characteristic (a) of the rate structure induced service competition rather than price competition which resulted in complex and irrational distinctions between

permissible ancillary services and prohibited rebates of the minimum commission;

c) reciprocal arrangements were prevalent;

d) all the foregoing factors proved that the nature of the securities commission business was such that traditional principles of rate regulation could hardly be applied to it.

In January 1968, the New York Stock Exchange (NYSE) in response to the SEC's concern with respect to the operation of the commission rates schedules then in effect, submitted to the SEC a proposal for certain revisions in the structure of its commission rates schedule. The proposal provided for:

a) volume discounts;

b) economic access to the NYSE for non-member broker-dealers through a discount;

c) limited recognition of 'customer-directed give-ups'[1], and

d) prohibitions on procedures then used by institutions to recapture commissions.

Note: The SEC Release No. 8239, January 26, 1968, described in some detail the give-up and reciprocal business practices[2] which had been adopted in order to evade the fixed commission structure.

The NYSE proposal initiated the first major hearings with respect to rate structures[3] which were held from 1968 to 1971. For the first time the question was directly raised as to whether fixed rates of commission should be replaced by competitive rates. In December 1968, in the midst of the hearings, the NYSE and other exchanges adopted volume discounts and banned customer-directed give-ups.

The second major study was transmitted to the Congress by the SEC on March 19, 1971. It was entitled "Institutional Investor Study"[4] and covered the years 1969 and 1970. It was basically an economic study which included an examination of the impact of institutional investment on the securities markets. In a letter attached to the study report, the SEC concluded, among other things:

"The fixed minimum stock exchange commission on large orders had led to the growth of complex reciprocal relation-

1 The customer-directed give-up was a payment by the executing broker of a part of the minimum commission it was required to charge its customer, to other broker-dealers designated by the customer or his investment adviser. The amount of the payment was negotiated.

2 These are practices by which executing brokers provide compensation to other brokers at the direction of institutional investors, permitting such other brokers to participate in the commission generated from execution, in the over-the-counter market or on regional exchanges, of orders which the institutional broker has received from other customers.

3 Securities and Exchange Commission, "In the Matter of the Commission Rate Structure of Registered National Securities Exchanges", SEC File No. 4-144 (1968–71).

4 SEC, "Institutional Investor Study Report", H.R. Doc. No. 92-64, 92nd Cong., 1st Sess. (1971).

ships between, on the one hand, institutions (particularly mutual fund managers and banks) and, on the other, broker-dealers. This has had the effect of making commission rates for institutions negotiable but limiting the extent to which the ultimate investor rather than the money manager has benefited from such negotiation . . . These relationships tend to aggravate potential conflicts of interest. . . ."

In April 1971, at the direction of the SEC, American exchanges provided that commissions on the portion of exchange orders involving $500,000 or more were to be competitively determined.

The "Market Structure Statement",[5] issued on February 2, 1972, by the SEC, concluded that a reduction to $300,000 was called for in the breakpoint above which commission rates on exchange transactions should be competitively determined. In response to the SEC's conclusions, the breakpoint on fixed commission rate schedules was lowered to $300,000 in April 1972.

Finally, in its Release No. 10383 (Sept. 11, 1973), the SEC indicated that it would act promptly to terminate the fixing of commission rates after April 30, 1975, if the exchanges did not, on their own initiative, adopt rule changes achieving that result.

One of the major reasons underlying that decision by the SEC was that, for institutional investors, the commission rates were in fact negotiated. The numerous interventions of the SEC and to a lesser extent of the exchanges to abolish the customer-directed give-ups and the reciprocal business practices were unsuccessful. In fact, institutions and the brokerage community were able to split minimum commission by devices which achieved the same results as "give-ups", such as "mirror transactions"; the "step-outs", the "four-way tickets"; the "eight-way tickets"[6] and all kinds of soft-dollar deals.

The history of the Canadian securities markets parallels that of the United States markets. The Canadian securities commissions and self-regulatory bodies have followed with great interest the evolution of this situation in the United States. This is to be expected because the Canadian and United States economic systems are so closely linked.

If we consider, for instance, the commission rate structure in Canada and in the United States, the similarity is remarkable. In fact, one of the arguments often used by the Canadian exchanges in requesting changes in commission rates was their comparison with the rates on United States exchanges (mainly the NYSE). The purpose of those comparisons was to show that the Canadian exchanges should be able to compete with the United States exchanges with respect to commission rates in order to prevent "the movement of sizeable portions of trading

5 SEC, "Statement on the Future Structure of the Securities Market", 37 Fed. Reg. 5266 (March 14, 1972).

6 Securities Industry Study, "Report of the Subcommittee on Commerce and Finance of the House Committee on Interstate and Foreign Commerce", H.R. Doc. No. 92-1519, 92nd Cong., 2d Session, at 133 (1972).

in interlisted issues of the United States (since) such an event would be injurious to the liquidity of the Canadian markets".[6a]

That relation between the two countries is made evident by the dates on which the recent changes in commission rates took place:

New York Stock Exchange	*Montreal Stock Exchange*
September 25, 1973	November 28, 1973
November 19, 1974	November 19, 1974
May 1, 1975	—
	January 1, 1976

Furthermore, it seemed important to point out certain features of the commission rate schedules and the evolution of those schedules in Canada and the United States.

1. COMMISSION RATES ARE A FUNCTION OF THE TOTAL AMOUNT OF THE TRANSACTION AND OF THE PRICE PER SHARE

Table II-1
Commission Rates in Canada Since January 1, 1976

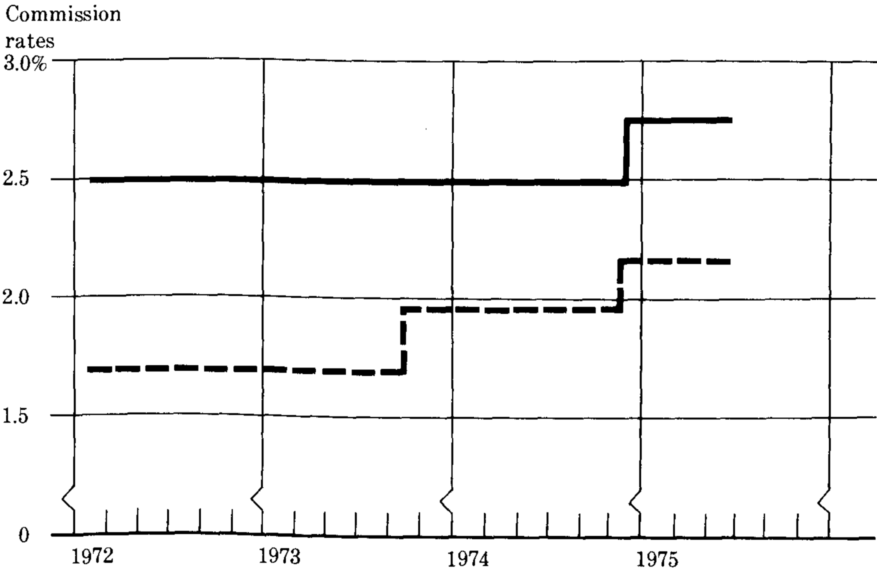
Total amount of the transaction (000's)	Rate of commission on shares of		Spread ((a-b)/a)
	$10 (a)	$30 (b)	
10	2.50%	1.64%	34%
30	2.25	1.48	34
50	1.95	1.28	34
100	1.40	0.92	34
150	1.18	0.78	34
200	1.08	0.71	32
300	0.97	0.63	35

a) According to the total amount of the transaction:
Table II-1 shows that since January 1976, if the price per share is $10, the commission rate on a $10,000 transaction is 2.5% and it is 1.40% on a $100,000 transaction. Likewise, if the price per share is $30, the commission rate on a $10,000 transaction is 1.64% and it is 0.92% on a $100,000 transaction. Thus, there is a spread of 44% in both cases.

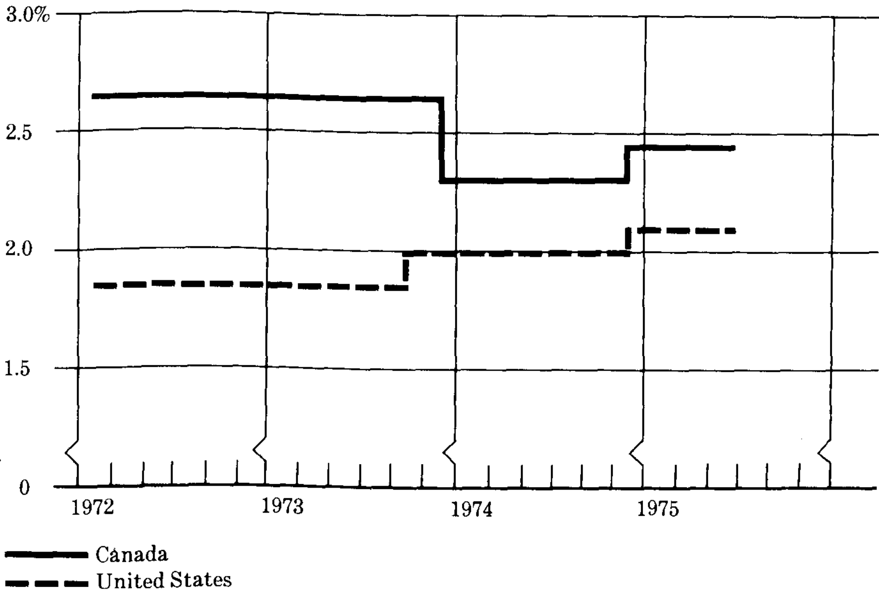
b) According to the price per share:
From the same table one can see that on a $10,000 transaction, the commission rate is 2.5% on a $10 stock, and it is 1.64% on a $30 stock. Likewise, on a $100,000 transaction, the commission rate is 1.40% if the price per share is $10 and 0.92% if the price per share is $30. In both cases there is a 34% spread.

6a MSE, "Presentation of the Proposed Commission Rates to the Members of the Montreal and Canadian Stock Exchanges", April 27, 1972, p. 17. A similar argument has also been invoked at the OSC hearings on commission rates (October 30 and 31, 1974).

Graph II-2
Changes in the commission rates in Canada and the United States from March 1972 to April 1975 on a 1,000 share transaction in a $10 Stock ($10,000)



Graph II-3
Changes in the commission rates in Canada and the United States from March 1972 to April 1975 on a 10,000 share transaction in a $10 Stock ($100,000)



Canada
United States

The above remarks suggest that it is less expensive for a client, to make a $30,000 trade in a $30 stock than in a $10 stock. We don't see how this could be justified since it is probably not much more costly for a brokerage firm to execute an order of 1,000 shares at $30 than an order of 3,000 shares at $10.

2. GENERALLY SPEAKING, BETWEEN FEBRUARY 1972 AND APRIL 1975, THE SPREAD BETWEEN THE CANADIAN AND UNITED STATES COMMISSION RATES HAS BEEN REDUCED

Graphs II-2 and II-3 show that, on a transaction totalling $10,000 in a $10 stock, the spread went from 45% in April 1972 to 29% in April 1975. On a $100,000 trade in a $10 stock, the spread went down from 82% to 29% during the same period.

3. IN APRIL 1975, WHEN THE AMOUNT OF THE TRANSACTION WENT UP, THE SPREAD BETWEEN CANADIAN AND UNITED STATES COMMISSION RATES INCREASED, THEN DECREASED TO ZERO AND INCREASED IN THE OPPOSITE DIRECTION

Graphs II-4 and II-5 show that for a $10 stock, the spread was 28% on a $10,000 transaction, 54% on a $50,000 transaction and 0% on a $300,000 transaction (*i.e.*, the United States and Canadian rates were equal). For a $30 stock, the spread was 15% on a $10,000 transaction, 32% on a $50,000 transaction and −4% on a $300,000 transaction.

4. IN JANUARY 1976, THE SPREAD INCREASED BETWEEN CANADIAN AND UNITED STATES COMMISSION RATES IN THE CASE OF INSTITUTIONAL TRADING ONLY

To reach that conclusion, we had to make different hypotheses, since no one knows the exact average rate structure at the New York Stock Exchange. These hypotheses were based on the following facts:

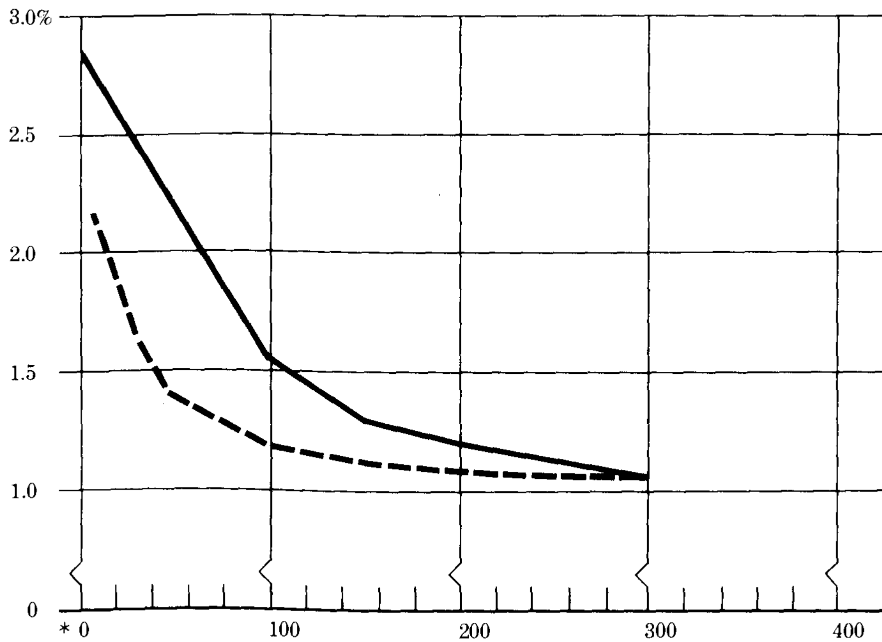
a) The average price per share traded at the NYSE by institutions was $31.38 on August 31, 1975.[7]
b) The average size of institutional (and intermediaries) orders were[8]
205 shares in 1961
644 shares in 1969
713 shares in 1971.

7 SEC, "Report to Congress on the Effect of the Absence of Fixed Rates of Commissions", December 1, 1975, p. II-4.

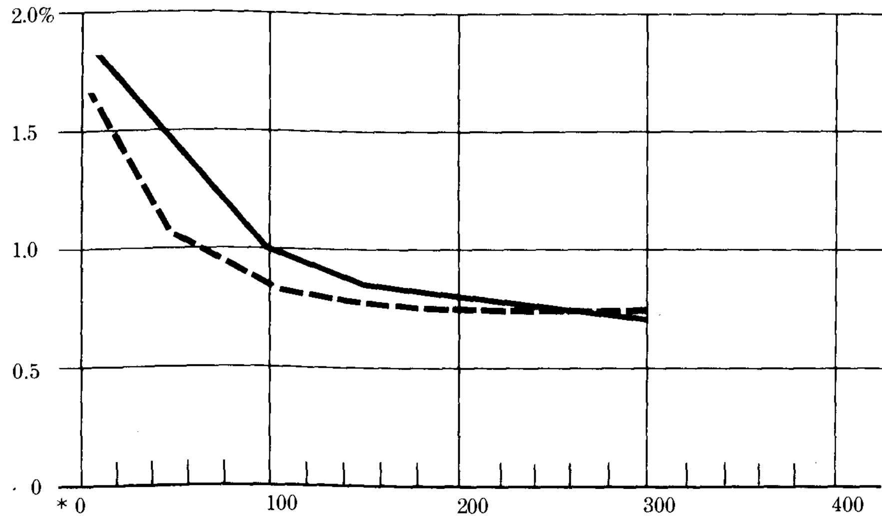
8 NYSE Research Department, "Public Transaction Study", New York Stock Exchange, Inc., April 1972, p. 16.

Graph II-4
Changes in the commission rates in Canada and the United States on a $10 stock as per the amount of the transaction in April 1975

Commission rates



Graph II-5
Changes in the commission rates in Canada and the United States on a $30 stock as per the amount of the transaction in April 1975



Amount of the transaction $(000)
Canada
United States

c) About 74% of all transactions at the NYSE in 1974 were made in blocks of 200 to 9,999 shares[9]
(*i.e.*, 200–999 shares: 36%
1,000–9,999 shares: 38%).
and the average shares per tape print was 438.[10]

d) From May 1, to December 31, 1975, the commission rates at the NYSE for institutions decreased by[11]
23% on transactions of 200 to 999 shares
31% on transactions of 1,000 to 9,999 shares
32% on transactions of 10,000 or more shares
30% on all institutional trades.

Taking these facts into account, we have made the following hypotheses for institutional transactions:

a) An average price per share of $30
b) An average order of 1,000 shares
c) Commission rates reduced by the following percentages:

Amount of the transaction (000's)	Reduction as a percent of commission rates in effect in April 1975
$ 10	20%
30	29
50	30
100	30
150	30
200	30
300	30

d) The above percentages of reduction also apply to the commission rates on $10 shares.

Given the acceptance of those hypotheses, we find out from Graphs II-6 and II-7 that, in the case of shares at $10, the spread between Canadian and United States rates was

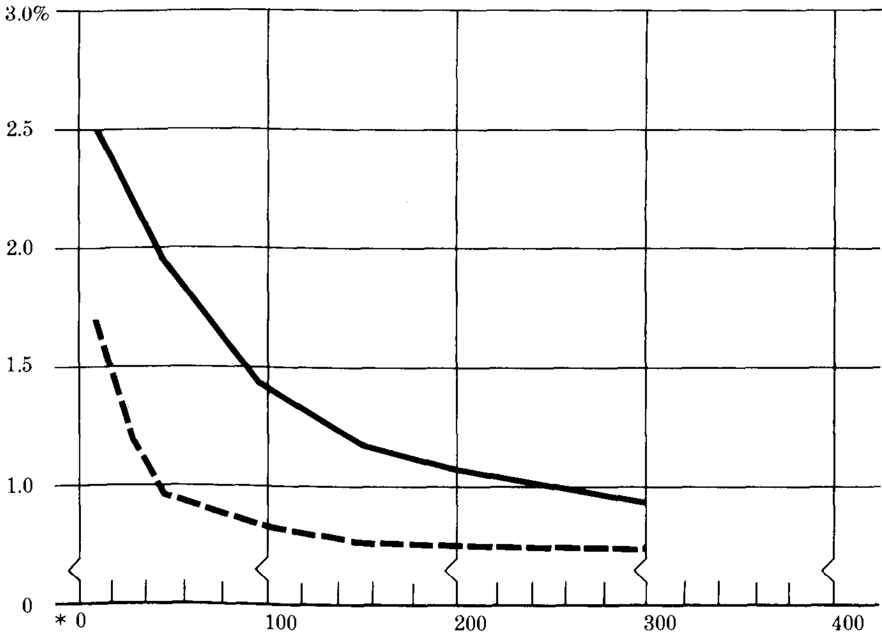
46% on a $ 10,000 trade
99% on a $ 50,000 trade
31% on a $300,000 trade.

Likewise in the case of shares at $30, the spread was

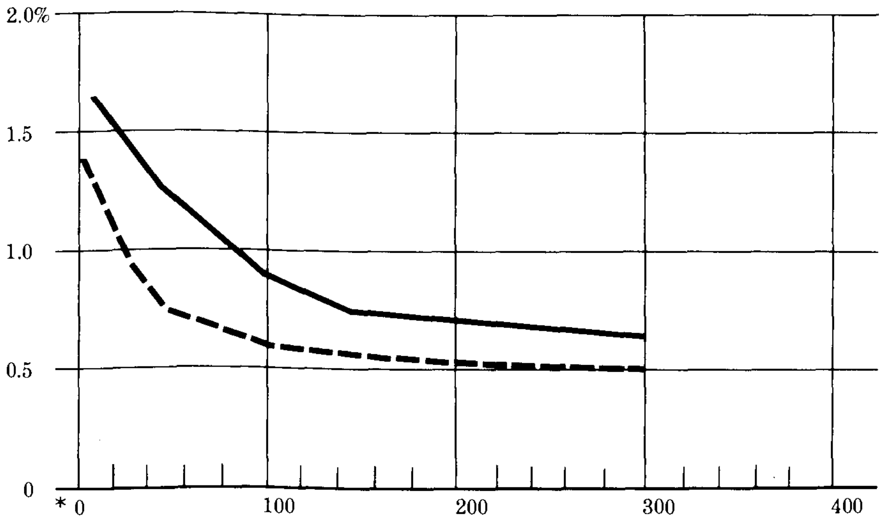
25% on a $ 10,000 trade
57% on a $ 50,000 trade
24% on a $300,000 trade.

9 NYSE, "1975 Fact Book", pp. 10–12.
10 *Ibid.* p. 11.
11 SEC, "Second Report to Congress on the Effect of the Absence of Fixed Rates of Commissions", March 29, 1976, Exhibits 4 and 5.

Graph II-6
Changes in the commission rates in Canada and the United States on a $10 stock as per the amount of the transaction in January 1976



Graph II-7
Changes in the commission rates in Canada and the United States on a $30 stock as per the amount of the transaction in January 1976



Amount of the transaction $(000)
Canada
United States

Thus, even after the elimination of the 10% surcharge in Canada, the spread increased between Canadian and United States rates. Table II-8 summarizes characteristics 3 and 4 above.

Table II-8
Spreads Between Canadian and United States Commission Rates in April 1975 and in January 1976

Price per share	Amount of the transaction (000's)	Spread as a percentage of the United States rate	
		April 1975	January 1976
$10	$ 10	28%	46%
10	50	54	99
10	300	0	31
30	10	15	25
30	50	32	57
30	300	−4	24

These spreads between Canadian and United States commission rates are theoretical since they are based on hypotheses and also because they do not take into account the soft dollar deals between certain brokers and clients.

We don't know to what extent these practices have diminished in the United States since May 1, 1975. However, we know that they are wide-spread in Canada.

These practices take many forms and the MSE classified them in two categories:[12]

a) "low grade type of abuses": junkets, payment of subscription to business magazines or newspapers, rental of equipment or facilities, etc. . . .

b) "sophisticated services": those which are considered by some as a normal extension of brokerage research facilities.

Whatever the category, these practices are nothing but a rebate on commissions for which the amount varies along with the institutions and the broker-dealers. In one case we have estimated the amount of soft dollars received by one institution in 1975 to approximately 10% of the yearly commissions paid by that institution.

Thus, agreements between broker-dealers and institutions do exist and are negotiated in order to establish the price that the institution will pay for the services it receives.

Chapter I
Introduction

In the early nineteenth century, Samuel Morse invented the telegraph. The first intercity line (Washington to Baltimore) was put up in 1844. In 1867, with the development of the stock ticker at the New York Stock Exchange, the telegraph was introduced to the United States securities industry.

This paper was prepared as part of the draft working documents for the meeting of the Securities Market Study group in November 1975. Papers were not completed in final form until 1978. Circumstances prevented a thorough updating of this paper and it should be regarded as a status report as of mid-1975. Certain items of statistical information have, however, been updated and short "1978 update reports" have been written to supplement certain sections of the paper which deal with the major automation programs.

The writer is grateful both to the Toronto Stock Exchange and to the Canadian Depository for Securities Ltd. for their willingness to allow him to use material developed on their behalf. Special thanks are due to Mat Ardron, Director of Systems Planning and Development at the TSE (until November 1977), and to Stan Deudney, General Manager of CDS, for their assistance, and for providing constructive criticism of the approach and substance of the paper. The writer also acknowledges, with thanks, the cooperation of the TSE in permitting him to update materials prepared for the original (1975) draft of this paper.

[*In December 1977, Hugh Cleland joined the staff of the Toronto Stock Exchange as vice president, Policy Development and External Relations. I wish to acknowledge the cooperation of the exchange in permitting Mr. Cleland to update this paper prior to publication – Philip Anisman.*]

Over the succeeding years "the wire" brought about a revolution in the securities industry. Whereas before the telegraph communications between cities by courier or pony express had taken a matter of days, with the wire, return messages became possible in hours. For brokers this not only sped up the sending and receiving of important messages like sale and purchase orders, but it also made possible the economic exchange of a much wider variety of messages (rumours, research reports) and the dissemination of transaction data to a much wider audience.

Thus from a decentralized industry with a stock exchange in virtually every major population centre serving a multitude of brokers, the securities industry was transformed into one dominated by a single focal point – New York. Where formerly distance had made local trading facilities necessary, the telegraph meant that local brokers could send their transactions to New York for execution in the primary market.[1] Not only could local firms now deal in New York, the new technology also made it feasible for the New York houses to open branches in the lesser centres. Many mergers and takeovers resulted, largely due to the potential released by the new technology.

A further revolution was launched in the early twentieth century with the addition of the telephone to the tools of the securities industry. Personal meetings were no longer necessary to obtain instructions. Brokers could sit at a desk and talk to dozens of people in one day. The retail salesman was invented, and securities investment became available to a much wider range of people. In the 1920s, "playing the stock market" became a national pastime in the U.S., and in Canada as well. Regulation of credit and market practices, however, operated more to the benefit of the Rockefellers than to the Smiths and Joneses, and the market collapsed.

In the 1950s and 1960s the technology of mass communication (TV and newspapers), supported again by the salesman with a telephone, brought about a resurgence of public interest in investment. At this juncture, the fate of the campaign for "people's capitalism"[2] and the surge of public involvement in securities

1 Interestingly enough, while early technology virtually eliminated local stock exchanges in the late nineteenth and early twentieth century, its further development in the mid-twentieth century was significant in the rebirth of the U.S. regional exchanges. Because it became so simple and inexpensive to route orders to almost any locale, regional exchanges were able to create convenient trading and commission/access rules, thus avoiding certain New York Stock Exchange standards. They could then solicit brokers and investing institutions to move their trades to the regional floors in order to avoid NYSE rules.

2 *See* various speeches by Keith Funston, president, New York Stock Exchange 1951-66, *cited in* R. SOBEL, THE BIG BOARD 346 (1965).

investment which it helped bring about is still too recent to be read.

What is clear is that the development of technology has played a major role in changing the securities industry. This has brought new opportunities and competitive forces which have significantly affected the level of service, profitability, corporate structure and regulatory framework.

Indeed, at the present time, the securities industry is struggling with the likelihood that technological developments have released another revolution through the introduction of the digital computer. Although the focus of industry news and distress cries may be on commission rates and institutional investment, the computer and computer-based communications networks are playing a major role as forces for change in the 1970s. Key questions relate to the impact which computers can have on order processing costs, potential marketing strategies and even the structure and organization of the markets themselves. Will computers impact on the industry to the same extent as the telegraph and telephone? What will be the pace of impact?

Although this paper does not purport to answer these questions, it does set out the background of an integrated securities market system[3] and describes some major computer-based projects both in Canada and the United States, the outcome of which will in large measure determine the shape and pace of change.

This background material and the information on operational mechanics are provided on the oft-voiced, but seldom practised theory, that any regulatory proposals should be based on a sound understanding of the operating environment in which they will be applied.

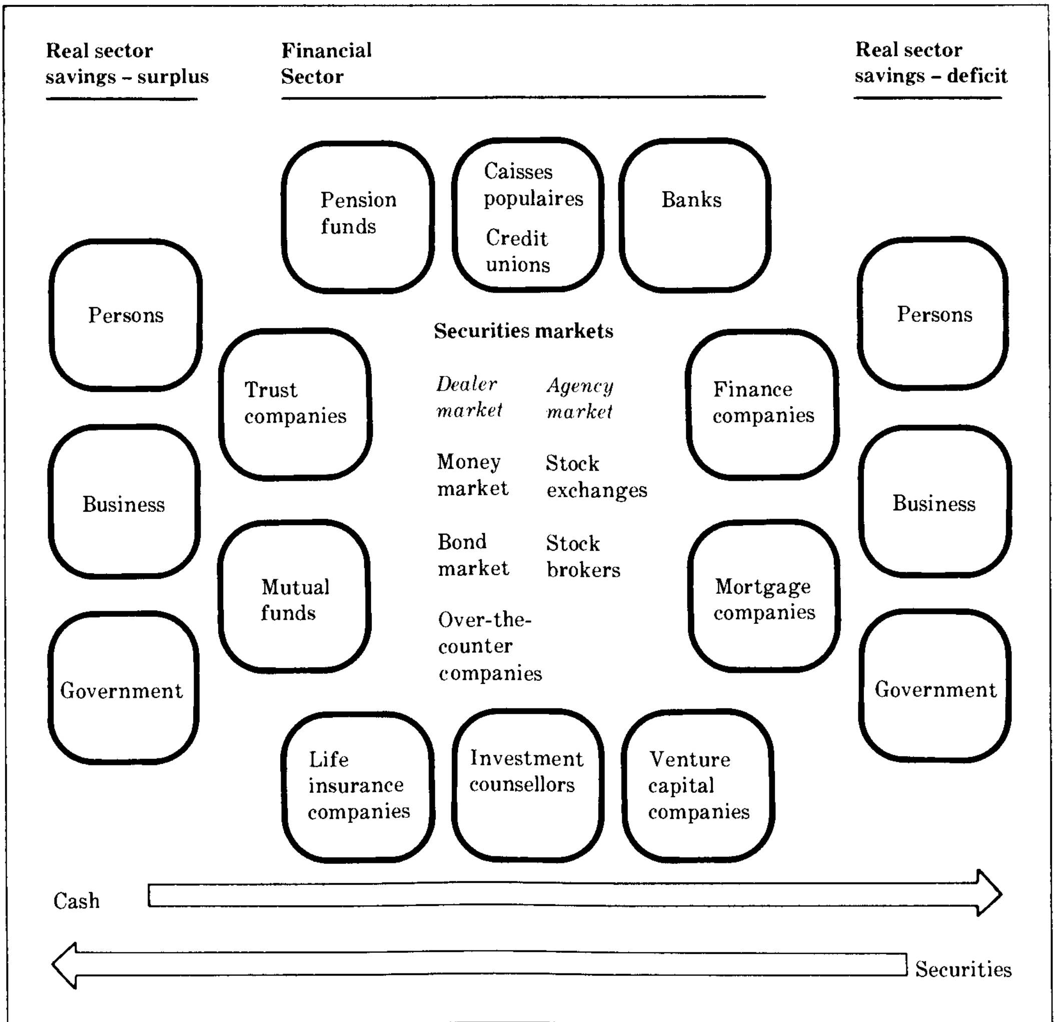
Chapter II
The Securities Market System: Economic Function and Participants

Many articles and books have been written describing the various participants in the financial markets and the flows of funds and securities between them. One such useful description is contained in a recent report of D. Shaw and R.A. Archibald.[4] The following pages from their text outline the fundamentals of the

3 WEBSTER'S THIRD NEW INTERNATIONAL DICTIONARY defines "system" as "a complex unit formed of many diverse parts subject to a common plan or serving a common purpose".

4 D. SHAW & R. ARCHIBALD, 1 THE MANAGEMENT OF CHANGE IN THE CANADIAN SECURITIES INDUSTRY 2-7 (1972) (Canada's Capital Market).

Figure 1
Securities Markets



financial system's function and purpose. Their graphic representation of the securities markets is shown in figure 1.

A. DESCRIPTION OF THE CAPITAL MARKETS

"For the purposes of defining and describing the capital market it will be useful to divide the economy into two sectors, the *real* sector and the *financial* sector. Included in the real sector are three classes: persons, non-financial business and government. Within this sector, decisions are made by some economic units to save, consume or spend less than current income, while at the same time other units decide to spend more than their current income using the savings of the former group to finance their deficiency.

"The financial sector or capital market exists to accommodate the transfer of funds from savings-surplus units to savings-deficit units within the real sector. The relationship of the financial sector to the real sector is set out in figure 1. In the diagram, cash flows from left to right, securities from right to left. The real sector is placed on both sides of the diagram, on the left as savers and on the right as spenders. The capital market in the middle provides the means whereby the deficit-units (spenders) in the real sector on the right hand side can exchange contracts (securities) for cash from savers on the left hand side. The capital market function is to match these demands for cash from the deficit units with the supply of cash available from surplus units. This may be accomplished *directly* by offering securities issued by the deficit units to the surplus units. It is accomplished *indirectly* by financial institutions acquiring the claims of deficit units and then issuing new claims on themselves which are tailored more closely to the requirements of savings-surplus units. Financial institutions earn profits on the 'spread', the difference between the rate earned on the direct securities they acquire and the rate paid on the securities they issue. This process whereby financial institutions attract savings by issuing claims on themselves which are more liquid, less risky or of shorter term or some combination of these qualities than the direct securities in which they invest the proceeds is known as *intermediation.*

"Economies of scale provide one major reason for the existence of financial intermediaries. Financial institu-

tions accumulate information, develop sophistication in their personnel and have available funds which permit them to operate in the financial markets in a continuous manner which could not be duplicated at the same cost by individuals or business firms acting in an *ad hoc* manner. In addition, financial institutions benefit from the risk reduction associated with efficient diversification of securities portfolios which an individual investor may not be able to accomplish because of his limited resources.

"II Role of the Capital Markets

"The channeling of savings

"The primary role of the capital market is to channel funds from surplus units to deficit units. Expenditures on consumption goods and on new investment in real assets, such as plant and equipment, generate incomes and employment. The term 'savings' refers to the annual amount withheld from consumption not to the accumulated wealth resulting from past savings. Saving is a withholding of spending. In order that these funds are not lost to the expenditure system the capital market exists to facilitate the flow from those who save to spenders who have projects which they want to undertake but do not have the necessary funds. Spending generates incomes; savings result from having income and not spending all of it. Savings finance the additions to the stock of capital in the economy.

"Reward for saving

"A person's decision to save is a decision to postpone consumption. This involves deferring present satisfaction for anticipated future satisfaction. Future dollars are greater than present dollars by the return earned on the savings, thus the capital market establishes the rate of exchange between present dollars and future dollars, present satisfaction and future satisfaction. The decision to consume presently or save and consume later hinges on the tradeoff between present and future dollars. By providing a means of accommodating such decisions, the capital market may affect the amount of savings within the economy.

"*Cost of financing*

"A second important purpose of the financial market is to establish the cost of financing for the borrower and the rate of return on these financing vehicles for the lender. Knowing the cost of funds permits the borrower to make an investment decision on the basis of comparing the expected returns and perceived riskiness of the project on which he intends to spend the funds with the direct costs of obtaining the funds. A corporate decision to invest in capital projects must be made in light of all the opportunities available at the time of the decision. Even though the corporation may not require external funds to finance the project under consideration, nevertheless, the corporate decision-makers must compare the available returns on similar-risk opportunities in the capital market to the return on their proposed project and choose the higher one if they want to maximize the wealth position of the shareholders. This *opportunity cost of financing* calculation used in the evaluation of capital projects is referred to in business finance as the *cost of capital*. The decision rule is to accept a capital investment proposal if its anticipated rate of return is greater than, or at the margin just equal to, the firm's cost of capital, *i.e.*, the opportunity cost of investing in similar-risk ventures in the capital market. Under these conditions, the capital market can be thought of as playing a major role in the determination and the allocation of a country's private resources. This is accomplished by providing opportunity rates of return for all investment and saving decisions. Given this role, it is critical that this market operates rationally and efficiently in setting prices and yields for risk alternatives.

"*Liquidity*

"Securities markets provide liquidity for holders of securities. Liquidity may be defined as the ability to convert securities into cash quickly at minimum cost and without a significant decrease in price caused by the transaction. A major attribute of liquidity is that it permits a 'transformation process' whereby short-term funds become available for long-term use. As long as an investor believes that he can sell his holding quickly without his transaction adversely affecting price, he may invest funds, which he considers to be short-term, in securities of a long-term nature.

"This transformation process permits a much larger flow

of savings to be made available for long-term investment than would otherwise be the case. Financial institutions facilitate this transformation process by intermediation, offering shorter term securities such as savings accounts and debentures, and investing the funds in longer term securities such as mortgages and bonds. The ability of a financial system to provide liquidity in secondary markets for investors in new security offerings is critical to the efficiency of the market, to the cost of an issue by a borrower and to this transformation process. The degree to which the market can provide liquidity is referred to as the 'depth' of market.

"*Valuation basis*

"The final role of the financial market is to establish a basis for valuation. Market prices of securities establish the basis of their value for the courts and for estate and income taxation purposes. Market prices of securities may influence directly almost all situations with financial consideration, *i.e.*, individual decisions about retirement, vacation and leisure, etc. Collectively these individual decisions have significant impact on society.

"III A Review of Canadian Financial Markets

"Financial markets are classified as *primary and secondary*. The primary market deals in securities issued by a unit seeking funds to units possessing surplus funds. Proceeds from the offering go to the issuing unit. For example, a corporation which issues securities, bonds or common stock to finance new plant and equipment raises funds in the primary market usually by selling the offering to an underwriter who, in turn, sells it to investors.

"The secondary market exists to permit a holder of securities to convert his holdings into cash and as a means of acquiring previously-issued securities for those who want to do so. As implied by the name, it is a secondhand market. Proceeds flow from the person acquiring the securities to the previous holder. Stock exchanges are the best known secondary markets but secondary markets exist for bonds, mortgages and consumer credit as well. The ability to convert a security-holding to cash quickly and without a significant reduction in value in a secondary market transaction adds liquidity to the instrument

for the purchaser and consequently reduces the overall cost of financing to the issuer.

"The capital market in Canada is made up of many submarkets. In a sense, a market is located in every part of the country where there is a bargain for funds. However, certain markets dominate, and it is in these markets that the prevailing structure of rates in the country is established. Three dominant markets are described briefly in the following paragraphs.

"The money market handles short-term debt securities, usually of one year and less to maturity, issued by governments and both non-financial and financial corporations. This is a *dealer* market; that is, an underwriting investment dealer or financial institution buys the offering from the issuing unit and then sells the securities (commonly referred to as 'paper') in parts to financial institutions, corporations and other institutions such as universities, or holds some of the issue itself. In this function it is a primary market; however, there is trading of these instruments in the secondary market as well, usually through the same set of underwriting dealers.

"The bond market has distinct primary and secondary operations. Investment dealers in their role as underwriters buy the primary issue and distribute it to financial institutions and the public. The secondary market involves dealers buying bonds for and selling bonds from their own inventory, making a profit on the spread between cost and selling price. Most underwriters are active in the secondary market, especially in the issues they originally brought to the market; however, other investment dealers and financial institutions also make secondary markets for bonds.

"The primary section of the equity or stock market involves dealers underwriting corporate issues and distributing them to financial institutions and individual investors. The secondary equity markets in Canada are mainly auction markets where bids and offers are made by brokers for their clients on listed stocks on a stock exchange. Brokers are paid for their services by a commission fee since they act in an agency relationship with their customers. Markets for some stocks not listed on a stock exchange are maintained by dealers buying for and selling from their inventory. Dealers in this market are compensated for their efforts by the price spread. This over-the-counter dealer market for equities is a small

component of the total secondary market for equities in Canada relative to stock exchange trading. Another type of secondary market transaction occurs when an underwriter acquires a block of stock from a stockholder and distributes it in much the same way as a primary issue in order to avoid putting stress on the secondary market by selling such a large transaction. These are referred to as *secondary offerings*."[4a]

B. INTERMEDIATION

It is necessary to differentiate the two aspects of intermediary activities brought out in the Shaw and Archibald report: investment (*i.e.*, financial) intermediation and transaction (*i.e.*, market) intermediation. In the process of intermediation, a financial organization interjects itself between savings surplus and savings deficit units in the real sector.

In *investment* intermediation, the intermediary *issues* its own obligations to savings surplus units in return for cash, while *accepting* the obligations of savings deficit units.[5] To successfully interpose themselves, investment intermediaries create and issue instruments which are more attractive to savers than are the obligations which the savings deficit units are able or willing to offer. Features of the instruments issued by these intermediaries which make them attractive to savers are: liquidity/redeemability, tax sheltered status, convenience of purchase (amount, location of sales office, etc.), safety (debt obligations are guaranteed by the capital of the issuing institution, often by government-backed insurance schemes). Examples of such instruments are bank and trust company savings accounts, deposit receipts and certificates, whole-life insurance policies and mutual fund shares.

It is important to note that in their securities market activities these intermediaries are not always acting for their own accounts but often also act as transaction intermediaries. Branch banks and trust companies are particularly active as handling agents and/or investment managers wherein for a fee they act as order routers and custodians of securities investments on behalf of their customers.

In *transaction* intermediation, brokers and dealers act as agents or dealers in the buying and selling of the securities of third party issuers. Under the major heading "Securities Markets" in figure 1 are the principal transaction intermediaries – stock bro-

4a *Id.*

5 *Id.* at 2.

kers/dealers and the markets which they have organized. Neither they nor their markets issue their own obligations[6] but simply act as agents or traders in the exchange of the obligations of others. Although the investment intermediaries' marketing ploy is to offer liquidity to surplus holders in the real sector by issuing guaranteed or participating claims of a short-term or demand nature on themselves, the transaction intermediaries seek to attract the funds of surplus holders by pointing to the potentially greater gains available through direct investment. They also emphasize the liquidity provided by the securities markets which they have organized.

The services of transaction intermediaries and investing intermediaries are not generally substitutes one for the other. In fact, a significant part of the transaction intermediaries' business is as a supplier of transaction service to investment intermediaries acting as agents or for their own investment purposes. A second and more important source of business is individual investors who seek to do their own investing directly in the market, rather than holding the instruments of intermediaries or delegating asset management responsibility to such intermediaries. Another portion of their business is in securities which are unsuited for ownership by trustees and other investment intermediaries with guaranteed obligations. The proportions of business vary from time to time depending on legislation affecting tax positions of individuals compared to institutions and the extent to which individual investors are in a speculative mood.[7]

It is of course possible for investment intermediaries or for savings surplus and deficit units in the real sector to deal directly with each other without involving transaction intermediaries. However, the principal services offered by brokers and dealers such as guarantees of title, credit and closing, an organized market for the economical handling of a high volume of transactions, market coverage through coordination of buying and selling interest as well as investment advice and trading expertise, favour their use by both investment intermediaries and individuals.

6 Some major U.S. brokers have "gone public" in that they have sold their own common shares to investors in order to obtain a permanent capital base; *see* ch. III.F *infra*. However, none except Merrill Lynch have issued money market paper or other investment instruments to the investment public as an investment intermediary would do; *see* The Wall Street Journal, October 3, 1975.

7 *See* ch. III.D *infra*.

Chapter III
Organization of Canadian Securities Markets[8]

The preceding chapter briefly described the various players in the capital markets and outlined the basic economic *raison d'être* for securities markets.[9] It also drew a distinction between investment intermediation (such as that provided by banks, trust companies, insurance companies, mutual funds and pension funds) and transaction intermediation such as that provided by brokers and investment dealers in connection with trading markets.

As the excerpt from the Shaw and Archibald report notes, there are primary and secondary markets for virtually all financial instruments. The main trading markets and instruments however, are the money market, the bond market and the equity market – the last being divided into listed and unlisted categories.[10] This chapter describes how these various markets are organized in Canada. To put this review in perspective, comparison is made to the organization of securities markets in the United States.

A. THE MONEY MARKET

In Canada, the money market[11] is centred around the thirteen to fifteen members of the Investment Dealers Association of Canada (IDA) which have been granted special borrowing (rediscounting) privileges at the Bank of Canada. The IDA is a national self-regulatory body composed of most dealers who are involved in underwriting and distributing the securities of governments and well-established corporations. The main users of the money market are financial institutions and corporations with short-term cash needs or short-term cash surpluses. The amounts involved are often very large and few issuers tailor instruments for transactions of less than $50,000.

The money market has no formal organization. It exists wherever its users and dealers are willing to deal. Since most of its users

8 This chapter is based on several sources: REPORT OF THE OPERATIONS COMMITTEE OF THE CANADIAN DEPOSITORY FOR SECURITIES (March 1972); Toronto Stock Exchange, Planning Report (July 1971) (unpublished); TORONTO STOCK EXCHANGE, COST STUDY REPORTS (1971-75) (Study of TSE member costs in relation to operational efficiency and also to the OSC's hearings on commission rates).
Specific references are made only where statistical information is given.

9 Ch. II.A *supra*.

10 *Id.*

11 The money market is defined as the market for federal and provincial government bonds of less than three years to maturity (including Treasury bills), bankers' acceptances and commercial paper.

are highly sophisticated organizations there is little need for regulation aimed at protection of investors.[12] Though the Bank of Canada collects and publishes statistics on outstanding money market obligations, no trading volume and price range figures are published and there is little, if any, control of selling or trading practice.

Oversight of the money market is maintained by the Money Market Committee of the Investment Dealers Association. Liaison is maintained with the Bank of Canada and Department of Finance. This committee establishes standard settlement rules and, in an informal manner, recommends any disciplinary necessities to the National Executive of the IDA. The committee has tried from time to time to recommend certain policies on spreads and commission reallowances to lenders but competitive practice among the dealers tends to nullify such policies.

B. THE BOND MARKET – PRIMARY AND SECONDARY TRADING

To discuss the bond and equity markets it is necessary to separate primary issues and secondary trading. On so-called primary issues, a detailed prospectus is filed with the securities commission or equivalent authority in each province in which it is intended to sell the securities. Upon acceptance of the prospectus, the bonds or stocks are then sold directly to the customers of the underwriting/selling group of dealers.[13]

On primary issues of bonds and equities, the Investment Dealers Association of Canada[14] exercises some authority. The vehicle of control is the IDA's code of ethics and by-laws dealing with pricing practice by members of a banking/selling group, delivery procedures and the syndicate manager's accounting for distribution of syndicate profits. Full statistics on primary issues are published monthly by the Bank of Canada.

Coincident with and subsequent to the direct selling effort, some dealers may "make a (secondary) market" in the issue. If the issue is a bond, then the trading simply carries on in the between-

12 Generally speaking, no prospectus need be filed on money market issues (due to the exemption given by s. 19(2)3 in the Ontario Securities Act). However, all corporate issuers of such paper are required to complete a Robert Morris Associates Questionnaire or a CANSAF report of standard financial data and signed by their independent auditor, if they wish their paper to be handled by an IDA member. In addition, IDA regulations strictly specify margin requirements for money market paper held in dealers' inventories.

13 The method described here pertains to the great majority of the bond and stock issues of governments and major corporations. However, another method, "primary distribution through a stock exchange", is often practised with some speculative equities.

14 *See* ch. III.E.2 *infra*.

dealer, over-the-counter (so-called) bond market. If it is an equity, the usual situation which pertains is that arrangements have been made by the underwriters to have it listed and called for trading on a stock exchange within a few weeks of completion of the distribution.

The bond market in Canada, like the money market and the over-the-counter equity market,[15] is rather loosely structured. It exists wherever dealers and to some extent chartered banks find it profitable to call markets and settle transactions. Toronto is by far the money market and bond trading centre for Canada. However, there is active trading in Montréal and, to a lesser degree, Vancouver.

There is no effective central data collection on prices bid and offered for Canadian bonds, much less of price ranges or volume of trading.[16] Once or twice a week "representative" quotations for most federal and provincial government issues, as well as a selection of corporation bonds, appear in the financial press.[17]

Responsibility for necessary trading and clearing rules in secondary bond trading in each bond market city has been assumed by the local bond traders association – a loosely knit affiliate of the regional IDA. Except for informal exclusion from trades and information exchange, few sanctions exist to discipline a wayward bond trader who is careless of interdealer ethics and practice. Unethical conduct in dealings with a customer, however, would draw the interest of the IDA's Disciplinary Committee or of the provincial securities commission.

C. THE EQUITY MARKETS

The organization of Canadian equity markets for both primary issues and secondary trading is relatively complex. There are two ways of effecting primary issues. Direct sale following upon filing and acceptance of a detailed prospectus is the most important in terms of dollar value and was described above along with primary issues of bonds. The second type of primary issues is

15 *See* ch. III.C *infra*.

16 Financial Research Institute (*see* ch. IV.C.1 *infra*) tried in 1973-74 to raise funding for a proposed "Bondata System" which would have provided full prospectus information on all extant Canadian bonds and also collected and disseminated quotes on them from dealers and other participants. The effort failed due to lack of interest on the part of some of the larger dealers who, it is said, preferred to keep their quotation information away from their competitors and already had an adequate file of prospectus data for their own purposes.

17 The Globe and Mail (Toronto) "Report on Business" carries quotes every Tuesday. The Financial Post (Toronto) every Saturday and The Financial Times (Toronto) every Monday.

"through the facilities of a stock exchange". This method has been generally used for selling the securities of companies with few or no certain assets but a speculative property with much-vaunted potential, and a promoter who organized the market for the distribution. The technique received much criticism.

> "The recommendation that primary distribution of speculative mining shares be removed from the Toronto Stock Exchange was made from the conviction that such primary distribution was not properly within the function of a major national security exchange."[18]

Financing by primary distribution on a stock exchange has been severely restricted on the Toronto Stock Exchange since 1967 and on the Montreal Stock Exchange since 1974.[19] It is still, however, a popular method on the Vancouver Stock Exchange.

Secondary trading in Canadian equities is done both over-the-counter (OTC) and on stock exchanges. The latter method predominates. Like the bond market, the OTC stock market exists wherever dealers are willing to make quotations. However, there are few companies of any substance whose securities are traded OTC. This is not only because it is generally believed that an exchange listing brings with it a better market, wider exposure to investors and considerable prestige, but also because most publicly held companies can meet the modest listing requirements of Canadian exchanges.[20] With listed status being so easy to achieve in Canada, it

18 WINDFALL REPORT at 113.

19 Passage of the Securities Act, 1966, S.O. 1966, c. 142 reduced exchange primary distributions in Ontario. The Quebec Securities Commission announced for comment a proposed revision of its Policy No. 8 which would make Québec rules more nearly uniform with the Ontario pattern; *see* 5 QSC Bull., No. 10 (March 12, 1974). The comments received were not encouraging and the proposed revisions were withdrawn. Subsequently, an administrative decision of the commission to deal with primary distribution proposals on an ad hoc basis put an almost complete stop to primary distributions on stock exchanges in Québec; *see* 5 QSC Bull., No. 42 (Decision No. 4463, October 22, 1974).

20 Basic requirements for an "industrial" listing on the Toronto Stock Exchange (the highest in Canada) are:
Net tangible assets - $1,000,000 (minimum);
Earnings - before tax income of at least $200,000 and a minimum three-year average income of $200,000;
Public distribution - minimum of 200,000 of the issued shares shall be held by at least 300 public shareholders, each holding a board lot or more;
Market value of issued shares in the hands of the public-minimum of $1,000,000.
The Montreal Stock Exchange has the same standards for most of its companies but also has a "junior industrial" list with somewhat lesser requirements. (The Vancouver Stock Exchange standards are slightly lower again.)
By contrast, a New York Stock Exchange listing requires:
2,000 shareholders (100 shares or more);
Market value of publicly held shares - $16,000,000;
Earning power before taxes - last fiscal year - $2,500,000 and each of preceding two years - $2,000,000.

is only logical that most companies have little investor interest.[21]

The principal action in Canadian equity markets is in listed securities on the Vancouver, Montreal and Toronto stock exchanges. The Toronto Stock Exchange (TSE) has about 1,250 issues listed for 885 different companies, and accounts for about 77% of the dollar value of trading in listed equities in Canada. The Montreal Stock Exchange (MSE) has 832 listings for 522 different companies accounting for 18% of dollar value of trading, and the Vancouver Stock Exchange (VSE) accounts for 5% of trading with 616 listings plus an interim "curb market" for 183 issues. The Alberta Stock Exchange (ASE) and the Winnipeg Stock Exchange (WSE) are the remaining exchanges operating in Canada.

Many of these listings and companies overlap. Tables 1 and 2 show the degree of overlap in 1977 and the dollar value of trading in each category.

Table 1 is constructed to highlight the concentration of multilisted stocks on the TSE. That is, 749 TSE-listed stocks are *also* listed on at least one of the other exchanges; ten MSE stocks which are not listed on the TSE are listed on one or more of the VSE, ASE or WSE; twenty-seven VSE stocks, which are neither on the TSE or MSE, are on the ASE or WSE; and two ASE stocks are listed on the WSE. The bracketed number in the multilisted column indicates the total number of multilisted issues on that exchange. The essence of table 1 is that of 2,093 companies interlisted on stock exchanges in Canada 1,267 are listed on the TSE.

Table 2 indicates the extent to which trading in Canada is concentrated in the issues that are listed on the TSE – though as shown in the table, some of the trading takes place elsewhere.

Table 2 shows that in 1977, nearly 94% of the dollar value of listed trading done in Canada was done in companies listed on the TSE – that is, total TSE trading plus MSE, VSE, ASE and WSE trading in stocks which are also listed on the TSE.

It is worth noting that the top ten issues accounted for 21% of total trading in 1977: the top one hundred accounted for 66%. Appendix A contains a list of the one hundred listed Canadian companies most actively traded on the TSE. It is commonly believed that, with few exceptions, companies which are not in the

21 It is estimated that in the U.S. there are 30,000 to 40,000 companies whose equity securities are publicly held and traded, and 5,000 of these companies are continuously quoted on NASDAQ. Further, in Canada, very few brokers doing business with the public are not members of the exchanges. Indeed, the OTC departments of exchange member firms probably account for well over 90% of transactions in Canadian over-the-counter equity trading. The IDA has 12 members who are not exchange members. The provincial broker-dealer associations have perhaps the same number again. By contrast, in the U.S., the NASD has over 2,500 member firms which are not exchange members or affiliates.

currently most active one hundred Canadian companies do not have adequate trading liquidity to make them suitable for institutional investors.

As facilities for transactions, the Canadian stock exchanges can handle a considerable volume of trades. During 1975 volume was extremely low – the TSE handling 3,500–4,000 transactions daily, the MSE 800–1,000, and the VSE 1,500–1,800. In the most recent particularly active trading period (November 1971), the TSE was handling 10,000 trades per day and the MSE and VSE about 2,500 trades each. The capacities of exchange physical plants would not be overtaxed at 50% higher volume than was experienced in 1971.[22]

In providing trading floor, listing facilities, surveillance, clearing, market information and statistical information for the Canadian securities industry, the three major exchanges spent about $9.3 million in 1977. Table 3 summarizes comparative data for these three exchanges and includes the New York Stock Exchange (NYSE) and American Stock Exchange (AMEX) statistics for comparison.[23]

Because the level and variety of services provided by the exchanges may vary somewhat, it is not prudent to draw far-reaching conclusions about relative efficiency from comparisons such as those in table 3.[24] It is evident that exchange expenditure is obviously a small fraction of trading value.

To this point, discussion has focussed on describing various Canadian markets and the securities (source and kind) traded on them. To round out the description, some reference must be made to the securities industry which provides the mechanisms and makes them work, and to the investors whose money is needed and on whose willingness to hold paper assets the whole securities market system depends.

22 In addition to exchange transactions, Canadian brokers and dealers are involved in a significant number of non-exchange trades. Bonds, money market, OTC equities and foreign securities in aggregate are estimated to equal about one-third as many trades as are due to listed business.

23 The information in this table is drawn from TSE ANNUAL REPORT (1978) (year-end March 1978); MSE, ANNUAL REPORT (1978) (year-end December 1977); VSE, ANNUAL REPORT (1978) (year-end March 1978); NYSE, ANNUAL REPORT (1978) (year-end December 1977); AMEX, ANNUAL REPORT (1977) (year-end December 1976).

24 The IDA is reported to have spent about $800,000 in 1977. Added to the $9.3 million expenditure of the exchanges, the securities industry's collective efforts cost just over $10 million in 1977.

D. THE CANADIAN SECURITIES INDUSTRY

In 1978, the brokers and dealers of Canada numbered about 120. Table 4 indicates the number of multiple and single memberships on the Toronto, Montreal and Vancouver stock exchanges at that time. In 1978 there were also twelve members of the IDA that were not members of any of the Canadian exchanges. The members of these self-regulatory bodies would account for over 99% of the dollar value of both underwriting and secondary trading business done by all brokers and dealers in Canada.

Evidently there is a great deal of overlapping in membership. The firms that are members of two or more exchanges account for over 90% of the volume of both the TSE and MSE[25] and over 70% of volume on the VSE.[26]

The total capital of Canadian brokers and dealers is $200 million to $250 million, over half of which is accounted for by the national firms. Total revenues for 1977 were estimated at about $350 million, with just under 60% of it being due to trading in listed equities. Employment in the industry currently numbers 12,000, a little over one-third of which is accounted for by producing salesmen.[27]

Direct investment in stocks by individuals is a popular activity. Tax statistics show that nearly 900,000 Canadians paid taxes on dividends in 1975[28] and may be assumed to be shareholders/investors. In 1965, 1968 and 1970 the Toronto Stock Exchange carried out Origin of Business studies on trading in listed securities by their members. These studies had two objectives: first to find out the amount of business coming from different types of investors; second to find out the geographical distribution of investors. Another more detailed and continuous study was launched in 1975. Termed the *Revenue and Market Analysis (RAMA) Study*, it has been conducted continuously since April 1975. Table 5 indicates the changes in sources of agency business from 1965 to mid-1978. It should be noted that this measure is of *agency* trading only. Exchange members in their capacities as

25 Informal study of 1973 trading volume done by the TSE and MSE for the Joint Industry Canada-Wide Committee.

26 The percentage of VSE business accounted for by national firms and joint members is less than on the eastern Canadian exchanges because of the dominant role played by a small number of local houses both in speculative underwriting where they "run the box", and in professional floor trading.

27 The information in this paragraph derives from a report prepared as of December 1977 by the national examiner who is employed by the National Contingency Fund.

market-makers, arbitrageurs and other inventory dealers account for about 20% of the value of exchange transactions.

The other topic investigated in the Origin of Business studies was the geographical location of investment activity which ended up as transactions on a Canadian exchange. It is evident from table 6 that while the bulk of the Canadian securities trading is based in Ontario and Montréal, brokers and dealers must maintain extensive branch office communication networks to serve a widely dispersed investing public. In fact there are over 500 brokerage branch offices in Canada and virtually every Canadian city of over 20,000 people is served by at least one brokerage office.[29] In addition, there are about fifty branches of Canadian brokers in the U.S. and abroad.

RAMA data are not collected on a basis which permits measuring the origin of trades executed solely on the TSE, so no 1978 data are available on this basis for table 6. It is necessary to remember that about one-third of the Toronto-originated business is for the accounts of registered traders[30] whose job it is to ensure a continuous flow of market quotations and enhance liquidity. It is generally agreed that non-Ontario areas have increased the proportion of TSE trading which they account for.

Information drawn from the *RAMA Study* indicates the geographic source of *all* agency business handled in 1977 by members of the Toronto Stock Exchange: Ontario, 48%; Québec, 21%, Atlantic provinces, 3%; Prairie provinces, 11%; British Columbia, 9%; and foreign sources 9%.

E. REGULATORY FRAMEWORK

1. *Government Regulation*

With such a complex and geographically dispersed system of markets and investors, an important feature of Canadian markets is the regulatory framework within which they operate. There is no national regulatory authority with a role parallel to that of the Securities and Exchange Commission in the United States.[31]

29 M. Fruitman, Data Communications within the Brokerage Industry (Ottawa, November 1974) (unpublished study for the Department of Communications).

30 TSE, Notice to Members No. 1039 (July 3, 1973). This notice outlines policies and rules applicable to this category of traders which operate special accounts on the trading floor on behalf of member firms.

31 The Securities and Exchange Commission established by Congress in 1934 to administer federal laws governing the issue and trading of securities is clearly the national securities regulatory body in the U.S. For 1975, it had a budget of $43.1 million, 1,200 employees located in Washington and nine regional offices. By the Securities Reform Act of 1975, the scope of the SEC's authority was extended to

Rather, each province is responsible for the protection of investors and the regulation of the issue and trading of securities within its own boundaries.

To accomplish this mission, there are ten provincial securities commissions or bodies of similar function. These bodies protect the residents of their own provinces by:

(1) registering any broker or dealer firm which is resident in the province and/or dealing with its residents on a regular basis;
(2) registering any salesmen of a broker or dealer who deals with residents of the province;
(3) monitoring the meeting of disclosure requirements for prospectuses of companies which offer securities to its residents;
(4) supporting an investigation and enforcement function.

In the provinces where a stock exchange exists, the securities regulators also have responsibility for oversight of the exchange's operation and rules.[32]

The provincial regulatory authorities have increasingly cooperated in developing "national policies"[33] and British Columbia, Alberta, Saskatchewan, Manitoba and Ontario are known as the "uniform provinces".[33a] Québec has reworked its securities law in the past three years to be largely similar to the "uniform provinces". To date, there is no specialized securities legislation in the Atlantic provinces but work is under way.[34]

In parallel with the provincial securities regulators, there are certain self-regulatory bodies which are recognized to varying degrees by the provincial legislation. In general the securities commissions do not become involved in day-to-day regulation of exchange members, trading or listed companies, but rely on the industry's self-regulatory bodies.

---

cover clearing corporations, depositories and transfer agencies, and also increased substantially in its overriding authority over the U.S. self-regulatory bodies.

By contrast, the Ontario Securities Commission had about 85 employees and a budget of $2 million. The entire complement of provincial Canadian securities regulators is under 150 people with a budget of less than $3.5 million.

32 In British Columbia, the securities act has been amended to give the Superintendent of Brokers greater responsibility and powers over the Vancouver Stock Exchange and the securities industry than exists in Ontario and Québec; *see* B.C. Securities Act, s. 137, *as amended by* S.B.C. 1975, c. 70, s. 9.

34 Dennett, *Maritimers a Little Wary about Stock Exchange Plan*, The Toronto Star, September 3, 1975.

2. *Self-Regulation*

The principal self-regulatory bodies are the Investment Dealers Association of Canada (IDA) and the Toronto, Montreal and Vancouver stock exchanges.[35]

The Porter Commission stated in 1964:

> "A substantial measure of self-regulation is vital, both because the industry possesses an intimate knowledge of its own workings and problems that no outside agency can hope to equal and because self-discipline helps to develop a broader sense of public responsibility."[36]

Since then there has been increased attention paid to the effectiveness of self-regulation by the aforementioned bodies. As each body upgraded its regulatory capability, it became necessary for the self-regulatory bodies to divide responsibilities to avoid duplication of expense and undue harassment of firms which were members of more than one self-regulatory body. For example, sixty-three of the IDA's seventy-five members as of mid-1978 were also members of one or more stock exchange and eighteen of these were members of the three major exchanges as is shown in table 4.

The IDA is a national body, with headquarters in Toronto and staff representatives in Vancouver and Montréal. In addition it has a district council in each of seven regions. The IDA functions substantially as a trade association to promote the welfare of its members with government and the public. It also carries out certain regulatory functions with respect to the bond market through the Montreal, Toronto and British Columbia bond traders associations. In addition, for its sole members and certain stock exchange members it has responsibilities for supervision of member firms' compliance with the industry's requirements regarding capital and internal procedure as well as salesmen's conduct in servicing customers.

The three stock exchanges all claim absolute jurisdiction over their members and listed companies. They do, in fact, exercise

35 The Alberta Stock Exchange and the Winnipeg Stock Exchange are also self-regulatory bodies but have exercised little administrative power. The Alberta Exchange, however, has employed a full-time president and is making efforts to increase its importance in the securities markets. It is understood that securities firms with branches in Alberta have been encouraged to buy a seat on the Alberta Stock Exchange as an affirmation of their involvement in the province's capital market and to protect their underwriting position in the province's securities issues. In addition, financial institutions (banks and trust companies) with Alberta branches have been similarly encouraged to list their shares on the Alberta Stock Exchange.

36 REPORT OF THE ROYAL COMMISSION ON BANKING AND FINANCE (PORTER REPORT) (1964) at 347.

authority over their members with respect to trading carried out on their own facilities.[37] Most regulatory responsibilities, however, are split. In effect, for a listed company there is a tacit understanding that the major thrust of regulation will come from the largest exchange on which it is listed.

With respect to supervising the operations of members, jurisdiction is also rationalized so that continuous monitoring of capital and procedures has been divided over the three exchanges and the IDA. The IDA has responsibility for several of the larger underwriting and money market houses. With two or three historical exceptions, the division of responsiblity for supervision of brokers is generally along regional lines by location of head office.

In responding to complaints from investors, there is the added problem of unlisted as against listed trading. If an offence is in a listed stock, then the burden of enforcement is assumed by the self-regulatory body on whose facilities the alleged offence took place. If an offence takes place in an unlisted stock or if a complaint involves a salesman's conduct but does not relate to trading, then the enforcement usually falls to the body which receives the report/complaint. The usual result is a regional division of enforcement.

As might be expected, evenhanded administration of rules on matters where jurisdiction falls to four different bodies is a continual challenge. Nevertheless, cooperation between the exchanges and with the IDA is generally good on such matters and has steadily improved.[38]

37 On the other hand, no exchange has succeeded in restricting the activity of its members on other exchanges. For example, when one exchange has issued a stop trading order in a particular stock and another has not, members of the latter exchange regard it as proper for them to trade on that exchange irrespective of their membership on the exchange where it is halted. Similarly, though short selling of listed securities is restricted on the TSE, joint members of the TSE and MSE are able to sell the same stocks short on the MSE without restriction.

38 If a split jurisdiction between the self-regulatory bodies seems to offer potential problems, it may be worthwhile to note the tangle of enforcement agencies which supplement or override the work of the self-regulators. In the few years preceding 1973, particularly in B.C. and Québec, questionable elements appeared to be able to exercise unusual influence with the Vancouver Stock Exchange, the Canadian Stock Exchange (now being wound up) and Quebec Securities Commission. In response to the explosion in securities fraud, which took place during that period, numerous enforcement agencies increased their complement and competence. In addition to stock exchange examiners and compliance officers, brokers and dealers may be visited by representatives from the RCMP Commercial Crime Section (branches in 15 major Canadian cities in all provinces but P.E.I.), the provincial securities commission and (in Toronto and Montréal) the city police fraud squad.

F. COMPARISON WITH U.S. MARKETS

As one would expect from their geographical proximity, the Canadian and United States markets are quite similar in organization. There are, however, some differences which are worth noting to place the Canadian market in context.

1. *Market Size*

The data for stock exchange dollar values of trading in 1977 in table 7 indicate how much larger the U.S. market is than the Canadian.[39] Although the U.S. population is about ten times that of Canada, the volume of trading and other U.S. market statistics indicate (as a rule of thumb) a factor of twenty to thirty times in terms of size of the industry and volume of activity. Merrill Lynch alone, with 1977 revenues of $1.1 billion, capital of $650 million and 20,000 employees, is substantially larger than the whole Canadian industry.[40]

2. *Market Structure*

With respect to detailed organization, U.S. primary issues, bond and money markets are generally similar in structure to those in Canada. There are some differences in the OTC equity markets and in the stock exchanges, however.

An historical difference is that the New York and American stock exchanges list bonds for trading. In 1976, bond volume on the NYSE amounted to $5.3 billion in 2,700 issues. The same issues also trade in the OTC bond market. A second difference is that though the U.S. regional exchanges (Midwest, Pacific Coast and Philadelphia Baltimore Washington) traded a substantial dollar value, most of that trading was in stocks listed on the New York or American stock exchanges. Unlike the Vancouver stock exchange which has several hundred stocks of its own (and to a lesser extent, Montreal), the U.S. regionals have only a small representation of local securities.

Probably the most noticeable structural difference is the large over-the-counter equity market in the U.S. Over-the-counter trading of equities in 1969 through 1972 was equal in volume to more than half the share trading of the New York Stock Exchange. The parallel Canadian comparison would indicate total Canadian OTC equity trading at less than 5% of exchange trading.

The importance of OTC equity markets in the U.S. is mainly due to the much higher listing standards of the U.S. exchanges.[41] Although a small number of senior securities – principally life insurance companies, but also such well-known names as Anheuser-Busch, First American Bank and Tally Corp. – have long-standing relations with OTC market-makers and have so far chosen to remain aloof from listing, the fact is that a much smaller proportion of publicly-traded stocks are able to obtain listing.

It is worth noting that the size of the United States OTC market has resulted in a nation-wide system being established to make quotation information conveniently available to brokers servicing investors in OTC stocks. The National Association of Securities Dealers (NASD) arranged in the late 1960s with Bunker Ramo to create an automated quotation system (NASDAQ).[42] This system permits market-makers to enter bids and offers through Level 3 terminals for dissemination to trading desk (Level 2) terminals. In addition a median bid/offer for each stock is available on most of the 40,000-odd desk-top sales terminals scattered around North America.

Three recent developments in the legal framework governing the U.S. industry are creating pressures which are gradually causing it to diverge in structure from its Canadian counterpart. These three developments are institutional membership in stock exchanges, public ownership of securities firms and removal of the stock exchanges' power to fix brokerage commissions. A fourth (and perhaps most important) issue has been the subject of hearings before the SEC in that the New York Stock Exchange's cornerstone rule (No. 390) – that is, that all trading by members in listed securities must be done on the exchange and subject to its rules – is being attacked as anticompetitive and inimical to the public interest.[43]

The related questions of institutional membership and public ownership go back to the 1969–71 period when the U.S. industry was suffering from the collapse of back office systems[44] and a general exodus of old family money from Wall Street. Whereas before that time some institutions had gained access to the regional exchanges in order to pocket part of the commissions generated by their portfolios, the NYSE had stood firm against financial

institutions either becoming, or investing in, member firms. With the crisis of 1970,[45] any source of capital became welcome as firms struggled to meet daily capital requirements. Various insurance companies and other corporations were permitted to buy substantial minority positions in NYSE member firms.

Similarly, public ownership was another source of permanent capital for a troubled industry. The first public issue was made in April 1970, when Donaldson Lufkin & Jenrette went public (underwritten by Merrill Lynch and First Boston) and raised $11 million by sale of shares to the public. Merrill Lynch, Bache, E.F. Hutton, Paine Webber, A.E. Edward, Dean Witter Reynolds, among others, followed by the end of 1974, resulting in a large amount of *new* capital being raised by public share issue, and committing to a "permanent capital status" more than $1 billion of brokerage firm capital.

By contrast, the Canadian industry considered and rejected both institutional memberships and public ownership in the so-called *Moore Committee Report*[46] and its follow-up *Joint Industry Committee Study*.[47] Rules governing Canadian brokerage firms' sources of capital were liberalized as a result of these studies but it has been made clear that public ownership of securities firms' shares would not be permitted and that capital invested in such firms by banks and other potential investors is to be closely restricted so that the persons providing not less than 60% of a firm's capital have to be actively involved in the firm.

From 1968 to late 1974 in the U.S., various SEC and congressional hearings took place to examine the need for fixed commission charges on stock exchange transactions. The result of these enquiries was that U.S. commission rates became negotiated as of May 1, 1975.[48] In the succeeding thirty months the U.S. industry adapted to the new competitive environment by significantly cutting commissions to large institutional investors and by consolidating into more capital-intensive units. In that it has so far

48 *Adoption of Securities Exchange Act Rule 19B-3*, SEC, Securities Exchange Act of 1934 Release No. 11203, January 23, 1975, 6 SEC Docket 146 (1975). This release contains an outstanding historical review of the fixed commission question as well as highlights of the crucial arguments and a complete set of footnotes referencing the key documents relating to the question and the SEC's paper record in dealing with it.

retained a fixed-rate structure, the Canadian securities industry is, of course, greatly concerned by the U.S. change.[49]

Before May 1975 the Canadian fixed-rate schedule was slightly higher than, but rather similar in structure to, the American one. Rates for small transactions (usually applicable to individual investors) were higher than for large trades (generally those of institutions). When it became clear that the U.S. rates would become unfixed, there was concern that the 30% of Canadian exchange business which is in securities interlisted with the New York and American stock exchanges might tend to move to the U.S. markets where American brokers would presumably charge less for institutional executions.

Four proposals for the Canadian exchanges were put before the memberships:

(1) Move immediately to unfixed commissions on all listed stocks.
(2) Move to unfixed commissions for executions on Canadian exchanges on a subset of stocks which were particularly subject to competitive activity by American brokers servicing Canadian institutions, and leave rates fixed on all other stocks.
(3) Require Canadian exchange members to charge Canadian rates on all transactions in Canadian securities for Canadian accounts regardless of whether the execution would be in the U.S. or Canada.
(4) Make no changes but monitor developments closely.

After much discussion,[50] the Canadian industry decided by majority votes of the members at the Montreal and Toronto exchanges that the appropriate course was to change no rules but to monitor developments. This meant that Canadian brokers could meet U.S. competition on interlisted stocks by taking executions to a U.S. exchange but that such business as came to the Canadian exchanges would be at traditional Canadian commission rates.

Extensive monitoring is being done by the Toronto and Montreal stock exchanges. Data obtained indicate that in the fifteen international stocks which account for 41% of total trading in interlisted stocks, the portion of total trading which was executed in the U.S. was 45% in the period January–April 1975, 54% in the period May–September 1975, and 58% in the period January–May 1977.

Chapter IV
Mechanics and Daily Operations of the Securities Market System[51]

The functions and mechanical operations which constitute the daily business of the securities market system in Canada are shown in figure 2. The diagram also indicates, with cross-references to the text, those sectors of the system in which computer automation is used. The primary issuers of securities instruments, corporations and governments, are shown on the upper left. Typically, an issue is underwritten by securites firms and distributed through salesmen to investors. In the event that the new buyers wish to sell, the contact is back through a salesman to a securities firm's trading department. That department may be inventorying the security or it may be turning it around immediately for OTC resale. Bonds generally trade on this basis. Equity securities also trade on this basis unless or until they become listed on a stock exchange.

After listing, the trade is more complex when orders to sell or buy are not dealt with completely in the securities trading area but are sent on to the stock exchange floor to seek a match as indicated in figure 2, lower right. When trades are taking place, immediate notice of them is handled in the securities firm's contracts, accounting, cashier and securities certificate storage ("cage") operations areas. If a trade is in a listed security, the exchange's clearing house procedures would also be activated.

In support of transaction settlement activities in the securities cage area, there is frequently an involvement of corporate transfer agents, as indicated in the lower left to put securities in the form requested by the securities cage. This contact is often through the "mailbox" envelope transfer facilities of the clearing house whereby the exchanges/depository provide a centralized envelope/mailbox service. It is not uncommon, however, for direct contact to be made between securities firms and transfer agents.

The banking and trust company areas are also involved in providing storage for certificates under the control of brokers' securities cages as well as those owned by the bank or trust companies or by clients of these institutions acting as investment managers. Similarly banks have a relationship with securities firms in financing, through collateralized call loans, the securities

51 This chapter was prepared in late 1975. In the intervening two years, there have been some changes, but basically the same services are currently offered and the conceptual material remains valid. Therefore, the details have not been updated and the reader should bear in mind that the facts constitute a status report as of year-end 1975, not 1978.

positions in customer margin accounts and also in house accounts, as well as the financing of underwritings.

In effect the model can be neatly divided into two sections: the "frontend" dealing with sales and trading; the "backend" or "operations area" dealing with credit, settlement, custody and ownership. The functions of both the frontend and operations area are increasingly being facilitated and streamlined by various applications of computer and communications technology.

A. FRONTEND SUBSYSTEM

In the securities industry, the frontend is where the money is made and where the saleable products and services are created.

There are four principal components in the frontend: sales, trading, underwriting and research. As the greatest part of securities industry revenue is in transaction charges (commissions) or underwriting spreads, sales is the pivotal function. The sales "system" in the Canadian securities industry involves 4,500 registered representatives in 550 branch offices in Canada and abroad.[52] The principal job of the other frontend subsystems is to support these salesmen with desirable products.

In effect, securities firms may be regarded as marketers of securities and securities-related products. It is not misleading to envision a securities firm as a team of salesmen (with customers having investment needs) whose job it is to keep the customers happy, and a backup group of product-makers, whose job it is to provide the salesmen with the necessary merchandise, ideas and services. Though firms vary greatly in the emphasis they place on different products, their goal is to offer sought-after products and services in a way that will win them business. There are four main products.

(1) *New issues and secondary distributions.* Although the conventional description identifies underwriting as a capital-raising function wherein the capital needs of corporations and governments are met by issue of securities to the public, it is equally a customer-servicing function. The sales manager is an increasingly important factor in deciding whether a firm will make an underwriting, what will be the terms of the issue and how it will be priced. His concern is not only that the securities can be "placed" (sold) on issue date but also that the customers who buy the securities will continue to want to deal with the firm in the future. Thus underwriting is in fact a complex trading off of issuer and investor needs. It analyzes

52 *See* text accompanying notes 25-30 *supra.*

divergent requirements and results in an accommodation of competing interests that will bring funds to the issuer in an acceptable form while meeting investors' needs for capital preservation or income, and assuring that both corporation and investor will want to stay with the firm for repeat performances in the future.

(2) *Liquidity for secondary trading.* This important product is an outgrowth of the organized marketplace for securities where a large number of investors' wishes are coordinated. Liquidity is the ability to convert (with convenience and at low cost) securities to cash, thus making direct investment in securities (instead of, for example, in mutual funds or a bank account or savings bonds) a credible proposal. The more liquid is the market for any security the more attractive will be investment in that security. The amount of liquidity in a market at any given time is the result of many factors. It is, in the first place, a function of the public's confidence in the fairness of that market and their interest in securities investment. Other factors determining liquidity are the degree to which professional investors and dealers are willing to trade in that market and the extent to which all trading interests are expressed in a single marketplace. In addition, liquidity is inversely related to any inconvenience and undue expense to investors in participating. The complex interplay of these various factors will further be affected by the regulatory environment and by the facilities and supporting systems which constitute the marketplace.

(3) *Research.* This is a "better idea" product. Through the provision of timely and insightful research, the salesman endeavours to persuade the investor to regard the firm's investment recommendations and analytic information as superior to that of other firms – therefore, warranting sale and/or purchase of securities through that firm. Investment research has become an extremely sophisticated field. To research a company at the level required today, analysis is required of national and international economic circumstances, the industry as a whole, and of the subject company in particular. The requirements for raw data and the ability to manipulate it are enormous.

(4) *Service.* This is a catchall of work. It includes everything from relatively concrete matters like favourably priced executions and quick reports, timely answers to customers' queries and provision of *unsolicited* information on their holdings, to such ephemeral services as sympathetic commiseration and remembering the customers' wives' birthdays. Although part of

a customer's view of a firm or salesman's "service" rating is based on personality or on facts such as execution price, a large part of service quality is dependent on the information and communication systems available to support the salesman.

Until six years ago most management and development efforts by Canadian securities firms were spent on the frontend functions outlined above. The data processing and paper handling systems which accomplished internal accounting and record keeping, and settlement and ownership recording functions were relatively neglected.

B. BACKEND SUBSYSTEM

There are several crucial functions of the back office or "operations area" in the broker and dealer offices. Preparing contracts and statements to obtain payment and inform customers of their securities positions, controlling credit, handling and keeping track of certificates and carrying out execution of customers' instruction for certificate registration and delivery are among the major functions. Volumes are large.

In all, active Canadian corporations and governments have outstanding over 30 million securities certificates, 16 million to 18 million of which are equities. Nearly half of the equity certificates were reckoned by the Canadian Depository for Securities Ltd. (CDS) to be in the hands of the financial community (brokers, 3 million; banks, 3 million; and trust companies, 2 million), primarily in safe-keeping custody or hypothecation for customers.[53] No estimates were made for bond certificates but an equal or greater number are likely to be similarly held, particularly by banks and trust companies.

In order to keep corporate ownership records up-to-date, brokers and dealers in 1971 were shuttling equity certificates back and forth at the rate of 10,000 units per day with the seven major transfer agents which do 90% of the corporate transfer for the 3,000 active Canadian corporations.[54] Transfer agents issued and cancelled an average of 22,000 certificates daily. In support of their call loan needs, brokers and dealers were moving 1,500–2,000 units daily with banks. Another 1,500–2,000 units were moved to

53 *See* REPORT OF THE OPERATIONS COMMITTEE, *supra* note 8, app. 6.

54 One unit of movement is one security delivered or received with a transfer agent by one brokerage office. There are often two or more certificates in one movement.

make delivery on purchases and sales involving other institutions.[55]

For every active customer a broker maintains at least one securities account. Given that institutional customers deal with a large number of brokers and that many individuals also have more than one broker, indications are that Canadian brokers and dealers maintain over 1 million accounts. Transfer agents maintained about 4.5 million corporate shareholders' accounts in 1971.

Evidently there are a lot of records to keep track of and a high level of daily activity. The cost for this work in 1971 was reckoned by CDS at about $40 million for brokers and dealers and about $10 million to $15 million for trust companies, banks and transfer agents solely in connection with settlement and transfer contacts with brokers and dealers.[56]

A securities firm operations area has two principal interfaces – streetside and clientside. The former deals with settlement of trades between members; the latter with settlement of transactions with customers. For some years streetside settlement has been highly organized through the stock exchange clearinghouses. Movements of certificates between exchange members and stock transfer agents is also coordinated through the clearinghouses. At the present time (1975), the thrust of new development is to bring the banks and trust companies within a formally organized clearing arrangement. This will mean that settlement of clientside transactions for institutions (which use banks and trust companies as agents for delivery and safekeeping) will have been converted to the same economical basis as streetside settlement. More explanation of this matter is included in chapter V.

C. COMPUTER SUPPORT FOR SECURITIES INDUSTRY FUNCTIONS

To this point, we have outlined the economic function of the securities markets, described the various types of markets, the principal participants and the regulatory framework in which they exist. We have also outlined, as an integrated system, the various functions and mechanics of the daily operation of the securities firms and certain bank and trust company operations in the market.

This section enumerates and describes the areas of this integrated system which use computers and communication technology. It constitutes, in effect, a status report as of year end 1975 on

55 REPORT OF THE OPERATIONS COMMITTEE, *supra* note 8, at 32.
56 *Id.* app. L.

the various applications of automation in North American securities firms and in the markets in which such firms participate.

There is nothing magic about computers. They are simply a highly organized collection of electronic circuitry, capable of moving, manipulating and storing vast quantities of information quickly and accurately. Even the most complex systems can be seen as an ordered arrangement of devices for data input, movement, storage, manipulation/calculation, and output. The large number of routine transactions to be processed and great amounts of corporate and market data to be collected and dispersed in securities research and trading functions make the securities industry a natural area for exploitation of the computer. What has perhaps opened up the securities industry for particularly significant progress is the ability of computers to be connected to remotely located users through communications systems such as the telephone (Bell Canada) or telegraph (CNCP Telecommunications) networks. By these connections, the former barriers of space and time and the difficulties of mailing and storing expensive paper records for awkward future access are being overcome.

In figure 2, note has been made in each area where a computer application is now being used by some participants in the market system.

The review of the several roles of computer and communications technology in the securities markets could be approached in several ways. For example, the review could be organized in terms of the users (brokers, exchanges, banks and trust companies), or it could be organized in terms of automation function (data base management, terminal communication networks, modelling, inventory control/transaction processing). Instead, the simple approach of going step-by-step around the areas of the securities market system schematic has been chosen and probable cross-references, rationalizations, or common trends noted. The areas on the schematic are cross-referenced by numbers to the headings in the text below.

1. *Research*

a. *Historical and Current Market, Corporate and Economic Information Data Bases*

Information is the raw material of securities industry research departments. Before computers came into general use, many thousands of hours were spent collecting and filing data from corporate financial statements as well as historical data on market prices and volumes and general economic statistics. Because each firm had to have its own file of information, the same

work was duplicated dozens of times to build these three data bases in usable form.

The ability of electronic memory devices to hold vast amounts of such data in a form easily accessible from terminals has greatly changed the organization of securities research. Instead of maintaining dozens of duplicated file folders, brokers and financial institutions subscribe to one or more of several data base services. In additon to raw data access, data base services also allow their users to program statistical comparisons and various analytic routines. Such time-share accessibility not only is a great time-saver compared to manual tabulations but it makes feasible a much more ambitious and comprehensive program of securities research.

At the simplest level (Ian Sharpe Associates Ltd., Dataline, Comshare, IBM's "Market"), a time-sharing computer facility simply loads memory devices with the basic data files. Trade data is obtained from stock exchanges (or indirectly via the *Financial Post)*, corporate data is obtained from the *Financial Post* (which gathers it for its own publishing purposes) and economic statistics are taken from Statistics Canada sources (CanSim tapes). Although certain standard programs and programming assistance are usually available from the service bureaus, users of the services generally develop their own programs or buy commercial program packages. Suppliers of these simple data base services are basically selling computer time. They do not tend to specialize in financial data or securities market servicing.

At a more specialized level, FRI Information Services Limited[57] offers a customized research/data service via Bell Canada's "Dataroute" service to seventy-five customers. Because of its specialization and sponsorship, FRI has made special efforts to upgrade and standardize the quality of its market price data and especially of its corporate financial data.[58]

In addition to maintaining a comprehensive data base of market and corporate data and CanSim series, FRI also has a large library of standard analytic programs which subscribers can activate in order to have specified runs produced on their terminals. Subscribers may also create custom programs of their own which

57 FRI (Financial Research Institute) started out in 1967 as a cooperative venture of the Financial Post and McGill University but has evolved to a more commercial operation. For a more complete write-up of its background, purpose, services and plans write to FRI Information Services Limited, 1801 McGill College Ave., Suite 600, Montréal, Québec, H3A 2N4.

58 FRI has its own programs to put stock price volume and dividend data in memory and has designed some special standardization methods which The Financial Post carries out exclusively for the corporate financial data it provides for FRI.

they can then run against the data to make their own unique analyses.[58a]

Many brokers have arranged connections to extant data base services. Two, however, are themselves involved to varying degrees in the business of providing securities research data bases. Jones Heward & Company Ltd. of Montréal, a broker of long-standing reputation in research and portfolio management, has developed its own data bases tailored to its own needs. To a limited degree it sells access to its data bases and also, through its own programming group, provides customized analytic and portfolio programs for clients. Wood Gundy Limited of Toronto which has made a large investment in computer capability has also organized a specialized data base of historical information on the trading, capital and similar matters of 200 companies. Access is limited to the firm's own purposes.

b. *Modelling/Simulation*

Securities firms are using econometric techniques to test various commercial and economic assumptions in computer-based models of the economy. By such simulation they hope to improve their judgments on how particular companies will be affected by certain economic shifts (component or product price changes, interest rate changes, foreign exchange rate shifts) or corporate changes (levels of production, etc.).

c. *Technical Analysis*

Stock price and volume charts which were formerly the product of trading and laborious posting are now produced by computers based on collection of machine-readable data direct from the exchange trade ticker. Draper Dobie & Co. Ltd. of Toronto, which has its own installation of Digital Equipment minicomputers and a network of video terminals, has a notable example of this application in "Dobie's Online Graphics System" (DOGS). DOGS has charts available for print-out or CRT (Cathode Ray Tube) display on request by any of the twelve terminals now operative in Toronto. Various other technical measurements and indicators are calculated through the aid of the system (*e.g.*, on balance volume, new highs and lows, etc.).

58a FRI began in 1967 with five employees and subscriptions from 10 interested institutions and broker-dealers. It and Data Directions (a commercial affiliate) now have 26 system consultants, programmers and clerical support staff and provide service to 75 customers, 23 brokers, 35 institutions, 17 universities and government departments. Including multiple location users, there are 125 terminals able to access FRI data bases.

d. *Liquidity Measurements*

Built on a data base of trading volume information, liquidity indices can be calculated to compare the relative liquidity of listed Canadian securities. Crang & Ostiguy Inc. are prominent in this area and will provide variations on request to screen for available issued shares, dividend reliability and growth of earnings records.

2. *Underwriting: Modelling/Simulation*

In order to test the financial impact on a corporation for which a financing is planned, some underwriters have developed modelling programs which permit various proposals to be tested against both selected economic and commercial assumptions and the detailed financial situation of the company in question. The result of such activities is believed to be more appropriately conceived and better-priced issues. Thus, both issuer and investor are afforded an improved product.

3. *Sales Support*

a. *Market Information for Salesmen*

i. Ticker tape

As noted earlier, the NYSE established its ticker tape in 1867. In 1909, the Toronto Stock Exchange established facilities to transmit quotes every ten minutes. It was not until the mid-1920s that a continuous trade ticker such as is known today was offered in Toronto (by the Standard Stock and Mining Exchange).

The stock ticker is an inherently simple system composed of a device to organize stock trade and quote data for transmission, a communications net to carry the transmission, and a device to read the transmissions, convert them to man-readable form on a paper tape or play them sequentially across a display panel. At present there are 540 stock tickers in Canada: TSE 450, MSE 30, VSE 60, plus a few NYSE and AMEX.

ii. Market information inquiry terminals quotation devices

One of the earliest online applications of computer by any industry was the introduction by Scantlin Electronics Inc. of "Quotron" desk-top market quotation terminals to the U.S. industry about 1959–60. Ultronics Systems Corp. introduced Stockmaster terminals to Canada in 1962. Such inquiry networks involve a computer-driven data base, communications net and addressable terminals. Up-to-date transaction and quotation information is collected by a computer which carries online files of the informa-

tion read from trade and quotation ticker tapes produced by the exchanges. A computer also manages the communications net and terminal system to give immediate responses to information requests.

In 1975, Scantlin, Bunker Ramo and Ultronics, the main commercial suppliers, had between 40,000 and 50,000 terminals operative in North America. In Canada, Scantlin does not operate, but Bunker Ramo had 200–300 installed terminals and Ultronics, 1,400–1,500. An additional factor in the Canadian market is the Toronto Stock Exchange which has 550 installed inquiry terminals,[59] while the VSE has a network of 40 dialup Telex terminals and 20 Vucom terminals in its recently announced MARS system.[60]

The marketing thrust of Ultronics and of Bunker Ramo in Canada has been to service the heavy population centres. On the other hand, the TSE's CANDAT system (first operative in 1965) was developed by the exchange principally to service smaller and more remote communities. Because of its basic teletype keyboard design and CNCP sales and service contract, it could be offered at low prices in areas where the population size did not justify a more elaborate terminal. CANDAT has devices as remotely located as Dawson City, Yukon, and St. John's, Newfoundland. Its existence in the larger centres has also ensured that a monopoly does not exist for the other suppliers.

iii. Block offering devices

An important innovation in the specialized market for big blocks of stock was engineered by Automatic Exchange Ltd. (AutEx). The founders of AutEx recognized in the mid-1960s that traders at both institutions and brokers spent many hours shopping around for offsetting trading interests. Recognizing this as an opportunity to save time and effort for highly paid people, AutEx devised and set up a data base and interactive terminal network which would permit brokers and institutions to file trading interests and broadcast messages to any or all subscribers. The messages indicate in which stocks they have buying or selling interest and give an indication of the size of the interest (small, medium and large). In 1973 AutEx had 474 subscribers and 550 terminals in the field.[61]

AutEx charges are high ($5,500 to $9,500 per terminal per month) and at the present time (1975) a competitor, Comstock, is

59 Including some 70 CANDAT II terminals which are part of a system described in ch. VI.B *infra*.

60 The Financial Post (Toronto), September 20, 1975, at 22; *see also* app. B *infra*.

61 *See*, *Jenkins*, at text accompanying n. 23.

attempting to set up a competitive network[62] to give much the same service but at lower cost. An earlier competitor of AutEx, the New York Stock Exchange Block Automation Service (BAS) which also did essentially the same thing as AutEx was discontinued in 1974.

b. *Customer Account Information*

A recently planned innovation is the use of desk-top terminals to provide salesmen and operations area personnel with up-to-date information on customer accounts – for example, what securities are held, excess cash or buying power and status of settlement on open transactions. At this date, a number of brokers in the U.S. are setting up their own in-house systems. In Canada, IBM has planned such a system, Online Account Status Information System (OASIS) and is trying to market it through the data centre but with little success. Both Draper Dobie and Wood Gundy have such systems in the design and development stage, but neither is looking for near-term implementation.

Because of its departure from traditional operations area practice Nesbitt Thomson has an online customer information system operating (1975) on terminals in Toronto, Vancouver and Montréal offices. So far the main application has been in the operations area to monitor open items but the firm expects salesmen to be using it for account servicing and sales by mid-1976.[63]

The potential for such systems appears very great in that a salesman will be able to have current information about a customer's portfolios on a screen in front of him before he talks to the customer. This will be a significant improvement from the present inter-office memo system giving periodic reports (perhaps as infrequently as monthly) on customer security positions. In addition, the potential will be available for firms with such facilities to distribute research opinions, information bulletins and margin calls instantaneously to all salesmen with terminals.

4. *Trading and Trading Support*

a. *Trading Systems*

There are at present (1975) no computer-based trading systems in Canada.[64] However, chapter VI describes at length the

62 Securities Week (New York), July 21, 1975, at 9; *id.* August 25, 1975, at 2a.

63 Conversation with G.D. Bronson, Manager of Systems, Nesbitt Thomson & Co. Ltd.

64 The OSC in July 1971 directed Guardian Management of Toronto to remove the Instinet terminal which it had obtained on an experimental basis because one of its subsidiaries was an investor in Institutional Networks Corp. Ltd. *See also* TSE, Notice to Members No. 744, December 1, 1970, reporting a TSE submission to the

current experiment at the TSE involving computer-assisted trading.

In the U.S., Institutional Networks Corp. Ltd. (Instinet) has been offering a computer-based trading system since 1969. Its purpose is to attract business away from regular brokers by offering low-cost executions to institutions.[65] The Instinet system has been installed in England under the name of ARIEL to service the accepting banks. At present Instinet is implementing an upgraded system and will be integrated into the SEC's Central Market System which is described in more detail in chapter V.

The Pacific Coast Exchange in San Francisco/Los Angeles has had an automated transaction system for up to 199 shares for some time in its COMEX system. In the COMEX system a member broker with a terminal sends orders to the Pacific Coast exchange specialist for automatic execution against the New York Stock Exchange market.

b. *Money Market Inventory Control*

The larger Canadian money market dealers have found that manual or even standard data centre bookkeeping of money market inventories and open transactions is not adequate. To maximize their effectiveness traders need to have their positions in money market instruments maintained on an up-to-date basis. The same is true of the cage area where status of delivery and banking arrangements must be closely monitored.

Nesbitt Thomson and Fry Mills Spence have been particularly innovative in this area and have developed programs run on their own in-house computers to carry out yield comparisons, inventory reports, and trade recaps, produce reports required for the IDA and the Bank of Canada, keep track of maturity dates of notes held by clients, etc. Other dealers have chosen time-sharing systems (I.P. Sharpe, G.E.) to accomplish much the same thing. The view among the aggressive computer-using dealers is that by having a customized system they are able to make quicker and more appropriate responses to market changes – thus improving their competition with profit position.

c. *Order Movement and Control*

At the present time Canadian brokerage firms with branch networks primarily use teletype facilities to carry orders and fill reports between branches and their trading centres. Two (Merrill

---

Quebec Securities Commission regarding the undesirability of nonexchange markets.

65 *Jenkins*, at text accompanying n. 35.

Lynch and Richardson Securities) have teletype terminals installed on the trading floors to shorten communication time. However, even these systems do not retain information about the orders entered nor about reports of executions. At this date (1975), capture of information for customer contract and accounting purposes is a separate order room operation.

5. *Clearing and Settlement*

a. *Brokerage Operations Area*

After a trade takes place a record of the completed trade is sent to the "contracts" department for checking and posting. In 104 out of the 124 exchange/IDA brokerage houses in Canada (probably covering 98% of the business) the data are entered into a computer for processing. In 1975, Wood Gundy, A.E. Ames, Richardson Securities, and Nesbitt Thomson[66] had their own operations area computers. The IBM Datacentres in Toronto, Montréal and Vancouver serve all but three of the rest of the computer-using brokers (Bongard Leslie and Midland Doherty run their own systems on the time-sharing facilities of Datacrown; Bache Halsey Stuart processes on its U.S. parent's computer).

Typically the computer serving the operations area will prepare and send a confirmation to the customer, update the customer's account, and enter the transaction in the firm's clearing position. It will also change the firm's stock record position and issue internal advices so that the relevant departments can start the necessary physical processing. Periodically the operations area system will calculate margin positions and other assorted management information, and print reports so that exceptions or errors can be identified by the appropriate manager. As a result of operations area processing an important data base consisting of customer information (name, address), securities owned, credit or debit balance is created. If this data base is maintained in online mode – that is, readily accessible to terminal inquiry – then a couple of important benefits result. First, convenient provision of customer account information to salesmen becomes practicable. Second, the amount of report printing required is vastly reduced as, instead of having to print the whole file, operations managers

66 The recent emergence of Nesbitt Thomson from being a user of the IBM Datacentre to having its own customized system on an "online" basis (rather than the batch basis on which the rest of the street runs) may be a preview of things to come. In addition to giving Nesbitt Thomson the ability to provide customer account information to salesmen, and giving them control over their service development program, the system is expected to provide cost savings of 50% on operations area expenses.

can simply ask the computer system to identify exceptions for their attention.

b. *Exchange Clearing and Settlement*

In the present system, data on all transactions between exchange members[67] in Canadian equity securities are reported to the exchange clearinghouses. On transactions in listed securities the data are captured on the contract made out on the floor at the time of a trade between two brokers; on unlisted trades the data are submitted as a trade report by the involved brokers. On the day of trade, the data are entered into the exchange computer and next day each broker is given a confirming list of trades for correction. The next day, the confirmed trading lists are netted by the exchange computer so that each broker has a minimum of actual deliveries to make in order to settle his transactions with other exchange members.[68]

At the Toronto and Montreal stock exchanges the netting results in reduction of actual delivery of items to about 60% of the number of transactions.

The Vancouver Stock Exchange has mounted a Continuous Net Settlement (CNS) system in which the exchange clearing entity is interposed in each trade and only net amounts are ordered for delivery.[69] In addition, each day's trading is netted against the previous day's closing balances, thus reducing to an absolute minimum the amount of stock or money which a broker is required to give or take in the interest of streetside settlement. The number of items for delivery is reduced to about one-third of the number of trades.

c. *Banks and Trust Companies*

Banks and trust companies are of course very large users of computers and communications technology in many of their functions. We shall consider here the application of automation only to the securities-related functions of these institutions.

As custodian and lenders against securities collateral, most banks and trust companies are now using a computer file to keep

67 Due to work of Canadian Depository for Securities Ltd., transactions by exchange members in Toronto and Montréal for or with banks and trust companies are now being handled by the exchange clearing houses in CDS's "Securities Settlement System". This has the effect of making broker-to-institution trades as easy and inexpensive to clear as broker-to-broker trades. *See* text accompanying note 85 *infra*.

68 REPORT OF THE OPERATIONS COMMITTEE, *supra* note 8, app. F, provides a concise but full description of the present clearing procedures, as well as describing procedures for safekeeping and transfer.

69 *See* app. B *infra* (Automation Program of the Vancouver Stock Exchange).

track of their total securities positions and of customers' accounts and also to produce monthly statements and confirmation of transactions for customers.

Trust companies in their role as transfer agents have also embarked on computerization programs. The most advanced now maintain their corporate clients' shareholder lists on computer files which are available for online inquiry and capable of producing various analyses of shareholder records which are of interest to the corporate clients.[70] Their aggregate data base in this function is practically all the Canadian shareholdings of Canadian brokers, institutions and individuals (4.5 million separate accounts).[71] It was estimated in 1971 that the seven largest trust company transfer agents maintained on the order of 100,000 accounts to cover the registered shareholdings of the 130-odd exchange members in the Canadian securities industry at that time. In addition, each day 3,000 transfers were made which generated a debit, a credit (or both) in the broker accounts. It is believed that this is a growth area for automation.

6. *Regulation and Enforcement*

To support their stated objective of operating a free and open market, the exchanges have assumed heavy trading surveillance responsibilities. While effective surveillance is largely a manual and judgmental task, the timely production by computer of listings of transactions in time sequence enhances the effectiveness of this function. Such print-outs are used to monitor the performance of professional traders as well as to support investigation of possible market manipulations or insider trading.

7. *Special Sales-attracting Services*

In a fixed commission environment, the revenue on large orders – usually from institutions – tends to exceed the execution, sales and administrative costs directly related to the trades. In other words, the incremental net revenue from handling trades for large accounts is great. Because a fixed commission structure prevents institutions from bargaining to squeeze the margins on large trades, the tendency is for them to bargain for more services to be paid for by the brokers in return for commissions or "soft

70 The Globe and Mail (Toronto), April 24, 1975 (full-page advertisement by National Trust).

71 Bell Canada, Imperial Oil, Gulf Oil, CPR, Alcan and the chartered banks keep their own shareholder records rather than contracting the job to a professional transfer agent.

dollars". In order to attract such institutional business, brokers have devised various useful services to provide to accounts willing to make "soft dollar deals".[72] Some of the services made available for soft dollars have involved computer applications as described below.

a. *Portfolio Valuation*

For mutual funds which value their portfolio daily in order to set selling and redemption price, quick and accurate valuation is particularly important. Crang & Ostiguy and Canavest House, among others, have responded by providing valuation services to meet these needs. Daily stock prices and subscribers' portfolio positions in securities and cash are the essential data base for these calculations.

b. *Investment Performance Measurement*

A number of brokers provide a measurement service which rates the participating institutions' portfolio investment results against each other and against some recognized stock average (Dow Jones Industrial Average or TSE Index, Standard & Poor 500). Prominent in this field with Canadian institutions are: A.G. Becker, Alfred Bunting, and Wood Gundy. The levels of various indexes and the net asset value of the subscribing funds are the data base for these measurements.

c. *Portfolio Selection and Modelling*

Given the ability of computers to store great quantities of data and perform myriads of calculations in a short period of time, theorists have conceived of various portfolio modelling techniques for the purpose of selecting a portfolio. Most modelling systems are based on various applications of volatility measurements or "beta" which purport to measure the relative riskiness of stocks. A stock's beta gauges the degree to which the historical price fluctuations of a stock are wider than the price fluctuations of a risk-free investment, for example, Treasury Bills. On the basis of trading off relative projected rates of investment return and the volatility (beta) of a stock based on past trading prices, portfolios are recom-

72 "Hard dollars", by contrast, are direct cash payments for a service. A slightly different meaning is put on "soft dollars" when it is used in the more restrictive sense of referring to the commission payments generated out of the capital of a managed portfolio and distributed to brokers by the investment manager (fiduciary) in order to obtain useful services (*i.e.*, cost-reducing) for the investment manager's benefit. "Hard dollars" in this sense are cash payments of the investment manager's money, rather than commissions from the customer's principal. For a description of allowable and improper soft-dollar deals in Canada, *see* Montreal Stock Exchange, Circular No. 27-75, January 23, 1975.

mended to meet the investment manager's specific objectives. Several brokers and nonbroker service companies are involved in variations of beta measurement and portfolio services which they sell for hard or soft dollars to institutional and private investors. PMS (Portfolio Management Services), associated with Canavest House, is perhaps most aggressive in this area in providing systems consulting and customized programming for customers in Canada and the U.S. for use on the FRI or Ian Sharpe data base/time-share computer installations. Jones Heward and Wood Gundy also are active in this area.

d. *Capital Gains Accounting*

Since the introduction of capital gains in Canada in 1972, accounting for the profits and losses for tax purposes has been a significant chore for investors. Responding to this need, some brokers have developed capital gains accounting systems to offer to their customers. The necessary data base ties in neatly with a customer accounting package and therefore has only been offered by brokers who do their own bookkeeping or by those on the IBM Datacenter. Apparently recent quiet markets and the expense of capturing the data have led to a less than successful marketing of this product.

D. DATA BASES AND NETWORKS – SHORTCOMINGS

Taken piece by piece, the applications of computer and communications technology reviewed in the preceding pages seem lacking in any unifying theme. To date in 1975, this is indeed the case. Each data base and network has been created in response to a specific need. There has been no overview or long-term systems framework within which suppliers of automation and the industry could work.[73]

In retrospect, it is apparent that there are a number of existing and potential terminal networks, each dedicated to a particular and relatively narrow function: market inquiry, order move-

73 Until very recently, the same was true in the U.S. However, the SEC has recognized a need for an overall plan; *see* SEC, White Paper: Statement of the Securities and Exchange Commission on the Future Structure of the Securities Markets (February 1972); SEC, Policy Statement on the Structure of a Central Market System (March 1973). An Advisory Committee on the Implementation of a Central Market System was appointed in May 1974; *see* SEC, Securities Exchange Act of 1934 Release No. 10790, May 10, 1974, 4 SEC Docket 273 (1974). These initiatives by the SEC have had a significant effect on automation suppliers, the exchanges and broker-dealers in their planning, and an integrated system can be seen emerging in the U.S. It is worth noting that the problem of bringing about integration in the

ment, customer account status inquiry, research data access and manipulation. It is also apparent that there are in theory three classes of data: (1) historical and current information about market prices, (2) capital and financial information about issues and issuers and (3) information about securities owner/customer accounts. The three classes of information are not at this time neatly organized into accessible and fully maintained data bases. For example, the Financial Post and FRI collection of market price information is not real-time with the markets. It is not adequate for quote and trade information pursuant to trading. On the other hand, the market inquiry system data bases which are online and more or less real-time retain little historical data and are not useful for technical analysis and other research activities. On the corporate side, financial information tends to be late in being filed in accessible form and is often based on non-standard definitions. Data on customer account status is reasonably good to the extent that customers leave securities with their brokers. However, the files are not updated on a real-time basis and most investors do not hold their shares with brokers. Broader securities ownership information is widely scattered over trust companies, banks and brokers. It may be off real-time by several days and in any case is not accessible, even if the investor should wish it to be.

The data base defects noted above are not unduly serious considering the uses to which the existing data bases are being put by the particular terminal network they are accessed to at this time. The point that emerges, however, is that to use these disparate data bases a user requires several different terminals.

A development which would rationalize these duplications and provide considerable incentive to upgrade the quality of the data bases would be a multipurpose terminal network which, subject to security checks and authorizations, would access any of several data bases. The seeds of just such a network may well be the result of the computer-assisted trading project of the Toronto Stock Exchange – a major topic of chapter VI.

As noted above, shareholder ownership data bases are widely scattered and therefore not available for certain useful purposes. For example, investors' securities holdings information – including investor name and address, names of companies, number of shares, price of purchase and certificate location – is important information for a securities firm's salesman and operations area in trying to service an account. Part of the information underlying broker, bank and trust company nominee names (investor name

---

U.S. is substantial in face of the numerous regional financial centres and array of private suppliers of computer services.

and address, company and number of shares held) would also be useful information for transfer agents maintaining a company's shareholder records so that more direct shareholder contact could be obtained. The possibility that this area can also be rationalized in the future is part of the hope of the project of the Canadian Depository for Securities Ltd. which is the other major topic in chapter V.

Chapter V
Canadian Depository for Securities Ltd.

In 1975, there were two automation development projects of national importance going on in the Canadian securities industry: the upgrading of the Canadian settlement, transfer and ownership recording system undertaken by the Canadian Depository for Securities Ltd. (CDS), and the Computer-Assisted Trading System (CATS) investigation at the Toronto Stock Exchange.[74] The latter will be discussed in chapter VI.

A. OBJECTIVE OF THE CDS

The original CDS objective paraphrased from the Woods Gordon study in 1968 was:

> "To put the holdings of all market participants into Depository accounts so that transactions among participants would result merely in debit and credit entries."[75]

That 1968 objective evolved through much analysis, introspection and discussion until by 1975, the objective might best be described as:

> "To have accepted and established in Canada a system of securities ownership such that the necessity to move, record and store paper stock and bond certificates will be substantially reduced or eliminated *in order to enable* operation of a more economical and reliable system for clearing and settling securities transactions for Canadian broker/dealers and financial institutions. The *method* of bringing this about will be to prepare the settlement

74 A third initiative in automation has been undertaken by the Vancouver Stock Exchange which has introduced a Continuous Net Settlement system through Vancouver Stock Exchange Service Corporation as well as an online inquiry system called MARS (Marketing and Reference System). App. B *infra* outlines the Vancouver developments.

75 WOODS GORDON LTD., CENTRAL DEPOSITORY FOR SECURITIES IN CANADA, REPORT NO. 1, at 1 (March 1968).

system so that the removal of certificates is simply one of a series of logical steps."[76]

B. BRIEF HISTORY OF THE CDS

The CDS project began in 1968 with the formation of a study group. In 1969–70 staff was hired and a $1 million funding was arranged with the participation of: Canadian Bankers' Association 15%, Canadian Life Insurance Association 5%, Canadian Mutual Funds Association 3.5%, Investment Dealers Association 10%, Montreal Stock Exchange 10%, Toronto Stock Exchange 40%, Trust Companies Association 10%, and Vancouver Stock Exchange 5%.

In the spring of 1971, a proposal was made by CDS to the financial community. While the proposal had many advanced concepts, generalized industry doubts about the project resulted in non-approval and the appointment by the board of an Operations Committee with additional funding of $250,000. As a result of that committee's work through the 1971–72 winter, the scope of the project was modified. In May 1972 the CDS board of directors adopted its recommendations which were, in part:

> "that the Canadian Depository for Securities Limited broaden its objectives to work toward improvement of the settlement, transfer, ownership recording, lending and safeholding system;
>
> "that the participant groups recognize that improvements in the system and the time required to implement them are dependent, firstly, on the ability of participant groups to agree to changes in procedure and operating patterns, and secondly, on their willingness to provide personnel resources and management effort necessary to support community objectives;
>
> "that work be commenced on the following projects:
>
> "(a) design and obtain agreement for an expanded settlement system;
>
> "(b) implement other innovations including: improved intercity delivery procedures, a mechanism for CUSIP numbering, the offering of deferred transfer service;
>
> "(c) prepare a basic design for a settlement/transfer system which is not dependent on certificates;
>
> "(d) further develop a legislative framework."[77]

76 Letter by S.J. Deudney, General Manager, CDS Ltd. (October 14, 1975).

77 Canadian Depository for Securities Ltd., minutes of directors' meeting (April 19, 1972).

Along with approval of the above program, a further $250,000 interim financing grant was approved in June 1972. This program was designed to work out through step-at-a-time practical experience, the difficulties in inter-industry cooperation.

All the policy problems were not solved by this means, however. In the spring of 1974 additional funds were necessary and the banks, trust companies, exchanges and broker-dealers had still not agreed as to what form the "depository" per se should take.[78] In addition, the Trust Companies Association and the Vancouver Stock Exchange[79] had given indications that they would no longer support the project financially.

To move the project forward on the political level a review committee consisting of the executive director of the Canadian Bankers' Association (CBA), the presidents of the Investment Dealers Association and Toronto Stock Exchange and the president of the National Trust (on behalf of a group of supporting trust companies), was established in June 1974. It made recommendations for further funding and board reorganization and also obtained agreement at the highest level that it would no longer be necessary to debate the final form of the securities ownership recording system (depository per se) but that it could, would and should evolve out of cooperatively working together on the Securities Settlement System (SSS). As a result, a reapportionment of financial support was agreed to, and in the fall of 1974 a group of trust companies agreed to assume 15% of the financing. The dealer community (represented by the MSE, TSE, IDA) and the banking community (CBA) agreed to split the remaining 85%. With the addition of another trust company, the formula was subsequently revised to 20:40:40. In the spring of 1975, a new board of management was appointed to reflect the new financial sponsorship.

C. COMPARISON OF THE U.S. SECURITIES DEPOSITORIES WITH CDS

Before reviewing CDS accomplishments and status as of September 1975, a review of the approach to clearing and settlement and securities depositories in the United States is in order.

Living next to the U.S. has frequently been helpful for the Canadian securities industry. In general, the two economies, their industries and cultures have been similar enough that the Canadian securities industry has been able to watch the Americans

78 *See* app. C *infra* for a discussion of the question of whether the proposed depository system in Canada should be based on physically vaulting a mass of paper certificates or whether it should be based on reducing share interests (at least for broker-dealers and financial institutions) to mere bookkeeping entries.

79 *See* app. B *infra* for a review of the VSE's independent automation program.

experiment and develop new approaches and, after they have been proven, borrow the best ideas without incurring the substantial costs associated with new research and development. In the case of CDS development, however, some significant differences in both the historical roots of the depository concept and the cost structure and volumes of the industries in the two countries have resulted in a somewhat different approach being taken in Canada.

1. *Historical Roots*

While the clearinghouses organized by the exchanges in Canada cleared only transactions effected on the exchanges, the New York Stock Exchange clearinghouse allowed members to put settlement of any transactions through its system. It operated the simplest kind of post office for envelopes of unknown contents and the netting of agreed money payments. In order to make the most of this system it was felt appropriate many years ago to include the major commercial banks in New York – the so-called "clearing banks" – as participants in the New York Stock Exchange Clearing House. Therefore, when the question of a depository arose in the U.S., money settlement of securities transactions between exchange members and the major banks had been a routine process of long standing, accepted by the banks and welcomed by the brokers. Not so in Canada, where each trade for banks and trust companies was settled item-by-item at the cashier's window of the purchaser.

A second and very important difference in the two environments was that in 1968–71, when the major American thrust was made, the U.S. securities industry had been brought to its knees by the "paper crisis".[80] Not only had the stock exchanges been forced to reduce trading hours and even close one day of the week due to the inability of their members and the clearinghouses to keep up with the post transaction paper processing, there was considerable fear that the loss of control over certificates and customer account status would result in many firms falling short of capital requirements and actually being bankrupted.[81] The U.S. depository development program had the aura of a national crisis. A parallel situation did not exist in Canada.

80 Lybrand, Ross Bros. & Montgomery, *supra* note 44.
81 C. Ellis, *supra* note 45.

2. *Early Problems Observed in New York*

In the late 1950s the New York Stock Exchange had initiated development of a "centralized certificate service" for its members. With the high volumes of the mid-1960s, the renamed Central Certificate Service (CCS) became a high priority project of the exchange and substantial resources were invested in it. Thus, when it was suggested in Canada that a depository should be investigated, leaders of the Canadian industry turned to New York for guidance. The view was not very encouraging. It was observed that the U.S. depositories, notably CCS, were having great difficulties. By the end of 1971, some $35 million had been spent, but no satisfactory service was operative, members were not satisfied with processing speeds, delays and breakdowns were common. In addition, bankers and transfer agents were generally unfriendly to the new facility.

The unresponsive attitude of the U.S. transfer agents and banks caused several problems for CCS. First, because the U.S. transfer cycle was upwards of five days (as opposed to a routinized fourty-eight-hour cycle in Canada), it was frequently necessary to release stock certificates registered in the depository's nominee name, Cede and Co., from the facility. These were causing problems regarding the tracing and claiming of dividends and in proxy solicitations. Second, because the custodian and lending banks would not hold securities in CCS or lend money against certificates held by CCS, very little stock was able to be immobilized. In the period 1968–72, it could be fairly concluded that the traffic tie-up in stock certificates had been exacerbated by the interpositioning of CCS.

As a result, the view in Canada was that the principal cause of the U.S. problems was that the transfer agents and commercial and trust banks had not been included in the U.S. planning for a depository. The decision was therefore made to correct this shortcoming and put the Canadian project on an inter-industry basis. The composition of both the original sponsors and the present board indicates this decision.

3. *Difference in Volumes*

When the Canadian project was originally launched, another part of the thinking which led to adoption of the inter-industry approach was the knowledge that the Canadian securities indus-

try was substantially smaller than its U.S. counterpart.[82] In order to finance the project and indeed to find the volumes to justify the investment, the participation of the Canadian banking, trust and transfer industries seemed virtually essential.

4. *Differences in the Unit Costs of Operations Area Activities*

The view that it was necessary to draw in all possible volume was confirmed by the Operations Committee in 1972, but what had not been fully recognized at the inception of the project was that the unit costs for the various processes were substantially lower in Canada. CDS estimates of comparative costs prepared in 1972 indicate that the cost of securities transaction processing in Canada was much lower on a per-transaction basis than it was in the U.S. The figures estimated by CDS were in a ratio of about 2:1 and this was reckoned to be conservative.[83] Principal reasons cited by CDS for relatively lower Canadian costs were:

(1) The great majority of Canadian securities transactions are on stock exchanges where settlement data is efficiently captured and carried through the clearing process. In the U.S. a much greater proportion of trading is over-the-counter. In addition the large U.S. exchanges generally lacked site-of-trade data capture systems.

(2) One or both sides of the majority of U.S. trades ended up in New York City where labour was unreliable and expensive.

(3) Regulatory requirements and the burden of related paper work were significantly greater in the U.S.

The conclusion from the above is that to be economic not only must a Canadian system gather up all available volume and still plan to be effective for what will end up being a much smaller total volume of processing, but it must also be significantly less expensive on a unit cost basis compared to a system which would be attractive in the U.S.[84]

82 Dollar value of trading, commission revenue and securities industry capital were found to be on the order of 20 times as large in the U.S.; *see supra*, text accompanying notes 40-42.

83 Operations Committee Report, *supra* note 8, at C-3.

84 The same point was underscored by members of the Financial Administrators Section of the IDA when the Midwest Stock Exchange tried to sell its clearing and depository services in Toronto in early 1974. Their observation was that while the charges are attractive for U.S. business, they would be unthinkable if they were proposed for Canadian business. More recent comments of Canadian brokers who are in close touch with the U.S. market indicate that U.S. operations area costs are falling significantly as the clearing corporations and depositories provide more and more services.

D. STATUS OF CDS

1. *Status as of 1975*

The Canadian Depository for Securities in 1975 was clearly not at the stage obtaining in the U.S. Evidently the same degree of urgency did not pertain and for various other reasons the approach chosen had to be considerably different. Nevertheless and in spite of the difficulties at the policy level of the banks, trust companies and exchanges, substantial progress on the 1972 recommendations noted in section B above was achieved by the operating people in the participating industries and CDS staff. First, a *standard* securities identification system, CUSIP,[85] (modified to meet Canadian needs) had been implemented and was being maintained by CDS on a continuing basis. Such a system is essential for standard computer-to-computer communications both within Canada and with the U.S. facilities. Second, several major banks and trust companies became involved in the recommended "pilot" securities settlement system to bring banks, trust companies and broker-dealers in both Montréal and Toronto into a coordinated system for clearing and settling securities transactions. Such service has been expanded and has become a routine service offered by CDS to the financial community.

In addition to CUSIP and the operative systems noted above the basic concept of a noncertificated system has been more widely understood and accepted and a master settlement system (phase III) embracing the concept has been designed and agreed to by CDS user-committees. Its implementation will result in creation of a single standard national settlement system capable of having branches in each major financial centre and interconnecting with the U.S. depository/settlement system and designed to work with or without certificates.

2. *Status in 1978*

By year end 1977, CDS had progressed to the point where it had assumed full operating responsibility for clearing all security trades executed on the floor of the Toronto and Montreal stock

85 The CUSIP system was developed in the U.S. under the aegis of the American Bankers Association, Committee on Uniform Securities Identification Procedures (hence CUSIP). Its purpose was to standardize the identification of publicly traded securities issues. CDS adopted the basic CUSIP system but modified it to fit into the Canadian context. This enabled many Canadian issues, which were previously not eligible, to be added to what is now a very comprehensive North American system.

exchanges in addition to the institutional trade settlement originally developed as part of its expanded clearing operation. The volume of settlements being executed through CDS facilities in the cities of Montréal and Toronto reached 8,000 per day by the end of 1977 representing some $16 million. In addition to its regular stock clearing activities CDS was also offering its participants the following services:

(a) an automated dividend claiming service;
(b) an intercity delivery service for the movement of securities;
(c) a drop-off service for delivery of securities being sent to transfer not only within the participant's city but also to any other city where CDS has an office;
(d) a transfer service through the National Securities Clearing Corporation (NSCC) for U.S. domiciled securities;
(e) an intercity reporting and payment option allowing its participants to receive their daily activity reports in any city of their choice where CDS has an operating centre;
(f) two settlement cycles per day;
(g) bond clearing facilities;
(h) a facility for any two participants to effect the settlement of either cash or security loans.

E. CDS ORGANIZATION, PLANS AND TIMETABLE

1. *CDS Organization as of 1975*

Figure 3 sets out the organization structure in 1975 at CDS as it prepared to move to implementing the final steps on phase III.

The Procedures Advisory Committee is a key organ in the CDS structure. It is made up of senior operations personnel selected from the various sponsors and is the principal sounding board for deciding on the desirability of proposed services and for hammering out procedural details. To some degree it also serves as a communication conduit for dealing with the various sponsors or for deciding operational policy matters.

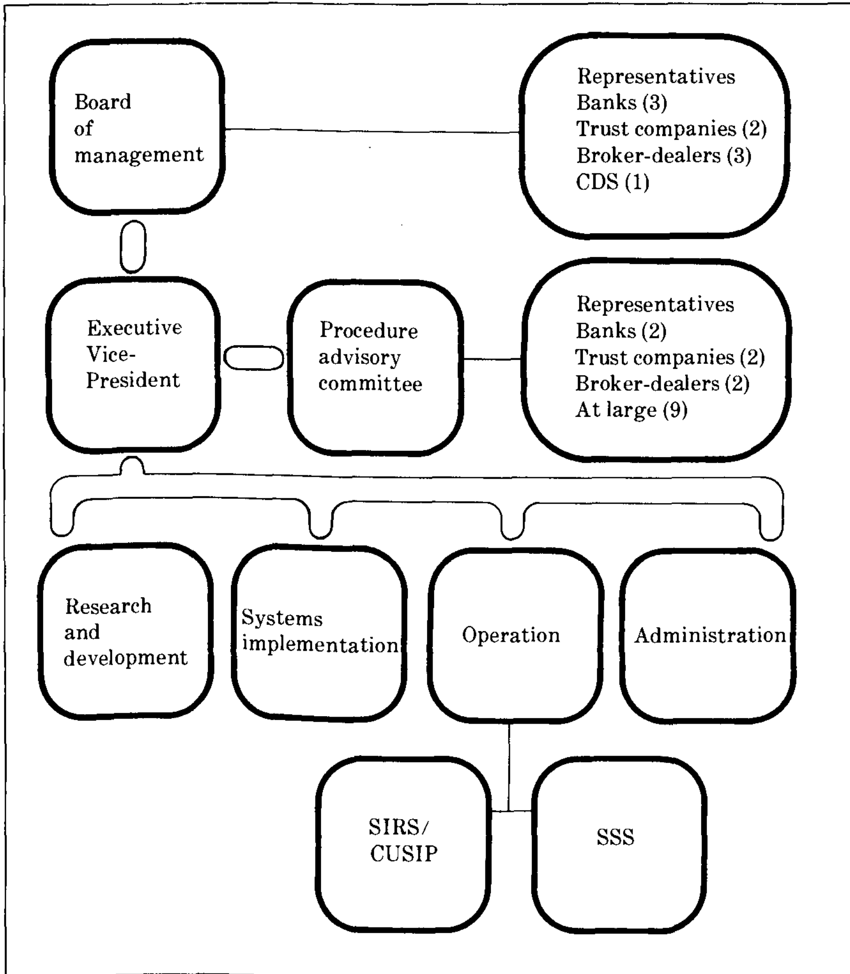
2. *Developments in 1978*

As of 1978, CDS's major efforts were being devoted to:

(a) Implementation of its "new issue" takedown service.[86] This

86 Such a new issue service has been offered by DTC since late 1975. On recent issues carried out in this fashion, as little as 15% of the issue actually is delivered out in registered or bearer form. The balance remains held by DTC and available for book entry transfer. In 1976, there were 134 such issues and debt and equity worth $6.7 billion and totalling 163 million shares.

Figure 3
Canadian Depository for Securities Ltd.



service will function as a pilot for CDS's participants in noncertificated settlements. It will also contribute substantially in reducing the number of certificates issued on the closing of a new issue by presettling all trades made on the "if, as and when" basis prior to settlement date. This service was scheduled to begin pilot operation in September 1978.

(b) Finalizing the systems specifications for its ledger security structure to allow for noncertificated settlements through its clearing facilities. Completion of this step anticipated to be operational by mid-1979 will represent completion by CDS of its major objective – that is, creation of a book-based ownership system – and will open the way for major savings to be effected by its participants as they will then be able to deposit their securities into the system and effect transfer electronically.

In addition to its Canadian operations CDS plans to work actively towards establishing links with its counterparts in the U.S. to allow for cross-border electronic movement of securities.

One of the unique features to be offered by CDS through its systems will be the facility for a participant in one city to effect settlements electronically with any other participant throughout the CDS network, regardless of location. This facility will complement the work being done towards a national system for trading securities.

CDS plans with respect to certificates are to avoid them as far as possible. As settlement system orchestrator it will encourage brokers and investing institutions to put their positions in book entry form by providing services which give strong economic incentive to noncertificated settlement. CDS will not have a vault for deposited certificates. However, handling of certificates, to the extent it is required, will be done by the issuer or by the transfer agent contracted by the issuer, or, alternatively, by a bank or trust company acting as nominee custodian for certificates of issuer/transfer agents which will not handle deposited positions.

With respect to the "deposited" or book entry position, CDS's approach is to provide maximum flexibility. The issuer or its transfer agent will legally be in the same relationship to issuers and their shareholders as pertains today for keeping track of registered ownership. CDS will accommodate transfer agents as the transfer agents choose. For example, if the transfer agent wishes to keep a vault of certificates representing the registered ownerships, that is fine with CDS. If it wants to render all deposited positions certificateless and maintain its own records by high-performance teleprocessing, that is also fine. It can even assign to CDS as subagent the job of keeping track of the deposited posi-

Table 8
Projects Scheduled by Canadian Depository for Securities Ltd.

1975 to June 1978

		Proposed implementation date
Step 1	A national comprehensive clearing system	In operation (Toronto, Montréal, New York)
Step 2	A comprehensive dividend report and claiming service	In operation
Step 3	Loan post services	In operation
Step 4	Takedown of new issues in noncertificated form	September 1978
Step 5	Merging floor trades into Securities Settlement System (SSS)	In operation (Montréal, Toronto)
Step 6	Intercity settlements and redirecting deliveries	In operation
Step 7 (a)	A book-based depository	June 1979
(b)	Automated settlements	June 1980
(c)	A Continuous Net Settlement (CNS)	December 1980

tions. In short, flexibility is the key and whatever suits the transfer agent and meets turnaround and accuracy specifications will be acceptable to CDS.

Although the master package will offer a continuous net settlement system[87] to users, CDS staff feels that it will not be greatly used because:

(a) banks and trust companies have advised that they will not participate in a netting operation;

(b) other phase III services which provide automatic deliveries and automatic loan (if stock is available) will generally reduce outstanding items.

Table 8 sets out a summary of CDS projected timetable.

F. AREAS OF CONCERN – JULY 1978

As of July 1978, there were two areas of concern which bore on the plans of CDS. One relates to the relationship with a group of sponsors (the trust companies), the other is simply the question of whether an inter-industry effort can move forward satisfactorily.

1. *Will the Inter-industry Approach Really Work?*

As the preceding section has indicated, Canadian Depository for Securities Ltd. is well along with design and programming of its plans for improving the securities clearing/settlement system by bringing the principal investing and lending institutions into an organized settlement arrangement with broker-dealers and offering them useful settlement services. The expectation is that the offering of a service to hypothecate and hold securities and transfer ownership interest between members of the system in noncertificated form will soon become simply the next logical step. This approach to depository implementation is designed to minimize the trauma of establishing a system which is not dependant on certificates. Heretofore the radicalness of the change, the attendant rearrangement of revenues and costs and the difficulties of getting inter-industry policy agreement have doomed to failure any frontal attack on the certificated system in Canada. Though it has been painful and relatively slow, the consensus is that the step-by-step approach is the only possible inter-industry route, absent an industry crisis such as was faced by the U.S. industry in 1969.

87 *See* app. B *infra* describing the Vancouver Stock Exchange System.

2. *The Depository and the Transfer Agents*

The problem of the role of transfer agents in a less certificated environment is an ever-present one. Studies at CDS have shown that, contrary to the historically stated position of trust companies that transfer business is unprofitable, corporate transfer agencies have been significant contributors to trust company profits.[88] For the most part, however, the participant trust companies have recognized that a reduction in certificate business is inevitable and that their investment/custodian function will be significantly benefitted by this reduction and by other CDS developments. They therefore have decided that the prudent course from a business point of view is to support CDS efforts. In this way they will be able to participate in the formulation of procedures and find ways to profit from the new and upgraded service.

A continuing difficulty at CDS has been the determination of the Royal Trust Company after June 1972 to withhold its support. The corporate plans and underlying business strategy which may be dictating a negative stance by the Royal Trust are not known. However, given all the discussion of CDS since 1969 and the U.S. developments, it must be apparent to Royal Trust that it too will have to modernize its transfer, safeholding and settlement techniques. It is to be hoped that some time soon the Royal Trust will commit itself to the CDS program.

G. STATUS OF THE U.S. CLEARING AND SETTLEMENT AND DEPOSITORY SYSTEMS

After many false starts and much prodding from Congress, the SEC, consultants and industry groups, U.S. depositories and settlement systems after 1973 went ahead at a rapid pace. Depository Trust Company (DTC) which was created in 1973 to take over the NYSE's Central Certificate Service is particularly impressive. It has a joint industry, user-oriented board of directors chosen from New York banks and a life insurance company as well as from broker-dealers and the exchanges.

During 1974, DTC processed 10 million book entry deliveries with a value of $136 billion. At 1974 year-end it had 258 participants, 59 banks accepting DTC-held stock as collaterial, 32 branch depository facilities, over 6,000 eligible issues and over 2 billion shares on deposit.[89] In 1975, to recognize bank participation, part

88 Operations Committee Report, *supra* note 8, at F-20 - L-32.

89 Depository Trust Company, Annual Report 1974, at 4 (1975).

of its ownership was sold to the banks and other participants. The plan calls for the NYSE to continue to relinquish its share of ownership as banks deposit more securities into the system. Similar but smaller depositories exist in Chicago and San Francisco in association with the Midwest and Pacific Coast exchanges.

The clearing corporations of the New York/AMEX, Midwest and Pacific Coast exchanges are associated with these depositories. In addition, the National Clearing Corporation (NCC) which clears transactions in securities traded over-the-counter has made interface arrangements with DTC. By 1975, negotiations were being concluded for Securities Industry Automation Corporation (SIAC), a wholly-owned subsidiary of the NYSE and AMEX which acts as contract operator for the New York and American Stock Exchange Clearing Corporation, to also run NCC operations. This would mean that there will be only one clearing system in New York as SIAC will carry out all operations on behalf of the historic entities.

Each of the depositories (DTC, MSTC and PSDTC) has opened branches in other major cities and has accomplished two-way interfaces. The interface means, for example, that securities held in a branch of the Midwest or Pacific Coast depository can be dealt with for virtually immediate withdrawal of equivalent securities from DTC in New York. Steps have also been taken to interface the clearing corporations so that delivery to SIAC by a Pacific Coast or Midwest exchange member can be almost immediately credited to meet a Midwest or Pacific Coast Clearing Corporation obligation.

Principal services now offered by the clearinghouse/depository complexes include:

(1) Intercity credit and debit of money and securities for members;
(2) continuous netting of security positions for broker members;
(3) hypothecation/pledging of securities for call loans virtually independent of geography;
(4) speeded up transfer service;
(5) interface with the Federal Reserve Bank of New York for settlement and collateralization of U.S. Treasury securities in book entry form.[90]

Interestingly enough, the next major move at DTC will be to implement positive confirmation of transactions which are for delivery to an agent bank on behalf of an institution. This is much

90 Out of the $441 billion in U.S. Treasury and Agency securities outstanding in August 1975, $260 billion were held in book entry form and could be dealt in without certificates via DTC and the Federal Reserve Wire Network; *see* letter of M.J. Hoey, assistant vice-president, Federal Reserve Bank of New York, to B. Ferguson, CDS (September 30, 1975).

like a system which CDS has already implemented through its agency system in which the bank or trust company acting as delivery agent is notified by CDS of a trade made by a third party for settlement by the agent.[91] The system prevents rejected or "D.K." (don't know) settlements.

The SEC is due some credit for the rapid improvement noted above. For over three years it had been SEC policy that the clearing/settlement systems should be *merged* under the plan for a central market system. However, because the Midwest and Pacific Coast as well as the National Clearing Corporation had made a significant contribution to the advancement of services and because it seemed that interfacing will be achieved, it appeared in 1975 that the SEC would be backing off this stand and would probably accept an integrated and interfaced arrangement such as the industry bodies are now developing.[92]

Through the Securities Reform Act of 1975, the SEC was given large responsibility and concomitant authority over clearing corporations, depositories, transfer agents[93] and processors of quotation information. The result of this significant expansion of responsibility will mean that the SEC can force the securities market systems into the direction chosen by the SEC for future market structure and performance standards.

H. COMPETITION FOR THE U.S. DEPOSITORY/CLEARING COMPLEXES

1. *Competition for Complexes in 1975*

An intriguing feature of the U.S. scene is the progress of the Bradford group of companies. Though it is not clear where this development will lead, the Bradford influence will be significant, and it is worth outlining here.

Bradford Computer and Systems Inc. started business in 1968 as a computer software company. One of its first contracts was to design a shareholder accounting system for mutual funds. It then accepted a system design contract for Marine Midland Bank, a medium-sized transfer agent, to upgrade its corporate transfer system. After designing the system, Bradford was actually awarded operation of the job as a processor and facilities manager. It has since formed Bradford Trust Co. Ltd., a limited powers trust

91 *See supra*, text accompanying note 85 and following.

92 *See* speech by Lee Pickard to SIA (September 1974).

93 In effect, the SEC will not generally be the administrative authority over transfer agents since most transfer agencies are associated with banks which are subject to the Federal Reserve System and in such cases administrative responsibility for enforcing the act will rest with the Federal Reserve.

company, which has taken over on a facilities management basis the transfer business of Bankers' Trust, Mellon Bank, Crocker National Bank and about a dozen smaller agencies. By 1975, Bradford claimed to be the largest transfer agency in the U.S. with six million corporate shareholders accounts, and two million mutual fund accounts.

At the same time as it was expanding into the stock transfer business, Bradford was courting the safekeeping business of broker-dealers with respect to the certificates of companies for which Bradford acts as transfer agent. Also in those companies they have sought to offer brokers a payroll savings or periodic investment plan service on a sufficiently attractive basis that the brokers can compete with similar bank plans. Bradford is able to offer economic service in this area because it is exploiting computer record- keeping rather than relying on certificate issuance and storage. In effect, with respect to their own transfer companies, they are offering transfer agent depository facilities and are marketing a package by the name of TAD.[94]

The third side of an impressive triangle of Bradford services was brought into place, at least temporarily, when Bradford brought the National Clearing Corporation into a facilities management contract through which Bradford will run clearing operations for the NASD.[95] The full synergistic potential of the transfer agent/broker services/clearing corporation base has not yet been fully explored but a significant impact may be anticipated if Bradford is able to market the idea to corporations and brokers that trades in Bradford's agency stocks (which are cleared by NCC) can be done at significantly less cost for all parties concerned. As of 1975 it appeared that Bradford might lose the NCC connection to SIAC and therefore have a less complete package to offer. However, the NCC contract in 1975 had a year to run, and in the meantime Bradford made a bid for the whole SIAC and DTC job as well as NCC, promising the industry an annual saving of $15 million out of $35 million currently spent for these functions.[96]

2. *Competition in 1978*

In 1977, all U.S. clearing agencies joined into the National Securities Clearing Corporation (NSCC).[96a] This created a national system so that brokers and banks could settle items anywhere in

94 BRADFORD COMPUTER & SYSTEMS INC., THIS IS BRADFORD - MID-YEAR REPORT 9 (1975).

the United States without regard to the market in which the transaction was actually made.[96b] This SEC-mandated manoeuvre was highly disadvantageous to Bradford. In 1978 Bradford attacked some anticompetitive aspects of the national system and received a favourable ruling from the Department of Justice. The dispute does not appear to be over, however. The main issue may simply be the amount of monetary settlement which Bradford can obtain as compensation for alleged loss of business.

Chapter VI
Trading Systems

The potential application of computer/communication technology to trading systems has increasingly caught the imagination of theorists.[97] However, in spite of the beguiling (and seemingly logical) theory, practitioners have not yet decided that computer trading is a realistic proposal. No less a forward-thinker than James Needham, president of the New York Stock Exchange has said:

> "We don't think they can duplicate the crowd from a technical point of view. But, in order to overcome that, the SEC says 'We'll build the box and everybody will put their limit orders in there'. Well, the firms tell us that if that's the case, there won't be any limit orders. They'll take inventories 'upstairs' and do business by themselves with other broker/dealers...'[98]

Support for the view that computerized stock trading is impractical can be found in the fact that the very modest Instinet/ARIEL, and WHAM (Weeden Holdings Automated Market) systems are the only extant systems in the world which actually trade within the computer system.

The statement that Instinet/ARIEL and WHAM are unique can be made with a good degree of confidence because of a recent survey done on behalf of the International Federation of Stock Exchanges to summarize the status of automation and the plans

96b *See, Williamson, Capital Markets*, ch. IV.A for a brief review of the various clearing systems now being linked by NSCC into a single functional system for the United States.

for it at all the world's stock exchanges.[99] The study disclosed that while some exchanges were designing a shared terminal network to route orders and other messages between the members and the exchange floor, none except the Toronto Stock Exchange was actually experimenting with a complete remote terminal trading system.

A. U.S. SCENE

Since it is unusual for the Americans not to be in the forefront in projects which are considered forward-thinking, a few paragraphs on the situation in the U.S. seem to be in order.

In its *Special Study* published in 1963, the SEC made reference to the need to increase the use of automation in supporting the New York Stock Exchange market.[100] The *Special Study* suggested that the potential for automation appeared great for execution of odd lots and maintenance of the specialists' book. They also felt that surveillance functions should be automated.

About the same time, the New York Stock Exchange, then the clear ruler of the U.S. securities industry and a large spender of money for research, put substantial resources into a very large systems development group with wide terms of reference. Several large projects were initiated and an extensive automation planning paper was prepared in 1968 but never officially released. The paper proposed "a broad development and implementation program leading to an advanced integrated trading system."[101] The early steps involved:

(1) an order delivery system to route orders and reports to and from members' offices and their floor brokers; and
(2) development of an electronic book and inventory management system for specialists.

Subsequently, floor brokers of the exchange would be provided with desks and trading terminals *on the floor* from which to trade with each other. It was felt that by "locking in" the trade in this manner, much of the generation of paper would be avoided and the space problem of the NYSE relieved.[102]

The proposal was less than warmly received by the NYSE board which consisted largely of senior floor traders and special-

ists. The board directed that no publicity be given to the paper and that the staff abandon the idea of an automated exchange. As a tradeoff with the pro-automation group, the exchange systems staff was asked to do further work on developing peripheral applications. An electronic book for floor specialists was designed and tested on a small-scale pilot system by a few specialists but it was generally found to be awkward and time-consuming to have to key in the order data and the project was deferred. Similarly a system for automatic execution of 100 share market orders was designed and tested briefly but terminated before implementation.

In mid-1970, the American Stock Exchange which had also developed a systems capability to research a "locked-in-trade" for clearing purposes, announced an eight-stage automation program called AMCODE (AMEX Computerized Order Display and Execution).[103] The program proposed to start with a high performance "floor input system" for switching orders between members' offices and various stations on the floor and move through oddlot execution, limit order booth display, specialist book to broker-to-broker execution on the floor. It was always suspected that the undisclosed ninth stage was remote terminal trading with no floor.

A substantial amount of work was done on AMCODE by the AMEX group in 1971 and 1972. However, in mid-1972 the New York and American stock exchanges announced that they were going to merge their system/automation efforts in a jointly owned service group – the Securities Industry Automation Corp. (SIAC). While the systems groups were merging, the AMEX continued to sponsor AMCODE. One of its more notable accomplishments was the creation of a simulated trading facility. SimFac was set up to model a specialists' station under the AMCODE concept. It was demonstrated in an amphitheatre to various groups of people including the SEC and numerous congressmen. A large number of members viewed it with interest but felt it was "too much automation" and were discouraged by the $20 million to $40 million price tag. At about the same time, the AMEX was facing budgetary restraints and petitioned the NYSE to join in AMCODE as a partner. The NYSE accepted and the project was renamed Centaur (Central Exchange Network and Unified Reporting).

During this whole period the NYSE and AMEX were subjected to SEC and congressional pressure to respond to attacks on the rules providing for fixed commission rates and the closed

103 AMERICAN STOCK EXCHANGE, AMCODE (1970) (an updated proposal of the AMEX Data Systems Division).

nature of exchange membership and to industry pressure to reduce expenses. As a result the automation program became somewhat bogged down. Political infighting and frequent personnel changes had always plagued the NYSE automation efforts but when the leadership of the industry got diverted to more pressing problems (like survival),[104] the automation program became much less dramatic. Centaur, itself, was gradually shelved; however, pieces of it have been carried forward to provide useful services on the floor, but not to interfere with the traditional face-to-face meeting of traders to make trades in the "crowd".

Nevertheless, the New York and American Stock Exchange floors have gradually installed a part of the AMCODE project. First in was the odd-lot switching system. The switch accepts odd-lot orders in a standard format from members and then routes them to the odd-lot dealer (Carlisle & DeCoppet). It handles 85% to 90% of present odd-lot orders and will be expanded in 1976 to send limit orders and "at the opening" market orders directly to the post of execution by the specialist. They have also installed specially designed CRT screens on the specialists' counters (Floor Terminal System – FTS). These are used by the specialists for enquiry into the exchange's market data system (a sort of internal market inquiry system), Dow Jones news, NASDAQ quotations, etc. They will also be used for the specialists to enter their quotes into the composite quote systems, such as "Q-Quote" run by Ultronics. FTS was designed to have considerable capability for expansion of service should the specialists and traders desire it but implementation has not progressed at the rate expected.

In spite of these available automation facilities and a substantial budget for continued development of these facilities, for the foreseeable future the New York and American stock exchanges' floor systems will be based on face-to-face negotiation by traders.

An overriding requirement for face-to-face negotiation means that regardless of how smoothly an order-switching system can capture order data from the salesman or firm order desk, part of that data (stock name, buyer/seller, number of shares, price and strategy instructions) will have to be moved to the traders in a special room (the floor). Depending on how far the system has advanced, the trader will push a button either to direct that the order be further switched in electronic form to the specialist for

104 Note the strong recommendation of the Securities Industry Association that a feasibility study be made of the NYSE and AMEX merger and elimination of executive staff duplication. This arose at the 1973 annual meeting of the SIAC and has since been reflected in pressure for merger of clearing operations; *see* Securities Week (New York), February 24, 1975; *id.* July 21 1975.

booking, or to convert it to memo form for the trader himself to carry to the trading post to negotiate a deal. Once a trader has made a trade, someone will have to reenter the trade information to the system for automatic matching to the original order (or telephone the trade report to the order desk where it will be reentered for matching) and subsequent transmission to the operations area and reporting to the originating salesman.

B. COMPUTER-ASSISTED TRADING SYSTEM RESEARCH PROJECT AT THE TSE

In Canada, no firm commitment has been made to face-to-face negotiation and the Toronto Stock Exchange is experimenting in this area. This is a matter of some controversy in Canadian financial circles as trading-oriented and conservative elements point to the U.S. example. Though it is generally agreed that automation can and should be used to improve and supplement the present system, it is not agreed as to how far to go. Indeed, proponents of face-to-face negotiation have argued that the interfacing of the automated system to the trader on the floor is only a slight variation from a fully locked-in system and it much more closely approximates the tried and true present system. The costs of such a variation are *not* slight, however. Among the major costs are:

(1) the physical floor and its switching system and information displays;
(2) the people on the floor;
(3) the terminals on the floor for the trader to receive orders and reenter fill reports;
(4) the order match system to connect the reports to the original order.

At this juncture, it is not clear to the Canadian exchanges whether the face-to-face negotiation is essential. A preliminary goal of the TSE's Computer-Assisted Trading System Research (CATS) project is to prove or disprove this hypothesis.

1. *Background*

The Toronto Stock Exchange building and trading floor was opened in 1937 – the most modern facility of its kind. Thirty-two years later, in 1969, in the midst of high trading volumes of 15,000 to 20,000 trades per day which strained the trading floor facility to the breaking point, the exchange recognized that the floor and supporting equipment were in need of replacement or at least major refurbishing. The exchange board of governors directed its systems planning department to investigate the problem and

make recommendations. The planning group prepared preliminary analyses of various alternatives including a new building, additions to the old building and minimal renovation of the present facility. Even the latter involved several millions of dollars. At the time it was recognized that the new technology of computers and communications would play a substantial role in any alternative system.

Coincidentally with these planning efforts, announcements were being made in the U.S. of the NASDAQ, AutEx, and Instinet systems.[105] The planning group therefore recommended that prior to any major investment decision, an investigation should be made to determine how far the exchange could go with computer/communications technology to support the trading requirements of brokers in Canada.

Preliminary analysis indicated that the potential economic benefits from using computer communications technology would be maximized if:

(1) all the information relating to buy and sell orders could be captured in data processing form at an early point in the process and held for subsequent use in settlement processing;
(2) trading decisions, *i.e.*, amount, price, timing of tenders could be entered through terminals in members' offices to a sufficient level to make face-to-face contact by traders in a room unnecessary;
(3) the same system which handled order traffic could handle market information, research and administrative traffic for firms and their salesmen.

In effect, if data could be captured at the source and the number of communications links in the system minimized, substantial economic benefits would accrue from fewer people, less need for real estate (*i.e.*, no trading room) and reduction of errors.

In addition to the potential economic advantages, the potential service benefits, both to brokerage firms and also to their customers, appeared to be substantial. The idea that any terminal would be the equal of any other terminal, thus putting the customer in Halifax and Victoria on the same basis as one in Toronto, was very attractive from a marketing standpoint.

It was decided by the exchange that the potential of computer-assisted trading was so significant that it ought to be thoroughly explored before a decision was taken on replacing or refurbishing the present trading system. Loosely put, the key questions were: "Will it *work* for trading?" "What would it cost and will it pay to implement it?" The second question is a standard feasibility

105 TORONTO STOCK EXCHANGE, *supra* note 99, at A-7.

study question. The question of workability, however, is not. And, obviously, the feasibility question cannot be properly addressed unless or until a "workable" system is defined. Such definition is the first purpose of the CATS project.

It is necessary to continually bear in mind that it is quite possible that trading via remote terminals in *not* "workable" in comparison with face-to-face trading. For example, if in making trading decisions at terminals traders find that putting limit orders in the system usually results in either poorly priced trades or no fill at all for the investor/trader, then such orders would not be entered. As a result of orders not being entered, market spreads would widen and liquidity would decrease, thus making for a net detraction from the effectiveness of the market. Or, from a human factors point of view, if it is found that people trading from terminals generate unbearable psychic pressure and traders can only stand the strain for one or two hours per day, then terminal trading is unlikely to be considered workable. The question of workability is one of genuine research into computer applications. There is much work to be done between theory and application.

The question "will it work?" might better be recast: "to what extent can computer/communication technology be used to improve service and decrease costs in support of trading and other related securities market functions?" The view of the TSE board of governors is that if the problems involved in making trading perfectly feasible from remote terminals can be solved, then the exchange can implement a system with very significant cost and service benefits. The CATS project then has the goal of devising and proving such a system. If it cannot do so, then at least the knowledge which has been gained from the project will permit the TSE to define and cost the optimum use of technology in a replacement trading system involving an optimum degree of face-to-face interraction.

2. *Approach to the Project*

The original work on the CATS project was done by two senior managers from Bell Canada and the exchange's Director of Planning and Computer Systems. This preliminary one-week analysis in 1969 resulted in the TSE board authorizing a six-month feasibility study. The study was carried out by a Bell Canada "business information systems" consulting team supplemented by TSE staff. Their conclusion was that computer-assisted trading was

feasible at a design and implementation cost of $28.5 million, exclusive of the terminal network.[106]

TSE systems personnel who had worked with the Bell group felt that their cost estimates were unduly high and they in turn prepared a request for information[107] which was sent to several potential hardware suppliers and commercial systems specialists for reestimation. The resulting estimates had a wide spread but seemed to cluster between $7 million and $10 million. Encouraged by this lower cost estimate and by further planning work done by its own staff at the end of 1971, the exchange board approved work to simulate computerized trading on Air Canada's ReserVec II system. This attracted significant interest across Canada, in the form that it was demonstrated in Air Canada offices in Vancouver, Winnipeg, Toronto and Montréal at the end of 1972. In early 1973 it was decided to develop a "pilot" operation on the TSE's own computer and suitable computer hardware was ordered.

To carry the pilot project and certain other systems developments which the TSE board felt would be desirable in the 1970s, the exchange purchased an IBM 370-145. Although this machine was considerably more powerful than required by 1973 needs, the projection was that the excess power would soon be justified. In addition, if CATS should prove to be workable, then it was estimated that probably at least an additional 370-145 would be necessary to handle the load.

To support the CATS project a subcommittee of the board was appointed to give expert guidance on the desired rules and order types. Trading specialists as well as systems consultants and human factors specialists have been used to advise on various aspects of the project. The pilot terminal design is being done in close consultation with the systems group of Draper Dobie, an exchange member, which is mounting an online computer-based system to supply research, market and customer account information to its salesmen. The pilot project group also works in close liaison with the group in the computer department which is responsible for the exchange's online market information (CANDAT) system. This close coordination has ensured system-compatible programs and system control procedures in the event that the CATS project becomes more than a pilot experiment.

In order to obtain the input of industry practitioners at an early stage, a group of twenty "pilot" traders were recruited in

106 BELL CANADA, BUSINESS INFORMATION SYSTEMS, COMPUTER-ASSISTED TRADING: A FEASIBILITY STUDY FOR THE TORONTO STOCK EXCHANGE 115 (June 1970).

107 TORONTO STOCK EXCHANGE, REQUEST FOR INFORMATION AND SUGGESTIONS AS TO TECHNICAL FEASIBILITY AND COST OF COMPUTER-ASSISTED TRADING SYSTEM (September 1970).

late 1973. They were drawn from all backgrounds (floor trading, institutional trading, trading management and sales) in order to obtain balanced advice. The pilot group was put through an extensive training program to make them familiar with the terminal and the system as it was being designed. As a result of their participation, the terminal has gone through two major phases of redesign and a number of changes have been made to the orders and trading logic. The active involvement of the twenty traders training group and the board's steering committee underlines the exchange's view that trading via remotely located terminals tied to a central computer is not so much a technical problem as a problem of thoroughly understanding and defining the application.

3. *Status of the CATS Project - Fall 1975*

As of October 1975 a wide variety of information displays (CANDAT II), all common orders (limit, on-stop, short, etc.), a number of complex orders (scale, flexible) as well as the opening, an odd-lot system and certain surveillance and control routines had been programmed in experimental mode. An in-house control program had replaced the original IBM CICS/VS software to increase efficiency.

The twenty-man pilot group which was involved in training sessions in late 1974 was to be reactivated to work with the system in its present phase. In addition, the other member firms which had ordered CANDAT II were to have a person trained to participate in the various tests. It was expected that such tests would begin in the early part of 1976 when the training group would be taken through sequences of dummy orders. It was also thought feasible to collect members' orders and retrade an actual day's trading in some stocks to compare results with what happened on the floor.

4. *TSE Plans for the CATS Project*

It bears reiterating that the CATS project involves fundamental research and design with the objective of obtaining a "yes" or "no" answer to the question of whether remote terminal trading is workable per se. It was the opinion of the TSE in 1975 that the question could not be properly answered until a complete working pilot were available and a substantial effort had been made to remedy the problem which would be defined by "hands-on" experience.

As of 1975 many system and terminal improvements had been made in the project, and modifications planned. There remained

some significant problem areas which could not be definitively explored until the complete pilot was operative. These problems included:

(a) the man/machine logistics of handling the preopening retail order backlog and also substantial institutional orders in a fair manner at the opening of trading;

(b) removing from traders acting for either public investors or their own firm accounts the ability which exists in a face-to-face system to change their minds at the instant that a bargain is consummated on the floor;

(c) how many stocks can be watched effectively by a trader? how many orders can he manage at one time?

It was the expectation of the TSE that a fully working pilot would be available in the spring of 1976 and that alterations, depending on their size, could be accomplished in the second or third quarter of 1976. At that time more testing would be done and, at any time after those tests, a decision to end the project could be made. However, there was then a growing body of opinion (even among doubters of the viability of a complete remote terminal system for all stocks) that a remote terminal system would "work" for inactive stocks.

"Inactive" stocks are the subset of 600 TSE-listed stocks which are traded in an open order filing system at one end of the floor. In such stocks members file their bids and offers openly. When a filed bid or offer is accepted by another trader, the trader who entered the order is sought out and a deal consummated. It is felt by many that the last step is simply administrative and that the whole inactive system is amenable to computerization. In any case, it was felt that, lacking an abort decision for reasons not now anticipated, it was likely that during 1976 the TSE would attempt to trade a selection of real stocks on the system.

Trading listed stocks, where the buy and sell orders represent real money and obligations, further defines problems, indicates solutions (or insolubility) and contributes to the decision on how far the exchange can go with remote terminal trading.

The plan for accomplishing a test of inactive stock trading involved using the CANDAT II terminal network which was to be installed in Toronto and Montréal by year-end 1975. Most of the major order-generating houses were to have CANDAT II terminals. To service other houses, a sufficient number of terminals were to be located on the floor to handle their terminal needs.

5. *System Integrity, Security and Back-up*

Questions related to maintaining continuous full-service operations in an actual trading environment, keeping unauthorized persons from using or meddling with the system and preventing improper use of the services attract considerable interest from professional doomsayers. An even-tempered discussion of all facets of this problem area is contained in Jenkins, *Computer Communications Systems*, in this volume.[108]

System breakdown is perhaps the least important. Obviously, failure during the trading experiment is easily remedied. Backup procedure would simply be to reinstitute floor trading in the erstwhile CATS-traded issues. However, such simple backup procedures can only exist so long as there is a floor trading system. If it were to be decided to go further and put all listed stocks on CATS, then the exchange would make a considerable investment in system security and backup procedures involving such things as alternate power supply, dual hardware and "hot" restart procedures.

The question of system integrity is a continually nagging one with computer systems. Terrible tales of altered files and stolen information are widely publicized.[109] With respect to unauthorized access to a remote terminal trading system like CATS there are certain safeguards. At the first level, terminals will only be made available to members for placement in their own offices and only by direct lines. Ability to enter orders and access private files will be controlled by terminal location and by changeable password or identification card procedures.[110]

Such safeguards can undoubtedly be circumvented by a determined criminal. However, there are severe limitations on what can be accomplished by a criminal who achieves access. First the clearing and settlement system (by which trades are settled and money is paid) actually does not pay until three days after a trade. Thus any improperly created trades are likely to have been identified, investigated and in all likelihood cancelled by the exchange before any money has changed hands. Second, the trading system has automatic surveillance monitoring which continually keeps officials advised of any large price changes and, in fact, automatically halts trading at certain levels of price change unless the Surveillance Department actually overrides the automatic halt.

108 *Jenkins*, ch. IV.
109 Parker & Parker, *The New Criminal*, 20 DATAMATION, January 1974, at 56-58.
110 *See, Jenkins*, ch. IV.C.

Manipulation of the market to mislead the public or improperly raise or lower prices is a matter of considerable interest in any trading system. While automation will not make market manipulation any more difficult to affect, it will significantly facilitate the identification and investigation of it so that, if anything, a net disadvantage should accrue to marketeers seeking to make the market "work" unfairly for their benefit.

6. *Attitudes and Expectations of Exchange Members in 1978*

The attitude of exchange members to the CATS project in 1978 varies widely. Some regard the implementation of computer-assisted trading as an opportunity to obtain significant economic and service benefits, perhaps resulting in Canadians having a competitive advantage over other securities markets and thus attracting trade from Europe and the U.S.[111] Another group regards a computer-based system for trading as inevitable but holds no joy at the prospect. This group feels that it will not only "take the fun out of trading" but will also reduce it to a lowest-common-denominator type of activity. A significant number, particularly those who have a trading function in the present system, believe it will not work well enough to be implemented. They feel that the money spent on the CATS project could be better spent elsewhere. However, in spite of their intuitive negative feeling, they have accepted the idea that the work should be completed now so that the question of the potential role of computers in trading is forever laid to rest.

7. *CANDAT II, a Spinoff Product*

CANDAT II has been adopted as a major market information system by the Canadian industry. In 1975, seventy-three brokerage firms and thirty-nine institutions had one or more units installed. Three major securities firms had adopted CANDAT II as their market information system for their whole network. Other firms were still using competitors as their basic device but had CANDAT II terminals on their institutional trading desks and in their major branches. In all, 550 units were in use in twenty-one cities from Victoria to Halifax.

There is undoubtedly risk to the Toronto Stock Exchange in going so heavily into the computer terminal network business. The

111 This feeling has been seldom expressed recently since investment value of Canadian securities was substantially depreciated in the last two years by various taxation and policy initiatives by the federal and provincial governments.

value of terminal hardware which is long-term leased or owned by the exchange now approaches $3 million. While CANDAT II is at present the best market information system available to support trading, it is possible that one of the U.S.-based networks will devise an equal system and offer it at a lower cost, thus upsetting the marketing plans of the CANDAT II group at the TSE.

For the immediate future, however, CANDAT II's success is assured because it is an essential part of the computer-assisted trading test – the CATS terminal being merely a CANDAT II terminal equipped with a printer and enabled in its cluster controller to handle order entry and CATS trading inquires.

8. *CATS in 1978*

For a number of reasons, progress of the CATS experiment was delayed. In the first instance, members felt it unfair that only twenty of their number would be allowed to participate in the project and thus gain the advantage of the sophisticated market information system which is used to support CATS trading activity.[112] Because this gave CANDAT II a much higher profile, it absorbed resources of the exchange that had formerly been directed toward CATS . The wider terminal network also permitted a major upgrading of the CATS experiment to cover many more firms and this meant that a whole new group of traders would have to be trained. Further, the earlier group of twenty traders had identified additional changes and improvements required in the working system.

In November 1977, the exchange first began trading "live" through the CATS system. A selection of eighty relatively inactive securities were gradually mounted on the system and were trading entirely on a CATS basis by mid-January 1978. Minor problems with the system have been identified and slight changes have been made in response but, as of the time of writing, no major problem which would cause the experiment to be terminated has been identified.

The eighty stocks which were in the system in the first part of 1978 experienced a volume of activity on the order of 100 trades per day. This was not deemed to be sufficient activity to attract the attention of enough members and traders to expect a proper evaluation to be forthcoming. Therefore, in April 1978, the CATS

112 The market information system itself has been spun off and made available by the exchange as a separate market information system (*see* ch. VII *infra*). As a consequence, the commencement of the CATS pilot was delayed in order to allow all members to obtain CANDAT II equipment. For the total information package on CANDAT II, write to the Toronto Stock Exchange.

steering committee decided that it should add to the CATS experiment enough inactive stocks to unload the floor trading system and, in effect, make the CATS system the focal point of activity for enough traders and members so that an effective evaluation could be made. In addition to adding up to 500 additional relatively inactive securities, the plan includes adding some representative relatively active securities and representative volatile securities. If the system is able to handle a large number of inactive securities and a relatively stable (but active) security and a volatile security (such as a speculative western oil stock) then the last major hurdle would appear to be trading a major Canadian issue which is interlisted with the New York market.

When mounting additional securities on the system the timing is important. The exchange expected to take delivery of an IBM model 3031 computer in November 1978. Installation of this computer as the main frame with backup from the present IBM 370-145 machine was expected to give the exchange the capacity to carry all the planned experimental additions to the system. Assuming no problems requiring significant delay for reprogramming or system modification, a full evaluation of the CATS system was expected to be possible in the first half of 1979.

As of the time of writing, no insurmountable stumbling block has been identified, though it is by no means agreed that the computer can replace the trading floor as the facility for carrying out the transaction function. Some of the original sceptics have a more positive outlook on the eventual success of the system. The mere fact that no serious problem has been discovered during the first six months of "live trading" accounts for this modest shift in view.

As of mid-July 1978, the CATS system was trading at a rate of 150 trades per day with the value of trading approaching a million dollars. This was just under 2% of total TSE activity.

C. CANADA-WIDE SECURITIES MARKET SYSTEM

1. *Developments to 1975*

Obviously the implementation of a successful computer-assisted trading system by the TSE would have significant consequences for the other exchanges. In Canada there is a heavy overlap of membership[113] and of listings. For example, 93% of business on the Montreal Stock Exchange and 90% of business on

113 *See* table 4 *supra*.

the TSE is done by joint members.[114] Similarly, over 80% of the business of the Montreal Stock Exchange and over 65% of the TSE business is in stocks which are listed on both exchanges.[115] The inferred consequence is that a successful CATS system at the TSE might draw away a great proportion of MSE business.

The overlap with Vancouver is not as great because of the predominance of speculative listings, but nevertheless joint Vancouver-Toronto members account for some 60% of VSE business.[116]

The potential significance of these factors to the Montreal Stock Exchange was recognized by the representatives of that exchange who attended a TSE board study session in May 1972 at which the CATS project was one of the topics discussed. As a result, the MSE struck a committee and engaged a consultant to prepare a proposal for a Canada-wide securities market system. The MSE report was released in February 1973.[117] It proposed that the VSE, MSE and TSE get together to discuss formation of a Canada-wide system which would use computers to support the trading function. The report suggested approaches to various problems such as:

(a) what stocks should trade on the computer system;
(b) how brokers who were not members of all these exchanges would obtain access;
(c) compensation for the impact on seat values occasioned by easier access by nonmembers;
(d) methods for new listings and new memberships;
(e) making exchange rules and policies uniform where necessary;
(f) location of the computer(s);
(g) sharing of costs for development;
(h) user charges for operations;

and concluded by requesting the views of the IDA, VSE and TSE on further joint study of the proposal.

The IDA, VSE and TSE welcomed the MSE initiative and indicated a willingness to pursue the MSE suggestion for a Canada-wide arrangement in spite of some reservations about the specific proposals. A Canada-wide project committee was formed. It consisted of the presidents, chairmen and vice-chairmen of the three exchanges and representatives of the IDA were invited to

114 Based on informal calculation of relative 1973 clearing values by firm.

115 TSE statistics department based on 1969 study. After 1969 the MSE reduced its component of sole-listed speculative securities so that in 1975 the figures were probably closer to 90% and 70%.

116 Though there are exchanges in Winnipeg and Calgary, activity on them is minimal and does not justify separate analysis here.

117 MONTREAL STOCK EXCHANGE, A PROPOSAL FOR THE FORMATION OF THE CANADA-WIDE SECURITIES MARKET SYSTEM (March 1973).

attend as observers. Meetings were held in April, May and September of 1973 and in January, March, May and June of 1974.

At the June 1974 meeting, the project committee decided to recommend to the sponsoring exchanges that a "permanent" committee for the study of a Canada-wide system be established, that IDA representatives be asked to participate as full members of the study and that arrangements be made to staff the research requirements and support the committee's work. The Committee for the Development of a Canada-Wide Securities Market was formed in October 1974 and J. Ian Collins, a Montréal consultant, was engaged to do research and prepare papers. The committee agreed on a "Conceptual Model of a Canada-Wide Market System" and prepared to air its proposal with the industry and government regulators.

The essence of the proposal was that the three exchanges would form a jointly owned body to operate a Canada-wide market which would essentially adopt TSE standards and trade all TSE stocks plus others which were qualified. All members of the three exchanges would have full access to the Canada-wide mechanism. The Canada-wide body would be subservient generally to the sponsoring bodies but would have delegated to it responsibility for surveillance and trading regulation as well as some administrative functions to ensure that listing and membership standards are maintained.

As of 1975, it was evident that all members of more than one self-regulatory body were less than pleased to be supporting the duplication of overheads which arose in the system. Therefore, it was anticipated that the industry would welcome any proposal that reduced multiple jurisdictional difficulties and costs. The question was, whether the Canada-wide arrangement could really be organized so that duplications would be reduced.

As in any such plan to significantly revise the structure of an industry, there were certain problems. Some arose purely out of the probable desire of the provincial jurisdictions to remain supreme over their "own" exchanges. How much delegation of responsibility can be accomplished and still meet the jurisdictional requirements of the local securities commissions? A second set of problems were anticipated possibly arising out of the attitude which brokers who are only members of the Toronto Stock Exchange might take toward dissipation of the monopoly value of their access to TSE trading, while no additional access to the MSE or VSE was given to them for their trading in MSE or VSE stocks which did *not* go on the Canada-wide arrangement. Lastly, the Canada-wide arrangement *assumes* the workability of computer-assisted trading. If CATS was to prove unacceptable, some indus-

try-based effort would undoubtedly be made to rationalize the present structure. This, however, would require a whole rethinking of the present conceptualization of a Canada-wide arrangement.

2. *Canada-wide in 1978*

In 1977 the Alberta Stock Exchange (ASE) was added to the Canada-wide group and participated in the discussions. The invitation to the ASE to join in Canada-wide was due to the fact that the cities of Calgary and Edmonton were rapidly developing as significant regional financial communities.

Through 1975 and 1976 the Canada-wide project came very close to signature by the four exchanges and the IDA. However, alteration of the CATS experiment away from its original schedule disrupted the plans involved in the formation of a Canada-wide arrangement.

In late 1977 the Montreal and Toronto Stock Exchange executives met to discuss the difficulty involved in matching the Canada-wide arrangement with the CATS experiment. It was decided at that time that maintaining the Canada-wide arrangement until the CATS experiment was completed was expensive and not necessarily going to be productive. However, it was also felt that it was important to progress toward a unified market system in Canada, irrespective of the status of the CATS system. Therefore, while the formal Canada-wide proposal was "put on the back burner", efforts were made among the exchanges to devise other ways and means of further unifying the markets.

Certain rule changes were effected which will bring the markets closer together and make better use of the Montreal Stock Exchange's market-making capacity. In addition, an agreement was proposed between the Montreal and Toronto stock exchanges wherein the exchanges would, for the duration of the CATS experimental period, arrange to have all members place their orders in the CATS experimental stocks into the system rather than execute them through the respective floors. The intention of the Toronto and Montreal stock exchanges is that if the steps being taken between the two exchanges to unify their markets can be agreed upon, similar arrangements will be offered to the Alberta Stock Exchange and to the Vancouver Stock Exchange and its sole members.

In this way, without the CATS system being proven or in place, steps are being taken to ensure cooperative efforts between the exchanges and a move toward a Canada-wide arrangement. If the CATS experiment shows that remote terminal trading can be

accomplished through a centralized computer system, then it is possible that parts, if not all, of the Canada-wide arrangement will be brought forward for implementation.

D. SECURITIES MARKET STRUCTURE EVOLVING IN THE UNITED STATES

1. *Evolution to 1975*

Between 1970 and 1975, the U.S. securities industry was subject to extensive examination by the U.S. Senate, the House of Representatives and the Securities and Exchange Commission.[118] The studies and subsequent policy papers and legislation resulted in the initiation of substantial changes in the structure of the U.S. industry. For example, a category of registrant designated as "Securities Information Processor" was established to include non-self-regulatory organizations which collect, process or distribute quotation or transaction information.[119] As of 1975, transfer agents were subject to SEC-determined standards and the effective operation of securities depositories and clearing corporations were made a clear concern of the SEC. In addition, securities firms were to be publicly owned, institutions could be members of stock exchanges (but could not do business for their managed accounts), commission rates were made negotiable, and, on grounds that such rules are anti-competitive, a major assault was thus made on New York Stock Exchange rules which require transactions by members to be done openly and on the floor.[120]

Obviously, the developments in the U.S. were very broadly based, and took into account the economic theories of the Department of Justice, the political forum needs of the senators and congressmen, as well as considerable public resentment against the New York Stock Exchange and its members for past protection

120 *Off-Board Transaction Study*, SEC, Securities Exchange Act of 1934 Release No. 11628, September 2, 1975, CCH FED. SEC. L. REP., No. 603 (pt. II) (September 5, 1975).

of privileges. There was also considerable interest in the potential contribution of automation in bringing about an improved securities market in the U.S. The SEC's policy thrust toward a Central Market System was the overriding influence there.

Already by 1975 several steps had been taken. First, the SEC mandated creation of a consolidated securities transaction reporting tape.[121] The "consolidated tape" was formerly only at stage "A", which included reports of transactions made on all U.S. exchanges and in the third market and Instinet in securities listed on the New York Stock Exchange. Tape "B" was to include all transactions in stocks listed on *other than* the New York Stock Exchange. It was postponed several times due to delays in establishing the high-speed line to carry trade and quote information between the exchanges and commercial vendors of market information. Tape "B" implementation was scheduled for January 1976.

Because of the substantial inter-institutional problems which arose out of formation of the consolidated tape by mandated cooperation, the SEC took a different approach to bringing about the next step – a composite quotation system.[122] Where previously quotes had been available only to exchange members, the SEC simply directed by rule that the exchanges make their market quotations available for a reasonable fee to anyone who wanted them. The "composite quotation system" was therefore to be developed by the commercial suppliers of market inquiry systems: Quotron, Bunker Ramo, Ultronics.

Formation of the consolidated transaction reporting and composite quotations system were supposed to be only the first two steps in creation of the SEC's concept of a Central Market System.[123] In the opinion of most observers, Tapes A and B were considered of minimal value. Though they do have the benefit of forcing third market trades out into the open by reporting them, the uncertainty of the time delays which take place in reporting were thought to make the information relatively unhelpful. Whether the broader reporting of the regional exchange's trading would attract interest to those exchanges (as the press notices indicated was the hopeful intent) was regarded as questionable.

121 *Consolidated Tape Plan Declared Effective*, SEC, Securities Exchange Act of 1934 Release No. 10787, May 10, 1974, [1973-1974 Transfer Binder] CCH FED. SEC. L. REP. ¶ 79,782. REP. ¶ 78,600, gave notice of the intended rule to create the consolidated shape. *See also*, *Jenkins*, ch. III.A.

122 SEC, Securities Exchange Act of 1934 Release No. 11288, March 11, 1975, [1974-1975 Transfer Binder] CCH FED. SEC. L. REP. ¶ 80,136 (written request to registered national securities exchanges regarding availability of quotation information).

123 SEC, Policy Statement on the Structure of a Central Market System (March 1973).

As the SEC's own advisory committee (discussed below) saw the question of regional exchanges, it was even doubtful whether such a result would be beneficial.

The composite quotation system was seen as providing some benefit in identifying the prices at which the market-makers and specialists of the various markets were bidding or offering. However, since the size of such bids and offers is unknown, the value of the information is minimal and the quotation system may only serve to generate a lot of useless activity for already busy desk traders in checking nominal quotations. In addition, there was the question of whether the enhancement of regional fragmentation of the market for a security was not, in fact, a net loss rather than a benefit. The question was raised as to whether the SEC's real motive in insisting on the composite competing markets philosophy was to cause such mayhem and expense for trading desks that the industry would itself revolt against multiple exchange markets and insist on moving to a unified black box approach!

Step three of the Central Market System was less well-defined. At the heart of it was a communications net connecting all the market centres and all the participants. In addition, the 1973 policy statement spoke of:

(a) a public preference rule (much as exists in Canada today) to give public orders preference over industry-originated orders;
(b) uniformity of rules between exchanges and also the third market – including a uniform short sale rule;
(c) standard membership/access criteria and stock eligibility (listing) requirements; and
(d) removal of NYSE Rule 390 requiring members to do all their trade in listed stocks on the exchange (or an exchange of which they are a member).

The "Advisory Committee on the Implementation of a Central Market Committee" (the Yearley Committee) was struck in May 1974 and reported the following year.[124] The major theme of this industry group was that the various existing exchanges should be brought into a single self-regulatory national securities exchange with as many floors as are desired. But all broker-dealers would be required to trade within the system – sort of a system-wide Rule 394. Except for this departure from the competing exchanges theme, they endorsed and extended the concepts of the SEC's policy statement.

It was clear in 1975 that the U.S. debate on how to structure

124 *Summary Report of SEC Advisory Committee on the Implementation of a Central Market System*, May 15, 1975, 308 BNA SEC. REG. & L. REP., June 25, 1975.

the central market was unlikely to be readily resolved. (The inherent problems in multisited trading of the same security under purported enforcement of some sort of "best execution" rule promised to confound the rulemakers and systems technologists alike.) The insoluable problem arises because, while the dissemination of quote information would be inexpensive and instantaneous, reacting to it by sending an order to a specific exchange and having the trader go out on the floor to make a trade (and perhaps bring back a report that the bid/offer has been preempted) would take a very long time and is costly.

On the face of it in 1975, there was only one solution – a single market for each security. This can theoretically be accomplished technologically by having the filing and matching of orders in any particular security done within a single computer-assisted system. The TSE's CATS project might be helpful in testing the potentiality of this "black box" solution – or, it might equally well be accomplished manually by having each listed security trade on only one physical floor on which all specialists', competing market-makers' and customers' tenders are represented and to which the communication net will direct all orders in the particular security. Whatever the solution, it was evident that until the Americans recognized the verity of the need for a *single* market for each stock there was unlikely to be much real progress toward a U.S. Central Market System, be it manual or computer-based.

2. *Status in 1978*

The preceding comments were also applicable in mid-1978, although it was evident by then that there were two competing points of view in the United States. One set of protagonists believes that a CATS-type system will work and is indeed the only way to implement the SEC's mandated National Market System. The most prominent advocates of a CATS-type system are J. Peake and Morris Mendelson. They are frequently referred to in *Securities Week* and have given papers at numerous conferences.

Weeden & Company, the well-known bond dealer and third market firm, has developed a working automated trading system – designated WHAM (Weeden Holdings Automated Market). Although Weeden has dropped out of the third market, it has put considerable effort into its dominant membership in the Cincinnati Stock Exchange and with a small contribution from the Cincinnati exchange has turned WHAM over to that exchange as an automated trading system – "the Exchange without walls".[125]

125 Securities Week (New York), May 22, 1978, at 5.

The Cincinnati Stock Exchange began trading on June 13, 1978, with two stocks. Merrill Lynch agreed to direct orders for these two stocks to the Cincinnati Stock Exchange and by the end of the first week of activity 143,200 shares were traded in those securities on the Cincinnati exchange.[126] In June 1978, Paine Webber, Prescott Ball & Turben and some other firms agreed to direct certain orders to the Cincinnati exchange. At this time the possible success of the Cincinnati exchange is of major concern to the New York exchange and its regional associates in the Intermarket Trading System (ITS).[127]

The New York Stock Exchange specialists and floor traders are extremely concerned about automation. Recognizing that it removes the ability to deal face-to-face and that it would carry out the specialist's agency function without any human intervention, the New York Stock Exchange has put its large resources into developing ITS with the regionals – the Pacific Coast, Philadelphia, and Boston stock exchanges. The Intermarket Trading System works on the basis that the specialist market (bid/ask) from each floor is available to the other floors. The system not only makes the information available, it also can route an order from one exchange to another for execution – if the market is superior on the second.

Opinions are divided on ITS. The NYSE regards it as a key building block in an evolving National Market System.

3. *Rule 390*

Rule 390 of the New York Stock Exchange was submitted to a major attack by the SEC and the Department of Justice as well as certain leaders of the U.S. Congress during 1975 to 1977. By year end 1977, the SEC had granted a reprieve on the removal of Rule 390. Thus the New York Stock Exchange may continue to have a rule which requires all members to direct orders to the floor of the exchange if:

(a) it is an order for an inventory account; or
(b) it is an order for a client in which the member is itself intending to fill the customer's order from firm inventory.

Spokesmen for both the securities industry and listed companies testified strongly before the SEC on their support for centralizing order flow, rather than letting broker-dealers execute transactions "upstairs" on their trading desks without the benefit

126 Securities Week (New York), June 19, 1978.

of exposure to potentially better bid or ask prices which might exist on the floor in the specialist's book or in the trading "crowd".

Chapter VII
A View of a Probable Securities Market System - 1980-85

In an industry such as the securities industry in which so much is currently in a state of flux, it is probably foolish to make forecasts about future structure and organization. On the other hand, there may be some very large forces at work which can be depended upon to move toward an inevitable result. On the basis of the kinds of projects and momentum of the Canadian industry reported in this paper, it would seem that computer/communications technology may be such a force.

The needs of the securities markets and the participants in them are for (1) storage of large amounts of accessible data; (2) an ability to manipulate the data; (3) an ability to communicate data and instructions relating to it; and (4) production of documents for archival storage. These needs seem well met by various applications of computer/communications technology, some of which are even now under way and have been described in chapter VI.

At the present time there exist reasonably comprehensive data bases for market quotation and trade data and for corporate financial information and securities issue data. Customer account information is in the process of being brought onto online data bases. What is most lacking at this time is a network of high performance flexible and interactive terminals which are able to access these data bases for the people who need the information. A second gap in the present systems is the ability to drive transaction data (including customer identification) directly into brokerage accounting and the settlement systems. Both these gaps appear to be answered by the sort of network which will emerge from the computer-assisted trading research at the TSE.

In the backend of the securities market system there is the curse of the paper certificate, and also a missing link in that the customer account and shareholder ownership records are not in an online mode, hence not connectable to a communications net. The solution to the former problem appears to be in sight via the Canadian Depository, and a start has been made on solving the latter problem in the CATS and MARS networks at the TSE and VSE, respectively, and in the recent moves toward online brokerage accounting records.

When these systems are in place and settled down (which would appear to be likely within five years) a rather streamlined securities market system will emerge (see figure 4).

In such a system, the salesmen, research analysts, traders, credit controllers, cashiers, lenders and registrars are able to access some or all of the various data bases and functioning systems. The system structure inferred above implies a single coordinated network but it does not imply anything about multiple or merged hardware installations for each of the six areas. Whether the various subsystems are run on independent computers or merged onto large installations will depend on the degree to which competition is found desirable and economic in the provision of services. For example, one could well imagine a large operations area service bureau being integrated and associated with the clearing/settlement and depository systems. But one could equally see a large number of separate operations area installations competing to give service, all coordinated to a standard terminal network and a single settlement/depository system.

Like settlement and depository systems, it is hard to imagine competing trading systems over any long term – certainly not in the same securities. The directions of the CATS and Canada-wide projects are consistent with this projection and it is plausible to regard the present Vancouver Stock Exchange program as ultimately complementary rather than competitive.

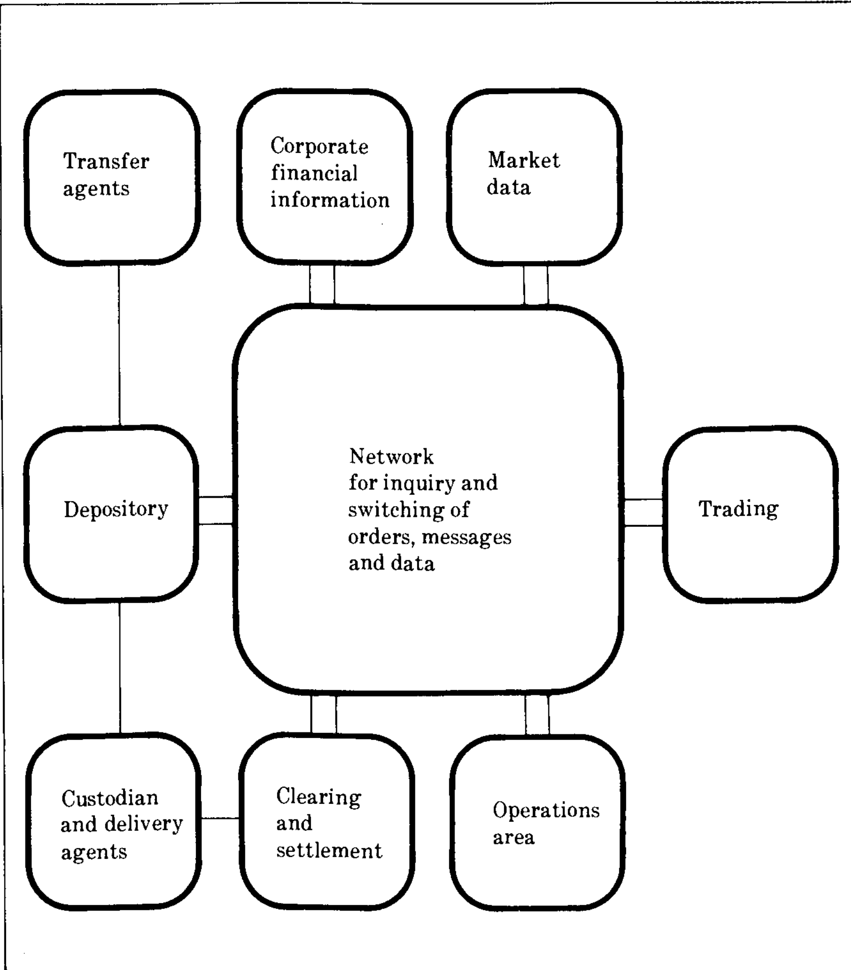
In the future, when the legendary retired farmer in Victoria decides to buy some ABC stock and the institution in Halifax has decided to sell ABC, the transaction might be described as follows:

Salesman Jones in Victoria, having been alerted on his desktop terminal that his firm's research department likes ABC, calls up the portfolio program which shows him all accounts of his which have a position in ABC and/or excess "buying power". Noting retired farmer Abernathy as a potential buyer, he telephones Abernathy. In response to questions, Jones uses his terminal to call forth recent research information, past prices, earnings projections and recent news releases from the corporate information data base supplier with which his firm has a contract. Satisfied that ABC is a good purchase, Abernathy expresses an interest in up to 500 shares. While still talking to Abernathy, Jones calls up the recent market information and the CATS market. He informs Abernathy that the market is 7-7/8 to 8, last sale is at 8, 1,000 shares have been traded today in three small trades at 8 and 8-1/8. Jones suggests that they try to buy 500 at 8. Abernathy agrees and Jones keys in the order and Abernathy's account number.[128]

Since the dollar value order limit assigned to Jones by his firm

128 His account number is something like his present social insurance number but is unique to him and therefore identifies Abernathy discretely at brokers, banks, transfer agents and other financial intermediaries.

Figure 4
Network Based on Securities Market System



is $3,000 and this order has a total value of $4,000, it is routed by the network to the central trading desk of his firm for control purposes. The master trader on the desk observes the stock is on their "buy" list and routinely OK's the order. The order then goes to the trading module for attempted match/execution. At $8 it finds 200 shares which it purchases and bids $8 for 300 shares more. The terminal reports that 200 have been purchased and that the order is actively bidding for 300 at $8. In the approximate 10 to 30 seconds (less than 5 seconds if the master trader authorization had not been activated), Abernathy waited on the telephone for the report. Upon hearing that he had 200 and that the market was 8 to 8-1/8, Abernathy decided to raise his bid to 8-1/8. Jones accomplished this with a single key stroke and sent the order again, whereupon 300 were bought at 8-1/8 and the order completed.

Reports of the trades were automatically produced by the network at the firm's operations area. Since Abernathy has given standing instructions for delivery of his purchases at a chartered bank, the operations area sets in motion the client accounting requirements and clientside settlement process. This is done by calling up Abernathy's account on the operations area terminal and by keying-in instructions to direct the depository and settlement system to go ahead with the book entry transfer of 500 shares of the firm's "free" stock to the bank against payment of cash from the bank.

On the streetside, the clearing house will advise the firm as of the close of business what its net cash pay or receive is as a result of that day's trading in all issues and also as to the positions to be settled by receipt or delivery of stock. (Abernathy's transaction may well be netted out.) The settlement system will be instructed (also via the terminal) as to what to do with the incoming positions and from which subaccounts to take the outgoing stock.

In Halifax the insurance company investment fund (for which the 200 shares purchased by Abernathy at $8 were being offered) is run by an ultraconservative manager. He likes to have his holdings held in the traditional manner. Thus certificates representing the shares he is selling are held in a vault at the Bluenose Trust Company. On receiving written confirmation of the sale two days later, he instructs Bluenose to make delivery to Broker X. Having only certificate denominations of 1,000 shares, Bluenose sends a 1,000-share certificate to the transfer agent for ABC (another trust company), requesting 1 x 200 and 1 x 800. Since ABC's transfer agent does not have a branch located in Halifax, Bluenose Trust must send the certificate to Montréal by insured mail or courier. The requested certificates are not received back

until seven days later. ABC is debited $5 by Bluenose for the transfer. (ABC is one of the few companies that continues to pay the agents for share transfer – most companies require the $5 certificate issuance charge to be made to the person asking for the certificate.)

On receiving the certificates back, Bluenose delivers 200 shares to the Halifax office of Broker X and receives a cheque for $1,600 *less* commission, *less* a handling charge of $10 in respect of the certificated delivery. (In spite of the $10 charge, the insurance company's broker will be out of pocket due to interest loss, insurance, mailing and accounting expense in handling the paper certificate.) The Halifax branch of Broker X then sends the 200-share certificate by armoured courier or insured mail to Broker X's head office in Montréal where it is sent to ABC's transfer agent for deposit in the CDS noncertificated account to the credit of Broker X (and cancellation of the certificate).

The 300 shares bought by Abernathy at 8-1/8 came from an offering by Broker Z on behalf of a sophisticated client in Alberta. Since the Alberta client has used the full service facilities offered by Broker Z and the stock position is held in noncertificated form, the settlement of the transaction is extremely simple. The client's account is reduced by 300 shares and his bank account credited with the proceeds (less commission). In streetside settlement, Broker Z's account with ABC's transfer agent is reduced by 300 shares (which are credited to the account of Abernathy's broker) and the money proceeds are directed into Broker Z's clearing account for daily netting.

Appendix B
Automation Program of the Vancouver Stock Exchange

For many years, the Vancouver Stock Exchange has had its own computer department which operated both a simple clearing system, a ticker tape and a modest market inquiry system. In 1973, however, the VSE undertook to upgrade its automation program. The old Univac system was replaced with an IBM 370-125 and projects were initiated to redesign the clearing system and also improve the online market inquiry offering.

1. *Clearing System*

The new VSE clearing system was decided on after a broad study of what other exchanges in North America were doing and considerable debate as to the VSE role as a sponsor of the Canadian Depository for Securities Limited. In early 1974, the decision was taken by the VSE Board that it would discontinue its support for CDS and put its full resources behind development of a Continuous Net Settlement (CNS) system modelled along the lines of the system run by the Midwest Stock Exchange Clearing Corp. The Vancouver Stock Exchange Service Corporation was formed and the new clearing system was brought on stream at year-end 1974.

In the Continuous Net Settlement system the Exchange Service Corp. takes the opposite side of every trade. That is, the contract resulting from a floor trade between brokers results in an obligation on the buying member to pay the Service Corp. and on the selling member to deliver to the Service Corp. Because the Service Corp. becomes the opposite side of every transaction, opportunities for netting are maximized, not only on a daily basis but in effect on a continuous basis as each member simply runs a position with the Service Corp. In each security, each member is "owing shares to", "owed shares from" or "flat" vis-à-vis the Service Corp.

In addition to maintaining continuously netted "owing to" and "owing from" positions, the VSE Service Corp. has set up a depository which allows members to deposit any Canadian listed security for holding as "free", "loan free" or "seg free" positions in the Service Corp.'s vault. Loan-free positions are available for use by the automatic loan system. This means that the Service Corp. can satisfy another member's "owing from clearing" position or request for withdrawal via delivery of certificates by borrowing stock from members with loan-free positions. The member supplying the loanable free position will gain by receiving a cash credit from the Service Corp. for the full value of the loaned positions. Credit control is tight in the VSE system as the value of all "owing to", "owed from" and "loaned" positions are adjusted to market value every day. The accompanying figure is a diagramatic outline of the system.

The fully implemented CNS system at the VSE has meant opera-

tions area manpower savings for members and savings on the financing of undelivered positions owing to the Service Corp. as well as improved delivery and payment relations with customers.

Some statistics will help put the VSE Service Corp. in perspective. Its vault now holds over 60,000 certificates representing over 210 million shares worth $115 million. On a daily basis, its ten employees clear and settle all VSE and VSE curb trading for the 23 clearing members, as well as continuing to accept net deposits running at an average of over one million shares per day. In 1977, the Service Corp. dividend processing system included over 330 stocks with over $500,000 paid to members for owing positions and certificate claims. The Service Corp. is audited on a continual basis and has had three "perfect" annual audits since 1974.

Another feature included in the Net Settlement package is the ability for members to move security positions from one to another via "book movement" either "free" or "against payment". This means that rather than withdrawing securities from the depository for delivery to another member, both members agree to the amount of securities and monies to be moved and the members' accounts are adjusted automatically.

This facility for book-based movements is available to trading members, non-trading local members and out-of-town members. In effect this means that out-of-town brokers using local trading members of the Vancouver Stock Exchange may maintain positions with the VSE Service Corp, thus avoiding the time-consuming and expensive movement of certificates across the country.

Further evidence of the success of the Vancouver Stock Exchange system was evident with the announcement in March 1978 that the Alberta Stock Exchange was to use the facilities of the VSE Service Corp. The Alberta Stock Exchange is to be linked to the Vancouver Stock Exchange computer network and members of the VSE Service Corp will be able to deposit or withdraw securities in either Vancouver or Calgary.

The attitude of the members toward Service Corp. is highly favourable. There is admiration for the innovativeness and the effectiveness with which the system has been implemented. Originally, there were some who doubted the economics of the new system in that the daily value of trading on the VSE was only $1 million (member gross revenue from such trading would have been something under $50,000 per day and total operations apportionment of this would be only $10,000-15,000). However, the system has proved to be a complete success. The VSE has had to increase its staff to manage the system but there has had to be no increase of the member firms' part of their operations area affected by the new clearing system.

As of December 31, 1977, there was definite evidence being seen in members' offices of reduced cage staffs, lower bank safekeeping charges, transfer costs, audit costs and insurance premiums. Increased costs of the Service Corp. compared to the old clearing house have been

offset by those gains and the general view in Vancouver is that a net positive result has been obtained.

2. *Market Data Inquiry Service*

The VSE announced a Marketminding And Reference Service (MARS) in mid-1975. MARS is an online terminal system which provides to subscribers the ability to inquire into the VSE data base of VSE and TSE trading and quotation information. One planned service of MARS which will be very useful to VSE members is that it will be able to access the VSE Service Corp. data base concerning open clearing items, dividends and issuer data. Section 3 below provides a summary of the services available on MARS.

The VSE database is available to subscribers through three different means.

Firstly, access is available through the dial up telex network.

Secondly, subscribers may use VUCOM I (or other compatible terminals) to access the system.

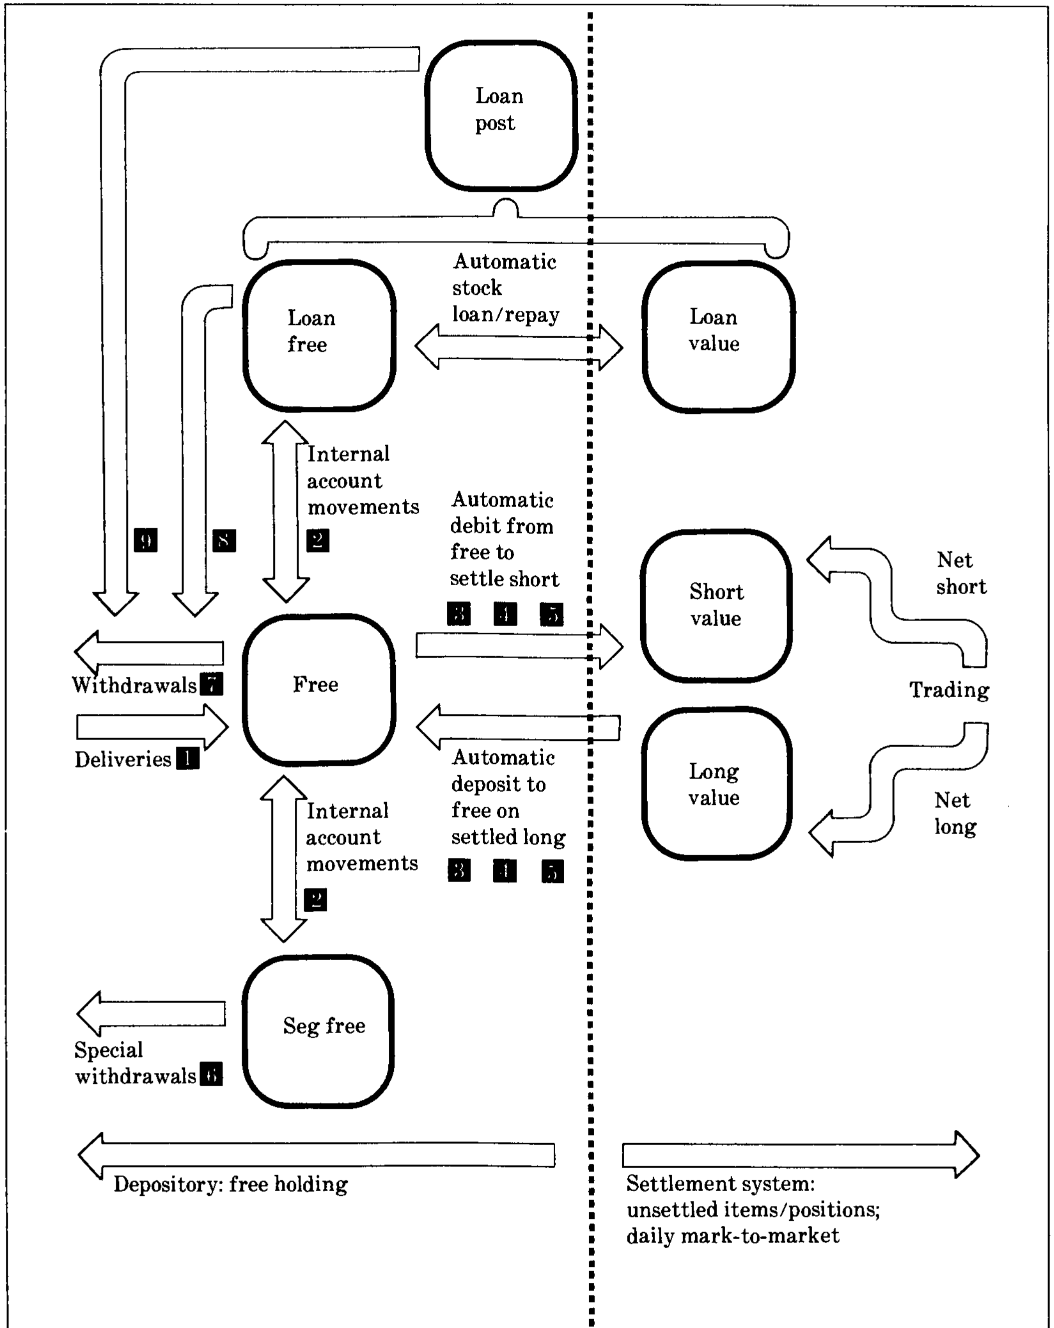
Thirdly, users of the CMQ (Combined Market Quotations) system may use Videomaster terminals to access both the CMQ database and the VSE database through one terminal simultaneously.

3. *Data-processing Department, Vancouver Stock Exchange*

MARS features

1.	Market Quotations	Bid and Ask prices; today's trading statistics; up to the minute sales, value, trend
2.	Most active stocks	By volume; by value; by number of trades; by percent change; by section (mines, oils, industrials, curb)
3.	Historical quotations	High, low, close for any day; high, low, close for any period
4.	Extended stock information	150 items of information per stock; dividend details; capitalization details; declared short position; day, week, month, year statistics
5.	Stockwatching	You choose the stock; you are informed of all trades and market changes as soon as they happen
6.	Toronto quotations	Today's market information; stockwatching
7.	Trade recall	Recall of today's or yesterday's individual trades

VSE Service Corporation CNS Depository/Settlement System



Source: Vancouver Stock Exchange.

Daily trading on the floor results in net changes to long and short value positions in the settlement system. For every eligible security a participant is either long, short or flat "value" in the settlement system.

Settlement Processing

Deliveries (1) of stock certificates received are first processed as directed by depositor (2). "Seg Free" is safekeeping stock which cannot be touched except on explicit directions by participant. "Loan Free" is stock available for loan or loan repay on request by the system. After internal accounts directions are recognized, each member's Free position is checked to see whether it can be used to reduce Short Value; if it does, money balance is credited (3). The Long Value is checked. If the service corporation has stock available to reduce Long Value, to the extent that it does, the position is moved to Free and money balance is debited (4) and (5). Special withdrawals (6) are recognized from Seg Free. An ordinary withdrawal request (7) is met from Free, but if the request cannot be met from Free, then that member's Loan Free position is searched (8). If the request is not met from the member's Loan Free, then the Loan Post (which is the amalgam of all members' Loan Free) is requested to supply it (9). If it can, the lender's Loan Value is raised and money credited. The borrower shows an offsetting Short Value. In any stock, Loan Value + Long Value = Short Value.

4. *Brokerage Accounting Services*

In December 1976, the VSE ventured into the role of providing brokerage accounting services to members. These services were achieved by acting as the input/output focal point for users and by buying raw computer power from the local IBM Datacentre, the traditional supplier of the service. Users of the service now look to the VSE rather than IBM for service and support.

By the summer of 1977 all Vancouver-based brokers, who had previously used the IBM system, were availing themselves of the service provided by the VSE, which by the end of 1977 was being offered at a cost which was significantly lower than its IBM equivalent.

This initiative shown by the VSE was based on the additional computer capacity which VSE's own computer system had during the overnight time period. The VSE was therefore able to provide the service at a low marginal equipment cost.

Savings accrue to the users of the VSE system in two ways. Firstly, there is a direct cost savings. Secondly, by deriving revenue from the provision of the service the VSE is able to avoid raising members' fees in other areas.

The VSE is also now in the process of developing programs to run on its own computer system. This will reduce the costs to the VSE of providing this service. A phased approach is being used and it will likely be a number of years before all the programs could run on the VSE computer. The first programs are scheduled to be run on the VSE's computer in the second quarter of 1978.

Appendix C
Nominee vs Shareholder Record - Two Kinds of "Book-based" Systems[a]

At this date [1972] there is considerable controversy among the banks and trust companies as to what form of depository should be instituted in Canada. Much of the debate seems to be based on a misunderstanding of the meaning of "book-based". This memorandum is to clarify that issue in the context of transfer agents.

The overall purpose of the CDS [Canadian Depository for Securities Ltd.] project is to make the Canadian securities system work more efficiently. The operational objective is to reduce the dependence of the system on the movement, storage and control of paper certificates. In effect the goal is to change the basis of the system from paper certificates representing negotiable ownership interests to computerized book entries. Two basic forms of book-based systems have been described by CDS. One is dubbed a "nominee" system because in it CDS would become an actual depository of certificates which it would have registered in its nominee name, and hold them on behalf of CDS participants. The issuing companies' shareholder records would simply show CDS as nominee holder of a large position. CDS would maintain records of the breakdown on this holding over its participants. The other system is denoted a *shareholder record* book-based system because it contemplates that the share certificates would be cancelled and the actual records of the company relied upon to keep track of shareholders and reflect their transactions.

In either system it is apparent that a lot fewer certificates will be issued as all changes in ownership between CDS members would be effected by book entry. Only deliveries out to nonmembers would require issuance of a certificate. If the large financial institutions are members, then compared to today's system, certificate issuance would be reduced to less than half its present level.

In a nominee system transfer agents and the shareholder records which they maintain would be merely peripheral to the system, reflecting only the net change each day in CDS's position on behalf of *all* members and issuing certificates only for nonparticipants.

In a system based on shareholder records rather than a nominee, the issuing company's records would themselves be the data base which is updated by transactions and certificated deliveries to and from nonparticipants. If trust companies are to maintain their traditional role as maintainers of corporate shareholder records, then a shareholder record system would imply a much more direct involvement of trust companies. In effect, the trust companies would either gear up to maintain their geographically dispersed records on a basis responsive

a Memorandum to file from H.J. Cleland, June 10, 1972.

to changes in ownership as reflected by settlements or they would use some centralized service bureau technique. For reasons of economy and standarization of service, the latter is believed to be preferable. In the end, the shareholder record service bureau would not look substantially different in terms of file sizes and response requirements than a nominee depository.

The trust companies are not keen on the nominee system because it reduces their revenues but at the same time they are nervous about a shareholder record system because they doubt their abilities to carry out a sufficieint standard of record-keeping.[b] Critics of the trust companies take some delight in pointing out the duality of the trust companies' position. With respect to cash deposit-taking the trust companies are competitors of the banks, yet their position on securities transfers is the opposite of what they are really doing with money. To make the two positions parallel, one would imagine the deposit-taking area saying that they would not take in money for holding nor rely on savings account bookkeeping, but would insist that customers store their currency bundles themselves. However, they would be willing to make change on presentation and they would keep a little score sheet on how much currency each person had. The score sheet would be updated for the owner of the currency if he would appear at the window (or mail his bundle) in for verification and score updating, after which the bundle would be returned.

b In the present system, shareholder records are only memo records of the real ownership interest evidenced by issued certificates. Consequently, maintenance of the shareholder records can be casual with respect to timeliness and even accuracy. Whether a noncertificated system is of the nominee or shareholder record type, the standard of record maintenance has to be an order of magnitude better than the present dual system. However, the system is well-precedented in the deposit-taking area of trust companies where the records of money ownership are maintained on a book-based system.

Computer Communications Systems in Securities Markets

Chapter I
Introduction

This paper provides a technical background for automation in the securities industry. It is intended to complement a companion paper in this volume which concentrates on the functional aspects of automation in the industry.[1] No attempt has been made to give an exhaustive study of all automation projects in the industry; instead, a few were chosen for detailed study to present the breadth of activity which is currently under way. The particular projects studied in detail in chapter III were chosen because of intrinsic interest or, in some instances, because of availability of information.

As well as reviewing particular systems, the paper presents in chapter IV a technical survey of security in automated systems with a focus on issues that might arise in automated trading and

I would like to acknowledge, with thanks, the people who assisted me in preparing this paper. Staff members at the Institutional Network Corporation, Automated Real-Time Investments Exchange Ltd., Securities Industry Automation Corporation, National Association of Securities Dealers Automatic Quotations system, Philadelphia Stock Exchange, Toronto Stock Exchange, Montreal Stock Exchange, and the Canadian Depository for Securities Ltd. - all cooperated by providing much of the information on which the paper is based. I would especially like to thank Philip Anisman, Mat Ardron, Hugh Cleland, and Stan Deudney for giving their valuable time to introduce me to the securities industry and to automation's role in it.

1 *See, Cleland, Applications of Automation.*

settlement systems. This is a large topic and an attempt has been made to present the basic points with a few examples. References to a number of sources for further information are provided.

Chapter V discusses three unrelated but short topics, none of which seemed to deserve a chapter to itself. These are: the rapidly evolving technology of the computer industry over the next ten years and the effect it will have on applications in the securities industry; the possibility of international hookup of automated trading and settlement systems, and the automated surveillance work which is an integral part of some of the automated systems in the industry.

The paper makes no specific recommendations since it is primarily intended for background reading. For those with little or no experience in computer systems, a brief definitional description is included in chapter II.

Chapter II
Computer Systems

This chapter is intended to introduce the reader to the design concepts and terminology of computer-based information systems.[2] It may be skipped by the reader familiar with such systems, although he may find it helpful for reference to ensure that his understanding of the terminology in the remainder of the report agrees with the definitions below.

A. WHAT IS A COMPUTER?

A *computer* is an electronic information processing device which carries out specific data processing tasks under control of instructions stored in its memory. A set of instructions to carry out a specific task is called a *program* and it is designed and written by a *programmer* who must understand the task to be done, must know or develop a procedure or *algorithm* to accomplish the task, and must know the *language* in which the computer accepts instructions.

2 The description given here is necessarily brief and it is suggested that the reader who wishes to gain a more thorough background read an introductory text on data processing. Suggested texts are A. VAZSONYI, INTRODUCTION TO ELECTRONIC DATA PROCESSING (1973). D. SANDERS, COMPUTERS IN BUSINESS: AN INTRODUCTION (1975). J. MARTIN, INTRODUCTION TO TELEPROCESSING (1972).

1. *Hardware*

Computer *hardware* refers to the electronic, magnetic and electromechanical devices which make up a computer system. The primary components are:

(1) the central processing unit (CPU) which is the control centre of the computer, actually executing instructions and controlling the sequence in which instructions are obeyed;

(2) the main memory which stores the instructions that make up the program and also stores the most actively used data in the system;

(3) the auxiliary memory which stores the bulk of the data used in the information system; and

(4) the peripheral devices which accept information into the system and display or print information as output from the system.

There are several ways the major hardware components of a computer system can be joined together; figure 1 indicates one simple approach in which all information flows through the CPU.

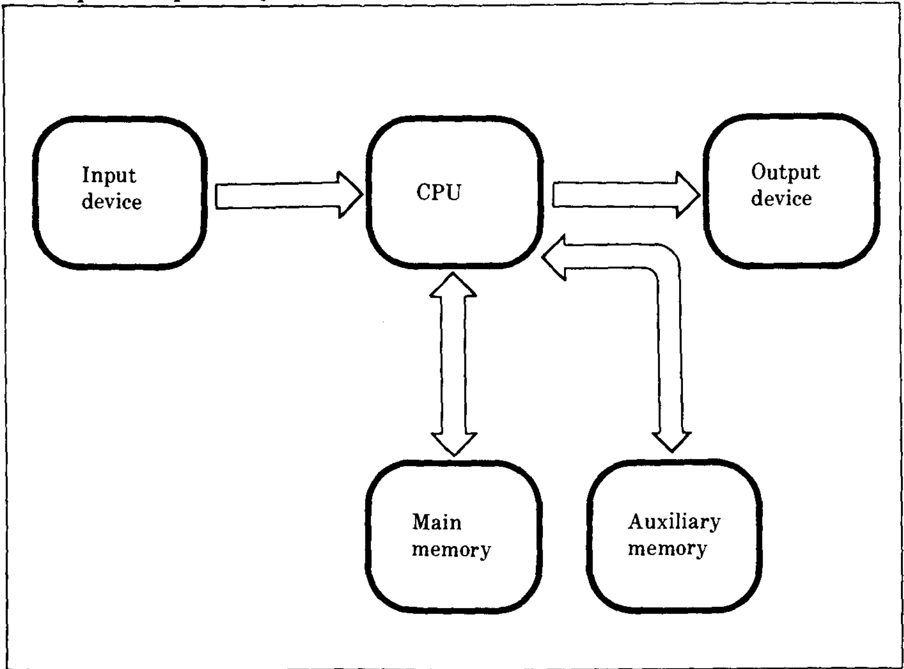
The input device may be a card reader which accepts the all-too-familiar IBM punched cards or it may be a typewriter terminal which accepts information from the keyboard. The output device may be a line printer, a card punch, or a typewriter terminal which types information under program control. Devices such as interactive typewriter terminals, or TV-like terminals, can act as both input and output devices. A computer system usually has a number of input/output devices of various types. Systems which connect large numbers of terminal devices to a computer system using telecommunications technology are discussed below.

The auxiliary memory of a computer system is usually viewed by the central processor as an input/output device, with the special property that information written out can later be read back in. Auxiliary memory is of two types:

(1) Sequential storage media – the prime example is magnetic tape which is used to store large volumes of information that can be processed efficiently by sequential access to the data stored on the tape. This is an inexpensive storage medium but the access time to retrieve a particular unit of data is quite long since all the information on the tape between the beginning of the tape and the unit of data required must be examined to see if it is the desired unit. This process may take three or four minutes on a typical magnetic tape unit.

(2) Random-access storage media – the primary examples are rotating drums or disks which can store information on mag-

Figure 1
A Simple Computer System



netized surfaces. Because each region of the disk or drum can be separately accessed, any unit of information can be quickly retrieved in a few thousandth's of a second (5–40 milliseconds).

The main memory of the computer system consists of a large number of cells each of which can contain one unit of information. The cells are assigned sequential numeric addresses and in modern systems the CPU can retrieve or change the contents of any cell in less than a millionth of a second. The main memory is used to contain both instructions and data to be processed immediately. The distinction between instructions and data is primarily one of their uses; the computer assists in preparing its instructions and while doing so is treating them as data. Of course the instructions being obeyed to carry out this preparation are separate from those being manipulated.

The technology of main memories is changing rapidly. Until very recently almost all main memories were made up of magnetic cores, which are small doughnut-shaped pieces of magnetic material arranged in a large wired array, but now semiconductor memories built on a few silicon chips have become economically viable and are being mass-produced.

The central processing unit is the "brain" of the computer system, and under direction of the program being executed it controls the flow of information in the computer system and carries out the processing actions required. It usually contains an arithmetic-logic unit and a number of special high-speed cells (called *registers*) which store information being processed by the CPU. These registers can typically be accessed in 40–60 billionth's of a second and are used to avoid access to the much "slower" main memory. The arithmetic-logic unit performs arithmetic operations on numeric data and comparisons or relational operations between numeric or non-numeric data items. It is its ability to perform arithmetic and comparisons operations at a rate of millions per second which gives the computer its information processing power. Each step is so simple that the detailed description of all the steps to accomplish any moderate-sized task is tedious to write, but once written, the specified steps are performed by the computer, at a rate almost beyond our comprehension. It is this power that allows the automation of information processing on a scale unimaginable even thirty years ago.

2. *Software*

Computer *software* refers to the programs used to control the processing carried out by a computer system. These programs can

be divided into two somewhat arbitrary classes: systems software and applications software. In general, systems software refers to programs which directly support the hardware functions of the computer and are not intended to accomplish any specific computer application. Systems software makes the interface between application programs and the computer system much simpler because many of the detailed hardware characteristics are masked from the application programmer's view. It also allows more efficient use of the hardware resources by permitting several application programs to be proceeding simultaneously, sharing the hardware resources among them. Management of the computer system resources is the task of a set of programs collectively referred to as the *operating system*. The operating system includes programs to manage the utilization of main and auxiliary memory, control all input and output functions, schedule the execution of application programs and record, for account purposes, the hardware resources used by each program. Operating systems are designed and written by the hardware vendors to utilize their particular hardware design efficiently. For most purposes the computer system is best viewed at the level of detail required to make use of it with the operating system in place.

The other major components of systems software are language processors. Programs are written in symbolic notations called programming languages. A low-level programming language is one that specifies actions to be executed which can be mapped directly to the machine's instructions. Translators for such languages are generally called *assemblers* and programs written in such assembly languages are potentially very efficient since the instruction set of the computer can be optimally utilized. However, the development of such programs is both time-consuming and error-prone and hence there has been a trend to avoid low-level programming except where efficiency is of prime importance. A high-level programming language is one that has been designed to allow algorithms to be expressed in a notation more natural to the programmer. Examples are FORTRAN and ALGOL which are intended for scientific computations, COBOL for data-processing applications, and PL/I which is a general purpose language. High-level languages are translated by *compilers* and result in many machine instructions being produced for each statement in the language.

The normal pattern of execution of a program is a two step process. The first step is the translation from the high-level language to machine instructions; the second step is the execution of the machine instructions. For a frequently used program, the result of the translation is retained and subsequent executions

may omit the first step. An alternative approach to the two step execution process is taken with some languages. The high-level language program is not translated but is executed directly by the actions of a program which "interprets" the meaning of the language statements. APL is an example of a language that is processed by an *interpreter*.

B. COMPUTER SYSTEM CHARACTERISTICS

Computer systems can be characterized as operating in three ways:

(1) Batch processing mode. A stream of programs or *jobs* continually enters the computer system: the jobs are executed and the results produced. There is no interaction between a job as it executes and the user who has requested its execution. The stream of jobs may be entered from a number of remote sites without output being transmitted to the submitting site. The operating system may share resources between jobs in order to make best use of the resources.

(2) Time-sharing mode. The operating system shares the resources of the computer system among users at interactive terminals. Each user appears to have a portion of all the resources of the system available to him and can communicate with his program as it executes. The terminals are usually located at sites remote from the computer and connect to the computer over leased or dialed telephone lines.

(3) Online processing mode. A computer system is used to support an application which requires gathering inputs and providing outputs to a large number of widely separated locations. The computer system acts as a databank and provides information on request. An example is an airline reservation system. The system must be capable of responding to requests fast enough to make the system useful in the normal working environment to which it is being applied. The functions of the application are accomplished by a set of programs which store, manipulate, and retrieve information as required. Information is transmitted to the remote locations over telephone lines and is displayed on teletype, typewriter or TV-like terminals. The users of an online system are not programmers. Hence much of the effort in its design is spent in ensuring that it provides functions that are convenient and efficient for users.

While it is conceptually convenient to classify a computer system as being one of the three types above, frequently a particular system operates in two or three of these modes simultaneously. For example, a time-sharing system may, for some group of users,

appear to be an online processing system because they are using it via an applications program. In addition there may be a batch stream of jobs executing in the background whenever the time-sharing process has spare resources. The latter may also be the case for a system whose primary task is an online application. Although some modern operating systems are capable of supporting any of these modes of processing, there still is a tendency to tailor the operating system to meet the primary function of the system.

All three modes of processing potentially involve the transmission of data between remote locations and a central computer site over telecommunication lines. The technology required to support such telecommunication systems lies on the boundary between computer technology and communications technology.

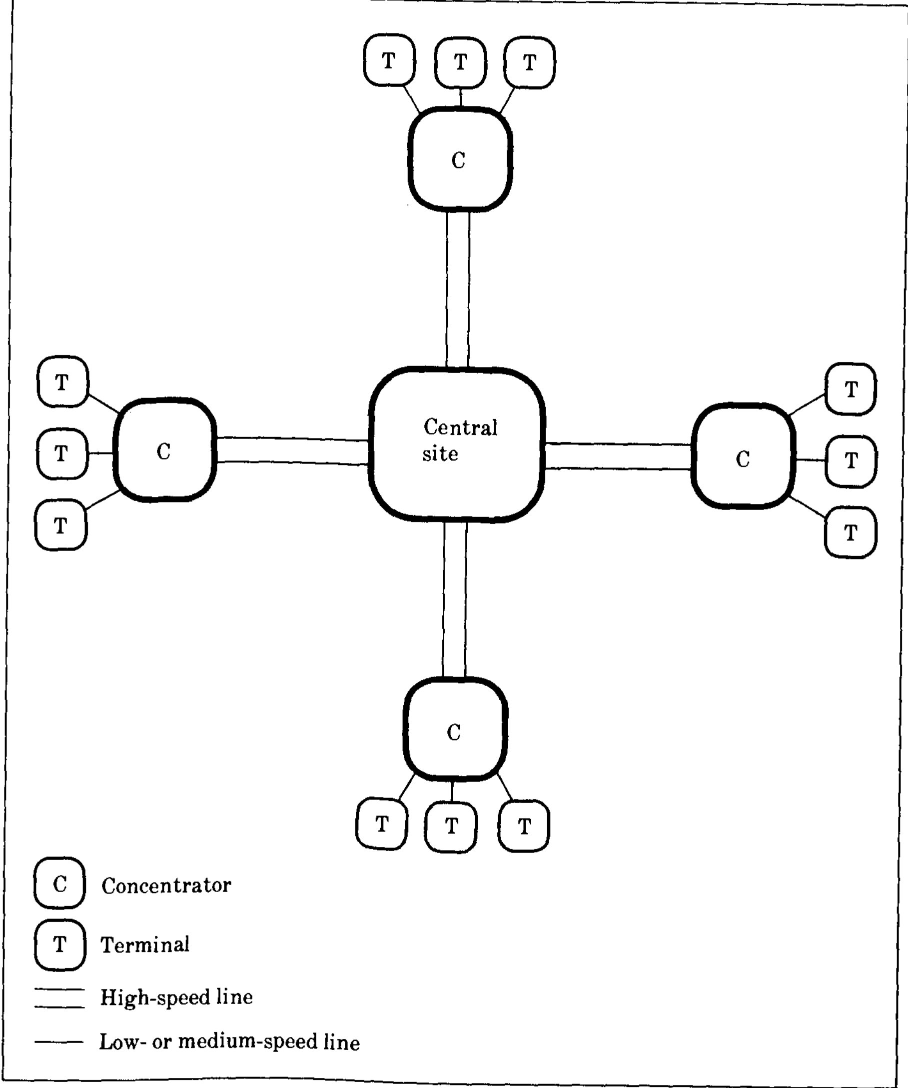
C. COMPUTER COMMUNICATIONS NETWORKS

In the most common design, a network functions as an information system in which the primary node is the central site. The central site has the major computer system in the network. High-speed trunk communication links connect the central site to small computers (usually called concentrators) at remote locations near centres of high usage of the system. Attached to each concentrator by low- or medium-speed communication links are the terminals through which the system is used. Schematically the network often is like a star as indicated by figure 2. The terminals may be connected by leased lines or by a dialup facility using normal voice-grade telephone lines. Information is received from and sent to the terminals one character at a time.

The task of the concentrator may be simple or sophisticated depending on the system design. It may simply act as a multiplexor, combining the stream of characters coming from a number of slow terminals into a single character stream to be sent at high speed over the trunk line. The central processor decodes the input from each terminal and determines the nature of the request. In a more "intelligent" concentrator much of the housekeeping work is done before messages are sent to the central computer. The concentrator handles message collection, answering simple requests, user authentication, password checking, display support, etc. By increasing the power and sophistication of the concentrator the message load being sent over the trunk lines can be reduced and hence reduce the communications cost and amount of work to be done at the central site. With the rapidly decreasing cost of processing units a trend to "intelligent" concentrators is developing.

The terminals at the edge of the communication network may

Figure 2
A Star-Like Computer Network



be simple teletype devices, typewriter terminals, or sophisticated display terminals. They may operate in full-duplex mode in which characters may be transmitted both ways over the line simultaneously or in half-duplex mode in which the line is used to send a number of characters and then is "turned-around" and used to receive a number of characters.

The terminals used in most of the securities industry systems are display-type terminals in which a cathode-ray tube (CRT) similar to a television picture tube is used to display the output information. The screen is often split into two or more sections with information for different purposes displayed in different sections. For some applications a printer is attached as well so that hard-copy documentation of what has appeared on the screen can be retained. Some of the terminals also contain a bell or buzzer which sounds when important new information is being displayed.

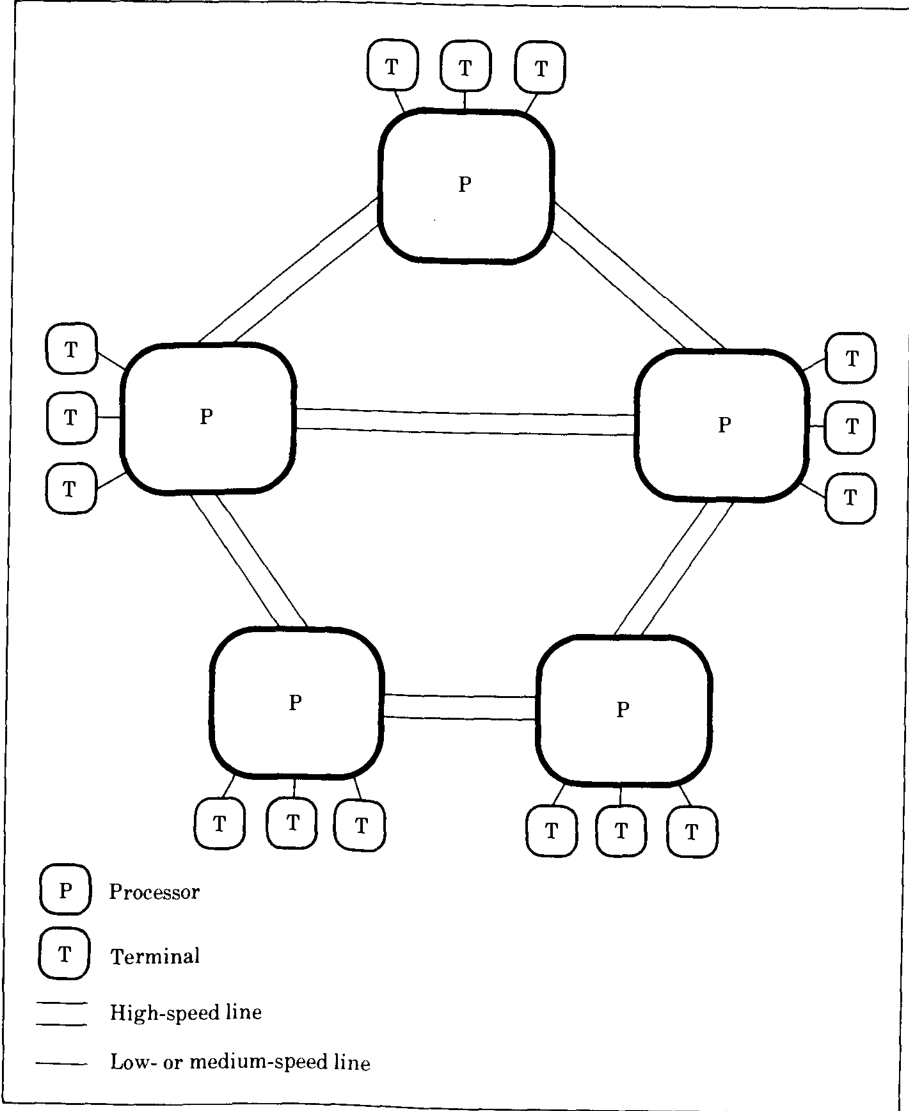
The input for the terminal is through a keyboard which has, as well as keys for all the letters, digits, and special characters normally found on a typewriter, a number of keys designed to expedite the normal activity for which the terminal is used. For example, on a terminal which displays a stock quotation, there may be a key marked ↑ and another marked 1/8 so that a market-maker wishing to change his quotation on the stock may simply press these two keys in succession to raise his quotation by an eighth. A great deal of human engineering is involved in tailoring a terminal so that it can be used efficiently for a specific application and the success of an automation project can be adversely affected if sufficient care is not taken in this task.

The connections of the leased or dialup telephone lines to the terminals at one end and the computer at the other is accomplished through electronic devices called *modems* which convert data between digital pulses used in the computer system and analog signals transmitted over conventional telephone lines. Modems are available to support half- or full-duplex transmission at a wide variety of transmission speeds. Transmission rates are generally quoted in terms of bits per second transmitted. The term "baud" has come into use as an abbreviation for bits per second. A 2,400 baud line is one capable of transmitting at a rate of 2,400 bits per second.

In some applications of telecommunication systems there is no requirement for a large databank of information and hence no need for a central large-scale computing system. In such cases the network no longer is star-like and involves direct connection between the smaller concentrator computing systems.

Generally each node in the network is directly connected to only a few of the other nodes and messages are routed from one

Figure 3
A Distributed Network



node to another in a number of steps. In a communications system of this design, the processors at the nodes provide the computational power required to support the function of the system. Such a system is referred to as a *distributed* network, referring to the fact that the computational power of the system is not concentrated at one location. Figure 3 illustrates a distributed network. This model of a computational system is acquiring more importance as the cost of processors decreases due to technological advances. Chapter V.A elaborates on these advances and describes in more detail the nature of computer networks as they appear to be evolving.

Chapter III
Automation in Securities Markets

This chapter provides a snapshot of the state of automation efforts in the securities markets in Canada, the United States and to a lesser extent in Britain in the spring of 1976.[3] The securities industry in the United States is in a state of rapid change and much of the technical data presented within this chapter will rapidly become outdated. The projects described are divided into four classes: trade reporting systems, quotation and pre-trade information systems, automated trading systems and clearance and settlement systems. There is considerable overlap of function among the first three classes since all of the systems make market information available and the automated trading systems do provide quotation information. The description of each project includes both functional and systems information in an attempt to present a complete picture of what the system does and how it accomplishes it. The descriptions assume familiarity with the terminology of computer systems to at least the level presented in chapter II. Not all of the systems mentioned are described in complete detail, and no attempt has been made to cover all similar projects that are going on at some of the smaller exchanges.

A major purpose of the chapter is to examine the possibility of nation-wide centralized securities markets which are substantially computerized. Both in the United States and Canada there are developments which are moving the industry in this direction. In the United States the impetus is coming from the Securities and Exchange Commission and Congress, which has enacted legisla-

3 The chapter does not treat automation efforts involved in the brokerage business for research or operations nor does it discuss the commercial market information services provided by information processors such as Bunker Ramo, GTE and Ultronics.

tion that gives the commission authority to direct development towards a Central Market System.[4]

In Canada, the necessity of updating the physical facilities of the Toronto Stock Exchange seems to be the prime motivation and a pilot project to develop the techniques for a computerized trading system is well under way.[5] A computerized central market for securities may be a single entity or it may consist of a number of linked facilities. Each of the classes of automation projects is discussed separately in this chapter, and the prospects for a computerized national market system are examined in section E.

A. TRADE REPORTING SYSTEMS

An early automation project at many stock exchanges has been to support the basic trade reporting technique, the ticker tape, by a computer system which receives information about all executions as they occur on the floor. The move to automated collection of data for the tape was motivated by the rapidly increasing trading volumes of the early 1960s and the desire to provide aggregate trading information on an up-to-the-minute basis. Most exchanges currently have some automated system to report trades; they differ primarily in the range of additional services provided by the exchange's system. Following is a detailed description of two trade reporting systems.

1. *Trade Reporting at the New York and American Stock Exchanges*

The Securities Industry Automation Corporation (SIAC) operates the Market Data System (MDS-II) for the New York exchanges. SIAC was formed as a joint venture of the exchanges to avoid duplication of efforts in the automation area. It took over the separate computer systems each exchange had developed for its own use and is responsible for implementation of all new automation efforts at the exchanges.

Whenever a trade is consummated on the NYSE, a floor clerk records the details of the trade on a mark sense card and this is fed into a small card reader located at the trading post. The information is transmitted directly to the MDS computer system for the

5 *See, Cleland*, ch. VI.

NYSE, is stored in the memory of the computer and is used to update the last sale data file for the particular stock. In addition, the trade information is processed for the tape and made available to the computer systems of the market information vendors, Bunker Ramo, Ultronics, and GTE Information Systems. The information from all trades is used to compute the market index which is continuously displayed and, in addition, the trading activity in each stock is monitored for surveillance purposes by observing price fluctuations and the volume of trades. The system also provides hard-copy documentation of trading activity, and at the end of the trading day, summary reports are produced.

The MDS-II system is implemented on a cluster of IBM 360/50s which provide reliability by duplication of system components. The workload is normally shared, but when one CPU fails, the system can remain operational using a single CPU.[6] A single IBM 360/50 can handle the data processing associated with the normal trading activity of the NYSE quite easily; only if one of the central processors breaks down during a period of peak trading activity is there any slowdown in handling the market data. One of the design difficulties in any automation effort in the securities industry is the wide fluctuation in trading activity. The activity during the peak hour of the peak day may well be four to ten times as large as the average activity on a normal trading day. Thus a system needed to handle the peak periods is under-utilized most of the time.

2. *Trade Reporting at the Toronto Stock Exchange*[7]

The Toronto Stock Exchange has a similar system based on an IBM 370/145. The information on trades is transmitted from the floor via a canister delivery system to a key-in room where the data is entered into the system.

Unlike the New York systems which essentially process raw trading data, the TSE system also maintains a data base of information about each stock (high, low, last sale, volume) and computes aggregate market data on selected groups of stocks at regular intervals. The TSE also has its own terminal network, in competition with the commercial vendors, which allows brokers access to the data base information. The network, called CANDAT I, involves 450 modified teletype terminals located in brokerage offices, connected to the system over leased or dialup lines. A new information network, CANDAT II, allowing access to the market information

6 The NYSE computer system has been modified to support the consolidated tape.
7 Information provided by the staff at TSE.

using CRT terminals[8], has gained wide acceptance. It provides a wider range of information, including the identification of brokers involved in large trades.

3. *The Consolidated Tape*

The first step in the evolution towards a Central Market System in the United States is the consolidated (or composite) tape which combines trade reporting from all the markets, including all the major exchanges, third market trades reported to NASDAQ, and fourth market trades processed by Instinet. The political and economic pressures which lead to the development of the consolidated tape are documented elsewhere;[9] here we are concerned with a functional description of the system and how it is implemented.

The tape is in fact two tapes: tape A, which displays all trades in NYSE listed stocks wherever the trade occurs; tape B, which displays all trades in AMEX listed stocks in other major issues listed on a regional exchange or traded in the over-the-counter (OTC) market. A data communications network linking the exchanges, NASDAQ and Instinet, has been established which feeds the trade reports to the consolidated tape processor, SIAC. A high-speed data link has been established to ensure that reports on all trades are available to the vendors of market information without delay. Because of variations in reporting methods, it is not guaranteed that the tape will always reflect the exact order in which trades occur but it should be reasonably close. The SIAC computing system, in fact the same one which handles the trade reports on the NYSE exchange floor, processes the trade reports and feeds the combined data to the ticker tape output. Trades from markets other than the NYSE are designated by a letter indicating the market.

After a pilot project and many delays, the full consolidated system including both networks was operational by March 1, 1976, and the market information vendors were reporting trades on a consolidated basis by April 30, 1976.[10] It is instructive to examine the difficulties encountered in getting the consolidated reporting system fully operational. An early difficulty was the political foot-dragging by various participants as the plan for the system

8 CANDAT II is a spinoff of the development of CATS; *see* The Globe and Mail (Toronto), January 28, 1976, at 83.

9 Panel, *Regional Stock Exchanges in a Central Market System*, 2 EXPLORATIONS IN ECON. RESEARCH 303 (1975).

10 342 BNA SEC. REG. & L. REP., March 3, 1976, at A11-12.

was developed on the SEC's insistence.[11] However, a more fundamental reason for the delay was that the system involved the interconnection of a large number of different computer systems, each owned by an independent body and each with its own conventions for representing trade reports. An agreement on how data was to be formatted had to be negotiated and then each system had to be modified to transmit data in the appropriate form. Since each of the systems was being actively used for production work the modification had to be carried out very carefully and testing could be done only during non-production hours. In addition there were delays due to lead time on hardware acquisitions and integration of the tape processing with MDS-II. Thus a project described in the *Martin Report*[12] as requiring only a few months to complete took two years to reach a final plan[13] and a further two years to implement at a cost of $4.5 million. This underscores the difficulty in getting institutions to cooperatively carry out a project under government regulation. Compare this with the experience of NASD in developing the OTC quotation system reported in chapter III.B, and the advantages of designing a system from scratch are quite apparent.

B. INTERACTIVE INFORMATION SYSTEMS FOR QUOTATIONS

Two major segments of the securities market in the United States are now served by computer-based information systems which have gone beyond the simple market information inquiry systems. These are the over-the-counter market (OTC) and the large block institutional traders. The two computer systems, NASDAQ (an acronym for National Association of Securities Dealers Automatic Quotations) and AutEx (Automatic Exchange) were developed to meet the information needs of these respective parts of the securities industry. Each of the systems provides information to potential buyers and sellers of stocks but the actual execution of the trade occurs in the traditional manner. In the case of NASDAQ the trade is negotiated by telephone with a market-maker who has been located by the use of the system. Whereas in AutEx, which is used to express block interests in listed stocks, the trade may be executed on the floor of an exchange or over-the-counter.

1. *NASDAQ*

The NASDAQ system was designed to provide information on the over-the-counter market comparable with that available for listed stocks on the major exchanges. It was felt that with this information available the OTC would be a much more visible market and hence more attractive to investors. The system would also make brokerage operations in the market more efficient by reducing the number of phone calls that a broker would make per completed transaction. The NASDAQ system was designed and implemented by Bunker Ramo from system specifications prepared by Arthur D. Little Inc. in little more than two years from the time the competitive contract was awarded. The system became operational on February 8, 1971, with the quotation system in place, and by the end of 1971, trading volume information and market indices were added to the system.[14]

The NASDAQ system is the only automation project in the securities industry in the United States which is on a scale with the type of system that would be required to support a computerized securities market. Therefore a more complete description of this project than of the majority of the others is included here.

2. *A Functional Description of NASDAQ*

The main purpose of the NASDAQ system is to provide timely and accurate price quotations for stocks actively traded in the OTC market. For a stock to be included in the system it must meet minimum NASD requirements – $1 million in assets, 500 or more shareholders and 100,000 or more shares outstanding.[15] In order for quotes to be disseminated to Level 1 terminals there must be at least two broker-dealers registered as market-makers and continually quoting the stock in the system.

There are three levels of service provided by the NASDAQ system. Level 1 is intended expressly for registered representatives working across the country. They can get a representative quotation for any stock in the system through one of the standard inquiry terminals provided by the market information vendors, Bunker Ramo, Quotron, Ultronics, and Telehuss and Reuters overseas. There are over 40,000 terminals in brokerage houses in the United States, Canada, Europe and Japan that are capable of

14 *Potential Use of NASDAQ Facilities in a Central Market System, Pt. II* in NASD, NASDAQ SEMINAR: NASDAQ ONE YEAR LATER 20 (Investment Dealers Digest, New York, April 27, 1972).

15 *Id.* at 18.

providing NASDAQ quotations. The bid quotation is actually a median quote representing the middle point of the bid quotes of all dealers. The ask is computed by finding the median spread and adding that to the representative bid. (The median rather than statistical average of the quotes was chosen deliberately to avoid any temporary distortion of the representative quote that might occur if an erroneous quotation was entered by a market-maker, and also to avoid quotes expressed in decimal fractions.) The representative quotes are always current, being updated within five seconds of a change in quotation by a market-maker.

Level 2 service is intended for traders effecting orders over-the-counter. The trader is equipped with a specially designed CRT display terminal which allows him to display the current quotations of all the market-makers in any security. After indicating the stock of interest and either the bid or ask side, the trader receives the first display of up to five quotes from the market-makers through his terminal. If there are more than five market-makers he can request more quotes to be displayed. The trader then uses his judgment on which market-maker can best effect a trade of the size he has in hand and proceeds to negotiate with that market-maker directly by phone. There are currently 1,112 Level 2 terminals in the field.[16]

Market-makers have Level 3 service from the NASDAQ system. They are equipped with terminals similar to Level 2 terminals with the additional capability of entering and changing their quotations to keep them current with market activity and the quotes of competitors. A market-maker can monitor the quotes of competing market-makers using the Level 2 functions; however, he is restricted to entering quotes only for issues in which he is registered. Market-makers currently have 923 Level 3 terminals.

The NASDAQ system also provides at all levels of inquiry a composite index and six group averages for various market sectors which are computed throughout the trading day and updated at five-minute intervals.

Although all trades are executed outside the system, each market-maker is required to report trades at the end of the day or within ninety seconds of their consummation if they involve NYSE listed stocks traded OTC. The latter reports are fed to the consolidated tape system and the former are used to produce aggregate daily volume figures which are made available to the press. The final closing representative bid and ask quotes, the change in bid from the previous day's close and the volume of

16 The number of Level 2 and 3 terminals on April 30, 1976, as reported in NASDAQ, THE NASDAQ/OTC MARKET FACT BOOK 1976, at 5 (1976).

trading are made available for each stock. Thus, much the same information available about trading activity of listed stocks is also available for the OTC market. The size and importance of the OTC market in the United States securities industry is reflected in the fact that total volume of shares traded daily through NASDAQ represented 27.8% of all trading activity in 1972, although this declined in a bear market to 20.6% in 1974.[17] This information only became available to the general public through the implementation of NASDAQ.

NASD has considered many additional functions which it could provide through NASDAQ in order to increase the use of this large computer system. Ideas which have been explored include an OTC options trading system, a missing securities certificate serial number databank, a supplier of the composite quotation information to various market information vendors, and a block interest system similar to that offered by AutEx.[18]

The NASDAQ system also carries out a market surveillance function similar to that described in chapter V.C.

3. *A System Description of NASDAQ*[19]

The NASDAQ system is primarily a communications network driven by computers to provide rapid dissemination of information on request to a large number of dispersed locations. The system has much in common with other large online computer applications such as airline reservation systems and large time-sharing services. The heart of the NASDAQ system is the data centre at Trumbull, Connecticut, where a pair of Univac 1108 computers provide the central computational power of the system. The NASDAQ communication network consisting of 20,000 miles of leased lines has a star-like structure with the 1108s at the centre and four concentrator sites. The concentrators are Honeywell 516 processors, with four located in New York and two each in Chicago, Atlanta and San Francisco. They are attached to the 1108s via leased high-speed trunk lines. There are two 50,000 baud lines to New York while the remaining cities are connected by dual trunk lines of 7,200 baud each. Each line is capable of carrying all the NASDAQ traffic; the second line to each city which goes out of

17 Macklin, *Letter to the Editor*, The Commercial and Financial Chronicle, June 23, 1975.

18 NASD recently purchased NASDAQ from Bunker Ramo for $9.6 million. Bunker Ramo will continue to operate the system on a four-year contract. It also announced plans to proceed with the composite quotation service and the OTC options market; 339 BNA SEC. REG. & L. REP., February 11, 1976, at A-7.

19 The information in this section was obtained, in part, by a personal visit to the Bunker Ramo data centre in August 1974.

Trumbull through an alternate route is included for reliability. Thus a natural disaster such as a flood or fire or an accident would not halt service to a section of the country served by one concentrator. The concentrators are multiplexors combining input from many slow-speed lines connected to terminals into one high-speed data stream. NASDAQ has an elaborate communications monitoring system which includes hardware detection of component failure and software error reporting. The latter allows indications of outage to be displayed at the central and concentrator sites.

The main computer system is a pair of Univac 1108 processors used in a multiprocessing mode. They share four memory modules and two drum memory subsystems. In normal operation both processors share the workload. If one component of the system breaks down, it can be switched out and the remainder of the system continues in operation. In some cases a breakdown may cause a thirty-second halt in order to remove the damaged component for repair. The system operates on a modified Univac operating system (Exec 8) which was altered with Univac's help to improve the performance of the system for this application. All of the telecommunications support software was developed especially for NASDAQ to achieve the efficiency required for the system specifications. NASDAQ is designed to handle 120 requests per second with the present configuration of hardware and once reached a peak activity of 130 requests per second on a busy day around opening time.

The software is designed to be as reliable as possible. Every piece of information in the security file system stored in drum memory is duplicated in the other drum subsystem. The secondary copy is used immediately to create a new copy if the system detects that the first one is lost due to hardware (or software) malfunction.

Each drum storage subsystem consists of two high-speed small drums and two lower speed large drums. The main copy of the files associated with the most frequently referenced stocks are kept on the high-speed drum to increase the efficiency of access. Another programming trick used to improve the efficiency of the system is that the information for the first display frame (up to five quotes) for each stock is kept in the security file in a format ready to be transmitted directly to a Level 2 or Level 3 terminal without any calculation. The ranking of quotations format must be recomputed each time a quotation is updated and this may require regeneration of the display frame. Since 90% of all requests for displays on Level 2 and Level 3 terminals are for the first frame of output this design greatly reduces the processing overhead. If subsequent frames are requested, the format must be generated for display.

NASDAQ software is organized as a number of separate program modules supporting the different functions of the system. These include modules for:
(1) communications network support and monitoring,
(2) online file maintenance,
(3) display processing,
(4) market index calculation,
(5) trading volume information,
(6) market surveillance,
(7) historical audit trail,
(8) consolidated tape support,
(9) end of day report generation,
(10) end of day file maintenance.
The programs used for online processing are all written in assembly language to achieve the high level of efficiency required for the system.

The Bunker Ramo data centre is a model of physical security for a computer installation. Virtually all the precautions mentioned in chapter IV.C have been taken. Electronic door locks operate only with magnetic coded keys. An intricate fire prevention system employs highly sensitive ionization detectors in the floors and ceilings which, if activated, indicate exactly where the incipient blaze is located. Complete historical records of each day's activity are stored on tape in a fireproof vault.

There appears to be very little possibility that the NASDAQ system will be misused. NASDAQ is essentially a communications network supplying quotation information which is made widely available, and because of such easy availability there is very little motivation for unauthorized access to the communications network. There is also little possibility of tampering with the system for private gain, both because of good operational practices and the difficulty in translating such manoeuvers into a personal gain without detection. Even if quotes were misrepresented the fact that trades are still negotiated over the phone would quickly reveal incorrect quotes in the system.

4. *NASDAQ as Part of the Central Market*

It has been suggested that NASDAQ could be converted into the electronic marketplace of the future, complete with automatic matching of orders and keeper of an electronic book.[20] From a

20 M. Mendelson, From Automated Quotes to Automated Trading: Restructuring the Stock Market in the U.S. (1972); Blumenthal, *The Development of the Central*

conceptual point of view it is true that NASDAQ has the communications network and the quotation information which would be required as part of the Central Market. However, it does not have access to the order flow of the exchange markets and is not designed to handle the much larger task of being an automated marketplace.

NASDAQ is an integrated hardware-software system tailored to do its present application effectively. With careful planning for a limited problem the designers have been able to achieve up to 120 data transactions[21] per second. The load on NASDAQ is well below this level most of the time but even the inclusion of a trading capability for the OTC market would seriously strain its capabilities as the volume of data and variety of tasks it would have to handle would increase sharply. Increasing the computational power of NASDAQ to support a Central Market System is not simply a matter of adding some more hardware to the central computers or increasing the transmission capabilities of the communications network. The characteristics of real-time systems are not enhanced in direct proportion to the increase of raw computing power added to the system. Thus doubling the CPU power of NASDAQ will not automatically increase the maximum transaction rate to 240 calls per second. If the U.S. securities markets are combined into a large electronic marketplace the computing system (or systems if the market is split) will require the careful design and tailoring which characterized the development of NASDAQ.

NASD has prepared a discussion paper on the Central Market in which it discusses the potential use of the NASDAQ facilities in a Central Market System.[22]

5. *AutEx*[23]

The AutEx Equity Trading Information System was designed during the late 1960s to meet the information needs of block trading broker-dealers and financial institutions. The system went into operation in August 1969 with 70 subscribers and grew steadily to the middle of 1973 when it had a total of 474 subscribers (264 institutions and 210 brokers). The cost of the system is borne primarily by the broker-dealers, who may partici-

21 A "transaction" here meant one request for data.

22 NASD, Three Issues in the Development of a Central Market Advisory Board, pt. II (April 12, 1976) (submission to the National Market Advisory Board).

23 Much of the information in this section was obtained on a visit to AutEx in New York in August 1974. *See also, Cleland,* ch. IV.C.

pate through a flat-rate, usage or performance plan. The most popular option is performance, where brokers pay a small monthly service charge, plus charges based on the dollar value of all trades made as a result of information provided by the system. Institutional subscribers are subject to a basic monthly charge which is reduced by credits for AutEx-initiated trades. This pricing arrangement is attractive to brokers because their participation in the system frequently allows them to capture the commission revenue on both sides of a sale.

Since the middle of 1974 AutEx has faced a number of challenges. First it was forced to abandon a lumber trading information system which proved unprofitable in the soft lumber market of 1974. With the advent of negotiated commission in May 1975 there was considerable broker resistance to proposed changes in AutEx's pricing. Moreover NASDAQ and a new company, Comstock Information Services, announced plans to enter the block-interest information market with competing systems. AutEx has emerged as the winner in this competitive battle.[24] Recently AutEx has moved to widen its role as an information service vendor in the securities market. It has merged with Itel, a computer manufacturer, and was the successful bidder for the SEC's Lost and Stolen Securities System. It has expressed interest as a facilities manager for the Intermarket Trading System (ITS) discussed in chapter III.E.[25]

6. *A Functional Description of AutEx*

Unlike NASDAQ which provides a wide range of information services to an extremely large number of subscribers, AutEx provides a highly specialized service to a small number of subscribers. All AutEx subscribers use a TV-type terminal equipped with a special keyboard and a small slave printer for hard-copy documentation. They are normally continuously connected over leased lines, though some of the smaller institutions and brokers are connected by dialup facilities over ordinary telephone lines. The basic input unit of the equity system is called an "interest-message". A broker simply enters his buy or sell interest in a stock, the size of the block (small, medium or large) and the security symbol. At his option he may include additional data such as scale, all-or-none, limit price or exact size. The message appears

24 Comstock has withdrawn from the market. NASD and AutEx have reached an agreement to have AutEx information displayed over NASDAQ; Securities Week (New York), August 8, 1977. A similar agreement is in effect with Bunker Ramo; Securities Week (New York), March 7, 1975.

25 Securities Week (New York), December 5, 1977.

on the screen of all participating institutions whose terminals are in normal mode and on the screens of any brokers to whom the initiating broker indicates he wants his messages sent. The terminals use a split screen approach, with the upper part of the screen displaying the latest interest-messages on both the buy and sell side in an abbreviated form. An institution may have its terminal in "flash-top" mode, in which case only interest-messages associated with stocks it wants monitored are displayed in the top part of the screen. All interest-messages are held in files stored on the auxiliary memory of the system and can be retrieved by asking for a recap of a stock. The recap appears in the lower part of the screen and displays the time or date of the message, the side, size, security symbol and the abbreviated broker symbol.

The AutEx system also includes a block trade reporting function which displays broker reported trades executed on any exchange or over-the-counter. Participating brokers, on a voluntary basis, report all trades they effect whether they were initiated by AutEx or not. The information displayed includes the security symbol, the size, price, side (buy, sell or cross), place of execution and broker. The trade reports are available for retrieval by all subscribers as part of the historical record of each stock. Unlike the consolidated tape the AutEx trade reports are voluntary and include the name of the broker.

There are two additional types of input to the system, "information-messages" and "super-messages". An information-message is entered by a broker to indicate that he has research or market information on the security or industry named. The broker may be in touch with a buyer or seller, he may be making a market in the designated security or he may have research information available. A super-message is a long flexible message form used to convey market and related information that requires a more lengthy description (up to eight lines or 280 characters of text). As with other message formats these can be made available selectively to other subscribers and can be retrieved as part of the historical record.

The recap by stock feature displays all entries relating to a particular stock, including active and inactive interest-messages, information-messages, super-messages and completed trade information on the NYSE for that stock. This display is only available to institutions. Recaps appear in the bottom half of the screen replacing the trade information and message displays.

Another feature of the system is the ability to monitor all information on stocks of particular interest to the subscriber. In "market-minding mode" all new entries associated with the selected stocks cause a warning bell to ring and hard copy to be

printed. If the terminal is in "flash-top" mode only interest-messages for these market-minded stocks are displayed in the top two lines of the screen. The remaining portion of the screen can be used to display recap information and/or incoming messages.

The AutEx system also permits the use of the terminal keyboard and display as a simple calculator for numeric computation and has the capability to compute commission rates.

An additional facility that AutEx provides to its subscribers is the ability to construct a private data base consisting of a collection of independent files using the subscriber's own indexing system. The system sorts and stores messages for the files and allows online editing and updating. The data base information is available for instant retrieval at remote branches or affiliates of the subscriber. AutEx prevents unauthorized access to this private information by stringent system controls.

As the system evolves AutEx is continually adding new services to meet its customers needs. With the rapidly changing conditions in the securities market in the United States and the pressure from competitors this evolutionary development will continue.

7. *A System Description of AutEx*[26]

The AutEx system is, in many aspects, similar to the NASDAQ system but on a smaller scale. The main AutEx computational facility is located at Wellesley, Massachusetts, and is built around a pair of Xerox Sigma 9 computers. Unlike the Bunker Ramo system where both computers normally share the computational load, the AutEx system runs on one of the Sigma 9s while the other is used for backup and development purposes. The use of the backup system for development reflects the philosophical difference between the stable single-purpose NASDAQ system and the continually evolving AutEx system. If the Sigma 9 computer supporting the AutEx system breaks down, the second computer is switched immediately from development to production work and service continues with only a short interruption. Both systems have access to the auxiliary memory where current and historical information is stored.

The AutEx communications network has evolved from a single frontend communications processor to a star-like network with 4–6 concentrators connected over trunk lines of either 1,800 or 9,600 baud. The concentrators are Interdata 50 minicomputers

26 Information was provided by the systems staff at AutEx and reflects the configuration in use in June 1976.

supported by software explicitly developed by AutEx for this application. The AutEx system uses a Xerox operating system (CP-V) substantially modified to meet the system requirements. The software is primarily implemented in assembly language, although AutEx does make use of the COBOL, FORTRAN, BASIC, APL and RPG language processors supplied by Xerox to do some of the applications programming. AutEx is designed to handle 1,000 terminals and up to 25,000 data transactions per day. There are currently 550 terminals on it with an average load of 14,000 daily data transfers.

The software has a standard restart procedure which, using the information stored on disk packs and tape, can recoup all the messages up to the point of a failure with the possibility of losing only those messages in process of transmission. The validity of data transaction processing is checked by the use of offline management programs which analyze the system's activities.

The physical security of AutEx is also impressive. A sprinkler system, and smoke and heat detectors protect the computer operations and tape storage area. The system is manned twenty-four hours a day and is protected from natural disaster by having the two central processors in physically different locations.

C. AUTOMATED TRADING SYSTEMS

Automation of the trading process has been proposed in a number of studies[27] as a means of reducing the cost of securities transactions and also as a means of achieving a centralized marketplace for securities. The latter aspect will be taken up in chapter III.E. A number of computer systems for automatic trading are already in use and others are being developed or designed. The trading systems being designed are primarily of two types:

(1) exchange-oriented systems which automate the function or part of the function of the exchange floor, and
(2) computer-based trading networks operating independently of traditional exchange floors.

The exchange-oriented systems are designed to automate those aspects of activity on the exchange floor which do not require the judgment of a broker or specialist. For example, at the NYSE, all odd-lot orders are automatically executed near the

27 J. BOSSONS, THE AUTOMATED STOCK EXCHANGE (1968); Black, *Toward a Fully Automated Stock Exchange - I,* 27 FINANCIAL ANALYSTS J., July-August 1971, No. 4 at 28; Black, *A Fully Computerized Stock Exchange - II,* 27 FINANCIAL ANALYSTS J., November-December 1971, No. 6 at 24; M. MENDELSON, *supra* note 20; Youngblood, *The Argument for a Publicly Owned Stock Exchange,* 25 FINANCIAL ANALYSTS J., November-December 1969, No. 6, at 104A. Blumenthal, *supra* note 20.

market price using the Odd-Lot Automation system, which routes all odd-lot orders to a computer system recently purchased from Carlisle DeCooppet.[28] Odd-lot trades are priced at one-eighth off the last sale after opening automatically.[29] After execution, a confirmation is routed back through the Odd-Lot Automation system to the order broker. Other activities on the NYSE floor have been or are being considered candidates for automation.[30]

It is important to distinguish between automatic execution and automated trading. Automatic execution involves matching an incoming order against a standing order to trade from a market-maker's inventory at a price determined by formula from the last sale or next sale on the principal market (invariably the NYSE). Processing such orders automatically with a computer system is technically quite simple as the NYSE Odd-Lot Automation program has shown. Automatic execution of small orders (up to 300 shares) based on either last sale or next sale information has gained rapid acceptance in the regional exchanges in the U.S. With the growth in volume handled by the Pacific Coast Exchange's COMEX system[31] (3,000 executions per day in January 1976, double the average rate of the fall quarter 1975), the other exchanges indicated a desire to share in this market.[32]

Automated trading involves the matching of two or more incoming orders on opposite sides by using a computer system to store and compare all such orders. Trading systems are characterized by an elaborate network to feed orders to the central processor in real-time and sophisticated handling of the order information once it reaches the central computer.

An order to buy or sell stock is reflected in it as an entry in an "electronic book" or file of outstanding orders. If offsetting orders appear in the book they are automatically matched and the trade executed. Automated trading already occurs in Instinet, a system which handles large trades in the fourth market between institutional customers. A similar system, ARIEL, has been set up in London by a consortium of merchant banks. There are also several other systems in development or being proposed.[33] The Computer-

32 Both Midwest and the PHLX have "automatic" execution programs, but here automatic refers to the formula pricing scheme, and in fact their systems are not automated; Securities Week (New York), January 19, 1976, at 26 (Midwest); Securities Week (New York), December 15, 1975, at 2 (PHLX).

33 Weeden Holding Corp. announced an automated market system pilot project

Assisted Trading System (CATS) being developed as a pilot project at the Toronto Stock Exchange is similar in philosophy to Instinet in that it is independent of the exchange floor as the trading site.

1. *Automation of Trading Functions at the Philadelphia Stock Exchange (PHLX)*

The automation of trading functions at an exchange are best put in perspective by examining one such project in detail. Each exchange has sought its own solutions to the problem it delineated as requiring automation and no two projects are very similar.

The PHLX Centramart system is primarily a tool to assist the specialist in managing his market-making job effectively. It supports a data base on approximately 3,700 securities traded on the NYSE, AMEX, CBOE and PHLX and provides the specialist with rapid access to the information he needs.[34]

Each specialist has a terminal which allows him to monitor as many as thirty-four securities at one time. For twenty-five of these, he has access to the last sale in the primary market, the market tick of that sale, the last sale on the PHLX and the PHLX specialist's bid and ask. The remaining nine securities depict the same information with the addition of the volume, the time of the last sale and high and low for the primary market.

A specialist or floor broker may obtain a quote on any stock which is in the data base, and in addition to the last sale information already mentioned, he may receive the volume on the PHLX, the time of the last PHLX sale, the primary market open and close, the earning, yield, price earning ratio, and ex-dividend date. All competing PHLX specialists' quotes (as many as four per security) are also visible.

All trades are entered through a CRT terminal by the specialist executing the trade who supplies the symbol, price and size data. Additional information needed for clearing on execution is picked up from the data base and recorded on magnetic tape. In the process, a three-part ticket is printed; one copy goes to the buyer, one to the seller and the third copy is maintained as a backup to the magnetic tape. The clearing data is later processed by the Clearing Corporation of Philadelphia. The result is a "locked-in" trade. This

---

scheduled for industry tests by October 1976; Securities Week (New York), January 26, 1976, at 5; *see also, Merrill Lynch Proposal,* Securities Week (New York), October 17, 1975.

34 The information on PHLX automation efforts was provided by PHLX in the spring of 1976.

innovation in the Centramart system makes the PHLX an attractive marketplace for option contracts which must settle "next day".

An automatic bid-ask tracking device in the system allows the specialist to track his quotes based on the last sale on the primary market. By setting a differential above, below or equal to the last sale and indicating tracking mode, the increment or decrement that he establishes will remain as the stock price fluctuates. A message area allows specialists and floor brokers to communicate with each other through the system.

Centramart acts as the PHLX's interface into the consolidated tape. Future plans for the Centramart system include interfacing with an order-processing message-switch operated by an independent company to bring orders to the PHLX floor for automatic execution and an extension of the system to all back offices of member firms.

2. *A Systems Description of the PHLX System*

The Centramart system is implemented using a duplexed Honeywell 716 computer system with four Incoterm minicomputers as concentrators each supporting up to sixteen Incoterm terminals. The communications network has three concentrators to support activity on the Philadelphia floor. The system runs under an operating system developed by Incoterm for the Honeywell 316 and modified for the Honeywell 716. The communications software to support the terminal network has also been developed by Incoterm specifically for the Centramart system. All the software for the project is written in assembly language for the two types of processors. Centramart has been designed to handle two PHLX trade reports per second and four requests per second for retrieval of databank information. Currently there are approximately four trade reports per minute on average and about ten data requests per minute.

The system achieves reliability by being duplexed. When a hard failure occurs it is manually switched to the backup computer after logging the conditions existing when failure occurs. A software support package to simulate trade traffic has been provided to verify correct behaviour of the major system functions. Communications traffic can also be simulated and there is maintenance software to assist in testing terminal functions.

The Centramart computer physically resides in a locked room on a balcony overlooking the trading floor. It is accessible by only one staircase and access is limited to authorized personnel.

3. *Instinet*[35]

Instinet, which began operations in 1969, services the so-called fourth market, *i.e.*, direct trading between institutions without the intervention of a broker-dealer. In effect the Instinet system acts as the broker and Instinet receives a commission for completing the transaction. The Instinet system has not been as successful in penetrating the securities market as one would expect given the relative efficiency with which it can complete large block trades.[36] Although Instinet is primarily aimed at servicing the fourth market it does have some third market firms as subscribers. The first Instinet system which was referred to as Instinet-1 has been replaced by Instinet-2 which greatly enhances the services provided.

4. *The Instinet-2 System*[37]

The Instinet system is primarily a system to store an electronic book of bids and offers made by its subscribers and to automatically execute any matching orders. It has been developed by Instinet as a vehicle for trading in the electronic central marketplace envisaged by the SEC. In addition to an electronic book of orders, it provides current market information, including information from the consolidated tape and composite quotation information.[38]

Orders are entered into the book by a subscriber who is equipped with a CRT terminal and hard-copy printer. With a few keystrokes he indicates the side, size, price, security symbol and expiry time of the order. The order is displayed to the sender with a unique order number attached and with the complete company name and total cost of the transaction. If the order is correct, the user confirms the message and it is placed in the book. If it is not correct or if the user has second thoughts about the order, it can be revised or cancelled at this point. The book entry identifies the order by its unique order number and only the sender is aware of the origin of the entry.

35 The information in this section was largely obtained on a visit to Instinet in August 1974.

36 With the unfixing of commission rates on May 1, 1975, there was a marked upswing in business by all fourth market firms, apparently due to the increased awareness by money managers of their fiduciary responsibility to achieve executions at the best possible price; *see* The Wall Street Journal, May 5, 1975, at 5, col. 1.

37 The description of Instinet-2 is based on a demonstration of a prototype implementation given in August 1974; however, the current system is believed to be very similar.

38 Securities Week (New York), July 19, 1976.

The order is transmitted to each subscriber and displayed on his screen. If he is "market-minding" that stock its appearance will be accompanied by an audible tone. Any terminal displaying the book for that stock is updated with the new entry.

The book for a stock consists of a list of orders on both sides indicating price, size, expiry time or date, order number and an indication of whether the order is active, has expired, has been traded or cancelled. A book entry may not include a price, in which case the sender is indicating an interest in the stock and is willing to negotiate a price. Expired or traded orders are kept in the book for thirty days and a buyer or seller can negotiate through the order number to see if there is further interest in the stock.

Trades are accomplished either by accepting a firm active order or by negotiation. The latter occurs by sending a reply message via the order number to the originator of the entry. The message indicates the size and price at which the replying party is willing to take up the order. The originator can accept this reply or send a counter offer. Negotiations on expired or traded book entries are primarily to see if the originator has further interest in trading the security. Many of the trades occur this way as the subscriber may not wish to tip his hand as to how large a block he is trying to move.

Once a trade has been accepted the system prints out two copies of trade confirmation to the parties involved and reports the trade to the consolidated tape. The actual transaction of cash and securities is handled by the Bank of New York which acts as the escrow bank for the system.

Many convenience features have been designed into Instinet-2 to make it a useful tool for the active trader. The format for the screen has two parts. The upper half contains the time, number of active orders and replies the subscriber has outstanding, and message fields labelled ALERT, BROADCAST, REPLY and SYSTEM. The ALERT field is used to display entries associated with stocks that are being market-minded, the BROADCAST field to display all order entries, REPLY to display replies to orders the subscriber has entered in the book, and SYSTEM to display messages sent by the Instinet operations centre to all subscribers. Each of these fields behaves like a push-down stack with the latest message overwriting the previous one. If the subscriber wishes to see the message prior to the current one for any of the fields, he deletes the current one and the previous one reappears. He can continue this search back through the message list for any messages which have not been deleted. The bottom part of the screen is used to display the book associated with a stock or is used to display order messages or replies as they are constructed. When the book for a stock is

requested, last sale data and quotations data are displayed along with the book entries.

The CRT terminals used in Instinet-2 are programmed to be used interactively. There is a flashing mark or cursor which can be moved to any part of the screen. It is used along with displayed information to construct messages from context with only a few keystrokes. For example, suppose the book for IBM is displayed and a bid is entered for 5,000 shares of IBM at $200. A reply for that entry at a price of $202 can be entered by moving the cursor to that entry and touching the PRICE key, followed by the digits 2,0,2, followed by the REPLY key. The appropriate message indicating that this is a reply to sell 5,000 shares of IBM at $202 is transmitted to the originator of the entry. The keyboard has many function keys such as REPLY, ACCEPT, etc., which greatly enhance the efficiency with which a user can effect trades.

The Instinet-2 system is functionally one of the most sophisticated trading systems in existence. It has been designed to provide the subscriber with immediate access to the market information (book, last sale, quotations) he needs to keep abreast of trading activity in a particular stock and will automatically update that data as it changes. The system is a prototype for the type of system which would be required for complete automation of the stock market. It has been designed to have a much larger capacity than its predecessor Instinet-1 but it is still far short of the size required to become the marketplace of the future. Instinet has proposed a system called UNIMART based on the Instinet-2 system as a contender for the Central Market System.[39] The backers of this company have clearly set their sights on winning a share of the central market business and, given an opportunity to compete in it, should fare very well.

5. *A Systems Description of Instinet-2*

The Instinet-2 system has been developed by Data Index Inc. for the Institutional Network Corporation. It is based around a network of Digital Equipment Corporation PDP-11 computers. The main site in Lexington, Mass., has a PDP-11/20 processor with 24K words of 16 bit memory. The system uses single plate removable disk cartridges for file storage using two disk drive units on a single controller. Historical data is retained in a library of disk packs. The main site communicates asynchronously with PDP-11/05 concentrators over 1,200 baud full duplex leased lines which will be increased in capacity as system traffic grows. The concentra-

39 Securities Week (New York), November 22, 1976.

tors each have a capacity for thirty-two terminals which are connected by 1,200 baud full duplex lines. The high-speed link between the terminals and the processors allows rapid update of the terminal displays and improves the response time at each terminal.

The terminals are teletype-compatible Datapoint 3300s made by Computer Terminal Corporation. Much of the "intelligence" of the terminals discussed in the previous section is achieved by programming in the PDP-11/05s. The concentrators, each equipped with 16K words of memory, are almost as powerful as the central site computer and are able to do most of the terminal support function on both input and output. The central system supports the functional aspects of the trading system. It retains a file of limit orders for each stock, processes all order messages and implements the order matching algorithm. It also retains a journal of all user actions which is used for market surveillance.

The Instinet-2 system used its own operating system written specifically for this application in PDP-11 assembler. This route was chosen because no existing PDP-11 software could meet the operational requirements of the system.

The security of Instinet-2 is enhanced by its use of leased lines throughout and by a password feature which allows subscribers to limit who can place orders in the system. Since all transactions involve the accounts of the subscribers at the escrow bank, Instinet is a closed financial system and there is little danger of fraudulent activity for the private gain of individuals who have access either properly or improperly to the system. Since all entries are public in the system and a journal of subscriber inputs is kept, any attempt to manipulate the market through the system should be easily detected.

6. *ARIEL*

ARIEL is the acronym for Automated Real-Time Investments Exchange Ltd., a company which was formed by a consortium of Accepting Houses to establish a computerized trading system to operate outside the London Stock Exchange. ARIEL has obtained the United Kingdom rights to Instinet's patented concepts of a trading system. The system is functionally very similar to the first Instinet system with two major changes. First there is no automatic matching of bids and offers. ARIEL is a negotiating system and although a subscriber may make an entry in the book at a certain price, he may wish to negotiate at a different price if a reply to the offer comes after the market has shifted. The removal of automatic matching has meant that entries in ARIEL have prices

attached, as compared to Instinet where the majority of entries are unpriced. The second difference is that a subscriber can make a "discreet" entry into a book, in which case it is not broadcast to all subscribers but merely added to the list of entries in the book.

ARIEL went into operation in early 1974 and by December 1974 had sixty-five terminals on line and was operating with a profit.[40] By June 1974 it was handling 1% of the equity business of British institutions and was on target for its eventual goal of obtaining between 5% and 10% of this business within five years.[41]

7. *A Systems Description of ARIEL*[42]

The ARIEL system is implemented on a PDP-11/40 system with a 64K bytes of memory. It can handle up to thirty-two multiterminal lines with up to five terminals per 1,200 baud line. It has, in addition, fixed head disks for fast retrieval and a disk pack capability for longer term storage. The operating system is a hybrid one using the standard PDP-11 Disk Operating System (DOS) with a substantial additional software written by ARIEL superimposed on DOS to handle the real-time monitoring, communications support and extended memory support. The system is written partly in PDP-11 assembler language and partly in FORTRAN IV.

The ARIEL system has been designed to handle up to 2,500 transactions or terminal input messages per hour giving rapid response time. The actual peak rate which can enter the system over the current network varies between 800–2,500 transactions per hour depending on the mix. Currently the peak hour rates rarely exceed 400 per hour and daily figures are rarely above 2,000.

Data integrity is a vital aspect of the system and sophisticated recovery procedures are used. Most failures require only a "fast recovery" technique which restores *all* data to the state it had following the most recent successfully completed transaction. The process may take only a few seconds, depending on whether hardware reconfiguration is necessary. To facilitate recovery, "transient" copies of active data are held on fast data storage during transaction processing.

A more conventional "slow recovery" technique is also available which operates completely independently of fast recovery and uses an audit trail to reconstruct the data from copies of start of day files. It may take several minutes if activity has been high, but

40 The Times (London), July 10, 1975, at 21, col. 1.

41 CITY CAPITAL MARKETS COMMITTEE, SUPERVISION OF THE SECURITIES MARKET, app. III (London, June 1974).

42 Information provided by ARIEL staff.

allows recovery even from catastrophes such as the loss of all data on a disk pack.

The ARIEL system has many features which assist in ensuring that the system is used properly. An advanced intelligent terminal (Computek 200) is used to minimize operator errors. It has function keys for the important transactions which display predetermined headings in the fixed input area of the screen, indicating the mandatory and optional input fields. Input may be visually checked and corrected before transmission to the system, or on receipt of a descriptive error message, prior to retransmission.

Subscribers must log in with their personal passwords before they can use the system. They may use training mode to familiarize themselves with facilities without danger of inadvertently using real securities. A transactions room at ARIEL has special terminals which monitor and control all transactions. The room is constantly manned by people experienced in the securities industry who may intervene in any negotiation if needed and can, if necessary, lock individual terminals or securities. The validity and consistency of all data is checked daily (offline) and backup and historical data is held either at the computer centre or at a remote secure location. All subscribers agree to a "code of conduct" which covers both confidentiality of information gained via the system and manipulation of the system. The code is policed by the transaction room.

Physical security at ARIEL is protected by the usual means – magnetic key systems, banditproof glass, etc. All terminals contain their hardware address and are connected via a fixed leased network. When dialup is used (for standby) it is manually initiated from the computer centre.

8. *The Computer-Assisted Trading System (CATS)*

The Computer-Assisted Trading System being developed at the Toronto Stock Exchange as a pilot project is designed to move the actual trading process from the floor of the exchange into an electronic communications network with trading terminals located in brokers' offices across Canada. It is hoped that the project initiated by the TSE will become the cornerstone of a Canada-wide system envisioned by the major exchanges.[43] A working prototype for the system has been developed and advanced testing on a few (inactive) securities has begun.[44]

43 For a fuller discussion of the motivation for and evaluation of the CATS project, *see*, *Cleland*.

44 The Financial Post (Toronto), December 3, 1977, at 25.

The basic philosophy of the CATS system is similar to that of Instinet-2 in that orders are traded according to auction market principles. However CATS is much more ambitious in scope. It is being designed to replace an existing market and hence encompasses a wider range of trading strategies and handles a much larger volume of trades than either ARIEL or Instinet (40,000 daily order entries and 500,000 inquires).

Brokers enter all orders to buy and sell stock through a TV-like terminal and all orders which are not immediately traded are filed for subsequent display and execution. The display indicates the broker's number, and the size and price for each order, with the orders queued according to price and time of entry. The size displayed for an order will be the amount the broker has chosen to show, but there may be additional stock behind the disclosed amount which will not be shown in the marketplace but can be traded. If other orders at the same price are in the system, they will share stock with that order up to their disclosed amounts.

When an order is filled by automatic matching, a message is sent to the terminal screen with a copy to the office's printer which may or may not be at the same location. The printed message or "fill" is the firm's formal confirmation of the trade. Any broker with an order at the bid or offer for that stock will be told of a change in the market's status by a message appearing on his terminal. All orders are automatically retained for the next day unless they were specified as day orders, their expiry date has been reached, or they have been specifically cancelled. Orders removed from the system are listed at the end of the day.

CATS retains a great deal of information about trading activity, including all transactions which have been entered by users and all matching executions. As well, extensive market information including facilities for displays of all stocks or selected groups of stocks (*e.g.*, all banks, oils or senior industrials) is incorporated in CATS as well as a stock-watch monitoring feature. Market information can also be obtained from other Canadian exchanges, from the consolidated tape and from other U.S. markets in the quotation data base. The TSE separated the market information services provided by CATS and offers them to brokers as CANDAT II.[45]

9. *A Systems Description of CATS*

The CATS pilot network shares the IBM 370/145 CPU on which the market information system at the Toronto Stock Exchange is implemented. The network is star-like with PDP-11/05 minicom-

45 *See* ch. III.A *supra*.

puters being used as the concentrators with each one capable of supporting up to fourteen terminals. The concentrators are primarily used to drive the terminal displays. Unlike the Instinet-2 terminals which behave "intelligently" in allowing the user to construct commands in the context of the display and a cursor position, the commands for CATS are keyed independently of the information displayed on the screen. Thus a simpler control program for the concentrator can be used since there is less interaction between the terminal and the concentrator.

The keyboard for CATS has been designed specifically to allow easy command entry. Rather than being a standard typewriter keyboard with additional function keys, it is a much bigger keyboard with colour-coded areas to allow the trader to enter the various parts of a command from different parts of the keyboard. The fields are ordered so that a typical order can be keyed with just a few keystrokes in a left to right sweep across the keyboard.

There is also a capability to define a complete order and have one of the "undefined" keys stand for it. The definition is stored in the concentrator data base and is activated each time the designated key is stroked. The definition feature allows a trader who is actively dealing in just a few stocks to have a "menu" of orders for his stocks prepared ahead of time. He may then concentrate his attention on monitoring the market.

The security of the system is enhanced by having a security code (or optionally a magnetic-strip credit card) required to achieve access to the system either for placing orders or retrieving private information. The code will be specific to the user and the firm to which he belongs, allowing him to access through any terminal designated as belonging to his firm. Only preliminary access security checks are made at the concentrator level in the system; hence once the system is functional the concentrators will not have to be maintained in secure areas.

The software for CATS has been primarily written by the staff of the Computer Systems and Planning Department of the Toronto Stock Exchange. The terminal support software in the PDP-11/105s has been written in PDP-11 assembly language. The 370/145 runs under the DOS/VS operating system provided by IBM and uses software developed in-house to implement the transaction processing associated with CATS.

10. *Summary on Trading Systems*

The design and implementation of a computer system for trading in securities is a difficult task for a number of reasons:

(1) It involves a complex human activity and the choice of which activities are to be automated and which are to be left to the traders is not obvious.
(2) It involves policy decisions such as the rules to apply in order-matching algorithms which have not been addressed before.
(3) There are direct economic tradeoffs between the volume of trading the system can handle and the degree to which it interacts with the trader, and this complicates both the functional specifications and the system design.

Both Instinet-2 and CATS are projects that have evolved using experience gained from earlier versions. Each project has successfully come to terms with the above difficulties in its own way. The ultimate success or failure of the projects in the long run may well be determined by political or economic considerations but their existence shows clearly that the technology and skills exist to create automated trading systems. There is no evidence yet that these automated systems result in better or worse markets than manual systems for the commodity being traded.

D. CLEARING AND SETTLEMENT SYSTEMS AND DEPOSITORIES

The legal document indicating a share of equity ownership in a corporation has traditionally been the stock certificate. The primary function of a stock exchange has been to provide an auction mechanism to allow investors to buy and sell such shares of ownership in a fair, equitable and efficient way. However, the stock certificate has outlived its usefulness[46] and it is just a matter of time until the majority of records of equity ownership exist only as book entries in an electronic information system. This development will be forced primarily by economic pressures to reduce the costs of clearing, settling and recording stock trades.

A discussion of the role of clearance, settlement, transfer of ownership and safeholding functions in the securities industry is given in *Applications of Automation*, in this volume.[47] We comment here primarily on the aspects which can be automated. Basically all the advances in settlement procedures involve netting or accumulating a number of transactions in order to reduce the actual number of physical transfers of money and/or certificates.

Systems based on a trade for trade settlement, daily balance order settlement and continuous net settlement have been insti-

46 S. Robbins, Paper Crisis in the Security Industry: Is the Stock Certificate Necessary? (1969).
47 *See*, *Cleland*, ch. IV.B.

tuted in various markets. In the first, only money is netted, all securities being transferred directly; in the second, both money and securities are netted on a daily basis, and in the final system, money is netted daily but securities are netted on a continuous basis, reducing the number of physical movements of securities.[48] In each case the netting operations are accomplished by extremely simple computer processing of files storing the required information. The applications are generally implemented by batch processing on a service bureau computer or on an exchange computer which is used primarily to support other automation programs.

A clearing and settlement system may or may not be associated with a depository. There are two types of depositories: those which hold stock certificates in nominee name and with the goal of immobilizing stock certificates, and those which maintain records of stock ownership only in book-entry form, without any dependence on paper certificates. Depositories which immobilize certificates can be viewed as the forerunners of ones that depend solely on book-entry records. Once the vast majority of stocks are in the depository the distinction becomes blurred, since all inventory control will be done by book entry. In either case the depository's main information-processing task is to maintain a data base of ownership records of the shares entrusted to it. The data base must be updated on the basis of settlement information and the issuance of new equity shares.

If one thinks of shares as being money, there is an analogy between depository book entries and a current account in a bank. However, a major difference is that the net value of shares stored in a depository are orders of magnitude greater than most banking units handle in their current accounts, which implies that much more stringent auditing and security controls are required than are normally associated with current accounts.

Like most banking applications, book entries in depositories are updated, not at the time a transaction affecting the balance occurs, but at a later time after all aspects of the transaction have been verified. There is a delay in processing from the time a trade is agreed upon until the point at which money and/or securities are credited or debited from accounts. The delay is an important aspect in the integrity of the system by which shares are transferred from one owner to another.

The so-called "locked-in" trade, in which information concerning trades executed in an automated trading system will automatically be confirmed and then transferred to the clearing

48 *See, Cleland,* app. B.

and settlement system, will greatly reduce this time from trade to settlement. It is conceivable to think of online settlement systems in which stock and money are exchanged between accounts within a few seconds of trade being consummated. This development must be viewed with a wary eye, however, as it may, for very little real economic gain, greatly increase the vulnerability of the system to fraudulent activities.[49]

1. *Canadian Depository for Securities (CDS)*

A major automation project in the clearing and settlement area is currently in progress in Canada. The Canadian Depository for Securities Ltd., which is funded by both the securities industry and the financial sector, was created in 1969 and has progressed steadily if slowly toward creation of a book entry depository for all Canadian securities.[50]

Phase III of the CDS Security Settlement Service (SSS) became operational in early 1976 and includes a wide range of services.[51] Briefly these are:

(1) a transaction reporting and confirmation procedure for a wide range of securities;
(2) a system for reporting and confirming client transactions for settlement through third party agents;
(3) a continuous net system;
(4) two settlement cycles per day;
(5) a redirection feature that will enable certificates due to be received through the SSS to be directed to delivery to other participants;
(6) a preclearing report available at 4 p.m. of items to be settled the next morning;
(7) a transfer envelope system;
(8) various dividend claiming services;
(9) settlement of new issues (stocks and bonds) on a book-based system up to and including takedown date;
(10) intercity settlement of confirmed transactions;
(11) a settlement interface with the Depository Trust Company in New York.

49 *See* ch. IV.C *infra* for a discussion of the vulnerability of online systems.

50 *See, Cleland,* ch. V.

51 CANADIAN DEPOSITORY FOR SECURITIES LTD., SPECIFICATIONS FOR PHASE III OF THE SECURITIES SETTLEMENT SERVICE (July 1974).

2. *Implementation of the CDS Security Settlement System*

At first glance the list of services provided under CDS phase III appears to require a large number of separate application programs to handle each of the types of service. Fortunately, however, a careful study of processing requirements for each major service shows that they are remarkably similar. The design of SSS takes advantage of the similarity by using a parameterized main processing cycle that can be tailored to each of the services with appropriate choices of parameters. Thus the continuous net settlement service and the new issues settlement service use the same set of programs but with different parameters to select the course of actions to be taken.

The system consists of eight main programs written in standard COBOL. The programs use decision table techniques to provide a systematic approach to achieving correct internal logic.

The entire system is designed for batch processing. Each run consists of feeding new input data and a recirculating transaction file through sorting, editing, updating and report generating steps. The result is a new recirculating transaction file and updated master and history files. Backup of the files is accomplished by producing a completely new file on update rather than modifying the current file. By saving two or three generations of old files and the input for the corresponding runs, accidental damage or loss of a file due to machine problems or programming errors can be rectified.

3. *Other Clearing and Settlement Automation Projects*

Continuous Net Settlement has in a very short time become the standard method and is used in virtually all North American marketplaces. In the United States, the system was pioneered by the Midwest Stock Exchange[52] and later adopted by the clearing corporations in New York associated with NASD and the New York exchanges. In Canada, the Vancouver Stock Exchange has implemented a Continuous Net Settlement (CNS) system independently of the CDS project described above.[53]

In England, where the settlement business has not changed in one hundred years, a major automation project called TALISMAN

52 BANK ADMINISTRATION INSTITUTE, SECURITIES DEPOSITORIES, A METHOD FOR IMMOBILIZING CERTIFICATES 16 (1962).

53 *See, Cleland,* app. B.

is well under way.[54] The settlement process at the London Stock Exchange is quite different from North American procedures and the system must accommodate these differences. However, the major principle of using book entry transfers to effect transfers of ownership is the heart of TALISMAN just as it is for CNS systems.

E. COMPUTERIZED SECURITIES MARKETS

It appears likely that in the not too distant future the securities markets in the United States and Canada will be centralized around computerized trading and settlement systems. This section examines the technical feasibility of the various approaches being discussed to forge such centralized markets; no attempt is made to give an economic analysis of the systems proposed or to comment on the desirability of the various approaches in terms of public interest.

In Canada centralization appears to be coalescing around the CATS project and the CDS efforts which are described above and in a companion paper in this volume.[55] There appears to be little doubt of the technical feasibility of the CATS project. But it is important to stress that it is a development project, and it should not be assumed that once the design is complete there will be no more work to do. If a CATS-like system is to become the sole marketplace for listed securities in Canada, then the system must have a level of security and reliability that will ensure the orderly functioning of that marketplace. This will require the implementation of many of the reliability and security measures discussed in chapter IV.[56] It appears quite likely that Canada will achieve an effective central marketplace before one is in place in the United States.

1. *The Central Market System in the U.S.*

The Securities and Exchange Commission issued in 1972 and 1973 the Future Structures Statement and the Central Market Statement which present the commission's view on how the securities market in the United States should develop in the near future. The Central Market Statement, in particular, laid down a number

54 *Talisman - A New Settlement System*, The Stock Exchange Journal (London), March 1974.

55 For a detailed discussion of the developments which are occurring in this direction, *see*, *Cleland*, chs. V.B, C, G; VI.A.

56 CATS has been designed with reliability and security as primary goals and hence the major focus will be on establishing operational measures which do not compromise the security and reliability of the design.

of points which are the guiding principles for the central market. The major points are open access to the market, best execution rule, competition between market-makers, competitive commission rates and public preference rule. Congress has actively supported the SEC in these developments and passed a major revision of securities legislation in the summer of 1975.[57]

The Securities and Exchange Commission did not lay down any specific functional form that the Central Market System (CMS) must take, but in order to begin the evolutionary movement toward such a system it mandated the development of the consolidated tape, and required that quotation data be made available to competitive information processors. It appointed the National Market Advisory Board (NMAB) to advise it on how the National Market System should evolve, but the board has completed its mandate without recommending a specific approach.[58]

There have been suggestions both by academics[59] and from industry[60] that the CMS will eventually be a large computer system and that all present exchanges as we know them will disappear. All current restrictions and regulations which impede competitive forces from making the market more efficient could be removed. The system would maintain an electronic book of orders for each listed stock as well as bid and ask quotations for any market-makers trading in that stock. A great deal of market information would be available since all transaction processing would be centralized. The system would function according to the SEC guidelines and in particular, since all executions occur in a single location, the public preference rule could easily be implemented. The exact nature of the trading process and the availability of information in the electronic book would have to be designed after more experience is gained with current computerized trading systems.[61]

It is not essential for a centralized market to be implemented on a single gigantic computer system[62] and it may be much more practical to divide the market into a number of classes of stocks

57 Securities Reform Act of 1975.

58 NMAB Report to SEC on the establishment of a National Market System, 432 BNA SEC. REG. & L. REP., December 14, 1977, at I1-6.

59 M. MENDELSON, *supra* note 20.

60 MERRILL LYNCH, PIERCE, FENNER & SMITH, PROPOSAL FOR NATIONAL MARKET SYSTEM (October 1975). M. MENDELSON, J. PEAKE & R. WILLIAMS, THE NATIONAL BOOK SYSTEM, AN ELECTRONICALLY ASSISTED AUCTION MARKET (April 1976).

61 CATS, Instinet and ARIEL all differ in these areas, which indicates that there is not one obvious best way to do computer trading of securities.

62 Extremely large online systems are difficult to build if a high degree of interaction is required to a large number of terminals. The success of CATS does not imply that a similar system can be easily built for the U.S. market, which is more than ten times the size of Canada's.

and have the market for each class implemented on a separate computer system. The use of several systems reduces the vulnerability of the market to system failures and would also allow for competition in providing the trading facility. Thus the benefits of a central marketplace can be achieved without the penalty of creating a monopolistic utility.[63] It is conceivable that many of today's participants in automation efforts (the exchanges, NASDAQ, Instinet, AutEx, Weeden) could share in a portion of the central market business if it evolves in this manner.

Not all observers of the securities industry believe that a complete shift to an automated trading system should occur.[64] They feel that the role of the specialist, with his obligation to make orderly markets in the stocks for which he is responsible, is a key feature of the U.S. securities markets and should not be eliminated by automation. If a role for the specialist is to be maintained in the CMS, then it is likely that the system will evolve as a communications network between the exchanges and the third and fourth markets. The NYSE has taken the lead in proposing such a system, the Intermarket Trading System (ITS).[65] This system is envisaged as a preliminary step in building the National Market System and has the support of four of the regional exchanges. Some observers[66] feel that ITS is a delaying tactic by the NYSE to put off the development of the Composite Limit Order Book (CLOB) which the SEC feels is needed to provide limit order protection, a cornerstone of the objectives it has stated. On the other hand, others feel that ITS will lead eventually to a CLOB organized around the current marketplaces (a soft CLOB) and that eventually efficiency considerations will result in its replacement by a computerized market with automatic execution of limit orders (a hard CLOB).[67]

The creation of ITS and then a Composite Limit Order Book based around the existing markets is a much larger and technically more difficult task than the first cooperative venture of the exchanges, the consolidated tape system. The book must reflect limit orders entered at many different markets and specialists at each market must be capable of executing against any order in the book. There are difficult policy problems associated with the processing of a sequence of information requests, order entries and execution reports. These problems may not be easy to resolve in a manner which can be technically achieved. If execution au-

67 *Interview with Sandy Yearly*, Securities Week (New York), December 12, 1977, at 7-8.

thority resides with the specialists then two executions against the same entry in the book is only one of many potential problems to be resolved.

The approach of achieving the CMS by building a composite book of limit orders at existing marketplaces involves inherently more difficult problems than centralization of the electronic book with computerized trading against it. It requires cooperative planning and design work by a number of independent bodies and complex interactions between several computer systems. If experience from the consolidated tape plan is any indication, a decision to proceed in this direction will require far longer and cost far more money than is currently being estimated.

Chapter IV
Reliability, Integrity and Security in Computer Systems

The securities industry is moving toward a greater dependence on computer systems in its day-to-day operations. Such dependence entails some risk, and this chapter outlines the risks involved and indicates the solutions applied in other areas of computer usage. The basic issues revolve around dependability and security. Two aspects of dependability are:
(1) the reliable provision of the basic computing services;
(2) the integrity of the information being processed by the system.

Four aspects of security are:
(1) physical security of the computer system from wilful damage or a disaster;
(2) prevention and detection of outsider intrusion into the system;
(3) prevention and detection of fraudulent use of the system by authorized users;
(4) internal security to avoid fraudulent behaviour by systems staff involved in the design, maintenance or operation of the system.

This subdivision of the topics is somewhat arbitrary as many of the security problems are closely related to the discussion on achieving dependable computing systems.

A. RELIABILITY

Most of the applications of computers in the securities industry involve large computer/communication systems tieing terminals and computers in scattered locations into a single network. A network allows individuals at widely separated locations to access

a common data base and to interact with one another as if they were all present in one location. Thus the benefits of such contacts are available without the congestion and confusion typical of an exchange floor. However, unlike an exchange floor which can still function (perhaps at reduced efficiency) despite major malfunctions in some of its equipment or failure of some employees to do their job correctly, an automated system may not function at all if there is a major malfunction or if key personnel fail in their task. There are plenty of "horror stories" about such happenings in the computer literature and it is important to realize that a key element in the design of any large-scale online automation system is the inclusion of planning on how to handle hardware and software failures.

1. *Hardware Reliability*

A common technique to achieve hardware reliability is to design duplex or twinned systems in which every component in the system has a twin that can be used in its place in the case of failure. There are a number of ways of designing such systems. A simple approach is to have two identical computers with all components duplicated which both can access a common data base. Only one of the systems is attached to the data base at a time. When the main system is working the backup system may be used for development work or low-priority production work. In the event of a failure in the main system, the second system is used in its place until repairs are effected. In some cases, the backup one may be in a physically separate location to assure that a natural disaster such as a fire, flood or earthquake does not destroy both systems simultaneously. For example, the Pacific Coast Service Corporation, a subsidiary of the Pacific Coast Exchange, maintains identical systems in Los Angeles and San Francisco to support the data processing requirements of the exchange and the Pacific Coast Depository.

A second approach to the duplexed system is to have both systems sharing the workload of the system, with the ability to intermix components of the two systems to ensure that at least one is running at all times. The NASDAQ system uses this type of design. Systems using the first approach are vulnerable to having both systems fail simultaneously due to different components being down on the two systems, whereas the probability of identical components failing in the latter systems is considerably smaller. Of course the latter systems are more vulnerable to natural disasters since the strong interconnection of the two systems requires that they be in adjacent locations. There are various combinations

of these approaches where parts of the system may be interchangeable but other parts are not.

Recently the technique of using several identical small computers as the computing power in a network has received considerable attention. The idea is an extension of the shared duplex system to a many-processor situation. Reliability is achieved by having each of the small systems capable of carrying out any of the functions of the others. Since each of the computers is small and hence inexpensive, it is possible to have one or two spares available which can be switched into the system to take over the function of an ailing processor. The attraction of this technique is that a high degree of reliability can be achieved with only an incremental increase in hardware costs rather than the usual doubling of costs associated with the duplexed approach. The frontend processor for the computer system at the Midwest Stock Exchange uses this distributed computing approach.

The discussion of hardware reliability thus far has concentrated on the hardware of computer systems. A parallel discussion of the hardware reliability of the associated communications network should also be made. Communications lines can be twinned (preferably over an alternate route in the telephone system) either with both lines in use sharing the load or with one primary line and a backup line (frequently of lower speed) to be used only in emergencies. The distributed approach is to have a network in which messages may be routed via a number of points before reaching their destination. By having redundant connections in the network it is possible to have two or more paths between each node and hence there are no individual lines which can shut down part of the network if they fail. Again the distributed approach saves money by reducing the number of connections. It should be noted that the distributed approach to both computer systems and communications networks is not without a cost; there is a significant complication in the software required to support distributed systems and networks that must be taken into account in estimating their cost. These costs are declining as distributed systems become more widely used.

2. *Reliable Software*

The design and development of the software required for a large online data processing application is a difficult and complex task. Although in many cases part of the system is taken directly from manufacturer-supplied software, the integration of the application-oriented programs and the tailoring of the supplied software to meet the operational objectives is still a major effort.

Programming alone is a difficult task. It requires the programmer to understand a problem well enough to write a fixed program which will react properly for the different kinds of input data (both correct and incorrect) that may be supplied to it. If the information is supplied by other programs in the system, the programmer must understand exactly what the input is and what he is to do with it. Since large systems are too big to tackle as a single program they are generally subdivided (sometimes with a hierarchical structure) into many smaller program modules. While this subdivision does make the programming of individual subparts much easier, it adds its own set of complications. The more modules used, the more complex the interactions and relationships between parts of the system, and these complex interactions greatly increase the possibility of misunderstanding among the programmers of the system.

Large computer systems are never completely correct – that is, there are always mistakes remaining in the programs (or bugs as they are commonly called) which have not been encountered or have not been isolated as the cause of improper action by the system. This is a fact of life. A major piece of software is considered reliable if the frequency of occurrence of bugs has been reduced to an acceptable level and the design is robust enough to allow rapid operational recovery when they do occur. It is considered stable if correction of a bug in one part of the system does not result in new bugs appearing in other parts of the system. Examples of unstable software are the operating systems of third generation computer systems, many of which became so big and complex that the list of outstanding bugs grew continously no matter how much effort was put into correcting them.

The techniques for development of stable, reliable software systems are evolving into a discipline known as *software engineering,* which encompasses the whole gamut of programming activity from project management to good coding techniques. A considerable amount of literature has already developed on the subject.[68] In a paper of this scope it is impossible to survey this subject in any detail, but following are a few of the central ideas.

A major idea in software engineering is to write better programs, thereby reducing the effort required to detect and correct errors. Programmers produce better programs if their task is simplified and if their activities are managed more successfully. A programmer's task is made simpler by:

68 F. BROOKS, JR., THE MYTHICAL MAN-MONTH: ESSAYS ON SOFTWARE ENGINEERING (1975); NATO SCIENCE COMMITTEE, WORKING CONFERENCE ON SOFTWARE ENGINEERING (P.

(1) reducing interactions between parts of the system;
(2) programming in a higher level language whenever possible;
(3) using structured programming concepts to make programs more understandable.

The management of programming activities is improved by sharing responsibility for the program modules across the whole programming team (which must be kept small).[69] Although different rationales and organizations[70] are given for this approach, the benefits are real; studies show that the quality of programs produced is greatly increased.

A second topic in software engineering is protection of a system from disastrous errors. By isolating the major tasks and preventing errors in one part of the system from destroying the functional behaviour of the other parts, protection can be accomplished. The discussion here cannot be separated from that on internal security in chapter III.D. Precisely the same mechanisms are used to thwart accidental intrusion of one part of a system into another part as are used to prevent deliberate attempts to intrude. With the mechanisms to provide such protection in place, major errors are generally found quite early in the development stage.

A third topic in software engineering is recovery from software (or hardware) errors. Basically there are two types of recovery required, recovery from loss of control and recovery from loss of data. Loss of control occurs when the normal sequence of control in the system is interrupted due to some error or unexpected event. A recovery routine is invoked which inspects the control tables stored in the nucleus of the system. The integrity of these tables is in doubt after an error and they must be checked before resuming normal execution. If a recovery routine modifies these tables it may also have to modify corresponding data tables to ensure that everything is compatible. To accomplish the recovery satisfactorily, enough redundant information must be retained to ensure that the validity of the tables can be checked.

Loss of data occurs either when data is being received or sent from the system or when it is stored on auxiliary storage. The probability of information loss during transmission over a commu-

---

Naur & B. Randell eds. 1969); NATO Science Committee, Software Engineering Techniques: Conference Report (J. Buxton & B. Randell eds. 1970).

69 It is a common misunderstanding by management that programming projects can be hastened by increasing the size of the staff. However, once a critical size has been reached, additional staff only hamper a project by reducing the capability of a team to communicate effectively. The result is usually longer delays and poor quality software.

70 G. Weinberg, The Psychology of Computer Programming (1971); H. Mills, Chief Programmer Teams, Principles, and Procedures (IBM Federal Systems Division Report, FSG, 71-5108, 1971).

nications link is high enough that no one would consider designing the telecommunications part of a computer system without the ability to ask for, or supply, a retransmission of the last message. Moreover, messages are transmitted with enough redundancy that the probability of an incorrect message going undetected is quite small. Often data stored on auxiliary storage is accessed through tables (generally referred to as directories) which give the location of all data items on the auxiliary device. It is essential that duplicate copies of the directories be maintained in case the main one is accidentally overwritten due to a software (or hardware) failure. If a high degree of data reliability is required, it may be necessary to duplicate all files in the system, with the copies placed on different physical devices. If files are duplicated an extra complication is introduced. The copies of a file must be kept synchronized and this task is especially difficult if the file can be rapidly updated.

Recovery can be accomplished only by retaining redundant or duplicate information. It is clear that recovery techniques cannot be added as an afterthought but must be designed into the system right from the beginning. With such planning, redundant information for recovery will be kept and recovery will be as swift as possible. Since manufacturer-supplied software normally has little in the way of designed-in recovery features, systems based on such software frequently have less sophisticated recovery schemes.

B. DATA INTEGRITY

A system is said to have data integrity if it only processes data that has been legitimately entered into the system, verified to be correct, checked for reasonableness, and preserved unmodified in the computer system. The frequency of articles in the mass media about credit billing systems, payroll systems, and banking systems where customers have been incorrectly billed, paid, or credited unreasonably large (or unreasonably small) amounts shows the need for a systematic approach to this problem.

Data integrity cannot be absolutely guaranteed. After all, data in a computer system is represented by a string of bits. There is no means of detecting whether any given string of bits, about to be processed by program B as a record of data, was created by program A (as is assumed), or was randomly selected from memory due to a bug or failure, or even worse, was deliberately fed to program B for fraudulent purposes. However, if program A always introduces redundant information into the data record and program B always validates that the redundancy is present, the likelihood of accidental use of bad data is decreased. It is likely that

those attempting fraudulent behaviour in a computer system would be able to provide suitably redundant information and hence other means for detecting fraudulent behaviour must be found.

There are three basic areas that affect data integrity. First, the data input process, which is frequently afflicted by human error, is examined. All input should be verified by testing it as much as possible for "reasonableness". Do the stock codes reflect actual stocks? Is the price mentioned within some percentage of the market value? Second, data transmission between the "intelligent" parts of the computer system should add redundancy and retain the data until it has been correctly received. As mentioned earlier this practice is pretty well standard today in communications systems and in the future it may include an encrypting process to reduce the likelihood of fraudulent interception or insertion of messages. Third, the data records processed within the computing system and stored in its auxiliary storage should be validated as they flow through the system. Data records should be verified for content and time of creation to ensure they are appropriate for the next task.

The temptation to have parts of the system rely on other parts of the system to validate the data should be avoided as much as possible. Without independent validation the system is vulnerable to massive disruption if bugs in the validation process allow bad data to get into the sensitive parts of the system. All data records in the system should be self-describing so that verification can be done independently of the modules that create the data records and also independently of modules that use them. With this design, validation of the data can occur in as many places in the system as appears necessary to avoid disruption. The verification process will be considerably more efficient and consistent than if every small module encodes a subset of the validity checks.

The techniques described above for achieving increased data integrity in computer systems have been presented simply to indicate that the reliability of data can be increased by sound programming practices. The best approach to be taken in a particular application will vary from one application to another, and it is the responsibility of the project programming management to select an approach to data integrity.

C. SECURITY

Security of a computer system involves not only the protection of the system and the information it contains from loss, damage, or destruction but also the adequate protection of information

from unauthorized access, use, or disclosure, and prevention of abuse or misuse of the system for fraudulent ends. The purpose of a security program is to reduce the risk and probability of loss associated with the above dangers to an acceptable low level at reasonable cost. In order to design security measures for a computer system, the potential threats to the computer system have to be identified and management decisions made on how best to minimize the risks. There is considerable literature now available in this area, including several general-purpose manuals for designing a security program.[71] There are also several good bibliographic sources for finding more specific information.[72]

1. *Physical Security*

The physical security of a computer system involves its protection from dangers that would destroy, damage, or render inoperable the physical components or data storage media of the system. The danger may come from natural, accidental or malicious sources and a secure computer system must have defences against all three.

Included in the category of natural threats is the possibility of damage due to fire, flood, earthquake, and disruption of major services. Protection of the computer system and the backup storage area (assuming there is one) from fire can be accomplished by standard fire protection techniques. Since fires in electronic devices generate a lot of smoke without intense heat, the use of smoke-detectors instead of heat-detectors is quite commonplace. These generally trigger an alarm system and after a suitable delay a fire-quenching system is initiated.[73] Water and smoke damage from fires associated with other uses of the physical location are also a threat and defences should be planned as the installation is designed. The only defence against a flood or earthquake is to choose a location that minimizes the risk and to provide a backup site at another location with a recovery plan to get the alternate system functioning as rapidly as possible. Disruption of the power supply and loss of the communications system are constant dangers. Protection against a power loss can be provided at three levels:

(1) against a loss of power for a fraction of a second, preventing an unscheduled shutdown;

71 AFIPS, SYSTEMS REVIEW MANUAL ON SECURITY (1974). IBM, THE CONSIDERATIONS OF PHYSICAL SECURITY IN A COMPUTER ENVIRONMENT (Manual G520-2700 October 1972).

72 Browne, *Computer Security - A Survey*, 4 DATA BASE, Fall 1972, No. 3, at 1. Hoffman, COMPUTERS AND PRIVACY: A SURVEY, 1 COMPUTING SURVEYS 85 (June 1969).

73 *See* IBM, *supra* note 71 for a detailed discussion on the merits of various systems.

(2) against a brief loss of power, allowing orderly shutdown of the system;
(3) against an extended loss of power, by using private generators to maintain continuous operations. The last level of protection is frequently used for online systems if the economic loss caused by a power failure is sufficient to justify the additional costs and most users of the system are on separate power grids. The loss of the communications system is less of a threat as the service it provides is in discrete quantities and it is unusual for the entire system to go out at once. Backup lines should be routed to avoid a natural disaster taking out both the primary and secondary networks.

Protection from accidental damage to system components or data storage is best afforded by good operational practices and adequate personnel training. A classic (and not uncommon) example is the damage caused if a disk pack, after it has been inadvertently dropped, is placed in a disk drive to see if it "survived". The attempt to use it will likely damage the read/write heads sufficiently that any attempt to read an undamaged pack will result in the destruction of its data. Further attempts to read the damaged disk pack on other drives simply propagates the disaster. If the sequence of events occurs during a backup operation or a recovery operation, it is possible to destroy all historical data from which recovery is possible. Operations staff must be trained to suspect the worst and must be made conscious of the vulnerability of the system to this kind of disaster.

Physical protection of the computing system and the data storage area from malicious attempts to sabotage its operations or to steal data or systems information is provided in much the same way that banks secure their premises. Access to sensitive areas is limited to those with a need for access. Thus the computer room is off limits to all but the operational and maintenance staff except in unusual circumstances. Strangers are kept out of the system location entirely by limiting the number of entrances and providing a guard or receptionist to monitor those who can come and go. Keys, magnetically encoded badges or credit cards, and closed-circuit television monitors are all protection techniques that are useful in limiting access. None of these techniques would protect a centre from a large-scale invasion by an organized group intent on forced entry to sabotage the system. They are designed primarily to increase the risk to an individual who would attempt such an act. As mentioned earlier,[74] the central site for NASDAQ at Trumbull, Connecticut, is a model installation for physical security. It

74 *See* ch. III.B *supra.*

was only while writing this report that it struck the author how vulnerable even a secure computer installation really is. A visit to the site was arranged by the author after placing three or four phone calls to NASD officials and explaining the purpose of the study. At no time was he asked for any evidence to authenticate his "story" (although it is possible that they confirmed its authenticity indirectly). He was given a complete guided tour of the installation including a half-hour visit to the computer room and data communications room. It is quite likely that tours are part of a public relations effort by NASDAQ officials to inform the "world" of their advanced system. Yet such tours lower the consciousness of the installations personnel to the danger of "unnecessary" access to a sensitive area and hence leave the system vulnerable to attack by a "madman" with a "plausible" story. The point is not that NASDAQ security is inadequate, far from it, but that no matter how extensive the technology to prevent unwarranted access, there will always be human judgment applied to exceptional circumstances which will bypass the technology. Hence there is a definite limit to the gain in security that can be made by installing such equipment.

2. *Security from Outsider Intrusion*

In the previous section we discussed means for securing a computer system from malicious attempts to damage or destroy it. Such dangers cannot be overlooked in the securities industry but they are not as great a danger as the possibility of outsiders intruding into an online computing system, either to gain confidential information or to subvert the system for their own purposes. The weakest link in an online star-like system is the communications network that passes information to and from the central computing system. It is possible to make the central site physically secure and to use internal audit procedures to provide protection from internal staff. But the security of the total system will depend on that of the communications system and, as we shall see, security in this area is extremely difficult to obtain.

There are two kinds of intrusion: passive and active. The passive intrusion is one in which confidential information valuable to some outside party is extracted from the communications system without detection. The extraction can be accomplished by wiretapping or by electronic "eavesdropping", *i.e.*, "listening" to the magnetic field emanating from a communications link. The technology to achieve passive information extraction is available today and it could be attempted with little fear of detection. The usual solution suggested is that the information should be scram-

bled or encrypted into a form that will be unintelligible to the would-be wiretapper. New encrypting techniques are now being introduced which can be implemented in hardware at low overhead.[75] However, encrypting of messages does not guarantee a defence against passive intrusion; it simply means the wiretappers have to upgrade their hardware and have to "reach" someone who has access to "keys" used in the encrypting scheme. Undoubtedly encrypting does raise the cost of penetration and hence lowers the risk, but it does so by adding to the cost of the network.

Whether encrypting to prevent passive penetration is economically justified depends greatly on the "value" of the information flowing in the communications system. As an example, consider an online securities trading system. There are proponents for both a closed book and an open book approach to designing a trading system. In a closed book system only the best price on each side would be displayed, whereas with an open book the entire set of outstanding orders would be available. Wiretapping to obtain order information in the open book situation is unnecessary as the information becomes "public" almost instantly. Whether it would be attempted in the closed book situation would depend on what economic advantages could be gained and by whom; the information would be primarily of interest to a broker and the risk involved in obtaining it might far outweigh the potential gain. Part of the overall design task for an online system is to assess such situations and determine the level of protection that reduces the risk of passive penetration to an acceptable level.

Active intrusion into an online computing system is a more severe threat than passive penetration since it can destroy the validity of the data being processed. However, there is also a greater probability of detection. Active intrusion can come in several forms. One simple form is when an unauthorized person attempts to access a system from a remote terminal. Protection from unauthorized access is achieved by using leased lines rather than dial-up facilities (thus, only the terminals known to belong to the system can be used), and by some authentication of the terminal user. Typical protection techniques are the use of sign-on passwords known (in theory) only by authorized users, or badge or magnetically encoded credit cards which must be inserted in the terminal before it will work.

All the techniques to limit access have their shortcomings. Users may forget to remove the credit card or to lock the terminal.

75 *See* Feistel, *Cryptography and Computer Privacy*, 228 SCIENTIFIC AMERICAN, May 1973, No. 5, at 15–23, for an excellent discussion of the use of cryptography in data security.

Passwords are usually jotted down somewhere and this information may carelessly be left near the terminal. Physical security in the area where the terminal is located is probably as important as these other protections. The encrypting schemes described earlier also provide protection against intrusion, as messages that are sent with the wrong key are easily detected.

A second form of active intrusion can occur if the online system is part of a general purpose time-sharing system. Typically such services use dialed rather than leased lines and accept input from almost any terminal device. Moreover the intruder as well as being able to present data to, or receive data from, the system, can create programs to be inserted in the system. No time-sharing system commercially available today is completely secure from this kind of penetration. Probably the most sophisticated system in terms of protection is the MULTICS operating system developed jointly by the Massachusetts Institute of Technology and Honeywell.[76] Yet it was successfully penetrated by the ZARF team with less than twenty-four hours worth of effort (ZARF is the code name for a joint computer security research project between the U.S. Air Force and the MITRE Corp.; one of their favourite pastimes is exposing the vulnerability of current systems).[77]

For most time-sharing systems, it does not take the talents of a high-powered defence research team to subvert them. Consider the following story which appeared in 1975.[78] A fifteen-year-old schoolboy with only four months' experience in assembly language cracked the security of a major time-sharing service in London, England. By dumping the object code of the operating system he was able to determine how telephone lines were assigned to terminals and where information being sent to or from the terminal was being stored. Accordingly he was able to eavesdrop on any transactions entering or leaving the time-sharing service and was also able to determine privileged account numbers. The article left the name of the time-sharing system unmentioned to protect the embarrassed, but it is likely that most time-sharing services have been penetrated in a similar manner at some time or other.

The lesson is that general purpose time-sharing systems are not very secure at present and are unlikely to be made secure in the near future. Their vulnerability arises from two sources: first, they are designed to be a public utility and hence it is extremely difficult to screen who uses them; second, they allow user-created

76 Saltzer, *Protection and the Control of Information Sharing in Multics*, 17 COMMUNICATIONS OF THE ACM 388 (1974).

77 Alexander, *Waiting for the Great Computer Rip-off*, FORTUNE, July 1974, at 143.

78 Computerworld (Boston), January 29, 1975, at 5. *See* ch. V.A *infra* for a discussion of packet-switching networks.

programs to execute, and if such a program can force itself into "privileged" mode it can potentially alter or read any piece of data in the system. A possible conclusion is that any online application where security is a primary concern should not be implemented as a package of programs on a general purpose time-sharing system. Even if the entire system is dedicated to one application, the vulnerable software will be in place ready to be exploited.

A third form of active intrusion is "piggybacking". Piggybacking is a wiretapping technique in which data transmissions are intercepted and processed by a computer which monitors or modifies the message before transmitting it forward. Even encrypted transmissions are vulnerable to piggybacking. However, the computer must have access to the encrypting keys and be programmed to decode the encrypting sheme. A piggyback system can even generate its own transmission, producing a completely false picture of the activity being carried out at either end of the data link. If the piggyback is attached between the concentrator processor and the central computer it may bypass the authenticity checking used to ensure that the terminals are being used for "reasonable" purposes by authorized users. Piggybacking is a potential threat in any system in which money transfers to accounts belonging to the general public can be initiated by messages sent over transmission lines. Bank-to-bank transfers are an obvious target.

Whether there is a serious threat of this sort of intrusion in automated systems in the securities industry depends on the nature of the systems that are developed. Currently, there are no real money transfers to public accounts proposed in the systems being implemented in this country and elsewhere. It is not obvious whether or not piggybacking could be used for fraudulent manipulation of an automated marketplace. The answer depends heavily on the specifics of the automated trading process and the details of the system design.

There are no documented cases of piggybacking being used to intrude on a computer system (except in research studies on the data security problem). With the introduction of packet-switching technology the vulnerability of data communications to piggybacking is reduced. However, the danger, even if just because it has been raised in the literature, is present now and will become greater as the cost of computer technology decreases and the number of highly-trained systems people increases. To not include defences against it in planning for any major online system to be used in the next decade seems at least shortsighted.

3. *Fraudulent Use of Computer Systems*

The previous section was concerned with outsider intrusion into a computer system for fraudulent purposes. The risk of outsider intrusion is much less than the risk of fraud or embezzlement perpetrated by those persons who are authorized to use the system. The Equity Fund insurance scandal brought into public view[79] the possibility of such behaviour on a grand scale. In addition, there have been enough other cases involving individual fraud to indicate the size of the problem.[80]

The following example illustrates the ease with which computers have been used to perpetrate embezzlement. It is the story of an $11,000-a-year bank teller at New York's Union Dime Savings Bank who had access to a computer terminal which hooked into the bank's online account management data base. The teller embezzled money by transferring amounts from inactive accounts into the accounts whose money he had pocketed after accepting a deposit at the window. In a little over three years he managed to pocket $1.5 million. The detection of his crime was purely accidental. Records seized from an illegal betting operation, which showed that he had been gambling $30,000 a day for several weeks, led the police to investigate his work activities.[80a]

This simple form of embezzlement, automated only in that the computer transferred amounts from one account to another, shows the extent to which the data processing community has, in the past, failed to provide adequate audit controls. The trail of paper which has traditionally been the auditor's tool for ensuring that all transactions are proper is rapidly disappearing as transactions are directly entered online into computer systems. As a result, auditors now rely on the computer to perform many of the accounting crosschecks. The computer is programmed to detect suspicious transactions and issues a warning message when they occur.

Internal auditing checks are not adequate in themselves to guard against embezzlement. First, the crosschecking algorithm remains fixed and is known in advance. Hence a would-be embezzler can plan means to avoid the check without the fear of a sudden change in auditing practices. Second, man's ability to find new ways to embezzle seems limitless and the auditing programs just cannot compete with a good auditor's ability to smell out a phoney

79 *Equity Fund Fraud Toll More Than $2 Billion*, DATA PROCESSING DIGEST, June 1973, at 19; Romney, *Fraud and EDP*, 46 CPA J., November 1976, at 23-28.

80 D. PARKER, COMPUTER ABUSE PERPETRATORS AND VULNERABILITY OF COMPUTER SYSTEMS (Stanford Research Institute Report, December 1975).

80a *See* Alexander, *supra* note 77, at 144.

situation. Finally, there is always the danger that the auditing aspect of programs will be tampered with.

4. *Protecting Online Systems from Fraudulent Use*

The enormous potential worth of the stocks and bonds being handled by automated systems in the securities industry makes them vulnerable to illegal activities of the type described above. Following is a survey of good system design techniques and internal auditing practices that can help reduce the risk associated with automated systems.

A major thrust in attempting to assure the security of online systems is authentication of the terminal user. (See the discussion in chapter IV. C.) Although none of the techniques are foolproof, the combination of a badge device along with a user-chosen and changeable password seems to give a level of protection, to both unauthorized access and illegal tampering. If a user regularly changes his password without notice, this greatly reduces the likelihood of an unauthorized person accessing the system by pretending he is the user.

Auditing practices associated with an automated system in the securities industry should be included in the design as the system is developed drawing both on experience with manual auditing practices currently used for the application and on the capability of the computer to perform systematic checks. For example, the auditing function in an online system is much simpler if access at a particular terminal is restricted to a few individuals who can be identified by their function. In a trading system it is likely that a trader for a particular brokerage firm would have responsibility for a certain set of stocks. He would be authorized to place orders to buy or sell only those stocks. Assuming he always works from one terminal or one of a set of terminals, his inputs could be checked to see if they come from a correct terminal and involve stocks in the authorized set. The concentrator which controls the terminal could authenticate the input data both for auditing purposes and reasonableness before transmitting the order to the central system using information which is stored in the concentrator.

Techniques for updating access control information would have to be developed to allow for normal changes in work patterns. The security of the concentrator becomes very important if it controls access since tampering with the information might completely bypass the checks. There is still a need for some authentication information to be sent to the main system for logging purposes and prevention of outside intrusion.

One of the inhibiting factors in fraudulent activity by people in manual systems is that repeated inquiries about the system or repeated attempts to gain information outside a person's normal working needs create suspicion which may lead to a close examination of the person's work. A problem with most early online systems, even if they are programmed to authenticate input to the system, is that they fail to react to suspicious behaviour. Generally the user at the terminal is given a mild rebuke in the form of an error message but no other action is taken. Thus a user with criminal intent can probe the system at will trying to find its weaknesses.

It is important in trying to design a secure system to find techniques that will discourage such probing. One approach is to keep a count of the inputs that violate one of the authentication tests, and when the count reaches some threshhold the system can notify the appropriate security office and produce a dump of the transactions log for that terminal. Care would have to be taken to avoid casting suspicion in instances where the user is simply making an abnormal number of careless errors.

The exact nature of the auditing techniques which should be incorporated in the system software are application dependent and are not discussed in general terms here. Several manuals and guidelines now exist to assist an internal audit team and the software design group in planning the audit process.[81]

5. *Internal Security*

No computer system in public use today is completely safe from threats to its integrity from internal staff or those who have direct access to the system. This fact should not be a surprise. All institutions that handle money or other liquid assets are vulnerable to misbehaviour by their staff; they rely on good audit controls and careful selection of personnel to minimize the risk. The surprising thing is how many institutions have completely ignored the risk of internal subversion of their computer systems.

Undoubtedly the cause of this neglect has to do with the aura

81 For discussions of internal auditing practices, *see The Internal Auditor and the Computer*, 13 EDP ANALYZER, March 1975, at 1. Anderson, *A Guide to Computer Control and Audit Guidelines*, 105 CA MAGAZINE, December 1974, No. 6, at 22; *Advanced EDP Systems and the Auditor's Concerns*, 138 J. ACCOUNTANCY, January 1975, at 66; AMERICAN INSTITUTE OF CERTIFIED PUBLIC ACCOUNTANTS, MANAGEMENT, CONTROL AND AUDIT OF ADVANCED EDP SYSTEMS (1977). This section has been concerned with the threat of fraudulent misuse of automated systems and means of protection to prevent or discourage it; *see* ch. V.C *infra* for the related but more specific question of detecting misuse of the trading activity itself through strategies which manipulate the stock market.

of mystery surrounding the sophisticated online systems. Management has been led to believe that the processes are too complex for them to understand and if the entire operation is left in the hands of experts the job will be well done. Being essentially technicians, the experts devote all their energy to solving the technical problems of designing and implementing an operational system. It is rare that the development team has management's perspective on the importance of non-technical issues to the success and security of the system. The situation is changing, especially with the amount of publicity that security issues are receiving today,[82] but there are still relatively few computer systems that have internal security as a major area of management concern. Following is a review of the technical details of the vulnerability of computer systems to internal subversion and a discussion of the defences being proposed in the literature.

6. *Vulnerability of Computer Systems to Internal Subversion*

The major control mechanism in a computer is the operating system.[82a] Primarily the operating system controls the sharing of the resources of the computer among the various tasks being processed by the computer. In controlling the sharing it must, for short periods of time, have complete control of the computer and all the resources. Computers have two control states: supervisor (or privileged) state and user (or non-privileged) state. In theory, only the programs of operating systems ever operate in supervisor state, and then only when they are carrying out some function that cannot be done in user state. An application program operates in user state. In order to use a systems resource, such as reading from or writing to a file, the application program executes a special instruction which requests supervisor intervention to carry out the required action. Each application program and its private data are kept completely separate from that of every other program and, ideally, there can be no interference or spying between the separate applications. The separation is essential for reliability. It prevents bugs or errors in one program from contaminating other parts of the system. Thus, provided the operating systems programs are completely correct and do not contain any subverting code, and provided no applications programs ever operate in privileged mode, the two-state mechanism prevents all attempts to

82 Grønning, *Data Security and the Financial Community*, 154 SLOAN MANAGEMENT REV., Spring 1974, No. 3, at 69.

82a *See* ch. II *supra*, for the tasks carried out by the operating system.

misuse the system which is not deliberately programmed into applications programs.

In practice the situation is not so straightforward. While most of the operating systems in current use were designed with this model in mind, most of them can be subverted by any good undergraduate student in computer science. Some of the techniques require the collusion of a systems programmer; others can be done entirely without help. An example is the restart game. For long running programs most operating systems provide a restart capability whereby the program can request that a "picture" of the state of the processor and memory be placed on an auxiliary file to avoid having to start again from the beginning if a failure occurs. The "picture" contains the privilege flag and the point in the program at which the restart should begin. This is an extremely useful facility and no one would suggest eliminating it. The flaw is that in some systems the restart file is considered a private file to the program that requested it, and hence there is no mechanism to prevent the program from tampering with it. The restart mechanism can be misused as follows. First, request a restart dump. Second, modify the contents of the file, inserting a new restart point and altering the copy of the program so that it appears the machine was in supervisor state when the dump occurred. Finally, deliberately cause an error to force the restart dump to be automatically retrieved. The net result is that the operating system restarts the application program in supervisor state at a point of its own choosing. The program then has access to all the system resources and files and can do virtually anything.

A second example of system subversion involves collusion with the systems programmer who is responsible for the nucleus of the operating system. The nucleus handles all requests for supervisor functions. Although the majority of these requests are generally designed into the operating system as it is delivered, each user may add some of its own to optimize the performance of its installed system. It is not too difficult for a systems programmer surreptitiously to add a supervisor request which can be used as a "trap door" into supervisor state. Any other programmer who knows about its existence can potentially subvert the system with any program he runs. Thus innocent-looking program development activity carried on in parallel with production work can in fact raid the system in some manner. In some operating systems, the "standard" supervisor requests can be made to act as trap doors if they are given arguments outside the expected range.[83]

83 Whiteside, *Dead Souls in the Computer* (pts. I, II), THE NEW YORKER, August 22, 1977, at 35; August 29, 1977, at 34.

A great deal of research and development effort is being spent on designing and building operating systems that cannot be subverted in this simple manner. Experts believe it will be another four to five years before really secure systems will be in wide use commercially. Of course not all fraudulent use of computer systems by the internal staff relies on the ability to take over the machine. In fact, many of the embezzlement cases that have come to light involve the programmer responsible for implementing an application program.

One of the earliest cases on record[84] is that of a bank programmer in Minneapolis who programmed the account's package so that all overdrafts on his account were ignored. This was discovered only by accident when the computer failed one day and the bank had to go back to manual processing. Another example from the folklore[85] of programming is that of a payroll programmer who siphoned all the fractional pennies from the payroll into his pocket. For every payroll amount which did not come out to the exact penny he would round up before adding it to the payout total, round down for the actual cheque and add a penny to an internal sum. At the end of the run he would add the sum to his paycheque amount just prior to the printing of the cheques. This simple ploy is quite difficult to check by any internal auditing scheme since the cross sums all match and there are no extra cheques printed.

The code to alter an application illegally can be added after the program has been installed by "patching" the machine language program. Thus anyone auditing the program by reading the original source language program would be completely unaware that it differed from the actual program being executed. One can be sure that no such tampering has occurrred only by ensuring that the actual production program in machine language corresponds exactly to the source language program. There is no reason to assume that the originator of an application program is the only person capable of subverting it. If the program documentation is readily available, almost any competent programmer can insert a patch.

There is a close analogy between bank account management and book entry recording of stock ownership. It would be safe to assume that all of the potential means of manipulating bank account programs are potential threats in a book entry system, particularly if accounts are held in individuals' names. (The added risk may be strong reason for not having individuals as holders of

84 *Computer Fraud and Embezzlement*, 11 EDP Analyzer, September 1973, at 1.
85 This story has been retold many times but the author could find no evidence that

records.) It is less obvious that there is a threat of similar subversion of a trading system. The motivation would probably be some deception to manipulate the market value of a share. Whether such manipulation could be carried out by subversion of the system is worth studying in any design for an automated trading system.

The emphasis in the discussions on subversion of computer systems so far has been on situations where the internal staff have intentionally been involved. However, there are cases where in attempting to expedite their job the programming staff may leave the system vulnerable to subversion. In almost all major programming developments the implementors include extra code to aid in debugging the system. Thus from an ordinary user's terminal, a systems programmer may have the ability to scan internal tables, modify them, even alter the machine language programs in the system. These tools are extremely useful during the development stage because they make it much easier to isolate and correct programming errors. The temptation is to leave them in the working version of the system (since it is never completely debugged). The existence of special commands is generally not advertised and frequently they are protected by allowing only "privileged" terminals to have access to them. Such features leave a security gap in the system big enough to drive a truck through. Inevitably word gets around about these "super" commands and their potential for criminal activity may be realized. Even "privileged" protection may not be worth much; terminals have been known to end up in privileged mode during a systems crash, and convincing liars have talked more than one computer operator into privileging a terminal "to aid debugging".[85a]

7. *Defending Computer Systems from Internal Subversion*

If a pretty bleak picture of the vulnerability of computer systems has been painted it is perhaps a good thing. For too long it has been assumed that automated systems will solve all the difficulties associated with information processing problems without creating any of their own. In fact, they usually replace one set of problems with another completely different set.

The picture is not really so gloomy, however. There probably will never be completely secure computer systems just as there are

---

such a case has come to public light (which may mean there are a lot of rich payroll programmers around).

85a Much of the discussion on internal auditing for EDP involves an evaluation of operational practices and controls to prevent the type of tampering discussed here; *see*, *The Internal Auditor and the Computer*, *supra* note 15.

no completely secure banks. Internal security of a computing system can be achieved by much the same means as it is for other areas of business or institutional operations. The keys are good personnel policy, sound operational controls to minimize the risks, including regular but unscheduled audits of the computing system, and sound planning to identify and minimize the security risks. Personnel who work in secure areas should be carefully selected and as much as possible motivated to have positive attitudes about system security.

Good operational controls can go a long way toward minimizing the exposure to internal criminal behaviour. Programming responsibilities should be shared for just the same reason that responsibility for a complete business transaction is generally divided among a number of people in a manual system. As much as possible a computer system should be devoted entirely to the production work of the application and not used simultaneously for developmental work. All programs should be carefully audited when they are accepted for production work and reaudited whenever they are modified. That is, the source program should be carefully checked to see that it does not contain trap doors and the object code should be checked to see that it actually corresponds in a one-to-one way. No patching of object programs should be allowed. Periodic checks that the programs have not been tampered with are also worthwhile. Debugging aids, if they are not taken out of the production systems completely, should, as a minimum, contain logging codes to indicate when they are being used. They should also not be any more powerful than necessary for the task for which they are designed.

Not all of the above procedures need be applied to all parts of the system. It is management responsibility in the area of internal security to discern the threats, assess the risks, and provide the defence mechanism necessary to reduce the potential loss to an acceptable level at a reasonable cost.

D. SECURITY PROLOGUE

The preceding discussions, though primarily of a general nature, have emphasized particular risks or threats which might apply in automation projects in the securities industry. A major question which should then be asked is whether in view of these risks the securities industry should automate its processes. The author believes the answer is yes; that defences to the majority of the security threats can be constructed. Although these defences will not be perfect, they should leave the industry at least as secure as it is today, if they are carried out conscientiously. It appears that

the risks are much greater in the settlement, transfer and depository functions than in the trading process. Thus the security measures required to protect the systems and facilities of the Canadian Depository for Securities will be more stringent than those required for an automated trading system. It can be argued that the probability of many of the security threats that have been mentioned earlier is quite low and the economic costs of defending against them may outweight the potential loss. This argument may be valid. However, such an evaluation must take into account the economic effect of a loss in public confidence in the securities industry if it becomes apparent that its automated systems can be subverted for private gain. The industry has a public trust to carry out, and it is extremely important that it be seen to be taking adequate security measures to ensure that the public interest is being safeguarded. A visible security program continuously monitored by an appropriate management body of the industry would provide such assurance.

Chapter V
Future of Automated Systems in Securities Markets

A. IMPACT OF TECHNOLOGICAL CHANGE

There is probably no other industry in which technical advances in the laboratory are incorporated into the products commercially available in the market place as swiftly as those in the information processing industry. An industry that is barely twenty-five years old has produced four generations of hardware designs and corresponding software systems, each with significant improvement in processing capability. The rapid pace of development can be expected to continue in the next decade. What follows is a discussion of these changes, in terms of new telecommunications techniques, advances in processor and memory technology, and developments in computing networks. It is difficult to assert what impact any particular advance will have on the securities industry other than that of lowering the cost of automation projects.

1. *Communications Systems Technology*

The major advance in communication is the development of digital communications networks based on packet-switching technology and digital transmission techniques. Conventional communication networks transmit information in exactly the same way as telephone conversations are transmitted. A connec-

tion is established over a telephone line between the communicating elements of the network with a carrier signal being transmitted on the line. Information is sent by modulating the tone of the carrier signal to produce a square analog wave pattern which corresponds to the bit representation of the data. At the receiving end the wave form on the carrier signal is analyzed by the receiving system and turned back into a bit pattern.

This process has two disadvantages. First, the normal telephone network is not designed specifically to transmit data rather than voice-signal and the square signal pattern gradually distorts as it is transmitted through the elements of the network so that it occasionally is not "readable" at the receiving end. Signal distortion along with "noise" frequently encountered in analog telephone circuits accounts for the rather "high" error rate (one in one million bits) encountered in current communications systems. Second, the connection is used exclusively for data transmission between two elements in the network resulting in an inefficient use of the data-carrying potential of the communication lines. As a result the communications costs of the network are much higher than necessary.

These disadvantages have been overcome by the introduction of digital transmission networks designed to transmit binary wave forms with little or no distortion and by the introduction of packet-switching networks. In the former, the square wave forms are reconstructed at frequent intervals in the transmission before distortion can cause loss of information. In the latter, small packets of information are shunted about the network, being picked up from the sender and delivered to the receiver without establishing an exclusive private link between the communicating elements. Much more efficient use of the available communication lines is made with packet-switching. Moreover its use forces a disciplined protocol for transmitting information, which facilitates the sharing of data among various computer systems utilizing such a network.

The DATAPAC service offered by Trans-Canada Telephone is the first commercial Canadian use of this technology with a true packet-switching network operational since June 1977. In addition, CNCP Telecommunications introduced INFOSWITCH, which combines digital circuit switching with packet-switching, during 1977. Canada is in the technological forefront in this area and commercial applications of this new telecommunication technology are already under way. Whether nationwide securities systems developed in Canada will use these systems rather than a leased

digital route will depend on an economical and functional evaluation carried out during the design phase.[86]

Data communications systems will also be affected by other technological advances. Major advances in encrypting methodology along with decreasing hardware costs will allow low-cost data encoding to be applied anywhere in a communication system where data security is important.[87] The encrypting technique, which is virtually unbreakable, can be encoded by a simple algorithm in hardware at the transmitting and receiving sites thus reducing, although not eliminating, the risk of unauthorized access to the data. It is rumoured in the trade press that the new computer systems under development by IBM will include encyrpting hardware as a standard feature.[88]

The third technological advance, which is only at the experimental stage, involves a combination of radio transmission and packet-switching techniques to transmit data between a central computer and a large number of terminals in a concentrated area. By using radio transmission, terminals can be easily added or removed from the network with no concern over the availability of telephone lines.[89] This technology might be suitable for the securities industry in major financial districts where there would be large numbers of terminals in a small geographical area.

2. *Computer Systems Technology*

Advancing technology is improving both major components of a computer system, namely, the processing unit and the memory subsystem. The major technological advance in processors is the commercial application of large-scale integration (LSI) technology to the fabrication of electronic circuits. LSI circuits are embedded on extremely small silicon chips and in their most sophisticated form may include all the functions of a small processor or a substantial memory storage capacity. "Processors-on-a-chip" have introduced computer control to many aspects of our everyday life including hand held calculators, automotive ignition systems, traffic light control systems, digital wrist watches, and recreational games.[90] The development cost for any one LSI circuit is

86 McMahon, *A New Philosophy in Data Networks*, 8 CANADIAN DATASYSTEMS, June 1976, at 41-45; *see also* 6 CANADIAN DATASYSTEMS, November 1974, at 48-49; 9 CANADIAN DATASYSTEMS, December 1977, at 32, 39.

87 Feistel, *supra* note 75.

88 IBM has released without royalties a patented encrypting technique that is very cost-effective.

89 Kuo, *The Aloha Broadcast Packet Communications System*, in COMPUTER ARCHITECTURE AND NETWORKS 275 (E. Gelenbe & R. Mahl eds. 1974).

90 *See* 237 SCIENTIFIC AMERICAN, September 1977, No. 3; the entire issue is devoted to

extremely high and it is only by mass-producing a particular design that the cost-effectiveness of the technology can be achieved. As a result, research and development efforts are being concentrated on designing a small number of general purpose circuits which can be used in various combinations to achieve a large number of individual tasks.

The development of LSI technology is having two effects. First, processing costs are going down. For example, the cost of sophisticated processing in the concentrators of a communications system is decreasing with the lowering of minicomputer prices. Second, processing power is being utilized in parts of the system to provide more function at little or no extra cost. For example, there are new "intelligent" terminals on the market which utilize a microprocessor to process and react to user input in a manner that has only been accomplished in the past by sophisticated front-end processors. The rapid decrease in processing costs does not imply that total processing costs will also drop as substantially. Other major cost factors in computer systems are not declining as rapidly.

LSI fabrication techniques are being used to mass-produce semiconductor memories which are faster than core memories formerly used for the main memory of most computer systems. The use of semiconductor memories will improve performance and will reduce costs as production volume increases.

The technology of random-access online disk memories for auxiliary storage of data files is improving steadily with increased data capacity and data transfer rates. A major development in the memory area is the emergence on the market of mass storage devices. IBM's 3850 mass tape storage system which holds up to 472 billion characters of data is one of several ventures in this field. Proposals for mass memories based on lasers, holography and magnetic bubbles are in the experimental stage and it appears that mass memory technology is likely to advance significantly in the next ten years. The advent of economical online mass storage may facilitate the use of general data base techniques for efficient and controlled management of data in computer systems.

Improvements in processors and memories will affect applications of automation in the securities industry primarily in terms of its cost-effectiveness. Since labour costs are rising rapidly in this inflationary period, the attraction of automation as a solution to

microcomputing with articles on the technology and its application. 14 IEEE SPECTRUM, December 1977, No. 12, at 20-25, describes new consumer games based on microelectronics.

the economic difficulties of the industry can only be enhanced by such developments.

3. *Computer Communications Networks*

The trend in computer systems design in the coming decade will be more and more to networks of computers which distribute the processing load among a number of processors. Current star-like systems with sophisticated concentrator processors are the beginning of a trend which will accelerate as the cost of communications decreases and the cost-effectiveness of "small" computer systems improve. There are many possible designs for such networks and a number are being explored in research projects currently under way. The major approaches are hierarchical, ring-like and parallel networks.[91]

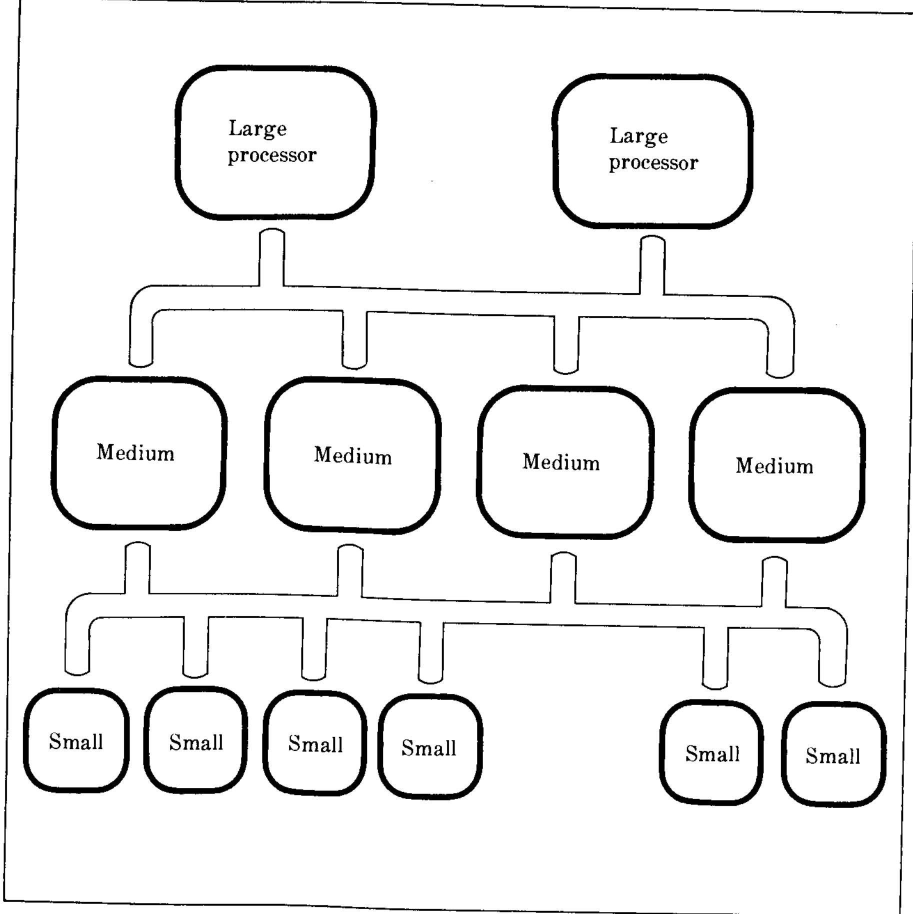
In a hierarchical network, processors of different computational power are combined in levels with the most powerful at the top and the least powerful at the bottom. Figure 4 shows a schematic diagram of a three-level hierarchy in which there are a large number of small processors at the bottom level carrying out simple processing tasks. The bottom level might simply be chip processors embedded in intelligent terminals which would connect to medium-size processors at the middle level. The second level processors would handle more substantial computational tasks, manage the auxiliary data for the small processors and transmit requests to the large processsors. The large processors at the top level would control the total system, manage the data base associated with the system and carry out the major system-wide algorithmic tasks.

The star-like networks described in chapter II.C are basically simple hierarchical networks; however, they have only two levels and very little interconnection between components on the same level. If a hierarchical network is designed so that any of the processors at one level can communicate directly with any of the processors at the next level, an extremely reliable system can be configured. It is expected that the majority of large computer networks will have hierarchial configurations in the next decade.

In a ring-like network there are a large number of small processors connected to a communications ring by ring-elements which transmit messages between the processors in the network. Each processor has its own local memory which contains a nucleus to control its actions relative to messages received and sent. No one processor is in charge of the network and failure of any

91 *See* 21 DATAMATION, February 1975, at 40-56 for series of articles on network designs.

Figure 4
A Hierarchical Network



processor simply removes it from the ring. This architecture has completely distributed control as well as distributed processing power. It can potentially provide extremely reliable computing services at much lower cost than conventional systems which are duplexed for reliability. Figure 5 illustrates a ring-like structure. Ring-like structures are suitable for message switching and other applications where no large data base is associated with the task.

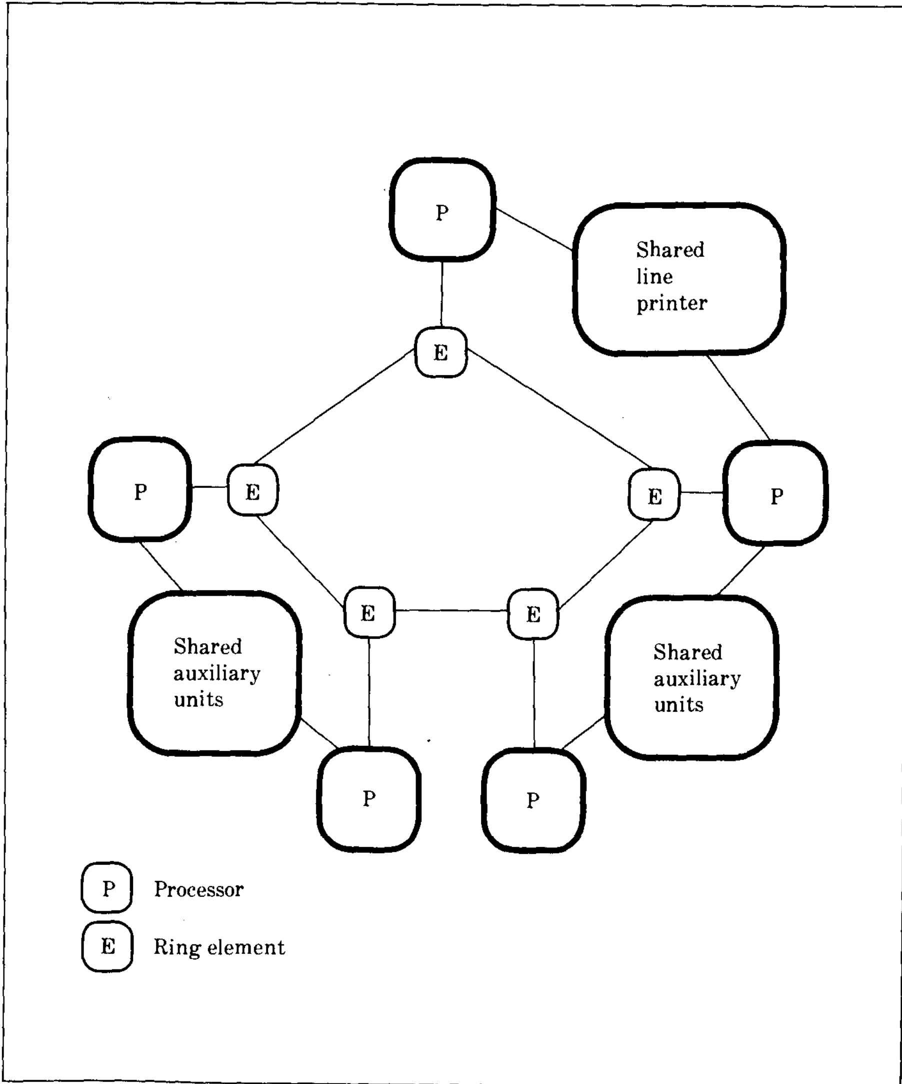
The cross-connected or parallel network approach consists of a set of processors located in close proximity, connected by a special switch to an equal number of memory units. Any processor can be switched to connect to any of the memory units for a particular memory reference. At all times one of the processors must act as the master processor, but the particular processor carrying out that function can change dynamically. Extremely high-speed computations can be achieved with parallel processing. There is little need for such high-speed capabilities in current applications in the securities industry. Moreover, architecture implies that it is suitable only for a local network. Hence it is unlikely that parallel networks will play a role in future developments.

B. INTERNATIONAL HOOKUPS

Futurists foresee a time when all information processing and transfer will be done by computer/communications networks. We will live in a completely wired environment with computerized access to all the information we need for work and pleasure and with automated systems to carry out almost all present-day labour. This technological world will be international in scope. A person sitting at a terminal in his home in Tokyo will be able to buy or sell gold on the bullion market in London. There are, however, many who believe that a totally technologically-oriented society will evolve very slowly – if ever – not only because there are so many important functions involving complex human judgment which will be very difficult to automate, but also because it will make society a less humane environment. For the foreseeable future we will, in my opinion, be faced with limited automation schemes implemented to serve individual segments of an industry or enterprise.

In the securities industry in the United States and Canada, automation projects are developing to provide new functions or cheaper solutions to current problems on a piecemeal basis. There are separate projects under development or already in use in the U.S., each with its own marketing target and tradeoffs in design. For example, Instinet, for fourth market trading; AutEx, for block-interest information, and NASDAQ, for the OTC market. The

Figure 5
A Ring Network



automation of clearing and settlement processes has been implemented at several locations in the United States, independent of the development of computerized trading and with little coordinated planning to achieve a nationwide system.

It is apparent that systems to automate the securities industry in Canada will develop in reaction to the economic forces of the Canadian securities industry and to the stimulus, or lack of it, provided by Canadian regulatory bodies. Moreover, it is apparent that Canadian designs for systems to automate the trading process and the clearance and settlement process, which meet Canadian needs and legal requirements, will likely be different from those adopted in the United States and elsewhere.

Because of the close links between the Canadian and American financial communities there will be some pressure to ensure that these developments do not preclude the orderly processing of international financial transactions, and there may be some desire to forge links in the automated systems to assist in such transactions. There are three potential areas of difficulty in such international hookups: technical, functional and policy.

The technical problem of physically joining the systems so that meaningful interchange of data between the systems can occur is solvable. It is largely a matter of interfacing communication systems and deciding on the conversion that data must undergo as it passes through the interface. If the French and English can connect their telephone systems so that one can direct-distance-dial from London to Paris, it is technically feasible for CATS to interface with Instinet. Connecting the systems, however, does not imply that the differences between the systems will be transparent to the users, only that it is technically feasible to access one of the systems from the other.

Functional differences that arise due to different philosophies in the basic design of the automated system may cause difficulties. For example, if CATS adopts an open book approach to limit orders and a future U.S. trading system works with a closed book approach, then there will be a need to resolve the difference if a hookup is desired. An appropriate solution can likely be negotiated but it will require deliberate policy decisions on what information should be made available in which parts of the combined system. Such policy decisions may be largely shaped by the legal requirements placed on one side or the other in the home jurisdiction.

The major roadblocks to international hookups will likely be legal and economic. It is difficult to envision a complete integration of automation in the securities industry when the systems must operate in different jurisdictions. The difficulty of negotiating a suitable treaty to ensure adequate enforcement of regula-

tions across the jurisdictional boundary is probably far greater than the difficulty of solving all of the technical and functional problems together. Moreover there will be nationalist pressures to ensure that any international arrangements are in the best interests of the Canadian economy and do not jeopardize the capital markets in this country. As a result, it is likely that any international arrangements which do develop will come about as individual solutions to particular problems rather than total interfacing across the border of technically similar systems.

C. AUTOMATED STOCK MARKET MONITORING

The securities industry in Canada and elsewhere is a self-regulating industry, with each industry group or body having regulations which must be obeyed by the membership.[92] Enforcement of a number of the regulations requries detailed information on trading activity in securities markets. With the advent of automation in the industry a great deal more information is and will be centrally organized in a form that can assist in surveillance of the marketplace.

1. *Current Monitoring Projects*

Most of the market information systems described in chapter III.A include a stock watch or market surveillance component. Typically the stock watch monitors the behaviour of trading activity in all the listed stocks, ready to react to a significant price change that might indicate attempts to manipulate the market in a stock. What is meant by a "significant price change" depends on the value of the stock, its normal price pattern, its normal volume of sales, and the market trend. Once a stock has been isolated as having unusual price movements, the audit trail of all transactions can be sifted to produce a display of all trades in it. A surveillance team can then examine the trading record and investigate the possibility of deliberate manipulation. This type of monitoring detects only successful price manipulations and only those which caused a "significant" price change. Therefore it is unwise to publish the parameters of the monitoring process since such knowledge would allow a sharp trader to manipulate the market without fear of prosecution if he keeps the price movements just within the allowable size.

In an exchange market that employs specialists in certain securities there are a number of regulations governing the special-

92 *See*, *Howard*, *Structure and Process.*

ist's affirmative responsibility to maintain an orderly market. The transaction records of a day's trading on an exchange can be analyzed after the close of trading to ensure that the specialist has carried out his responsibilities properly. Specialist performance checking has been done at some exchanges on a spot-check basis and in the United States the SEC has carried out a surveillance program of this nature.

The data to monitor price fluctuations and specialist performance is already captured in the market information systems. Therefore monitoring can be done with little or no addition to the cost of the system. The price fluctuation monitoring mechanism does not need to test the price change on each transmission but instead can periodically check the price movement and volume of trades of each listed stock since the last check. The process can be going on continuously as a lower priority task than the transaction processing. If the market information system has spare capacity to handle wide fluctuations in trading volumes, there is plenty of processor time available to do the checking. Only in times of sustained, extremely high transaction activity is the monitoring function shut out of the processing cycle. Hence, bursts of trading activity during the day are processed as expeditiously as possible without being slowed by the monitoring process.

Automated monitoring is in use in several of the current automation projects. The market information systems at the Toronto Stock Exchange and SIAC's system for the New York exchanges both include a monitoring feature. The NASDAQ system also includes a surveillance function and, in addition, the American exchanges and NASD send transaction data on magnetic tapes to the SEC which has its own surveillance program.

2. *Monitoring in Future Systems*

Current automated monitoring systems for stock markets use data which must be available for the efficient running of the marketplace. There is a limit to the amount of checking that can be done with such data, particularly on attempted manipulation and insider trading,[93] since the principals in a trade are brokers acting as agents for their clients. Without knowledge of the originators of a sequence of transactions in the marketplace, it is difficult to detect manipulative behaviour or insider trading directly. The current practice of having a surveillance group investigate the transaction history of any stocks with "suspicious" price move-

93 *See, Yontef, Insider Trading,* for a discussion of the legislative efforts to prevent insiders from benefiting personally from their knowledge.

ments must be hampered by this lack of information. Moreover the detection of suspicious behaviour is of necessity based on crude measures which may fail to detect many cases of manipulation.

If automated monitoring to detect manipulation behaviour and insider trading is considered essential in a computerized marketplace, more information has to be provided to the system to ensure that it can be done effectively. There is a definite cost involved if the monitoring process becomes more elaborate. The added information will require more time to carry out a transaction both for input and processing, more memory space in the system to store the data, and much more elaborate monitoring algorithms. Will the implementation of a more elaborate monitoring process benefit the public and the industry? If there is, in fact, substantial undetected price manipulation occurring which can be detected by such monitoring, then the public interest will be served. Moreover by increasing public confidence in the fairness of the marketplace by publicizing a strong monitoring program, there may be an increase in public participation which would strengthen the entire industry.

Undoubtedly there will be resistance within the brokerage industry to provide more information for this purpose. Assurance would have to be given that access to the additional information would be limited to those who are involved in surveillance. Arguments against providing the information may well prove futile if automation of trading is extended to include the settlement and transfer of ownership functions in a single system, since all of the information required for the surveillance function would also be required to complete a transaction.

The point to be made is that automated monitoring of stock transactions can be used much more extensively than it is at present, if additional information is provided to the system at the time a trade is consummated. Whether public benefit from doing so outweighs the direct and indirect costs of more elaborate surveillance activity involves a policy judgment beyond the scope of this paper.

One point about the implementation of monitoring should be made. The extent of the monitoring subsystem should be decided during the design phase so that the monitoring information can be organized for efficient access. Attempting to add monitoring to an already existing system may prove difficult if the required information is dispersed across several files.

Part I
Extraterritoriality

Chapter I
Introduction

This paper examines two separate topics. The first is the extent to which a federal securities law should attempt to reach beyond the territorial limits of Canada. The second is the problems of investigation and enforcement which arise when a country seeks to apply its laws to persons or transactions outside its boundaries.

The first question is essentially a foreign policy one. We would expect that various government departments will wish to consider this issue carefully before any legislation may be drafted. Our conclusion on this topic is the sort you might expect if you appointed a lawyer to analyze the problem. The traditional lawyer's way of solving a problem is to look at how the problem has been solved by other people in the past, how other people are solving it now, and to follow those precedents. This is exactly what we have done. There are more imaginative and more extreme solutions. We might have advocated unfettered jurisdiction over the discernible universe. We might have urged a retreat into a concept of "Fortress Canada". However, we think our compromise is sound and we shall describe and attempt to justify it below.

The second part of our paper, the discussion of international enforcement, also betrays typical lawyer's thinking. If a lawyer really believes in enforcing something, whether it is a mortgagee's rights or a government's interest in securities transactions, he piles up every possible remedy, existing or imagined, and allows the person having the interest to be enforced to select the remedy or group of remedies which look best when the time comes. This solution lacks grace and neatness but, again, in our opinion, is sound in the circumstances.

There is one important area with which this paper does not deal. That is the question whether a person should be allowed to own or trade in Canadian securities at all if he is not both a Canadian citizen and resident in Canada. Canada already has legislation which in effect denies a non-resident the right to own certain securities by means of constrained share provisions limiting to certain percentages the relative shareholding of a company which a non-resident may own.[1]

Other legislation creates discretionary standards which foreigners must satisfy before they are permitted to acquire certain Canadian securities.[2] Other legislation makes it more expensive to sell securities to a non-resident than to a resident.[3] Rules have also been created restricting the appointment of non-residents and foreigners to the boards of directors of Canadian companies.[4]

We prefer not to involve ourselves in the issue. Like the authors of the proposals for a new business corporations law for Canada,[5] we believe that the issue has no place in a general law such as a securities law. The real difficulty is that notions concerning foreign investment shift markedly from time to time and from region to region.[6] For example, in the Canadian federal election of

1 *For example, see* Bank Act, ss. 53, 54; Investment Companies Act, S.C. 1970-71-72, c. 33, s. 14; Trust Companies Act, R.S.C. 1970, c. T-16, ss. 38, 39. 5 Dickerson, Howard & Getz, 1 PROPOSALS FOR A NEW BUSINESS CORPORATIONS LAW FOR CANADA (Ottawa 1971) at 72.

6 Canada is by no means alone in enacting legislation controlling foreign investment. British restrictions are described in Sheldon, *Restrictions on Foreign Investments, United Kingdom*, [1976] INT'L BUS. LAW. 199; and in UNITED STATES

1911, Borden defeated Laurier in a campaign in which he urged: "No truck or trade with the Yankees". This cry is heard again in the 1970s, but in intervening years there were times when the national body politic almost unanimously favoured all obtainable foreign trade and foreign investment. In addition, there are differing regional opinions on the activity of foreigners. Rules which inhibit non-residents from investing in or buying Canadian businesses directly benefit those Canadian investors and businesses which have the financial and managerial resources to be in the investment and acquisition business. Most of those persons and institutions are located in Ontario.[7] It is a public relations coup of a high order that Ontario has succeeded in labelling as "nationalistic" the various measures which promote its investment, manufacturing and publishing industries. Proposals which benefit other regions by, for example, reducing tariffs on manufactured goods or permitting provinces to receive market value for their petroleum products are dismissed as "regional". The Québec government's rejection in 1970 of the Moore Committee proposals for "Canadianization" of the securities industry was one of the few cases when another region has articulated the point that the chief effect of a "nationalist" proposal emanating from Ontario would be to promote existing industry in Ontario by protecting it from foreign competition which might help Canadian customers and industry in other regions.[8]

There is no point in belabouring the issue here. Rules against non-residents will wax and wane.[9] We believe that it is better that the federal rules against foreigners be contained in other legislation, perhaps legislation dealing with the problem industry by industry or region by region. We assume in this paper that the

The restrictions on foreign investment in three European countries are set out in a series of articles; *see* de Marsac, *Restrictions on Foreign Investment - France,* [1976] INT'L BUS. LAW. 51; Haggeney, *Restrictions on Foreign Investment - West Germany, id.* at 59; Briner, *Restrictions on Foreign Investment - Switzerland, id.* at 67.

7 The Ontario Economic Council admits the point that Ontario has benefitted greatly from policies of economic nationalism; ONTARIO ECONOMIC COUNCIL, NATIONAL INDEPENDENCE, ISSUES AND ALTERNATIVES 4, 27 (1976).

8 Restriction of foreign ownership in the securities industry is criticized *id.* at 19; *see also* MOORE COMMITTEE, *Report of the Committee to Study the Requirements and Sources of Capital and the Implications of Non-Resident Capital for the Canadian Securities Industry.* (Trevor Moore, chairman, May 1970).

9 As this paper is being written, some evidence of waning is beginning to appear. *See e.g.* ECONOMIC COUNCIL OF CANADA, LOOKING OUTWARD (1975), a publication consisting in part of a rediscovery of free trade. *See also* ONTARIO ECONOMIC COUNCIL, *supra* note 7, at 18-19. Similarly, Canadian interest in investing in foreign countries will wax and wane. *See* Pritchard, *Small Investors Show Preference for U.S. Stocks,* The Globe and Mail (Toronto), December 11, 1975, at B1.

same securities rules will apply to all persons and it will be our task to investigate ways in which they can be made to apply in cases where some implementation is required outside the country.

A. EXTENT OF FOREIGN INVESTMENT IN CANADIAN SECURITIES

Some passing reference must be made to the extent of non-resident involvement in Canadian securities markets. If there were no non-resident involvement or if that involvement were negligible, it might be sensible to ignore it or specifically to exempt it. Such simple solutions do not commend themselves. Foreign investment in Canada is substantial.[10] This paper is concerned with only a portion of the total amount invested, namely, the amount invested in common and preferred shares and debt obligations of corporations. Even this amount is considerable.[11]

From the point of view of the nation as a whole, the most useful economic function of a securities market is to provide funds for business and government. However, attention is usually focused on a corollary feature: that an initial investor can change his mind and sell his investment to someone else. From the point of view of the individual investor this is probably the most important feature of securities markets. In 1973, companies listed on the Toronto Stock Exchange raised $195,217,927 by issuing shares from their treasuries. The total trading in shares on that exchange that year was $6,737 million. So there was approximately $35 of trading for every $1 of capital raised through the issue of new shares.[12] As of December 31, 1973, the total value of the shares listed on the Canadian securities exchanges, excluding rights and warrants, was probably in the area of $250 billion. The total value of those shares traded in that year was less than 5% of that, namely, $9,402,076,057.[13]

10 Statistics Canada estimated that the book value of foreign capital invested in Canada as at December 31, 1967, was roughly $35 billion; STATISTICS CANADA, FOREIGN INVESTMENT IN CANADA (1971). The amount has increased significantly in the intervening eight years.

11 Government securities will not be specifically considered in this paper though some sections, especially those on crime, will also be relevant to them. Generally speaking the various securities rules dealing with fair and accurate disclosure and representations of the issuer do not apply to governments since governments always reserve the right to keep secrets and (in the case of the Canadian federal government at least) adamantly, and as a matter of constitutional law, assert that they are not bound by their own representations. *See e.g.* Stickel v. M.N.R., 27 D.L.R. (3d) 721 (F.C.T. 1972), *rev'd*, 36 D.L.R. (3d) 153 (F.C.A. 1973), *appeal dismissed*, 47 D.L.R. (3d) 638, [1975] 2 S.C.R. 233 (1974); M.N.R. v. Inland Industries Ltd., 23 D.L.R. (3d) 677, 682 (S.C.C. 1971).

12 TORONTO STOCK EXCHANGE, ANNUAL REVIEW 50, 56 (1973).

13 *Id.* at 56. The $250 billion figure is very rough. The trading volume on the TSE

Total trading with non-residents in 1973 constituted a significant dollar amount and a significant percentage of the amount traded though not of the value of listed shares. Sales of Canadian common and preferred shares to non-residents totalled $1,398,300,000. Purchases of such securities from foreigners amounted to $1,422,000,000. Total foreign activity, therefore, reached $2,820,300,000. (It is misleading to compare this total of $2.8 billion with the trading volume of $6.73 billion unless we double up the latter figure to $13.46 billion so that it includes both sales and purchases.) In the same year, Canadians had substantial dealings in foreign securities with non-residents, buying $1.477 billion from non-residents and selling to non-residents $1.570 billion of foreign securities.[14]

B. INTERNATIONAL FINANCIAL CONTEXT

The foregoing description of the Canadian securities markets must be viewed in the context of a dynamic international situation. Greatly improved transport and communication has created, in recent years, an increasing interaction and interdependence in international financial markets. The trend to increased interdependence has been accelerated by the multinational corporations which operate in more than one country. Large American firms, especially, have found it profitable to operate in several countries at once and to finance their activities by borrowing wherever they can. The desire to borrow abroad began because of American attempts to prevent the outflow of investment dollars and the consequent development of a Euro-dollar market, but it has grown and continued until the treasurers of large corporations have become skilled in evaluating many currencies and money markets.[15] In turn, many European investors and businesses have

---

constitutes about two-thirds of the trading volume in Canada ($6,737 million as against $9,402 million; *see id.*). The total value of the securities listed on the TSE in 1973 was $194,764 million; *id.* at 50. If one applies the Toronto-Canada trading ratio of two-thirds, the result is a Canadian listing volume of about $300 billion. Of course the ratio of traded value to listed value may be quite different on other exchanges. And we would expect that there is an enormous duplication in the listing values since so many companies are listed on more than one exchange. Hence we conclude that $250 billion is a better estimate than $300 billion. In either case, the estimate is very rough.

14 Statistics Canada, Security Transactions with Non-Residents (July 1974). Another source of statistics on this matter is Ontario Securities Commission, Report of the Securities Industry Ownership Committee (E. Royce, chairman, 1972).

15 *See* Bodolus, *The Internationalization of the Securities Markets*, 29 Bus. Law. 107 (1974); Cohen, *International Securities Markets: Their Regulation*, 46 St. John's L. Rev. 264 (1971). As an example of the analysis of foreign securities now being

been attracted to the U.S. market because of a sound currency, low interest rates and a volume of trading which ensures liquidity.[16]

Interest in world stock exchanges is growing[17] and bodies such as the Fédération Internationale des Bourses de Valeurs are working on common listing standards, clearing arrangements, exchange memberships and taxes. While few markets rival in size those of New York, and few companies receive large sums from the sale of equities abroad, multinationals have found it beneficial to be better known to local financial communities, especially where they intend to expand into that community or to arrange debt financing there.[18] In a world of rising interest rates, it is the desire for access to new sources of capital which prompts much of this expansion.[19]

C. CANADIAN LEGAL FRAMEWORK

Each Canadian province has a commission, registrar or administrator charged with the administration of the securities laws and with some discretion in the registration of securities and securities traders. The commissions in the provinces with these bodies have wide powers to investigate offences against the securities acts. In addition, there are a number of provisions in the federal Criminal Code which apply to securities transactions.

The rules which have developed in Canada and in other jurisdictions that have attempted to regulate securities fall generally into four classes:

---

undertaken by U.S. investors, *see* Shohet, *Investing in Foreign Securities*, 30 FINANCIAL ANALYSTS J. 55 (September-October 1974).

16 Generally on the attempt by U.S. stock exchanges to attract foreign listings *see* Watson, *Global Role for U.S. Stock Exchanges*, [1974] COLUM. J. WORLD BUS. 42 (Spring); on international finance generally *see* H. Areskong, The Liberalization of International Capital Movements: International Financial Consequences (Salomon Brothers Center Working Paper, No. 41, undated).

17 It is not without opposition. *See* the report in Securities Week (New York) May 20, 1974, at 6, on the OECD study; and *see* Loveday, *The Integration of European Securities Markets*, [1974] STOCK EXCHANGE J. (June). *See* also M. Cohen, Report on the Concept of an International Over-the-Counter Market in Securities (December 1975 unpublished paper prepared for OECD) which advocates that a study of such a market be undertaken.

18 *For example, Six Big Board Stocks Go to Tokyo*, THE EXCHANGE (August 1974) (reporting on foreign exchange listings for major American companies); *and see* Garrett, *Is the SEC a Barrier to New York's Role in International Finance?* The Financial Times (London), June 10, 1974. A comprehensive discussion of the Tokyo market is found in Misawa, *Tokyo As an International Capital Market - Its Economic and Legal Aspects*, 8 VAND. J. TRANSNAT'L LAW 1 (1974).

19 It is open to sophisticated investors to profit by the fact that markets in different parts of the world often behave differently. *See e.g.* Bergstrom, *Spreading the Risk*, Barron's (New York), February 24, 1975, at 9; and Shohet, note 15, *supra*, at 183 n. 1.

(1) Registration of the issuing company and the securities being issued, including such specifics as initial and continuing disclosure requirements, rules requiring that an issue of securities be accompanied by a prospectus, or rules requiring approval of the securities for issue.
(2) Registration of persons other than the issuing company, including dealers and investment advisers.
(3) Rules about trading in securities. This is the largest of the categories and contains rules varying from technical rules such as those describing the material which management must send with a proxy to rules which in Canada are found in the Criminal Code and relate to false pretences and manipulation of stock exchange transactions. Included in this list would be rules on insiders, takeover bids, fraud, mail fraud, margin requirements, etc.
(4) The regulation of stock exchanges.

Chapter II
The Effect of International Features on Rules Developed for Canadian Transactions

As this paper is written, we are a long way from having a federal securities law or even a bill describing a federal securities law. However, as we state in chapter I, we assume that the rules set out in any such law should be the same for transactions which are entirely domestic and those which have some international element. Of course the rules might have some exempting or mitigating provisions so that transactions having very little impact on Canada can be exempted, or so that Canadian requirements might be specifically waived where there is an inability to reconcile the rules with a foreign system having a more substantial and significant connection. But if one is going to require that an issuer provide a prospectus with an issue of securities, there is little to recommend a system in which Canadian buyers receive more or less information than foreign buyers of the same securities.

Our paper, then, is concerned with the application of an essentially Canadian system to transactions having foreign elements. It is misleading to use an expression such as "international enforcement" since what we would be doing except in a few cases discussed below is applying Canadian rules. These might be applied in a Canadian jurisdiction or in a foreign one, depending on the sanctions which are incorporated in the Canadian system. At this stage it is important to consider the various situations in which the four basic types of rules described in the previous chapter may apply so that one may see the range of factors which may assume

an international aspect and begin sorting out those which cause problems or justify special Canadian regulation.

Consider the rules about registering the security issuer and the security itself. Their most common application occurs where the issuer is incorporated in Canada, does business in Canada, and sells only to Canadian purchasers. But many variations involving foreign elements are possible. There may be some foreign purchasers as well as Canadian purchasers. There may be no Canadian purchasers but only foreign purchasers of an issue.[20] There may be no Canadian but only foreign purchasers of all the issues of the company. It may be that the latter case is compounded by the further element that the company does not carry on business in Canada though it is incorporated here. The seat of management may also be abroad.[21]

Consider the converse possibility. The company is incorporated abroad, sells all its securities abroad, but carries on business here. Or it carries on no business here but lists its securities on a Canadian stock exchange. Assume that it is not listed here, never specifically sells its securities to the Canadian purchaser, but finds that Canadian purchasers have gone into foreign markets and acquired a few, some, or many of its securities. The problem in each case is to decide when Canada should regulate these situations and to what extent.

The second class of rules deals with the registration of dealers and securities other than those of the issuing company. Should a foreign broker who buys and sells stocks listed on a Canadian securities exchange be subject to Canadian jurisdiction? Should he be subject if he buys and sells outside Canada securities of Canadian companies which are incorporated in Canada but which are listed on a foreign exchange? Would it make a difference if the customers were in Canada? If a foreign investment adviser writes an article about a Canadian company, should he be required to register in Canada? Should it make a difference if he has no Canadian readers? Should it make a difference if none of his readers ever trade in a Canadian security?

Trading rules raise just as many issues. If a person in Canada communicates to a person abroad in violation of a rule relating to fraud, false pretences or manipulation of a stock exchange trans-

20 There have been several recent promotions of Canadian securities in Europe where the company has been inoperative in Canada, of which the Aquablast promotion is the most notable; *see* The Financial Post (Toronto), June 8, 1974, at 1.

21 In this situation the Appeal Division of the New Brunswick Supreme Court decided that the New Brunswick courts had jurisdiction to order the winding up of a federally incorporated company; *see* Re IOS Ltd., 43 D.L.R. (3d) 759 (N.B.C.A. 1973).

action, should that be a case for Canadian concern?[22] What if foreign buyers can succeed in taking over a Canadian company entirely through transactions on a foreign stock exchange? Should they be governed by Canadian takeover bid rules? Should a foreigner who qualifies as an insider comply with the insider trading rules? Should communications between one foreign trader and another, both located abroad, in which Canadian rules on fraud, mail fraud, false pretences, stock exchange manipulation, etc., are infringed, be governed by the rules applying in this country?

The fourth class of rules (relating to stock exchanges) is not considered in this paper. The legal regime governing a stock exchange is the jurisdiction in which it is situated. Consider first a stock exchange located in Canada. There may be rules about how companies incorporated in other jurisdictions deal with the exchange and these rules may differ from those governing how domestic firms deal with the exchange. But the enforcement of those rules against the exchange itself will be a domestic matter. If the transaction involves the infraction of a Canadian rule by a non-resident, that rule will be one of the other three types, perhaps a rule about margin requirements or about disclosing the beneficial owner of a nominee account. Depending on the circumstances, it may be possible to require compliance with the rule by taking action against the Canadian exchange or it may be necessary to chase the non-resident person. But enforcement against the exchange can be achieved without any extraterritorial activity.

What about stock exchanges located in foreign countries? Should a Canadian federal securities law attempt to regulate the London or New York Stock Exchanges? No. Canada may wish to make rules about the way in which Canadian issuers, brokers or investors conduct their affairs on such exchanges but those rules can be within the other three classes of rules. They should not purport to control the business of stock exchanges located in other countries.

Chapter III
Outreach of National Legal Systems Permitted by International Law

The extent of the outreach permitted national legal systems by international law depends to some extent on whether the rules

22 Under Canadian law it is a Canadian concern but under English law a different view is taken; *compare* Re Chapman, 5 C.C.C. (2d) 46 (Ont. C.A. 1970) *with* R. v. Brixton Prison Governor, *ex parte* Rush, [1969] 1 All E.R. 316 (Q.B. 1968).

governing the situation sought to be controlled are criminal or civil. Though the civil and criminal law rules have developed separately, one finds a number of common features. Both systems start from a notion of territoriality and both entertain examples of outreach based on expanded notions of territoriality. For example, a court will assert jurisdiction where not all of the constituent elements take place within the jurisdiction. The court may continue to describe the transaction as wholly domestic when in effect it may be requiring extraterritorial compliance with a domestic rule. When injury or damage is the only feature within the jurisdiction, then the "territorial" justification is more difficult to maintain and both civil and criminal courts assert jurisdiction on an "impact" theory, often coupled with a requirement that the impact be intentional or foreseeable. Notwithstanding these similarities, there are a number of differences between the civil and criminal rules and we shall examine them separately.

A. CRIMINAL LAW

There are five general principles on which penal or criminal jurisdiction is claimed. The first is territorial and determines jurisdiction by reference to the place where an offence is committed. This principle is widely regarded as the basic one and is generally respected by all states. As Marshall, C. J., said in *Schooner Exchange v. McFadden*:[23]

> "The jurisdiction of the nation within its own territory is necessarily exclusive and absolute. It is susceptible of no limitation not imposed by itself."

The territorial principle is neither as certain nor as rigid as it might seem. Where a crime occurs because a person in one state has committed an act which injures a person in another state it is common for the state where the injury occurred to claim that the crime in fact occurred in its territory. Thus, notwithstanding the basic English position that aliens will not be punished for breaches of the criminal laws committed outside England, in *R. v. Godfrey*[24] the court determined that a person who had been in England at all relevant times had committed the crime of obtaining goods in Switzerland by false pretenses through his communications with his partner in Switzerland and ordered his extradition to that country.[25] For the purposes of the territorial principle,

23 11 U.S. (7 Cranch) 116 (1812).

24 [1923] 1 K.B. 24.

25 *See* J. Brierly, The Law of Nations 300-01 (6th ed. 1963). In R. v. Markus, [1974] 3 All E.R. 705 (C.A.) the accused was convicted of inducing a person to take part in an arrangement to defraud even though his acts in England were limited to the processing of an application to take shares that had already been solicited in

courts often assume a constructive presence of the offender at the place where his act caused injury. This assumption of constructive presence is called the objective territoriality principle, although its relationship to territoriality is based upon notional presence.

The second basis of jurisdiction is nationality. Nationality bases jurisdiction on the nationality of the person committing the offence. This principle is also widely recognized although its application may differ substantially from country to country. Examples of an explicit claim based on the nationality principle are the sections of the Criminal Code prohibiting treason and piracy. The treason section states:

> "a Canadian citizen or a person who owes allegiance to Her Majesty in right of Canada,
> "(a) commits treason if, while in or out of Canada, he does anything mentioned in subsection (1); or
> "(b) commits treason if, while in or out of Canada, he does anything mentioned in subsection (2)."[26]

The United States and England have similar provisions.[27]

The third principle, the protective, determines jurisdiction by reference to the nation injured by the offence. This basis of jurisdiction is widely claimed yet is often regarded with a skeptical eye when asserted by someone else. An illustrative American case is *United States v. Pizzarusso.*[28] The defendant, a Canadian citizen charged with knowingly making a false statement under oath on a visa application in the U.S. Consulate in Montréal, was arrested and tried in New York. The court, on the question of jurisdiction, pointed out that a theory of objective territoriality would allow a state to punish acts abroad as if they had occurred in the state if these acts would produce detrimental effects within the state and

---

Germany. The court reasoned that no arrangement had been made until the application was approved, and the approval took place in England. In dismissing the appeal the House of Lords took a somewhat broader approach, holding that the activity in London constituted part of the "arrangement" by which the investor was defrauded; Secretary of State for Trade v. Markus, [1975] 1 All E.R. 598 (H.L.). The territorial principle is adopted by the ALI, RESTATEMENT (SECOND) OF FOREIGN RELATIONS LAW OF THE UNITED STATES, s. 17 (1965) [hereinafter cited as RESTATEMENT]. A note discussing extraterritorial application of U.S. securities laws argues that courts should not always assume jurisdiction merely because some conduct takes place within the jurisdiction; *see* note, *American Adjudication of Transnational Securities Fraud*, 89 HARV. L. REV. 553, 568-71 (1976).

26 Criminal Code, s. 46(3) *as amended by* S.C. 1974-75-76, c. 105.

27 18 U.S.C. s. 2381 (1970); and *see* United States v. Chandler 72 F. Supp. 230 (D. Mass. 1947); Kawakita v. United States 343 U.S. 717 (1952). *See also* R. v. Azzopardi, 1 Car. & K. 203, 174 E.R. 776 (Cent. Crim. Ct. 1843) (homicide); Trial of Earl Russell, [1901] A.C. 446 (King in Parl.) (bigamy). Other examples of Canadian assertion of the nationality principle may be found in Zucker, *Extraterritoriality and Canadian Criminal Law*, 17 CRIM. L.Q. 146, 161-65 (1975).

28 388 F.2d 8 (2d Cir. 1968).

U.S. courts would apply such a principle. However, the court went on to say that this principle was distinct from the protective principle because under the latter there need be no claim that the crime occurred within the United States, only that it had a "potentially adverse effect" on government functions.

The principle is sometimes expressed as if it applies only to conduct affecting government operations or national security.[29] Some authors describe it as applying also to the vital economic interests of the state.[30] There is authority for applying the principle to any conduct which is generally recognized as a crime in states which have reasonably developed legal systems.[31] Further, as we shall see in chapters IV and V, there is precedent for applying the protective principle in the securities regulation area.[32]

The fourth principle, universality, determines jurisdiction by reference to the state having custody of the person committing the offence even though custody was acquired long after the offence was committed. Until very recently this principle was regarded as no more than an auxiliary ground for jurisdiction except in the case of pirates, but it has also been used for war criminals.[33] The Geneva Conventions on Protection of War Victims and Prisoners of War require parties to try offenders against them whatever their nationality,[34] and Israel offered universality as one of the bases on which it claimed jurisdiction to try Adolf Eichmann.[35]

The fifth, and final basis of jurisdiction, is passive personality which determines jurisdiction by the nationality of the injured person. This principle is the most widely contested; it is vigorously

29 *See* T. Pickard, Criminal Enactment Jurisdiction: Transnational Problems 115 (unpublished paper for Law Reform Commission of Canada, July 1974).

31 *See* T. Pickard, *supra* note 28, at 115. *See also* Restatement, *supra* note 25, s. 18; Bassiouni, *Theories of Jurisdiction and Their Application in Extradition Law and Practice*, 5 Cal. W. Int'l L.J. 1, 11-19, 47-50 (1974).

32 A recent example is Bersch v. Drexel Firestone, 519 F.2d 974 (2d Cir. 1975), *cert. denied*, 423 U.S. 1018 (1975). The Court of Appeals, *id.* at 992, in a statement which combines the protective and territorial principles, said: "While merely preparatory activities in the United States are not enough to trigger application of the securities laws for injury to foreigners located abroad, they are sufficient when the injury is to Americans." The protective principle in securities cases is discussed in: note, *supra* note 25, at 556-57, 563-68.

33 Cowles, *Universality of Jurisdiction over War Crimes*, 33 Cal. L. Rev. 177 (1945). *See also* J. Starke, *supra* note 30, at 217 et.seq. The principle is extended to certain offences committed against "internationally protected persons" in legislation recently passed by Parliament; Criminal Law Amendment Act, 1975, S.C. 1974-75-76, c. 93, s. 3.

asserted by some states and just as vigorously denied by others. It has been asserted by Turkey in the *Lotus* case,[36] and by Mexico in the *Cutting* case,[37] but it is unpopular in common law countries.[38] A 1975 article stated that the principle has never been accepted by a Canadian court,[39] but it has now been accepted in Canadian legislation.[40]

The differing bases for asserting criminal jurisdiction over nationals can lead to conflicting claims. If criminal laws were substantially the same, the overlap of jurisdictions could be reduced to a minimum by allowing the state with the most substantial interest in the crime to try the parties. However, as a practical matter, transfer to another state is governed by extradition treaties which are restrictive and cumbersome and which do not necessarily provide for the transfer of persons to the state having the most substantial interest. However, it is clear that very broad claims for extraterritorial jurisdiction are made under the rubric of criminal law and that there is considerable authority in international law to support the exercise of broad jurisdiction.[41]

Treaties are another universally accepted method by which states obtain jurisdiction over criminal acts committed either in another country or in an area having no single territorial sovereign, such as the high seas. Typical examples are the conventions on the suppression of slavery and military agreements, such as those between Canada and the United States, by which the host nation grants criminal law jurisdiction to the visitor with respect to certain criminal acts committed by the latter's armed forces.[42]

36 S.S. Lotus, [1927] P.C.I.J., ser. A, No. 10. The case involved a French officer arrested in Turkey after a collision on the high seas had injured Turkish citizens.

37 For a short summary, *see* W. BISHOP, INTERNATIONAL LAW 459, 465 (2d ed. 1962). The case involved an American citizen arrested in Mexico for the libel of a Mexican committed in an American newspaper.

38 The best summary of the complex international law in this area, viewed from a common law perspective, is the draft convention and comments prepared by Harvard Research in International Law, *Jurisdiction with Respect to Crime*, 29 AM. J. INT'L L. SUPP. 435 (E. Dickinson, Reporter, 1935).

41 Criminal judgments may have effects in foreign jurisdictions. *See e.g.* Pye, *The Effect of Foreign Criminal Judgments in the United States*, 32 U. Mo. K.C. L. REV. 114 (1964). A review of the foregoing principles of criminal jurisdiction can be found in Bassiouni, *supra* note 31. The cases cited generally relate to problems of extradition.

42 *See* North Atlantic Treaty Organization Status of Forces Agreement, 4 U.S.T. 1792, T.I.A.S. No. 2846; J. BRIERLY, *supra* note 25, at 270-71. For a discussion of this treaty *see* Mueller, *International Judicial Assistance in Criminal Matters*, in INTERNATIONAL CRIMINAL LAW 410, 427-29 (G. Mueller & E. Wise eds. 1965) [hereinafter cited as G. MUELLER & E. WISE].

B. CIVIL ACTIONS

1. *Defendant Within Jurisdiction*

There are a number of different bases under which jurisdiction is claimed in civil cases. These bases are not as neatly classified as those described above for criminal law. However, some of the same general notions can be identified in the civil law cases. There are, for example, decisions based on the territorial, the impact and the universality principles, but nationality is seldom controlling in civil law situations (at least in the common law jurisdictions).

Under the common law system a court has jurisdiction over a defendant who is personally present and properly served within the jurisdiction. This principle is so firmly entrenched that jurisdiction was sustained in an action brought by one French resident against another when the defendant was served at Ascot, having entered England solely for the purpose of attending the races.[43]

The application of jurisdictional rules in civil cases is more difficult if the defendant is a corporation. For example, the simple question of "presence" creates several problems. Most corporation statutes provide that service may be effected upon a corporation incorporated within the jurisdiction by service on the registered office,[44] and that a corporation which is incorporated elsewhere and carries on business in the jurisdiction must register as an extraprovincial corporation and appoint an attorney to accept service of process in every suit or proceeding by or against it within the province.[45] If a foreign corporation is doing business within the jurisdiction but has not registered as required, it may still be served within the jurisdiction. In determining whether a corporation is doing business within the jurisdiction, the courts have considered, among other factors, the amount of time and attention which has been devoted, and the labour which has been applied within the province.[46]

Though the cases are difficult to reconcile, in many the bene-

43 Maharanee of Baroda v. Wildenstein, [1972] 2 All E.R. 689 (C.A.). *See also* Doyle v. Doyle, 52 D.L.R. (3d) 143 (Nfld. S.C. 1974).

44 *See e.g.* Companies Act, S.B.C. 1973, c. 18, s. 225 (which also permits service of a document on a company by personal service on any director, officer, manager or liquidator of that company).

45 *See e.g. id.* s. 326(1).

46 *See e.g.* Miller v. B.C. Turf Ltd., 8 D.L.R. (3d) 383 (B.C.S.C. 1969). There are also special rules if a company has agents in the jurisdiction; *see* Canada Life Insurance Co. v. C.I.B.C., [1974] 3 O.R. (2d) 70 (Ont. C.A.).

fit of the doubt has been given to the foreigner attempting to deny jurisdiction.[47]

Foreign corporations are also brought before the courts under rules of court which facilitate service on them as an extension of the basic rule which requires "presence". For example, Marginal Rule 55 of the Rules of the Supreme Court of British Columbia permits service of a writ against a foreign corporation by service upon any person who, within the province, transacts or carries on any of the business of or any business for a corporation whose chief place of business is outside British Columbia.

Marginal Rule 64(c) provides for service out of the jurisdiction on any person domiciled or ordinarily resident within the jurisdiction.[48] Both of these rules provide a method of pursuing people who at one time have been within the jurisdiction.

Although the basic requirement in the Rules of Court is personal presence, jurisdiction can also be achieved without it. One example is submission to the jurisdiction of the court. This submission may be manifested in several ways, including appearance in a case or specifically contracting to accept the jurisdiction of a particular court.[49] Submission to a jurisdiction and contracting in favour of a jurisdiction are unknown in criminal law but common in civil law. These principles are useful when a regulatory agency wishes to ensure that it can enforce its orders in courts in its own country.

2. *Defendant Outside Jurisdiction*

There are several types of cases in which civil courts assert jurisdiction even when the defendant is not physically in the jurisdiction, either in fact or notionally.[50] Many of these cases are decided on the same rationale as the claims of territoriality relating to crime. In some, jurisdiction is founded on subject matter in

47 *See e.g.* Re Geigy (Canada) Ltd., 66 W.W.R. 689, 1 D.L.R. (3d) 354 (B.C.S.C. 1968) (foreign manufacturer not carrying on business under Sales Tax Act because contracts made in Montréal); Wat-cha Farms Ltd. v. Charolais Int'l Inc., [1971] 5 W.W.R. 554 (Alta. S.C.) (defendant owned cattle within jurisdiction but they were managed by a local company); Weight Watchers Int'l Inc. v. Weight Watchers of Ontario Ltd., 31 D.L.R. (3d) 645 (Ont. H.C. 1972) (foreign franchiser under licence agreement not doing business in Ontario though some negotiations there).

48 *See also* A. DICEY & J. MORRIS, THE CONFLICT OF LAWS 176 (9th ed. 1973) [hereinafter referred to as A. DICEY].

49 The English cases are discussed *id.* at 167. The leading U.S. case is Bremen v. Zapata Off-Shore Co., 407 U.S. 1 (1972). For Canadian authorities on the validity of contracts to accept jurisdiction, *see* Cowen & Mendes Da Costa, *The Contractual Forum a Comparative Study*, 43 CAN. B. REV. 453 (1965); and *see* E.K. Motors Ltd. v. Volkswagen Canada Ltd., [1973] 1 W.W.R. 466 (Sask. C.A.).

50 *See generally* W. WILLISTON & R. ROLLS, 1 THE LAW OF CIVIL PROCEDURE 323ff. (1970).

the jurisdiction and such cases are really *in rem* claims. For example, under the B.C. Supreme Court Rules it is permissible to serve a person out of the jurisdiction where the whole subject matter of the action is land within the jurisdiction or where the action is to construe, enforce, rectify or set aside any act, contract, deed, will or other obligation affecting land within the jurisdiction.[51] The rules are substantially similar in England and Ontario.[52] In addition, the writ may be served outside the jurisdiction where the action is by a mortgagee or mortgagor in relation to a mortgage of property within the jurisdiction.[53]

Land cases are readily distinguishable from securities cases since companies and securities are not normally thought of as immovable property. A company may be incorporated in state A, have all its officers in state B, all its directors in state C, all of its shareholders in state D and carry on business only in state E. A rule by which, for example, the state of incorporation claims jurisdiction over all transactions in shares between shareholders is plausible; but it is less likely of international recognition than a rule by which the place where land is located claims jurisdiction over trades between owners of that land when the owners are located outside the jurisdiction.

Another territorial type of civil rule, available under the Supreme Court Rules of British Columbia and formerly in Ontario,[54] holds some promise as a guide to expansion of the jurisdiction of the securities laws. Under this rule the court has jurisdiction when a defendant has assets within the province of at least $200 in value. One of the philosophical underpinnings of this rule is the same as that underlying the rules relating to land referred to above, the notion that if an asset is located within a jurisdiction, the courts of that jurisdiction can make orders affecting the ownership and disposition of the asset.

Service upon the foreign defendant under the Ontario rule was upheld in the case of *Gibbons v. Berliner Gramophone Co. Ltd.*[55] The plaintiff sought leave in Ontario to serve his writ in Québec; the contract on which the action was based was founded upon an oral arrangement which was made in Montréal and subsequently confirmed in writing. The defendant company carried on business in Montréal and its assets were substantially all in

Québec. It had customers throughout Canada, including Ontario, who were indebted to it. Its contracts with its debtors called for monthly settlement; these revolving debts were the assets in Ontario upon which service was based. In the Appellate Division the court emphasized that the services were performed by the plaintiff in Ontario, that the defendant was also carrying on business in that province and had books and accounts there. Meredith, C.J.O., stated:

> "To read the Rule as (counsel for the defendant) would have us read it, would practically wipe out the provision which was enacted to cover cases where persons living near the border were trading on each side of the line. It was felt a great hardship that, although there were assets in the Province, the creditor had to go to the neighbouring Province and sue there in order to recover his debt."[56]

A case in which jurisdiction was rejected is *Brenner v. American Metal Co.*[57] The facts are not clearly disclosed in the reports, but it appears that the amount sought to be recovered was $91,000, that the contract was made in New York State, that the breach occurred there and that the defendant had assets of approximately $1,000 in Ontario. The main assets of the defendant were in New York. At first instance, Middleton, J., stated that it was "a mere accident that there is some transient property in this country".[58] In the reported judgments there is a clear reluctance to assert jurisdiction based on so small an amount within the jurisdiction. Middleton, J., said:

> "Where our Court assumes to exercise an extraterritorial jurisdiction, and the foreigner has not in any way attorned to our jurisdiction, and the only excuse or justification for the assertion of jurisdiction over him is the existence within the Province of assets which may be reached by execution (Rule 25(h)), manifestly the situation is one of delicacy and one calling for the exercise of the most careful judicial discretion. It is not seemly that a command should issue from our Sovereign to the subject of another State calling upon him to submit himself to the jurisdiction of our Courts, save in the clearest possible cases."[59]

And in the Appeal Court, Meredith, C.J.O., said:

> "The Rule [citation omitted] is an extraordinary one; it is

56 13 D.L.R. at 378.

57 64 D.L.R. 149 (Ont. C.A. 1921), *aff'g*, 57 D.L.R. 743 (Ont. H.C. 1920).

58 57 D.L.R. at 744.

59 *Id.* at 743-44.

> a Rule that does not exist in any other country; and, if my recollection is right, it has been said to be contrary to international practice."[60]

The Divisional Court drew the additional distinction, one which in fact is uncommon in cases of this kind, that the "foreign" jurisdiction involved in the *Gibbons* case was a Canadian jurisdiction whereas in the *Brenner* case the jurisdiction was a foreign one, namely, New York.

The rule on which the *Brenner* and *Gibbons* cases are based suggests that a securities law might adopt the device of requiring persons outside the jurisdiction to leave (forfeitable) deposits within the jurisdiction so that actions can be begun and proceeded with there.[61]

The *Brenner* court's concern that the jurisdictional claim over the foreign corporation was almost accidental would not arise if the jurisdictional claim were based on the foreign person's intentional deposit of funds in this country for the express purpose of providing jurisdiction and an amount from which a judgment or fine might be satisfied, and as a condition precedent to carrying on a securities business. In the half century which has elapsed since *Brenner*, businessmen have become inured to systems by which they must put up security before being allowed to conduct business within a particular jurisdiction.

We have discussed the territorial principle in civil cases. There are in addition a number of specialized rules with respect to particular civil actions. In contract, the British Columbia and Ontario rules are quite narrow and limit jurisdiction to cases where the breach is committed within the province.[62] The English rules are broader, and extend the claim to those cases where the contract by its terms or by implication is governed by English law.[63] The governing law is the law of the legal regime found by the court to be the appropriate or proper one for the transaction being considered. The English courts follow a flexible approach to determining this "proper law" as it is called. In the typical reported case an English court analyzes the facts to determine the proper law and then goes on to apply that law, either English or foreign. Here we are not concerned with that case, but with the

60 64 D.L.R. at 150.

61 Payment of deposits has the disadvantage of being anti-competitive in that it tends to restrict the market to established and large businesses which have less concern to find working capital than many firms just going into business.

62 B.C.S.C.R., Marginal Rule 64(e); O.R.P. 25(1)(e).

63 A. Dicey, *supra* note 48, at 179-83. For a recent example see British Duneston Appliances Ltd. v. Cummins Engine Company Inc., reported in The Globe and Mail (Toronto), November 28, 1975, at 6, col. 7 (Ont. C.A. November 26, 1975).

corollary rule that if the proper law is English, the English court has jurisdiction.

The English approach to the proper law of the contract is especially relevant to securities rules. In criminal cases, courts refuse to apply the criminal law of another state. Consequently the determination of the question of jurisdiction also determines what law is to apply. In civil cases the issues of jurisdiction to try and applicable law may be separated. The English rule reunites the two issues. Such a rule in a Canadian securities law would ensure that Canadian courts can try civil cases involving securities even if the defendants were abroad so long as it is clear that Canadian law is applicable in a substantive though not in a jurisdictional sense.

An illustrative case is *Kleinwort v. Ungarische Baumwolle.*[64] The plaintiff was a London bank which had accepted a bill of exchange drawn by a Hungarian company and guaranteed by a Hungarian bank. Payment was to be made in London. During the period between the acceptance of the bill and the time for payment, Hungarian legislation was passed declaring it illegal for the payment to be made. The English court held that the proper law governing the transaction was English and gave judgment against the two foreign defendants notwithstanding the Hungarian legislation. Though the jurisdiction of the English court was not in issue, the decision that the proper law was English meant that the court asserted its right to give judgment against both foreign defendants.[65] From the point of view of the two Hungar-

64 [1939] 2 K.B. 678, [1939] 3 All E.R. 38 (C.A.).

65 A contrasting case arising from the same type of foreign law is Kahler v. Midland Bank Ltd., [1950] A.C. 24, [1949] 2 All E.R. 621 (H.L. 1949). The plaintiff, a Czechoslovakian national who had been resident in Czechoslovakia, was a customer of a Czechoslovakian bank and he had bought on the London Stock Exchange some shares in a Canadian company. The shares were held on his behalf by the Czechoslovakian bank. However, the actual certificates were held by the Midland Bank in London in an account in the name of the Czechoslovakian bank. After the German occupation of Czechoslovakia the plaintiff, as a condition of obtaining permission to leave Czechoslovakia for the United States, transferred his shares to a new bank in Czechoslovakia. The initial Czechoslovakian bank wrote to the Midland Bank and asked it to transfer the shares to the account of the new bank. At this time the beneficial ownership of the shares became known to the Midland Bank and they were recorded in the plaintiff's name. After the war, the plaintiff sought to obtain his shares from the Midland Bank but the Midland Bank refused to deliver them on the ground that delivery was forbidden by Czechoslovakian exchange control restrictions which had been in effect throughout the period. The courts held that the proper law was Czechoslovakian and that the rights of a person now resident in the United States to obtain share certificates in a Canadian company from a London bank were subject to foreign exchange restrictions in Czechoslovakia. As in the Kleinwort case, jurisdiction was not an issue; however, the decision shows that the English courts were prepared to defer to the Czechoslovakian courts on the disposition of securities held for safekeeping in a London bank.

ian banks the only English features to the transaction were that England was the place of payment.

There are also useful analogies for a securities law to be found in the law of torts. Again the rule is that a writ may be issued for service outside the jurisdiction if a tort has been committed within the jurisdiction.[66] Interesting situations arise when the persons involved in the tort are located in different jurisdictions.

Defamation cases provide a good starting point for discussion of the tort rules. In *Kroch v. Rossell*[67] the English Court of Appeal held that a libel was committed in England by the distribution there of newspapers published in Belgium and France.[68] Similarly, in *Jenner v. Sun Oil Co.*,[69] McRuer, C.J.H.C., held that a defamatory broadcast in New York heard in Ontario constituted a tort committed within Ontario. The *Jenner* case was followed by the Supreme Court of Canada in *CAPAC v. International Good Music Inc.*[70] where the issue was whether a Canadian court in British Columbia had jurisdiction with respect to transmissions from a television station in Washington State.

Another case involving transmission of words was *Original Blouse v. Bruck Mills.*[71] In this case the tort alleged was deceit. The defendant was a Montréal cloth manufacturer which had represented to the plaintiff in Vancouver that it could supply certain material conforming to a sample. The material proved to be unsuitable and the plaintiff sued to recover damages resulting from its inability to meet its commitments to its own customers. Aikins, J., stating an increasingly common view on interjurisdictional transactions, said:

> "I think in these circumstances that the lack of any act literally done by an officer or servant of the defendant in this jurisdiction is immaterial because such officer or servant of the defendant who wrote or spoke on the telephone was putting in motion a chain of events which he knew would result in the representations reaching the plaintiff in Vancouver."[72]

In essence, the judges in the foregoing "words" cases have been applying the impact test when claiming jurisdiction over foreign defendants.

However, the courts have been surprisingly slow to apply the

impact theory to cases where a product is carelessly manufactured in one jurisdiction and then sold to a person who is injured in another jurisdiction.[73] In a recent decision, *Moran v. Pyle National (Canada) Ltd.*,[74] the Supreme Court of Canada decided in favour of a wider basis of jurisdiction. The plaintiff was an electrician who received an electric shock in Saskatchewan when removing a light bulb manufactured by the defendant. He claimed that the defendant was negligent in the manufacture and construction of the bulb. The defendant did not carry on business in Saskatchewan, and had no assets, salesmen or agents there. All of its manufacturing and assembling took place in Ontario. Dickson, J., reviewed the authorities in considerable detail, including a similar recent case decided by the Privy Council in favour of an injured plaintiff.[75] In concluding that the Saskatchewan courts had jurisdiction, Dickson, J., said:

> "[T]he following rule can be formulated: where a foreign defendant carelessly manufactures a product in a foreign jurisdiction which enters into the normal channels of trade and he knows or ought to know both that as a result of his carelessness a consumer may well be injured and it is reasonably foreseeable that the product would be used or consumed where the plaintiff used or consumed it, then the forum in which the plaintiff suffered damage is entitled to exercise judicial jurisdiction over that foreign defendant. This rule recognizes the important interest a State has in injuries suffered by persons within its territory. It recognizes that the purpose of negligence as a tort is to protect against carelessly inflicted injury and thus the predominating element is damage suffered. By tendering his products in the marketplace directly or through normal distributive channels, a manufacturer ought to assume the burden of defending those products wherever they cause harm as long as the forum into which the manufacturer is taken is one that he reasonably ought to have had in his contemplation when he so tendered his goods."[76]

In short, the conflict of laws cases involving torts support a theory of jurisdiction based on the defendant's knowledge that his act within one jurisdiction will have effects within another. The analogy between these cases and the securities law area is strong,

73 A. Dicey, *supra* note 48, at 188-89; Hebenton, *Jurisdiction: The Place Where a Tort Is Committed*, 2 U.B.C. L. Rev. 361, 364-75 (1966).

particularly with respect to rules governing filings, disclosure, insider reporting and the like, where an erroneous statement made in one jurisdiction foreseeably will have an adverse economic effect in another.

Another way in which courts of one state obtain jurisdiction over persons resident in another is through treaties specifically negotiated for that purpose between the respective governments. Such treaties are beginning to appear in certain specialized areas such as transportation,[77] although they remain less common in civil areas than in criminal.

C. ECONOMIC REGULATION

Before discussing the present use of domestic securities laws to control activities outside the country, we shall consider other laws relating to economics and finance which are extraterritorially enforced. When regulating economic activity the territorial principle is most often asserted as the basis of jurisdiction. However, one interesting phenomenon of recent years has been the proliferation of prosecutions by nations under their own laws where the only claim of jurisdiction is that the proscribed acts have effects within the state. The use of the "impact" justification has been especially marked in the area of regulation of commerce, perhaps because of the growing interdependence of national economies.

States are less willing to accept their neighbours' use of the impact or objective territoriality principle to assert jurisdiction in the economic area as opposed to the criminal.[78] There is some justification for this resentment of the impact theory to justify control of the economic activity of persons abroad. In the economic area national interests are much more diverse and there is less likelihood of general agreement than there is on the question of prohibition of conduct leading to injury of persons or property.

The most frequently discussed problem in the extraterritorial application of economic laws is the American antitrust legislation.[79] It is unfortunate that antitrust regulation has been taken

77 *See* A. DICEY, *supra* note 48, at 171-72.

78 A good example is the nylon litigation in which an English court enjoined an English company (which had been a party to U.S. antitrust proceedings) from complying with an American judgment where such compliance would have affected the rights of another British company which was not a party to the American litigation. *See* United States v. Imperial Chemical Industries (I.C.I.), 100 F. Supp. 504 (S.D.N.Y. 1951); United States v. I.C.I., 105 F. Supp. 215 (S.D.N.Y. 1952); British Nylon Spinners v. I.C.I., [1953] ch. 19, [1952] 2 All E.R. 780 (C.A. 1952); and British Nylon Spinners v. I.C.I., [1955] ch. 37, [1954] 3 All E.R. 88.

79 The basic statutes are the Sherman Act, 26 Stat. 209 (1890) *as amended*, 15 U.S.C. ss.

to epitomize extraterritorial economic regulation because monopolies are given very different legal treatment in different countries. The U.S. position is set out by Learned Hand, J., in the *Alcoa* case, as follows:

> "We should not impute to Congress an intent to punish all whom its courts can catch, for conduct which has no consequences within the United States....On the other hand, it is settled law...that any state may impose liabilities, even upon persons not within its allegiance, for conduct outside its borders which the state reprehends...."[80]

The American cases have focused on the question of effect on that country, and have either ignored or considered very briefly how far such laws should be extended or at what point the interest of the United States in the conduct complained of is less than that of other states.[81] If the judges were applying a criminal law that was basically the same in each state this might be sufficient. Unfortunately, they were attempting to enforce a law unique to the United States[82] against persons, many of whom were operating as they were allowed, and sometimes encouraged to do, abroad.[83]

One approach a court may take when faced with the problem of the application of a local law to foreign nationals is to consider whether there is a mandate from the local legislature to apply the law outside the jurisdiction and the probable efficacy of such an application. For example, in *Airline Stewards & Stewardesses Association, International v. TWA*,[84] the union certified for the stew-

---

1, 2 (1964); the Clayton Act, 38 Stat. 730 (1914) *as amended*, 15 U.S.C. ss. 12-27 (1964); and s. 5 of the Federal Trade Commission Act, 38 Stat. 717 (1914) *as amended*, 15 U.S.C. s. 45. The basic cases are American Banana Co. v. United Fruit Co., 213 U.S. 347 (1909); United States v. Aluminum Co. of America, 148 F.2d 416 (2d Cir. 1945); and for a selection of comments *see* P. AREEDA, ANTITRUST ANALYSIS (1967); INT'L LAW ASSOC., REPORT ON 51ST CONFERENCE 304-592 (1965); K. BREWSTER, ANTITRUST AND AMERICAN BUSINESS ABROAD (1958).

80 United States v. Aluminum Co. of America, 148 F.2d 416, 443 (2d Cir. 1945).

81 An excellent discussion of this problem is contained in Trautman, *The Role of Conflicts Thinking in Defining the International Reach of American Regulatory Legislation*, 22 OHIO ST. L.J. 586 (1961), although the suggested reform is limited to a dominant interest approach. On European antitrust *see* Jacquemin, *Application to Foreign Firms of European Rules on Competition*, 19 ANTITRUST BULL. 157 (1974); and INT'L BAR ASSOC., 1974 CONFERENCE REPORT ON EXTRATERRITORIAL APPLICATION OF NATIONAL LAWS WITH SPECIAL REFERENCE TO ANTITRUST LAW (1974).

82 In degree if not always in form. *But see* the discussion of this problem from the point of view of discovery of documents in Smith, *Discovery of Documents Located Abroad in U.S. Antitrust Litigation*, 14 VA. J. OF INT'L L. 747 (1974).

83 One particularly startling example of the insensitivity of some Americans to the antitrust laws is the proposal to charge OPEC under them; *see* The Wall Street Journal, May 20, 1975, at 22, col. 4.

84 173 F. Supp. 369 (S.D.N.Y. 1959), *aff'd*, 273 F.2d 69 (2d Cir. 1959), *cert. denied*, 362 U.S. 988 (1960).

ards of Trans World Airlines sought to compel TWA to recognize it as agent for fifty stewards who were foreign nationals, based abroad and serving flights wholly outside the United States. The court dismissed the application, enumerating sixteen criteria to be considered when the extraterritorial application of federal law was in question. Its review of these criteria led the court to its identification of the dominant interest in the activities to be controlled and to its conclusion that the United States did not have the dominant interest. The *Airline Stewards* case is an extension of the leading case of *Lauritzen v. Larsen,* in which the court held that the Jones Act (seamen's welfare legislation) would not be applied for the benefit of a seaman when another country had a greater interest in controlling the liabilities that arose from his injury.[85]

Another potentially important case is *Securities and Exchange Commission (SEC) v. Myers,*[86] a case in which the district court granted a SEC petition to enjoin a Canadian investment dealer from soliciting American clients without registration under the Investment Advisers Act. The court recognized that the defendant intended to disregard the order, but it pointed out that the Alberta Securities Commission had aided the SEC in the past and there was reason to expect further cooperation in the interests of reciprocity.[87] The *Myers* case is interesting, and, it is hoped, prophetic, because it goes one step beyond the dominant-interest analysis of *Lauritzen v. Larsen* and the *Airline Stewards* case. Can conflicts between jurisdictions really be settled satisfactorily by identification of the jurisdiction with the dominant interest? If a state identifies itself as having the dominant interest should it apply its rules without further consideration? While a dominant interest analysis is only now being recognized as a consideration in tort and economic regulation, it has not the magic properties sometimes ascribed to it. There remains the problem of making the rules to be applied tolerable if not fair to all the states concerned.

It is difficult to identify the interests and policies of all the jurisdictions involved, and even when they are identified the analysis gives no method by which they may be resolved. Even if,

85 345 U.S. 571 (1953); *see also* Reynolds, *Extraterritorial Application of Federal Antitrust Law: Delimiting the Substantive Law under the Sherman Act,* 20 VAND. L. REV. 1030 (1967); note, *Extraterritorial Application of the Antitrust Laws: A Conflict of Laws Approach,* 70 YALE L. J. 259 (1960); Steele v. Bulova Watch Co., 344 U.S. 280 (1952) (application of Lanham Trademark Act proper in view of fact that Mexico has expunged trademark and extraterritorial application would not interfere with its sovereignty).

86 285 F. Supp. 743 (D. Md. 1968).

87 Other interesting examples of accommodations to foreign interests are set out in Kinter & Hallgarten, *Application of United States Antitrust Laws to Foreign Trade*

for instance, the United States finds it does not have a dominant interest in some transaction, can it not still decide to regulate it? Myres McDougal commented on the *Alcoa* case (American and Canadian companies controlling sale of aluminum) and the *Swiss Watch-makers* case (a government-promoted watchmakers' cartel in Switzerland) by saying:

> "When Switzerland or Canada or any other country employs its governmental processes to protect business entrepreneurs in activities which impair the healthy functioning of community processes within the United States, it is interfering with the internal domestic affairs of the United States fully as much as the United States may be interfering with the internal affairs of such other country in applying its antitrust laws to the injury causing activities. Agreements made by private entrepreneurs in Switzerland and Canada, and ostensibly protected by the laws of those countries, may affect or determine the prices which I must pay within the United States for aluminum and watches. In an interdependent world interference by States in each other's community processes, including economic affairs, is inescapable. The question is by what principles and procedures such interference can be moderated and made reciprocally tolerable in the maintenance and expansion of an international economy."[88]

The problem is not which interest is dominant but how the impact of one state on another is to be made reciprocally tolerable. We can offer little assistance.[89] We only point to the problem and recommend that the rules be drawn with it in mind.

D. CONCLUSION

There are a number of bases of jurisdiction upon which Canada may extend the ambit of its securities laws. Criminal jurisdiction may be based on the territorial, nationality or impact princi-

and Commerce - Variations on American Banana since 1909, 15 B.C. IND. & COMM. L. REV. 343, 360-67 (1973).

88 INT'L LAW ASSOC., *supra* note 79, at 331.

89 One of the most sensitive discussions of the international regulation of securities is Jones, *An Interest Analysis Approach to Extraterritorial Application of Rule 10b-5,* 52 TEX. L. REV. 983 (1974). This article attempts to analyze all the 10b-5 cases discussed in the next chapter in terms of conflicts of laws principles and dominant interest analysis. The problem of reconciling American principles of competition with other people's notions of state enterprises is arising again, as this paper is written, in relation to the role of the Saskatchewan government in the marketing of potash.

ples. We do not recommend resort to the passive personality or universality principles. Using the three bases we recommend, a system of criminal securities law rules can regulate persons in Canada, Canadians wherever located and persons producing detrimental effects in Canada.

In the civil law area there are similar precedents, notably rules based on territorial and impact justification. More particularly, there are rules which allow an action to be brought if there are assets within the jurisdiction or where the proper law of the transaction is that of the jurisdiction. The civil jurisdiction may be accepted or submitted to by contract. Both the civil and criminal law areas can be expanded by treaty.

However, as our section on economic regulation indicates, the extension into other jurisdictions of rules affecting their commerce and economics can create great difficulties. We recommended that economic regulation affecting conduct in other countries should be circumspect and based on sound, practical justification.

Chapter IV
Extraterritorial Application of Securities Laws - The Example of Other Jurisdictions

A. UNITED STATES FEDERAL SECURITIES LAW

From the time of the New Deal the United States has striven to maintain a securities market in which large numbers of investors, even those with a small amount of money, may participate with some degree of protection. Both to protect the small shareholder and to give him confidence that the value of his share is not being manipulated, the SEC has set up a system of relatively complete disclosure of corporate information. While the federal law in the United States has not gone as far as those state laws which empower a commission to decide which securities will or will not be sold, it does create a very comprehensive scheme of initial and continuing disclosure for issuers of stock.

The American securities laws are the most highly developed in any free enterprise country and at the same time the most restrictive of corporate activity. It seems to be a characteristic of highly developed national schemes of regulating any activity, whether it be antitrust, tax collection or labour legislation, that the administrators try to reach out beyond their own borders. This outreach is certainly characteristic of American securities regulation. We can learn about the difficulties the Americans have encountered, and perhaps what we will need to regulate, from

looking at some segments of the American securities laws and their application abroad.[90]

1. *United States and the Foreign Issuer*

a. *Which Foreign Issuers Are Subject to U.S. Rules?*

Prior to 1964, the U.S. federal securities legislation applied to a foreign issuer only if the issuer either made a distribution of securities to the American public or listed a class of its securities on a national stock exchange in the United States.[91] In what was essentially a reform of domestic law governing over-the-counter markets, Congress in 1964 passed amendments to the Securities Exchange Act of 1934 (the "Exchange Act") enacting a new section 12(g) which extended the application of that act to the securities of an issuer engaged in a business affecting interstate commerce (which includes foreign commerce) with more than $1 million in assets and a class of equity securities owned by at least 500 shareholders.[92] Recognizing that the expansion of the regulatory net could result in unfairness, Congress in section 12(g)(3) authorized the SEC to exempt the securities of a foreign issuer if the commission found that an exemption was in the public interest and was consistent with the protection of investors.[93] After protracted negotiations including, at one point, diplomatic protests from Canada, the SEC promulgated Rule 12g3-2 to reduce the number of foreign issuers whose securities had to be registered. The rule exempts foreign securities if there are fewer than 300 American shareholders and exempts the foreign issuer from registration under section 12(g) pursuant to 12g3-2(b) if the foreign issuer registers its securities under a less onerous regime created by the rule. To qualify for a 12g3-2(b) exemption, a foreign

90 A short summary of the Canadian-U.S. relationship from the American point of view is Loss, *International Securities*, in NATIONALISM AND THE MULTINATIONAL ENTERPRISE 257 (H. Hahlo, J. Smith & R. Wright eds. 1973). A short summary of U.S. federal securities law from the point of view of a Canadian corporation wishing to issue shares in that country is Sobie, *The Canadian Corporation and Wall Street: Application of the United States Securities Laws to Canadian Issuers*, 6 WESTERN ONT. L. REV. 93 (1967). A longer and more detailed summary of American law (including state laws) is contained in J. WILLIAMSON, c. XII. The application of American law to Canadian companies issuing in the United States is also discussed in J. WILLIAMSON, SUPP. at 312-37.

91 Hovdesven, *Applicability of the Registration and Reporting Requirements of the Securities Exchange Act to Foreign Issuers*, PLI, SIXTH ANNUAL INSTITUTE ON SECURITIES REGULATION 353, 354 (R. Mundheim, A. Fleischer Jr., J. Schupper, J. Jewett & J. Thomson eds. 1975).

92 Securities Exchange Act of 1934, as amended by Securities Exchange Act of 1934 Amendment of 1964, Pub. L. No. 88-647, 78 Stat. 565 (1964). *See* Hovdesven, *supra* note 91, at 354-55.

93 *Id.* at 355.

issuer must furnish to the SEC the information that it makes public under its domestic law, files with a securities exchange or distributes to its shareholders. The information need not be in English though if an English translation has been made, it must be supplied instead of the foreign version.[94]

The commission publishes a list of foreign issuers which have submitted material pursuant to 12g3-2(b)[95] to bring to the attention of brokers, dealers and investors that some current information concerning the issuers is available in the public files of the commission. As of July 31, 1976, 152 foreign issuers have qualified under Rule 12g3-2(b).[96]

The commission has not aggressively pursued foreign issuers which have not applied for the exemption but it does maintain a list of foreign issuers which are offering or selling securities to American investors without complying with the registration provisions of the Securities Act.[97] The list, referred to as the Foreign Restricted List, is intended to alert brokers, dealers and others to the fact that the issuer has not complied with the registration provisions and is an indirect means of controlling foreign issuers, since American brokers and dealers generally will refuse to participate in a transaction involving an issuer on the list[98] in order to avoid involvement in an unlawful distribution. Control by listing on a list of offenders has been judicially approved; in *Kukatush Mining Corp. v. SEC*,[99] the Circuit Court dismissed a Canadian company's action for a declaratory judgment that the inclusion of its name in the list was invalid. The court held, *inter alia*, that the list was not a blacklist and did not state or imply that the Canadian company was involved in any illegal act. Rather, it was simply a warning to brokers and dealers to make sure that *their* transactions were not illegal.[100] Moreover, the Post Office Department has, on occasion at the SEC's suggestion, issued "foreign fraud orders" barring the use of the mails to companies on the list.[101] As L. Loss points out, this request is "presumably on the theory of an

implied misrepresention of marketability though this is by no means automatic for securities on the restricted list".[102]

b. *The Rules Applicable to Different Classes of Foreign Issuer*

The American system has developed piecemeal and is rather complicated. The type of registration and disclosure depends on the nature of the foreign issuer's activity in the United States and on its place of origin. The Americans have concluded that more can be demanded of Canadians than most other issuers in view of the similarities in corporation law and accounting practice in the two countries. Technically, Canada is not singled out; the different category is "North American and Cuban". Because virtually all the issuers in this category are Canadian,[103] this paper refers to it as "Canadian".

Public offerings in the United States by foreign issuers are governed by the Securities Act of 1933.[104] The registration form and the requirements including those relating to financial statements are the same for a foreign as for a domestic issuer.[105] Concessions with respect to prospectus requirements have been made in such areas as disclosure of management compensation, financial reporting and independent audits.[106] But even though some leeway is granted to the foreign issuer, substantial compliance with the U.S. domestic disclosure standards is generally required of foreign issuers who offer their securities to the American public.[107]

Greater deviation from domestic norms is accorded foreign issuers who list their securities on an American stock exchange without an offering to the American public. A Canadian company which lists on a U.S. exchange must register with the SEC and thereby becomes subject to the reporting requirements of section 13, the proxy requirements of section 14 and the insider trading provisions of section 16 of the 1934 act. The reporting requirements are substantially the same for a Canadian as for an American issuer.[108] A non-Canadian issuer, on the other hand, registers on a significantly less burdensome form and is exempt from the

108 Hovdesven, *supra* note 91, at 362-63.

proxy and insider trading provisions.[109] The registration form does not require the extensive and detailed disclosures required of domestic and Canadian issuers. For example, it does not require line of business, product line, backlog, research and development, environmental and customer identification disclosures. And it requires less disclosure of controlling shareholders, management remuneration and transactions with management.[110] Furthermore, such companies are not required to file the same annual report form, quarterly statement form or the form for monthly reports of material events. Instead, they file an abbreviated annual report form and furnish to the SEC on another form whatever they report to their home government, any stock exchange, or make public to their security holders.[111] However, in practice the more favourable legislative treatment for non-Canadian firms is offset by the rules of the exchanges which require foreign companies to provide substantially the same information as is provided by American companies.[112]

Above we have considered American treatment of companies making public offerings (essentially the same as domestic treatment) and American treatment of companies listing on American exchanges (essentially the same for Canadian companies but significantly relaxed for non-Canadian companies). It remains to consider the third category, the company affecting interstate commerce, having assets in excess of $1 million and more than 300 American shareholders which must register under the regime created by Rule 12g3-2(b). Such issuers are exempt from the proxy solicitation, insider trading and reporting rules but they must provide the information they make public pursuant to the law of their place of domicile or organization, file with foreign exchanges or distribute to their security holders.[113]

2. *The United States and Foreign Brokers*

a. *Which Foreign Brokers are Subject to U.S. Rules?*

The American position on foreign brokers has become clouded by the amendments resulting from the Securities Reform Act of 1975 which are intended to increase SEC control over domestic brokers. Section 15(a)(1) of the Exchange Act as amended makes it unlawful for any broker or dealer to make use of the mails or any means or instrumentality of interstate commerce to effect a transaction in, or to induce or attempt to induce the purchase or sale of any security (subject to certain exceptions) unless the broker or dealer is registered in accordance with the act. Section 15(a)(2) authorizes the SEC to exempt individuals or classes conditionally or unconditionally from the registration requirement as it deems consistent with the public interest and the protection of investors. (Prior to 1975 the legislation contained a further exemption for transactions which took place through an American stock exchange which, as a practical matter, must have applied to most foreign transactions.)

The reference in section 15(a)(1) to use of the mails and interstate commerce suggests that the jurisdictional standard under the section is one of conduct within the United States. However, when those expressions are coupled with other terms of the section, namely, those dealing with the purchase and sale of a security, it is clear that the jurisdictional standard is impact. In a pre-1975 ruling, the SEC concluded that activities such as selling securities into the United States or purchasing securities in the U.S. for sale to American investors abroad required a foreign broker to register under the Exchange Act.[114]

There is also an exemption for a foreign broker-dealer who participates as an underwriter in a distribution of U.S. securities being made abroad or abroad and in the United States. The exemption applies only if the foreign broker limits its activity to taking down securities which it sells outside the United States to persons other than American nationals and participates solely through its membership in the underwriting syndicate in activities of the syndicate in the U.S. such as sales to the selling group members, stabilizing, over-allotment and group sales, which activities are carried out for the syndicate by a managing underwriter who is registered with the SEC.[115] This exemption fits within the

114 SEC, Securities Exchange Act of 1933 Release No. 4708, July 9, 1964, 17 C.F.R. s. 231.4708 (1964); 1 CCH Fed. Sec. L. Rep. ¶1363.

115 *Id.*

SEC's general philosophy that the U.S. federal securities legislation exists to protect American investors.

Section 15(a)(1) requires registration by a Canadian broker who places an order with an American broker to acquire shares on an American exchange, even if the customer is a Canadian. The statutory language is anomalous in that it places a foreign broker in violation of the law for doing what a foreign investor could do with impunity, namely phone an American broker to place an order. Writing prior to the 1975 amendments, Professor L. Loss stated that, "the commission has never taken exception to the common practice of American firms effecting transactions in the United States for *customers* who are unregistered Canadian broker-dealers".[116] It remains to be seen whether the commission's attitude will change now that the stock exchange exemption has been removed.

The firms involved have developed a procedure to conform to the SEC's approach. Generally the American broker attending to the purchase or sale does not split the commission with the Canadian broker. Instead of splitting that commission, the American broker often remunerates the Canadian by a "contra" of some sort, perhaps reciprocating through a transaction on a Canadian exchange or perhaps providing some research or other service. Practicality suggests that the SEC may tolerate the *status quo* and attempt to bring about its regulatory goals in such situations through its control over the domestic U.S. broker and not through pursuit of foreign brokers. Of course, if the foreign broker establishes an office in the United States with a view to carrying on a brokerage business there, it must comply with the American domestic system.

b. *The Rules Applicable to Foreign Brokers*

A non-resident broker or dealer applying for registration with the commission must furnish a written irrevocable consent and power of attorney designating the SEC as agent on whom civil process can be served[117] and must satisfy the commission's record-keeping requirements either by keeping copies of its records in the United States or by filing an irrevocable undertaking to furnish copies when demanded by the SEC.[118]

The registration requirements under the American system are undergoing some revision in view of the changes made by the Securities Amendment Act of 1975 which expanded the authority

116 5 L. Loss, at 3356.
117 J. Williamson at 344-45.
118 J. Williamson at 346.

of the SEC with respect to the control of brokers. For example, the commission in section 17(f)(1) of the Exchange Act is authorized to require brokers and dealers to request information about missing, lost, counterfeit or stolen securities. The commission is engaged in a study in this area, the result of which will eventually be incorporated in specific rules.

Other features of the control of brokers established by U.S. legislation are the registration procedure itself, a provision for a six-month inspection of a newly registered broker, competency requirements for employees, rules about disclosure of financial statements to the commission and to customers, rules about capital requirements and hypothecation of customer securities.[119]

The legislation does not contain all the rules governing the conduct of brokers in the United States. Other rules are established by the various stock exchanges and the National Association of Securities Dealers.[120] When this paper was being written there was considerable controversy over the proposal by the New York Stock Exchange to alter its membership rules to permit membership by foreign brokers only where in the reverse situation an American firm would be entitled to become a member of the foreign exchange. In its release dated August 25, 1976, the SEC disapproved the proposed NYSE rule conditioning foreign membership on such reciprocity. The release in effect instructed the NYSE to repeal from its constitution other rules limiting the membership rights of non-citizens. The SEC decision was founded upon a U.S. national policy, articulated by the Treasury Department in representations to the commission, supporting the elimination of burdens on international competition. We comment no further on this issue since, as we have stated above, we believe that a federal securities act is not the place to enact rules of economic nationalism. In our view, these rules should be contained in separate legislation which can be adjusted in response to changing pressures for and against providing Canadians with the benefits and burdens of international competition.

3. *U.S. Treatment of Trading Rules: Rule 10b-5 – the Anti-Fraud Section*

The position of the United States on the extent to which its trading rules should apply extraterritorially has been developed in

119 *See generally* ss. 15 and 17 of the Securities Exchange Act of 1934; Rowen, *Securities Act Amendments of 1975*, 8 REV. SEC. REG. 889-90 (June 27, 1975). For the pre-1975 law *see* J. WILLIAMSON at 343-47; J. WILLIAMSON, SUPP. at 330-33.

120 *See e.g.* Pergam, *Foreign Firms and Broker-Dealer Activities in the United States*, in PLI, INTERNATIONAL SECURITIES REGULATION, 1975 145 (H. Dale, Chairman, 1975).

a number of decisions, largely in the Second Circuit Court of Appeals. The jurisdictional provision of the Securities Exchange Act of 1934 section 30(b) states:

> "The provisions of this title or of any rule or regulation thereunder shall not apply to any person insofar as he transacts a business in securities without the jurisdiction of the United States, unless he transacts such business in contravention of such rules and regulations as the commission may prescribe as necessary or appropriate to prevent the evasion of this title."

Though the technical language of 30(b) "without the jurisdiction of the United States" fairly presents the courts and the SEC with the authority to apply the securities rules extraterritorially within the permissible limits of international law, the phrasing suggests that the chief thrust of the section is to confine the operations of the securities laws to regulating conduct within the United States.

Conduct within the jurisdiction seems to be the guiding principle of the most significant trading rule, Rule 10b-5, under the Securities Exchange Act of 1934. That rule provides:

> "It shall be unlawful for any person, directly or indirectly, by the use of any means or instrumentality of interstate commerce, or of the mails or of any facility of any national securities exchange,
>
> "(a) to employ any device, scheme or artifice to defraud,
>
> "(b) to make any untrue statement of a material fact or to omit to state a material fact necessary in order to make the statements made, in the light of the circumstances under which they were made, not misleading, or
>
> "(c) to engage in any act, practice, or course of business which operates or would operate as a fraud or deceit upon any person
>
> "in connection with the purchase or sale of any security."[121]

The rule contains phrases commonly employed by American draftsmen seeking to establish federal jurisdiction in an area where there is a claim to jurisdiction by the states, namely, "interstate commerce", "the mails", and "any facility of any national securities exchange". Though domestic jurisdictional problems may have been uppermost in the minds of the drafters of Rule 10b-5, again the language fairly can be interpreted as applying extraterritorially. "Interstate commerce" suggests a conduct justification since it includes commerce between the United States and foreign countries. Jurisdiction based on an impact principle

121 17 C.F.R. s. 240.10b-5 (1977).

may be derived from the reference to "the mails" since mail travels to the United States from foreign ports of origin.

One preliminary point should be made concerning Rule 10b-5; the section operates not only as a rule to govern conduct between persons buying and selling securities but has also been interpreted by the courts as creating a private cause of action by which a shareholder of a company can complain of conduct by the directors. This feature complicates analysis of the 10b-5 cases since, as we shall see below, they may involve issues of shareholders' rights rather than of trading rules. In a typical case a plaintiff shareholder asserts that a corporation has been fraudulently induced by its directors to buy worthless or overpriced property. The shareholder seeks to press the corporation's claim against its directors in a derivative action. However, the use of an anti-fraud rule as a rule creating shareholders' rights within a company presents the possibility of a clash between federal securities law and the law of the state of incorporation of the company.[122]

122 In discussing the law which governs the internal affairs of the corporation, we have assumed that this is the law of the state of incorporation. It would be more precise to say it is the personal law of the corporation which governs the corporation, in much the same way that the personal law of an individual governs matters such as legal capacity, succession and domestic relations.

Internal affairs of a corporation are generally considered to be structural matters concerning the organization of the company, the composition of the board and its powers to act, and the liabilities of directors and shareholders for activities of the corporation which injure creditors or third parties. Internal affairs also include financial structure, solicitation of proxies and the power of directors to issue new shares, matters which in some circumstances may also be subject to securities laws.

In common law countries, the personal law of the corporation is taken to be the law of the state of incorporation. While this solution is justifiable on the ground of certainty, it can lead to the situation in which a corporation is incorporated in one state and has all of its assets, employees, activity and management in another state. Common law jurisdictions, except for a few states in the U.S.A., have refused to pay attention to the actual location of a corporation; *see* Latty, *Pseudo-Foreign Corporations*, 65 YALE L.J. 137 (1955); Reese & Kaufman, *The Law Governing Corporate Affairs*, 58 COLUM. L. REV. 1118 (1958).

However, the European countries do not use the law of a state of incorporation but the law of what the French call the *siège social*, and the Germans the *Geschäftssitz*. Determination of the *siège* is by no means easy and there is extensive French case law on the subject. In general, the most important factor is taken to be the location of the management of the enterprise, hence the translation of *siège social* as "head office" or "business seat". Often a court accepts the place of incorporation as the *siège* unless that place is entirely separate from the real activity of the corporation; *see generally*, note, *Nationality of International Corporations under Civil Law and Treaty*, 74 HARV. L. REV. 1429 (1961). The consequences of finding that the *siège social* of a company is not the same as its state of incorporation vary. Some cases have gone so far as to hold that the corporation is "void" because of its fraudulent creation, but more often the court applies the legislation of the *siège* to the corporation without questioning the validity of the incorporation.

Even if a state cannot question the "nationality" of a corporation, it can sometimes treat a foreign corporation as domestic when it has substantial links with the citizens of the state. For example, the American Foreign Asset Control Regula-

A shareholder was the plaintiff in the first major case involving the extraterritorial application of Rule 10b-5, *Schoenbaum v. Firstbrook.*[123] An American stockholder in a Canadian corporation, Banff Oil Ltd., brought an action under Rule 10b-5 alleging that insider controlling shareholders of Banff, acting on inside information, had issued to themselves treasury stock at a price below fair market value. The sale had taken place within Canada but the plaintiff argued that the U.S. federal court had jurisdiction because Banff stock was listed on the American Stock Exchange and was traded by American investors. The District Court dismissed the suit. The Court of Appeals for the Second Circuit reversed, holding that:

> "Congress intended the Exchange Act to have extraterritorial application in order to protect domestic investors who have purchased foreign securities on American exchanges and to protect the domestic securities market from...'improper foreign transactions in American securities'."[124]

The Court of Appeals found jurisdiction based on an impact principle. It held that the anti-fraud provision:

> "reaches beyond the territorial limits of the United States and applies when a violation of the Rules is injurious to United States investors."[125]

but it limited its holding somewhat:

> "We hold that the district court has subject matter jurisdiction over violations of the Securities Exchange Act although the transactions which are alleged to violate the Act take place outside the United States, at least when the transactions involve stock registered and listed on a national securities exchange, and are detrimental to the interests of American investors."[126]

In the next major case to test the extraterritorial application of

---

tions, 31 C.F.R. 500329 (1968), affect corporations "wheresoever organized or doing business" that are owned or controlled by U.S. citizens or other persons present in the United States. While such laws such as these are difficult to enforce, it is possible to attain some indirect control over foreign corporations owned by nationals by a state's power to make laws for its nationals.

126 *Id.* at 208; *see also* note, *Extraterritorial Application of the Securities Exchange Act of 1934*, 1 L. & POL. INT'L BUS. 168 (1969).

Rule 10b-5, *Leasco Data Processing Equipment Corp. v. Maxwell,*[127] the court based its jurisdiction on conduct within the jurisdiction. The plaintiffs, shareholders of Leasco, alleged that the defendants had conspired to cause Leasco to buy stock of Pergamon Press Limited at a price greater than its real value in violation of Rule 10b-5. Pergamon was a British company, owned and controlled by Maxwell, a British citizen. Its stock was not listed on an American exchange, nor was it traded in the U.S. The purchase took place on the London Stock Exchange through a subsidiary of Leasco, but the contract of sale had been signed in New York. The *Leasco* court could not employ the impact rationale of *Schoenbaum* because there had been no purchase on an American exchange and no effect on American securities markets.

But the court relied on conduct within the United States as the basis of jurisdiction. It found the meetings in New York and the closing of the transaction in New York constituted conduct within the United States. Its dicta went further. In discussing what constituted "conduct within the United States" the court said:

> "[W]e see no reason why, for purposes of jurisdiction to impose a rule, making telephone calls and sending mail to the United States should not be deemed to constitute conduct within it. On what is now before us it is impossible to say that conduct in the United States was not an essential link...in leading Leasco into the contract of June 17, 1969."[128]

If this test were applied, any correspondence with an American in the United States would be sufficient to give jurisdiction to U.S. courts even though the defendant had never entered the United States.

The result of *Schoenbaum* and *Leasco* was that a foreign defendant could be caught by either the effect or the conduct test, and both of them were widely drawn.[129]

129 Note, 6 VAND. J. TRANSNAT'L L. 678; Becker, *Extraterritorial Dimensions of the Securities Exchange Act,* 2 INT'L L. & POL. 233 (1969). One of the best articles on *Leasco* and subsequent cases is Jones, *supra* note 89. An especially forceful presentation of the impact test is in the SEC's brief before the Ninth Circuit Court of Appeals in SEC v. United Financial Group Inc., [1972-1973 Transfer Binder] CCH FED. SEC. L. REP. ¶93,747 (9th Cir. 1973), a case involving an offshore mutual fund which the SEC felt was being mismanaged to the detriment of foreign investors, the American balance of payments, the reputation of the American financial community and the reputation of the SEC. In another recent case involving

A case in which both conduct and impact were considered and which is of particular interest to Canadians is *Travis v. Anthes Imperial Ltd.*[130] This case involved a takeover bid by Molson Industries Ltd. to the Canadian shareholders of Beaver Lumber Ltd. The plaintiff American shareholders alleged that Molson had represented to them that if they held their shares a separate offer would be made to them; no separate offer was made and the shares declined in price after the bid. The district court found that all the parties were Canadian except for the plaintiffs, all the relevant actions had taken place in Canada, the offer was only for Canadian shares and that there was no listing on an American exchange. Thus there was no effect on a domestic securities market. Further, the only conduct in the U.S. was use of the mail. The court, noting that the communications containing the misinformation had been initiated by the plaintiffs, found the use of the mail to be insufficient to give jurisdiction. The Eighth Circuit reversed. It held that the use of interstate commerce was sufficient conduct to found jurisdiction and it observed that even if it were assumed that all dealings took place in Canada, Rule 10b-5 would still be applicable since:

> "any state may impose liabilities, even upon persons not within its allegiance, for conduct outside its borders that has consequences within its borders which the state reprehends."[131]

In two cases arising from the Investors Overseas Services (IOS) affair, *Bersch v. Drexel Firestone Inc.*,[132] and *IIT v. Vencap, Ltd.*,[133] the Second Circuit further refined the impact and conduct tests. The court held that the impact principle does not establish jurisdiction where the evidence establishes only generalized harm to the nation's economic interests. There must be direct injury to a significant number of buyers or sellers of securities. Conduct within the United States does not entitle foreigners to the protection of the American securities laws unless the acts or omissions in the United States directly cause the losses in question. Though confirming the point that the United States is not to become a base for the export of fraud,[134] the court held that the U.S. courts are

offshore mutual funds, the SEC chose to emphasize the contacts with the United States; *see* SEC briefs in SEC v. Vesco (S.D.N.Y.).

not open to foreign plaintiffs if the activity in the United States was merely preparatory. On the other hand, if the plaintiff is American, whether resident or non-resident, acts which are merely preparatory may provide the basis for jurisdiction.[135]

B. EUROPEAN SECURITIES LAW

Outside North America, capitalism has a different history and different premises and there is less emphasis on facilitating investment in securities by a large part of the population. In Europe, trading and investing in securities, particularly equity securities, is regarded as the province of a small number of individuals and banks who are in relatively continuous but informal contact. Even companies that are not wholly family-owned place a great deal of emphasis on secrecy. The widespread feeling that disclosure will aid competitors has more validity in Europe than the United States because it is possible for firms in different countries to be close rivals while the close competitors of an American firm probably will be other American firms subject to the same disclosure rules.[136]

In addition, there are significant historical and economic differences between Europe and America. For instance, insurance and pensions are much less important in Europe than in North America, government control over the issue of securities is much stronger and banks play a larger role in securities matters. There

---

domestic system should protect foreign plaintiffs from the export of fraud is discussed in ch. V and particularly in the text accompanying note 144, *infra*.

135 There is a wealth of comment on recent developments in the United States; *see e.g.* Grosser, *Extraterritorial Application of Section 10(b) of the Securities Exchange Act of 1934*, 33 WASH. & LEE L. REV. 397 (1976); Martin, *From Schoenbaum to Scherke: The Continuing Question of Subject Matter Jurisdiction in an International Securities Transaction*, 12 HOUS. L. REV. 924 (1975); Mizrack, *Recent Developments in the Extraterritorial Application of Section 10(b) of the Securities Exchange Act of 1934*, 30 BUS. LAW. 367 (1975); Parker, *Securities Regulation and Subject Matter Jurisdiction under Securities Exchange Act of 1934, Section 10(b)*, 11 TEX. INT'L L.J. 173 (1975); note, *American Adjudication of Transnational Securities Fraud*, 89 HARV. L. REV. 553 (1976); note, *Extraterritorial Application of the Securities Acts*, [1974] WASH. U. L.Q. 859. The Bersch decision was followed in F.O.F. Proprietary Funds Ltd. v. Arthur Young & Co., [1975-1976 Transfer Binder] CCH FED. SEC. L. REP. ¶95,296 (S.D.N.Y. 1975), in which the court denied relief to a foreign corporation alleging fraud in the sale to it of securities on the ground that the transaction was predominantly foreign, and in Recaman v. Barish, [1976-1977 Transfer Binder] CCH FED. SEC. L. REP. ¶95,608 (E.D. Pa. 1975) a case involving the U.S.I.F. (Gramco) mutual fund.

136 On disclosure in European securities law *see* Jackson, *Public Offerings: A Comparative Study of Disclosure in Western Europe and the United States*, 16 W. RES. L. REV. 44 (1964). Although a little out of date, this article is a well written and comprehensive guide. *See also* E. STEIN, HARMONIZATION OF EUROPEAN COMPANY LAW: NATIONAL REFORM AND TRANSNATIONAL COORDINATION 209-82, 354-64 (1971).

is, however, a growing trend in Europe to the use of methods of financing similar to American ones because of a belief that it is possible to tap a larger pool of savings with an active securities market. Indeed, Bernard Cornfeld's IOS profited by the inability of European investors to invest in their own securities markets; it found a large group of investors eager to buy mutual funds based on American stocks. Consideration of European securities regulation is hindered by the fact that European laws on securities are scattered throughout commercial, corporate and penal codes and banking laws and in the rules of private bodies or stock exchanges. No country has a single centralized agency comparable to the SEC.[137]

In European countries a prospectus with a public issue is either mandatory or customary, but it is not as complete or detailed as is common in North America. Also, much accounting and auditing is internal and few countries have a developed body of independent accountants. There is little attempt to regulate use of corporate information or the trading practices associated with it. Proxies are not often solicited and if they are, little information accompanies the solicitation. Disclosure in general is less detailed and financial statements are often given for a group of companies without being consolidated.[138]

As to the extraterritorial application of European securities laws, in 1972 the International Bar Association, Committee on Issue and Trading in Securities set up a subcommittee on the Extraterritorial Application of Securities Laws under Manuel F. Cohen. The subcommittee reported in January 1974 that "we have not so far found any major developments in decisional law affecting the extraterritorial application of securities laws except in the United States".[139] The committee points out that none of the states surveyed, other than the U.S., had special rules relating to foreign security sales and none made a special attempt to regulate them except with respect to criminal sanctions.

137 Belgium comes closest with its Commission Bancaire. Japan has a SEC-type body created by a securities law modelled on those of the U.S.A. It is discussed in Misawa, *supra* note 18. France is also considering a regulatory agency; *see*, *Sharpie's Heaven*, The Wall Street Journal, October 6, 1975, at 1, col. 6.

138 For a summary of the securities regulation systems of most countries *see* 1 L. Loss at 429-54; 4 L. Loss at 2463-84; for Europe *see* Brock, *Securities Regulation in Selected European Countries*, [1969] VAND. INT'L 21 (Winter). On the Eurobond market *see* Knauss, *E.E.C. Progress toward Establishing European Capital Markets*, [1969] VAND. INT'L 35 (Winter); Bodolus, *supra* note 15, at 107. An interesting case study of the problems of British securities regulation is Davies, *An Affair of the City: A Case Study in the Regulation of Take-Overs and Mergers*, 36 MOD. L. REV. 457 (1973).

139 *See* Cohen, *The Extraterritorial Application of Securities Laws*, [1975] INT'L BUS. LAW. 173, 174. Included in the report is a summary and analysis of the U.S. law which is among the best available.

Australia has recently been prompted by a series of collapsed mining promotions to set up a comprehensive national securities law.[140]

C. CONCLUSION

The only really useful model for the extraterritorial application of securities law for Canadian purposes is that of the United States. Although the United States makes some very wide jurisdictional claims, it is significant that American treatment varies to a marked degree from situation to situation and that a number of the American domestic rules are relaxed when foreigners are involved.

Chapter V
Present Jurisdictional Claims in Canadian Securities Laws

The regulation of the Canadian securities markets is achieved through two separate systems: the federal criminal law and provincial securities acts. Aggressive extraterritorial thrust is not a feature of either.

A. CRIMINAL CODE

A general denial of extraterritoriality is contained in section 5(2) of the Criminal Code:

> "Subject to this Act or any other Act of the Parliament of Canada, no person shall be convicted in Canada for an offence committed outside of Canada."

The prefatory language of section 5(2) indicates that there are some exceptions to the principle, both in the Criminal Code and in other statutes. Some of the Criminal Code exceptions are discussed in this chapter. Some of the exceptions in other statutes are discussed in chapter VI.[141]

There are two sections in the Criminal Code relating to securities offences which contain an extraterritorial reference. Section 341(1) provides:

> "Every one is guilty of an indictable offence and is liable to imprisonment for five years who, with intent to make gain or profit by the rise or fall in price of the stock of an

140 The Corporations and Securities Industries Bill, 1974. *See Murphy's Super SEC,* The Australian Financial Review, December 6, 1974, at 1.

> incorporated or unincorporated company or undertaking, whether in or out of Canada, or of any goods, wares or merchandise,
>
> "(a) makes or signs...an agreement for the purchase or sale of shares without the *bona fide* intention of acquiring or selling the shares."

The placing and punctuation of "whether in or out of Canada" is curious. Applying ordinary rules of grammatical construction, one can easily interpret the phrase as applying to "every one" in the first line. Thus the section could prohibit a person in Seattle from gaming in stocks on the Vancouver Stock Exchange or even on the New York Stock Exchange. The expression "whether in or out of Canada" may apply only to the words "incorporated or unincorporated company or undertaking". The more probable interpretation is the latter so that the section makes it a crime for a person in Canada to game in the shares of a company which has been incorporated in Canada or elsewhere. This interpretation is supported by the succeeding section, section 342:

> "Every one is guilty of an indictable offence and is liable to imprisonment for five years who, being an individual, or a member or employee of a partnership, or a director officer or employee of a corporation, where he or the partnership, or corporation is employed as a broker by any customer to buy and carry upon margin any shares of an incorporated or unincorporated company or undertaking, whether in or out of Canada, thereafter sells or causes to be sold shares of the company or undertaking for any account in which
>
> "(a) he or his firm or a partner thereof, or
>
> "(b) the corporation or a director thereof,
>
> "has a direct or indirect interest, if the effect of the sale is, otherwise that unintentionally, to reduce the amount of such shares in the hands of the broker or under his control in the ordinary course of business below the amount of such shares that the broker should be carrying for all customers."

The expression "whether in or out of Canada" is the same as that appearing in section 341 and it follows in the same sequence, following the expression "an incorporated or unincorporated company or undertaking" which is the same in both sections. The purpose of this section is to prohibit a broker from reducing his holdings of a particular stock below the levels required to meet the claims of his customers by selling shares for his own account. One interpretation of the section is that it applies to all brokers everywhere in the world. The more reasonable explanation is that it

applies to Canadian brokers but applies to the stock of any corporation, irrespective of the place of incorporation. After considering the language and possible interpretations of sections 341 and 342, we conclude that neither section is intended to have extraterritorial effect.

There does not appear to be any attempt to regulate extraterritorial conduct in the four major provisions of the Criminal Code intended to prohibit securities frauds: section 338, fraud (including fraudulently affecting the public market price of shares); section 339, using mail to defraud the public; section 340, fraudulent manipulation of stock exchange transactions; and section 358, publishing a false prospectus. The fraud and mail fraud sections were subject to analysis in *Re Chapman*[142] where the Ontario Court of Appeal upheld counts under the two sections charging the accused with defrauding the public in a scheme involving home sewing kits. The accused remained in Canada throughout but the scheme was aimed only at consumers in the United States. With respect to the fraud charge under section 323(1) (now section 338(1)) the court said:

> "The recital of facts herein, referable to the Canadian phrase of Jamster's operations, shows the initiation and consummation of a scheme in Canada through the dispatch of letters from Canada and the receipt in Canada of money or valuable securities by way of cheques and money orders. This is enough to support a charge of the substantive offence in Canada, subject only to the construction of the phrase 'defrauds the public or any person'. On the facts before this Court, the only members of the public or persons who could be said to have been defrauded were residents of the United States.
>
> "The completion of the offence under s.323(1) lies in the obtaining of the fruits of the fraudulent means or inducement. What is said in *R. v. Brixton Prison Governor, Ex p. Rush,* (1969) 1 All E. R. 316 at p.322, also points to this conclusion. If there is an initiation of a fraudulent scheme in Canada (as was the case here in the mailing out of the letters of solicitation) and a realization thereof in Canada through receipt of money or securities intended to be brought in through the scheme, the offence has been committed in Canada although the inducement has extended only to persons outside Canada. In short, 'the public or any person' in s.323(1) are not limited to the

142 11 C.R.N.S. 1 (Ont. C.A. 1970).

Canadian public or to persons in Canada: see *Shulman v. The King* (1946), 2 C. R. 153."[142a]

The *Chapman* court similarly interpreted the expression "public" in the mail fraud section.

We do not expect *Chapman* to be used as a basis by which Canadian Criminal Code rules relating to securities trading will be applied to persons outside the country. As the quotation indicates, the court relied heavily on the fact that the accused's acts all took place within Canada.

A similar approach was adopted by Munroe, J., in *Re Bennett and Schuette and The Queen.*[143] The accused were charged under section 340 with fraudulent manipulation of transactions on the Calgary Stock Exchange and the Crown alleged that the offence was committed at Vancouver, B. C. The court dismissed an application for a writ of *certiorari* to quash the committal for trial, reasoning that the overt acts of placing the orders with a Vancouver broker which initiated the transactions in Calgary were sufficient to vest jurisdiction in the courts of British Columbia.

In neither *Chapman* nor *Bennett and Schuette* was the court attempting to protect persons within the jurisdiction by applying rules of conduct to persons outside. Rather, the courts' venture into extraterritoriality was for the purpose of protecting a person outside the jurisdiction from acts committed within it. We conclude that a Canadian federal securities law should include the principle established in these two cases so that Canada does not become a base for the export of fraud. The principle that the domestic system should be activated to protect foreign victims from wrongs initiated within the jurisdiction has been accepted by the courts in Britain and the United States.[144]

142a *Id.* at 6-7.

143 50 D.L.R. (3d) 730, 19 C.C.C. (2d) 61, [1974] 6 W.W.R. 193 (B.C.S.C.).

144 In Treacy v. D.P.P., [1971] 1 All E.R. 110 (H.L. 1970), the House of Lords upheld a conviction where the accused posted a letter in England blackmailing a person abroad. The Second Circuit Court of Appeals affirmed the principle in a case arising from the IOS affair; IIT v. Vencap, 519 F.2d 1001, 1017 (2d Cir. 1975), *noted in* note, *Transnational Transactions - Transnational Application of the U.S. Securities Laws*, 11 Tex. Int'l L.J. 208 (1976). A similar decision was reached in Ferland v. Orange Groves of Florida, Inc., [1974-1975 Transfer Binder] CCH Fed. Sec. L. Rep. ¶94,821 (M.D. Fla. 1974). In *Vencap*, the Second Circuit ruled that jurisdiction would not be accepted when mere preparatory activities or the failure to prevent fraudulent acts took place in the U.S. and the bulk of the activity occurred in a foreign country. In a case arising from the Manitoba forest industry fraud, a District Court in New Jersey held that the American securities laws should not apply with respect to activity in the United States when the only persons who suffered damages as a result of that activity were non-residents; SEC v. Kasser, 391 F. Supp. 1167 (D.C.N.J. 1975). The case is described without criticism in note, *Securities Regulation - Transnational Reach of Securities and Exchange Acts*, 11 Tex. Int'l L.J. 204 (1976).

There are two offences having extraterritorial features which could be employed in the securities area. Sections 312 and 315 make it an offence to have in Canada or to bring into Canada anything which has been obtained within or without Canada by an act or omission which, if it had occurred in Canada, would have constituted an offence punishable by indictment. These sections could be used to convict a person possessing share certificates obtained by him or to his knowledge by acts in another country equivalent to false pretences. However, while the sections could be employed in such circumstances, they certainly do not represent a parliamentary intention to create rules having extraterritorial application to securities laws.

In addition to the six sections discussed above, there are a number of other sections of the Criminal Code which could be employed in the prosecution of a securities fraud: section 320, false pretences; 321, obtaining execution or endorsement of valuable security by fraud; 326, uttering forged document; 332, making or executing document without authority; 333, obtaining by instrument based on a forged document; 336, falsification of document; and 383, giving or receiving secret commissions. None of them applies extraterritorially.

There are two sections applicable in the securities area which specifically create rules of conduct in Canada designed to protect persons in other countries. Section 324 prohibits the making of a false document with intent that it be used or acted upon as genuine to the prejudice of anyone whether in Canada or not, and section 334 prohibits the use of false marks and stamps which are defined to include marks and stamps of a foreign government as well as Canada.

There is one notable but recent exception to Parliament's restraint in the criminal law field. Section 36 of the Criminal Law Amendment Act, 1975, enlarges the scope of criminal conspiracy to include conspiracies in Canada which are intended to be effected outside Canada and conspiracies outside Canada which are intended to be effected inside Canada. This enlargement permits prosecution in Canada of persons who have conspired abroad to violate Canadian securities laws.[145]

Subject to this one exception, Parliament has not exercised the full extraterritorial jurisdiction in the criminal law area to which it is entitled under international law and as far as the criminal law regulation of securities is concerned, the outreach approaches insignificance.

145 Commentary on this feature of the Criminal Law Amendment Act, 1975, is contained in CANADIAN BAR NATIONAL, September, 1975, at 3.

B. PROVINCIAL SECURITIES LAWS

The provincial securities acts have been slightly more expansionist than the Criminal Code in attempting to regulate conduct beyond provincial borders.[146] Nevertheless, their emphasis is on regulating conduct within the province. With respect to stock exchanges, for example, the statutes carefully spell out the obvious, that they apply only to the stock exchanges in the province.[147]

As if signalling an awareness that conduct in other jurisdictions will be regulated by other institutions, the provincial securities acts authorize the courts in the home province to endorse warrants issued in other provinces for the arrest of persons who have contravened securities statutes of those provinces so that enforcement officers from the issuing and endorsing province may both execute the warrant in the endorsing province and take the accused person to the province in which the offence was committed.[148] A system for the interprovincial enforcement of subpoenas which would compel the attendance at court within a province of a witness who resides outside the province is also developing.[149]

This concept of interdependent enforcement is strengthened by provisions such as that of National Policy No. 17 by which securities registrants are warned that violation of the securities laws of any jurisdiction is considered in principle to be prejudicial to the public interest and may affect fitness for continued registration.

The concern for establishing jurisdiction based on physical presence is also demonstrated by provisions such as those requiring applicants for registration to provide an address for service in the province where all notices under the act may be sent.[150] The provincial statutes also contain special discretion by which registration may be refused to non-resident applicants.[151] Although the main reason for such provisions is probably protection of local business dressed up as economic nationalism, a supporting argu-

146 In this paper we do not discuss the constitutional issue. It is discussed in *Anisman & Hogg*; *see also* J. WILLIAMSON and J. WILLIAMSON SUPP., chs. VII, VIII.

ment may have been that residents are the only persons whom a regulatory system can reach effectively.

The principal regulatory sections of the provincial acts are those prohibiting trading without registration[152] and requiring a prospectus for trading in the course of distribution to the public.[153] Although there is no overt limitation in these sections to conduct within the province, their general language and context suggest that they were intended to have narrow geographical application. Support for this proposition can be found in the limited situations where extraterritorial effect is invoked. Thus, the regulation of telephone solicitation is carefully drawn to apply to the making of telephone calls from the province to persons within and persons outside the province; the prohibition does not apply to persons outside the province telephoning residents of the province.[154]

However, in the past decade there have been significant examples of outreach achieved by judical interpretation. The leading case is *R. v. W. McKenzie Securities Ltd.*[155] where the accused were convicted under the Manitoba Securities Act of unlawfully trading in securities in Manitoba because they were not registered under the Manitoba act. The accused were both registered in Ontario from which province they made telephone solicitations to a resident of Manitoba. The solicitations were held to fall within the Manitoba definition of trading. The court explained the ambit of the statute as follows:

> "The Securities Act of Manitoba is not designed to reach beyond provincial borders and to restrain conduct carried on in other parts of Canada or elsewhere. Its operation is effective within Manitoba, and nowhere else. For a person to become subject to its restraint he must trade in securities in Manitoba. This is not to say that a non-resident of Manitoba can never become subject to the controls of the statute. If the activities of such a non-resident can fairly and properly be construed as constituting trading within the Province, then they fall within the purview of the act. Thus examined, the act cannot

> justly be considered as designed in any way for the regulation of interprovincial trading."[155a]

The court went on to construe the activity of the accused in the following terms:

> "Solicitation of subscriptions to the capital stock of various corporations is precisely what the accused were engaged in doing in the present case. Can it effectively be denied that such solicitation took place, at least in part, in Manitoba? I think not. It was to Mr. McCaffrey in Manitoba that the accused sent their letters and other literature in which subscriptions for the purchase of capital stock were solicited. It was to Mr. McCaffrey in Manitoba that telephone calls for the same purpose were made by the accused. I think it completely unrealistic to suggest that when the accused sent their letters by mail from Toronto, Ontario, to Shilo, Manitoba, the act of solicitation there represented took place only in Toronto or at most within the borders of Ontario. Such an approach ignores completely the nature and character both of a letter and of the postal service. The invitation put forward by the accused in their letters was a continuing one. It started when written in Toronto; it continued when deposited in the post box there; it did not cease to exist during the period when it was being transported through the postal service (the agency selected for that purpose by the accused); and it retained its validity and spoke with special effectiveness to McCaffrey at the time when he opened and read the letter in Shilo in Manitoba. It was in this Province that McCaffrey was solicited by the accused to purchase the shares in question, and it was in this Province that McCaffrey responded favourably to such solicitation. I would agree with the learned Magistrate and the learned County Court Judge that what took place in the present case constituted an act of trading in securities within the definition of the Securities Act of Manitoba."[155b]

Although expressly purporting to regulate activity within the province of Manitoba, the court, in effect, applied Manitoba rules of behaviour to govern conduct in Ontario.

The *W. McKenzie Securities* case was followed in *R. v. Jaasma*,[156] an Alberta case involving remarkably similar facts. In

155a 56 D.L.R. (2d) at 62-3.
155b *Id.* at 64.
156 [1974] 1 W.W.R. 245 (Alta. Prov. Ct. 1973).

that case the telephone solicitations originated in British Columbia and were made to customers in Alberta. The court quoted at length from *W. McKenzie Securities* and concluded that even though the telephone calls were made from British Columbia the offence was committed in Alberta.

This type of analysis provides a fertile field for persons wishing to draw rules having extraterritorial application in the securities area. As the above cases suggest, one can draft a statute prohibiting within the jurisdiction any act which, taken with other acts outside the jurisdiction, constitutes a forbidden transaction. This device can be used to create rules whose effect is to govern extraterritorial conduct though they purport to apply only within the jurisdiction.

There are guarded attempts to regulate conduct outside the province in the parts of the provincial securities acts dealing with solicitation of proxies, insiders, financial disclosure and takeover bids. The first three are set out in much the same way so we shall consider the proxy provisions as an example.

The proxy rules (set out in part X of the British Columbia and Ontario acts) apply to external conduct in that they apply to persons outside the province who send proxy material to shareholders within the province. However, the basis of regulation is consensual in that the mandatory proxy rules do not apply to all foreign corporations but only to foreign corporations which have filed a prospectus with the provincial commission or whose shares are listed for trading on a stock exchange within the jurisdiction.[157] This consensual approach is buttressed by other provisions of part X which state that the commission may order the director to refuse to issue a receipt for a prospectus until the company delivers undertakings satisfactory to the commission in which the company, its directors and officers, undertake to comply with the various provisions of part X.[158] Further, both the British Columbia and Ontario statutes provide that they cease to apply in a case where, jurisdiction having been founded on the filing of a prospectus, the corporation ceases to have shareholders in the province.[159]

Part XI, Insider Trading, and part XII, Financial Disclosure, are set out in the same way. That is, jurisdiction is claimed only where there has been a filing of a prospectus in the jurisdiction or a listing on the stock exchange within the jurisdiction.[160] There

157 B.C. Securities Act, ss. 98(a), 99; Ontario Securities Act, ss. 101(a), 102. A more far-reaching ambit is provided for in Ontario Bill 98, s. 86.

158 B.C. Securities Act, s. 104; Ontario Securities Act, s. 107.

159 B.C. Securities Act, s. 101(3); Ontario Securities Act, s. 104(3).

160 B.C. Securities Act, ss. 106(1)(b), 116; Ontario Securities Act, ss. 109(1)(b), 118(1)(b).

are similar provisions for undertakings[161] and for termination of regulation in the case where jurisdiction is founded upon registration of a prospectus and there is no longer a shareholder within the jurisdiction.[162]

Uniform Act Policy No. 2-01 indicates that the commissions have directed the director to refuse to issue a receipt for a prospectus until the company proposing to distribute the shares has delivered undertakings with respect to proxies, insider trading and financial disclosure as referred to above.

The takeover bid requirements to be found in part IX of the British Columbia and Ontario acts do not have the same element of consent. Demonstrating a purpose to protect shareholders residing in the jurisdiction, part IX defines both "offeree" and "takeover bid" in terms of a shareholder having an address within the province.[163] The provincial statutes have thus claimed a wider jurisdiction in the area of takeover bids than they have in the proxy, insider trading and financial disclosure areas. Part IX provides that an offeror who does not comply with the provisions is guilty of an offence and on summary conviction is liable to a fine of not more than $25,000 or to imprisonment for not more than one year, or to both.[164] The Ontario act also grants a right of rescission to the offeree.[165]

The only other section of the provincial acts worth including in this discussion is the provision, similar to the Criminal Code section 342, prohibiting a sale by a broker for his own account which would reduce his holdings of margined securities below the amount that he should be holding for his customers.[166] The drafting creates the same problem as in the Criminal Code section, namely, that one cannot tell whether the expression "either in Canada or elsewhere" applies to the broker, customer, the securities issuer or some combination of them. Section 47 of Ontario Bill 98 is clearer. That section makes it apparent that "in Canada or elsewhere" applies to the issuer of the securities. Probably the other provincial sections should be interpreted the same way.

After surveying the provincial administrators in 1958, J. Williamson concluded that while the majority of the administrators felt they had the power to control interprovincial solicitation, most did not attempt to enforce their registration requirements in

161 B.C. Securities Act, ss. 115, 130; Ontario Securities Act, ss. 117, 133.

the absence of egregious breaches of standards of conduct in selling.[167] The Canadian administrators cooperate by cancelling registrations for fraudulent or "high pressure" selling even if it occurs outside the province.[168] Saskatchewan and Québec will also cancel registrations for breaches of American laws.[169]

In summary, the federal Criminal Code does not reach out as far as international law would permit in order to protect Canadian investors from fraudulent schemes created abroad. The provincial statutes have a somewhat broader external reach, generally built upon either a segmentation of a transaction to find a part of it within the jurisdiction or a quasi consensual relationship between the corporation which is expected to comply with the domestic provisions and the domestic institution wishing to safeguard the interests of investors.

Chapter VI
Canada's Foreign Policy and Its Attitude to National Jurisdiction

It is a commonplace that until 1968 Canada's foreign policy was "internationalist" in approach, with an emphasis on altruism, Canada's world responsibilities, and Canada's potential as a contributor to solutions for the world's problems. A feature of this internationalism was a deference to foreign countries marked by very limited exercise of our right under international law to legislate extraterritorially. The former policy was reflected in legislation such as section 5(2) of the Criminal Code which establishes the general principle that a person should not be convicted in Canada for an offence committed outside Canada.[170] In her paper on extraterritoriality in Canadian legislation,[171] Professor T. Pickard points out that Canada makes little use of its power to legislate over nationals abroad, that Canada has made little use of the protective or impact principle, and that it has made no use of the passive personality principle.[172]

Interestingly, Canadian judges have been aggressive in

167 J. WILLIAMSON at 207.

168 An example involving a broker-dealer and an unregistered associate promoting shares in Italy is Re Donaldson Securities Ltd., B.C. Corporate and Financial Services Commission Weekly Summary, March 7, 1975.

169 J. WILLIAMSON at 302. American jurisdictions have done as much or more for Canadians. After the many years of high pressure selling from Canada it is ironic that American courts have had to extend the protection of Securities Acts to Canadians defrauded by American promoters; *see e.g.* Ferland v. Orange Groves of Florida, Inc., *supra* note 144.

170 For a discussion of some of the exceptions to this general principle *see* ch. V *supra*.

171 T. Pickard, *supra* note 29.

172 *See id.* at 101, 115-16, 118.

claiming jurisdiction over acts taking place outside the jurisdiction. There are a number of cases where the judges have employed protective principle reasoning. One of the earliest is *R. v. Gillespie (No. 2)*[173] which held that the Québec courts had jurisdiction to try a charge of publishing false statements in a letter sent to Montréal from the accused who was in Ontario. Ouimet, J., stated at 311:

> "The essential ingredients of this offence are:
>
> "(1) the falsity of the statement made by an officer of an incorporated company;
>
> "(2) the circulating or publication of such statement so that it may reach the parties or party intended to be defrauded. In the present case the parties intended to be defrauded resided in Montréal, and it is here they were intended to be reached by the accused and the intended fraud was to be achieved and did in effect take place.
>
> "The defendant has of his free will accepted the jurisdiction of this Court by doing an act the intended result of which was to take place here. In the same way A, standing within the limits of a judicial district and shooting across the boundary of the district at B, standing on the other side of it, within another judicial district, with intent to kill him, would bring himself within the jurisdiction of the courts of the latter district. In the same way C, writing from Montréal, a threatening letter to E, a citizen of Toronto, to whom the letter is sent by mail, could be tried either at Toronto or Montréal."

In the foregoing passage Ouimet, J., neatly blends the protective and impact principle by dissecting the transaction complained of, finding some feature of it within the jurisdiction, and claiming jurisdiction over the whole by virtue of jurisdiction over the part.

The *Gillespie* case was followed by the Supreme Court of Nova Scotia in *R. v. Scott.*[174] The accused, who had apparently never left Montréal, was convicted of sending liquor into Nova Scotia contrary to the provisions of the Canada Temperance Act. The Nova Scotia court expressly followed *Gillespie* and employed the same type of blended reasoning. More recently in *R. v. Trudel,*[175] the Manitoba Court of Appeal, in 1968, held that the courts of Manitoba have jurisdiction to try an accused on a charge of conspiracy to commit the offence of forging documents when the only overt acts in Manitoba are the delivery of a parcel by the post office and its receipt by one of the accused. In the foregoing criminal cases, of

173 2 C.C.C. 309 (Qué. Q.B. 1898).

174 [1924] 2 D.L.R. 277 (N.S.S.C.).

175 [1969] 3 C.C.C. 95 (Man. C.A.).

course, the "foreign" acts nonetheless took place within Canada. However the decisions can all be justified on the basis that one aspect of the complete transaction took place within the province.

Some indication that Parliament may be becoming more aggressive with respect to extraterritoriality appears from the provisions of Criminal Law Amendment Act, 1975, relating to "internationally protected persons". Section 3 utilizes the nationality principle, the passive personality principle and the universality principle.

In 1968 the Trudeau government completed a review of foreign policy that was published as *Foreign Policy for Canadians.*[176] The review began a new direction which emphasized national self-interest and the development of national goals on the assumption that foreign policy is "the extension abroad of national policy"[177] and national policy should be directed to such things as economic growth, social justice and the quality of life.

This shift in emphasis has changed both the direction of our foreign policy and the means we use to pursue goals in this area. The emphasis has been shifted from global security to problems such as fisheries, pollution and resource development and the means used to attain foreign policy goals shifted from collegial bodies such as NATO, NORAD and the United Nations to a reconsideration of international law and unilateral assertions of sovereignty. A sense of vulnerability awakened in the minds of Canadians new interest in the problems of control and of jurisdiction to control such global problems as multinational corporations, ocean exploitation and ocean pollution. Especially in relation to the seabed and marine pollution, Canada has in recent years been aggressive in asserting sovereign and custodial rights where it considers protection necessary and international agreement impossible.[178] The new approach is not yet reflected in a wide range of legislation. Nonetheless the individual examples are important because of their value as a precedent for a federal securities law.

A feature of special importance in recent Canadian initiatives has been the claims of jurisdiction for a particular purpose as opposed to claims of full sovereignty. Claims of jurisdiction for a particular purpose are functional, that is, they are related to a particular need; and they are custodial in that they are justified by

176 CANADA DEPARTMENT OF EXTERNAL AFFAIRS, FOREIGN POLICY FOR CANADIANS (1970) (6 booklets).

177 *Id.* at 32 n. 3 (general booklet).

178 Gotlieb & Dalfen, *National Jurisdiction and International Responsibility: New Canadian Approaches to International Law,* 67 AM. J. INT'L L. 229 (1973). *See also* Alexandrowicz, *Canadian Approaches to the Seabed Regime,* in CANADIAN

the assertion that Canada acts in the interest of and on behalf of the international community to preserve some geographical area or other special interest. These claims have been especially important in relation to marine pollution and fisheries and are a type of claim that Canada has made with more force and effectiveness than any other state.[179]

Along with its custodial claim, Canada has developed the idea of delegation of powers from the community of nations to the most interested nation for resource and territory management of areas.

L. H. J. Legault has summarized Canada's position on the law of the sea:

> "Finally, it is important to note that Canada has sought to accommodate as much as possible the interests of other countries affected by Canada's unilateral initiatives often at the cost of severe domestic political criticism. This accommodation of the interest of other countries has led, first of all, to restrictions on the qualitative scope of the Canadian claims. Thus they have been limited generally to extensions of functional jurisdiction for special purposes and cannot be said to have had any significant impact on freedom of navigation responsibly exercised. By way of further accommodation, Canada has not sought to terminate unilaterally either treaty fishing rights or traditional fishing practices; the former have become the subject of new arrangements and the latter are being phased out gradually and by agreement.
>
> "In these preparations Canada has sought to devise a new way of approaching the problems of the law of the sea and to establish new ground for an accommodation in the increasingly sharp conflict between coastal interests, on the one hand, and flag or distant-water interests on the other. To this end Canada has advanced the concepts of 'custodianship' and 'delegation of powers' as vehicles for the development of the future law of the sea. The essence of the policy summarized in the terms 'custodianship' and 'delegation of powers' is simple but nevertheless of fundamental importance: first, the primary or priority interests of the coastal state in all activities in areas of the sea adjacent to its shores must be reflected in international

---

PERSPECTIVES ON INTERNATIONAL LAW AND ORGANIZATION, *supra* note 1, at 410; Lowry, *Maritime Pollution: Canada's Approach*, 4 INT'L BUS. LAW. 365 (1976).

179 *See* L.H.J. Legault, *Maritime Claims*, in CANADIAN PERSPECTIVES ON INTERNATIONAL LAW AND ORGANIZATION, *supra* note 1, at 384-94. *See also* Ocean Dumping Control Act, S.C. 1974-75-76, c. 55.

law; second, much of the administration of the law of the future must be 'delegated' to the coastal state and must be based on resource management and environmental management concepts; third, the basis for an accommodation between conflicting interests in the uses of the sea must lie in a better balance between the rights and consequent responsibilities of states, and hence the coastal state must exercise both its existing sovereign powers and its future 'delegated' powers not only in its own interests but as 'custodian' of vital community interests in the uses of the sea, on the basis of internationally agreed principles to this end."[180]

The tone of the passage is self-congratulatory. Yet the approach to maritime problems described in it summarizes what is best among present Canadian initiatives in international law. It is more flexible and more responsible than traditional assertions of jurisdiction and provides a useful example for claims about jurisdiction in matters of securities.

Canadian economic regulation has also recently become more assertive and unilateral. The Foreign Investment Review Act demonstrates that it is now Canadian policy to control the purchase by foreigners of securities of Canadian corporations.[181] This legislation also controls the sale by one foreign company to another of a Canadian subsidiary and applies when a reorganization abroad involves the transfer of shares of the Canadian subsidiary even where there is no change in the beneficial interest.[182]

An interesting example of Canadian reaction in the area of economic regulation is the recent response to the problems of offshore mutual funds.[183] Canada does not have as great an inter-

180 Legault, *supra* note 179, at 391-92.

181 S.C. 1973-74, c. 46.

182 *See id.* s. 3(6)(h); and *see* Spoliansky & Easton, *Beware of Canadian Subsidiaries*, 30 Bus. Law. 1053 (1975).

183 Offshore mutual funds are usually funds incorporated in tax haven jurisdictions and concentrate their selling and trading activities in countries other than the one in which they are incorporated. There are offshore hedge funds, leverage funds, real estate funds and other specialty investment funds but the mutual fund is most common. These funds have caused problems for regulatory authorities in most jurisdictions by managing to operate in the interstices between sets of regulations or in countries without laws regulating securities trading. Recent publicity concerning Investors Overseas Services (IOS) and Gramco International has emphasized the danger inherent in their conduct.

The offshore mutual fund is the creation of Bernard Cornfeld, an American who began his career by selling American mutual funds to American servicemen in Europe but who quickly developed his own funds using European capital, and in the early years, flight capital from politically unstable areas of South America, Africa and Asia. (Of the several descriptions of Cornfeld's rise and fall, the best is C. Raw, B. Page & C. Hodgson, Do You Sincerely Want to Be Rich? (1971).) Once the

est in offshore mutual funds as the U.S., but it was implicated in the IOS fiasco because some companies of the IOS group were incorporated in Canada. Canada's reaction was to attempt to clear its "good name" by increased regulation in future. The federal government commissioned the *Proposals for a Mutual Fund Law for Canada,* which recommended that all Canadian funds be regulated with respect to selling of shares, custody of assets, etc., and that the more speculative funds be prohibited from selling abroad.[184] The only area left unregulated under this scheme is transactions in shares in Canadian companies abroad by foreign-based funds.

Several European countries have reacted to activities of IOS by setting up schemes requiring foreign funds to meet specified requirements before they can sell securities there. This requirement may be enforced by forbidding the sale of domestic securities to a fund or broker for a fund that fails to register.[185] This kind of enforcement provision could also be used by Canada if it were discovered that foreigners or Canadians were trading in Canadian securities abroad in violation of Canadian mutual fund or securities laws.

The 1975 Amendments to the Combines Investigation Act are also more expansive than the former provisions. The new sections 31.5 and 31.6 empower the Restrictive Trade Practices Commission to order individuals and companies in Canada to disobey applicable foreign judgments and legislation and failure to comply with such an order constitutes a criminal offence in Canada.[186] The Canadian Human Rights Act asserts the passive personality principle in declaring that the Canadian Human Rights Commission

---

funds were established, Cornfeld found there was great interest among the European middle classes in a fund investing in American securities, and his, and other funds, became so large that their circumvention of disclosure and trading requirements, their creation of fund holding companies and their large-scale "dumping" of securities posed a serious threat to the system of regulation set up by the SEC. At the same time the U.S. government was very interested in importing foreign capital to reduce its own balance of payments deficit, and the Foreign Investors Tax Act of 1966, 80 Stat. 1541, spurred on the sales of the offshore funds among Europeans by providing tax exemptions for U.S. earned income. The SEC sought to reconcile its desire to control IOS with the government's desire to increase foreign investment by requiring IOS to refrain from selling shares in interstate commerce. The complex negotiation between IOS and the SEC is outlined in note, *Offshore Mutual Funds: Possible Solutions to the Regulatory Dilemma,* 3 L. & POL. INT'L BUS. 157, 166-69 (1971). *See also* comment, *Offshore Mutual Funds: Extraterritorial Application of the Securities Exchange Act of 1934,* 13 B.C. IND. & COMM. L. REV. 1225 (1973). IOS continued to do business by using the London offices of a U.S. broker and many of the abuses continued as before.

186 *See* S.C. 1974-75-76, c. 76, s. 46.1.

has jurisdiction when a Canadian citizen or person admitted to Canada for permanent residence is subjected in any part of the world to any discriminatory treatment which is proscribed by the act.[187] By passing this act the government has indicated that it is not unduly troubled by multiplying problems of what might be termed "inevitable jeopardy", namely, a situation in which a person may be punished under Canadian law for performing an act which he is positively required to do by a foreign law.

It might be argued that in order to develop a maximum of international freedom and flexibility, legal systems should generally contain exemption provisions creating a defence of compliance with a foreign law and perhaps simplifying conflicts by permitting the law of the jurisdiction of incorporation to govern. However, there are a number of arguments against that position. In the name of sovereignty, states prefer to retain control of acts occurring within their jurisdiction, notwithstanding international conflicts. As a result, persons who carry on affairs in several jurisdictions are now inured to the problem of "inevitable jeopardy" and it can be argued that an increasing amount of control by Canada will cause little additional difficulty for the multinational enterprises which are most subject to conflicting jurisdiction. In fact, it would be fair to conclude that the recent policy by which foreign business has been challenged by Canadian legislation seems to have worked; no foreign government has yet tried to defend its corporations by retaliating in a significant way against Canada or Canadian corporations.[188] At the time of writing, there are signs that the United States may cease to preserve its unruffled calm as opposition in that country mounts against two Canadian initiatives: Saskatchewan's nationalization of potash mines and the federal government's decision to disallow as expenses for Canadian businesses the cost of advertisements in certain periodicals and on television stations in which foreigners hold the predominant number of shares. It is too early to tell whether foreign reaction will stunt this new growth in Canadian foreign policy.

Nevertheless problems which arise when a situation of "inevi-

187 S.C. 1976-77, c. 33, s. 32(5)(b).

188 In the United States the SEC has opposed the proposed restrictions by the New York Stock Exchange restricting access to the exchange by foreign-owned securities firms. One of the exchange's arguments has been that access of foreign brokers to the exchange should be conditional on reciprocal rules in the foreign jurisdiction permitting access to the foreign market by American firms. In February 1976, it was announced that the SEC in conjunction with the Departments of State and Treasury would conduct a study of how American securities firms have been treated in foreign countries. It is too early to predict what effect, if any, this study will have on access by Canadian firms to American exchanges. *See* Inter-Agency Group

table jeopardy" has been created are serious. Many consider it a basic principle of fairness that persons who have acted in compliance with the laws of one jurisdiction should not be punished in another jurisdiction. A recent Canadian constitutional law decision is illustrative. In *Interprovincial Co-operatives Ltd. v. The Queen in Right of the Province of Manitoba,*[189] the appellants were prosecuted in Manitoba for polluting streams in Manitoba with mercury. The mercury entered the streams in Saskatchewan and in Ontario in both of which provinces the discharge took place in compliance with permits issued by government agencies. The Supreme Court of Canada by a majority of six to three held that the Manitoba statute under which the appellants were charged was *ultra vires.* Though the case turned on the interpretation of the BNA Act, both majority judgments emphasized the feature that Manitoba was treating as unlawful water contamination which had occurred at a place where it was lawful.

Obviously there are situations where the principle that one should not punish a person for an act which was lawful at the place where he did it should not apply. We do not suggest that it be established as a generalized defence. We do urge that the principle be kept in mind when drafting and applying the provisions relating to the extraterritorial enforcement of a federal securities law. However, it would be wrong to recommend an undue deference to foreign sensitivities which might restrain Canada from taking any extraterritorial action at all.

Another limitation to a policy of unilateral extraterritorial expansion is the practical code of conduct known as the "do unto others" rule. In the securities area, for example, Canada may be reluctant to impose on non-residents rules about trading in Canada which Canada would not want imposed on Canadians if the parties were reversed. An interesting example is a recent case in the Supreme Court of Ontario. McIntyre Porcupine, a Canadian company, had its shares listed on two American stock exchanges as well as on the Toronto and Montréal exchanges. American federal securities law contains a provision known as the "short swing" rule, the purpose of which is to protect shareholders from insiders trading in the securities of the company; an insider who profits by selling securities within six months of acquiring them is liable to the company for the profits. This rule is a trading rule, designed to protect both domestic and foreign shareholders. Yet in the *McIntyre Porcupine* case, Keith, J., of the Supreme Court of

Backs SEC-Led Study on Access to Foreign Exchanges, Securities Week (New York), February 23, 1976, at 2.

189 [1976] 1 S.C.R. 477, [1975] 5 W.W.R. 382.

Ontario, refused to apply it against a Canadian resident insider, even though that Canadian resident insider filed insider trading reports in the United States and therefore might have been considered to know the U.S. rule.[190] If Canadian courts are to grant such exemptions to Canadians, is it fair to purport to impose our trading rules on non-resident shareholders of Canadian companies?

The mutual fund problem illustrates to some extent our national interest in control over the activities of Canadian nationals and Canadian companies abroad. Some speculative ventures bring no benefit to Canada, but damage Canada's reputation and that of its legitimate business enterprises.[191] The IOS disaster was directed by an American resident in Europe, Bernard Cornfeld, who, with a large number of other people (Americans, Canadians and Europeans) in Europe brought enormous financial losses to investors in Europe and North America. Some of Cornfeld's vehicles were Canadian corporations, and a number of Canadians, and certainly many foreigners, now point at Canada and argue that financial losses would not have occurred if Canada had deprived the Cornfeld group of the use of Canadian vehicles. Though that position may strike some people as unrealistic, the fact remains that it is held. We conclude that Canada should be prepared to take action internationally when Canadian institutions are being abused to the detriment of Canadians and to Canada's reputation.

Chapter VII
Conclusions and Recommendations - Part I

A. SUMMARY

In this part we consider the extent to which a federal securities law, if enacted, should attempt to reach beyond the territorial limits of Canada. Foreign involvement in the Canadian securities markets is of significant magnitude, and we conclude that any new regulatory system must take cognizance of this and attempt

190 In a recent case a U.S. court reached the same result in an action by American shareholders under the short swing rule against Canadian directors of a Canadian corporation which was registered with the SEC and whose shares traded on the American Stock Exchange; *see* Wagman v. Astle, 380 F. Supp. 497 (S.D.N.Y. 1974). Wagman is discussed in Walters, *Extraterritorial Application of Section 16(b) of the Securities Exchange Act of 1934*, 32 WASH. & LEE L. REV. 699 (1975).

191 This seems to be commonly recognized by Canadian securities administrators. The QSC recently issued a cease trading order against a company run by Americans and advertising only in Europe but giving a Montréal address as a contact point; *see* The Montreal Gazette, May 7, 1975, at 15.

to regulate it. Some features of this foreign involvement can be adapted neatly into an essentially domestic system of regulation. However, as individual transactions are examined in detail, there are foreign features which would be very difficult to reach through an essentially Canadian system and there are foreign features which there is probably no point in reaching.

A broad measure of outreach is permitted by international law. Though legal thinking and legal systems (both civil and criminal) are founded on a concept of territoriality, there is considerable extraterritorial scope permitted in international law. Thus, if a Canadian federal securities law were to adopt criminal law rules, international law would recognize their enforcement against Canadian nationals abroad, against persons in Canada and notionally in Canada, and against persons abroad who could be brought within the protective or impact principle, namely, persons who conduct activities outside the jurisdiction knowing that their activities will have consequences within it.

A parallel pattern is apparent in the civil system. There is widespread recognition of a universality principle, namely, that a person can be brought before the courts of a jurisdiction if he is present in that jurisdiction, notwithstanding that his action took place prior to his arrival there. The civil system also reveals a number of ways in which a person who is outside the state can be treated notionally as being within it if he consents to be so treated or if he has some asset within it over which the domestic authorities can exercise control. There is also precedent for assuming jurisdiction on the basis of impact within the state when the actor, although outside, intends that his acts take place within it. The real problem is to find a meaningful limit on the exercise of external jurisdiction so that the interests of the different states can be accommodated. An obvious possibility is the dominant interest analysis. In the most sophisticated of the existing systems of securities regulation, that of the United States, there is very broad international outreach. The outreach actually exercised varies with the circumstances, more effort being made to reach the fraudulent trading transaction than to reach non-fraudulent transactions which might actually have greater economic impact on American investors. European countries, on the other hand, have not sought to expand their securities laws extraterritorially.

The existing Canadian legislation in general is drawn within narrow compass. The present provincial securities laws have limited extraterritorial scope, largely because in the areas in which most effort has been concentrated, regulation of issuers and brokers, control can be secured by requiring registration. The provincial departments in charge of securities have not been eager to

regulate to the limits of their powers and so their extraterritorial powers remain untested and largely unused. Similarly, the Criminal Code sections are subject to the general philosophic principle that criminal law should not be applied extraterritorially. However, in cases decided under the provincial statutes and the Criminal Code, there have been cases where the courts have been willing to apply the techniques for outreach which were discussed in chapters III and IV.

Finally, the national regulatory mood seems to be one of expansion, at least in areas where Canada's economic interests are concerned. This new mood in itself would probably justify a securities law which reaches as far abroad as international law allows. A second argument in favour of broad outreach is a philosophical one on which reasonable people could disagree: if we are going to do something, we should do it well and thoroughly.

A third ground is fairness, that all the players in the game should be governed by the same rules. Since there are a number of international players in the Canadian securities game they should be governed by the same rules as the domestic players. However the principle of fairness, if carried too far, can have unjust consequences, for example, if the effect is so far-reaching that the foreign person has no reasonable notice of the rule or if its terms are such that compliance with the Canadian rule will require him to violate a domestic rule in his home jurisdiction. Finding the correct compromise between universality and unjust consequences is very difficult. Two examples illustrate the dilemma. One is the potash controversy. Many people in Saskatchewan feel very strongly that the potash within their soil is theirs and that they should be free to make whatever marketing arrangements most benefit Saskatchewan. Many people in the United States feel very strongly that all price fixing is bad, domestic or foreign, by government or by private industry. It is not easy to reconcile these strongly held and divergent views. The second example is a contrasting one, the question of insider trading. Profiting on insider information is abhorred both in Canada and the United States. Yet as we saw in chapter VI,[192] courts in both countries have refused to apply against Canadian directors the short swing rule which is little more than a strict liability form of the rule against insider trading. These difficulties lead us to conclude that although our approach to securities regulation should be expansive it should, at the same time, be thoughtful.

The one missing link in our argument for an expansive approach to securities regulation is the statistical one. We have no

192 *See* text accompanying note 190 *supra.*

evidence, or even an estimate, of the deleterious effect, if any, of transactions with foreign features on the Canadian securities markets. But need for control reasonably may be inferred from the volume of such transactions and from their susceptibility to manipulation. (See chapters VIII and IX.)

B. RECOMMENDED JURISDICTIONAL PRINCIPLES

1. *Nationality*

If Canadian federal securities rules are enacted, we recommend that they be made applicable on the basis of nationality to Canadian citizens and landed immigrants. Though Canada has relied very little on the nationality principle in the past, there is little international objection to it. On the contrary, there is some international expectation that a nation will police its cheats wherever they may roam. Although unrealistic expectations that Canada will be successful in policing Canadians (wherever they may be) who violate Canadian securities laws should not be encouraged. Canada can protect some of its legitimate interests and win international approval by adopting the stance that it will enforce its securities laws against its nationals whether within or outside Canada. We would restrict the scope of the new jurisdiction which would be achieved by adoption of the nationality test by requiring that there be some significant connection with Canada in the underlying transaction.

2. *Territoriality*

Our second recommendation is that Canada exploit to the fullest the principle of territoriality. In its simplest form that means that Canadian rules apply to all acts on Canadian territory without regard to whether or not there are victims in Canada. We should not hedge the rule, as some U.S. courts have done,[193] by ignoring conduct which is merely preparatory or which is less significant than foreign conduct. Further, we recommend that the territorial rule be based upon any feature of the transaction rather than the whole transaction. It should not be necessary that all constituent parts of the whole transaction take place in Canada, so long as some part takes place in this country.

3. *Impact*

Our third recommendation is that jurisdiction be claimed on

193 *See* text accompanying note 135 *supra*.

the basis on impact within Canada. There are a number of important differences in the way in which this principle can be stated. We prefer the formulation adopted by the American Law Institute (ALI Federal Securities Code)[194] which sets out the impact principle in this way:

> "Within the limits of international law, this Code applies with respect to...
>
> "(C) an attempt, solicitation or conspiracy outside the United States to commit a violation of this Code within the United States; and
>
> "(D) any other prohibited, required, or actionable conduct (i) whose constituent elements occur to a substantial (but not necessarily predominant) extent within the United States or (ii) some or all of whose constituent elements occur outside the United States but cause a substantial effect within it (of a type that this Code is designed to prevent) as a direct and foreseeable result of the conduct."

We considered whether proof that the actor intended that his act have consequences within Canada should be required. We rejected the idea because of our dissatisfaction with the treatment of intent by the courts in Canadian securities cases such as *Lampard* and *Jay*.[195]

C. RECOMMENDED JURISDICTIONAL RULES

Different problems emerge when one attempts to apply these three basic principles of jurisdiction to the four separate classes of rule referred to in chapter I. C. Those four classes are: the registration of the issuer and its securities, registration of dealers and

194 ALI FEDERAL SECURITIES CODE, Reporter's Revision of Tent. Drafts Nos. 1-3, at 233, *as amended by*, Tent. Draft No. 5, at 230.

195 The *Lampard* and *Jay* cases are discussed in ch. VIII commencing with the text accompanying note 231. A formulation of the impact test, largely parallel to the rule we have quoted above but incorporating the element of intent was developed at the 55th conference of the International Law Association and is set out in W. Brown, Extra-Territorial Application of National Laws with Special Reference to Antitrust Law (July 1974) (unpublished paper delivered at the 15th conference of the International Bar Association at Vancouver). Its provisions are as follows (at 3):

> "Article 5
>
> "A State has jurisdiction to prescribe rules of law governing conduct that occurs outside its territory and causes an effect within its territory if:
>
> "(a) the conduct and its effect are constituent elements of activity to which the rule applies;
>
> "(b) the effect within the territory is substantial; and

advisers, trading rules, and rules governing stock exchanges. We shall consider each class in turn.

1. *Registration of Issuer and Its Securities*

The nationality of an issuer derives from the place where it is incorporated. A company incorporated in Canada should be subject to Canadian rules concerning registration as an issuer and registration of its securities. An argument might be made that an issue of securities may have no domestic impact; for example, a Canadian company with extensive operations elsewhere may decide to borrow at an American bank to meet an immediate need for cash for its American operations. The issue of the note evidencing the indebtedness may fall within sections of the law requiring registration of securities. It is arguable that in the circumstances the issue of the note has no relevance to the Canadian shareholders or to Canadian regulatory authorities and that the expense of registration should be spared. There is some strength to such a contention. However, we think that the law should be drawn to cover the issue of a note by a Canadian multinational wherever it occurs, but the exemptions to registration established either by statute or by regulation should exclude transactions which have no demonstrable effect on Canada or the Canadian shareholders. In contrast to debt issues, issues of equity shares, whether to residents or non-residents, would have a significant influence on the Canadian shareholders in that most new issues reduce the interest of the existing shareholders in the company.

What about the foreign issuer? Where an issuer is a foreign incorporated company and it plans an offering of securities which will be purchased by Canadian investors, then it may become involved in Canada in a number of ways. It may retain a Canadian underwriter. Such activity would justify regulation under the territorial principle. The impact principle may justify regulation where the issuing company conducts no physical activity in Canada but in which a number of shares are acquired by Canadians through such routes as immigrants bringing shares to this country or by Canadian individuals buying shares through American brokerage firms or Canadian branches of American brokerage firms.

The general principle should be that foreign companies making a distribution of their securities in Canada or whose securities

"(c) it occurs as a direct or primarily intended result of the conduct outside the territory."

are traded on a Canadian stock exchange should provide the regulatory agency with appropriate information by whatever system applies to similar issuers in Canada. The regulatory agency should have the authority to, and should be encouraged to accept, in satisfaction of the technical Canadian requirements, documentation prepared to fulfil substantially similar requirements under foreign legislation. Like the SEC it should also have the power to grant partial exemptions to foreign issuers both by regulation and on a case by case basis. With respect to "inadvertent issuers", those which have neither distributed nor listed in Canada but whose shares are owned by significant numbers of Canadians, we recommend a tiered system such as that obtaining in the United States. If the number of Canadian shareholders is substantial, perhaps over 2,000, Canada should require registration on the same basis as if the company had issued shares in a Canadian offering or had listed on a Canadian exchange. A middle tier should be created, possibly from 2,000 down to 500, for which filing only the material filed publicly in the issuer's own country and with stock exchanges or regulatory authorities in other parts of the world is required. "Inadvertent issuers" with fewer than 500 Canadian shareholders should not be subject to any filing requirements in this country.

We recommend that Canada adopt a requirement like the American one, that a foreign issuer be required to consent to service of process on it in Canada.[196]

2. *Registration of Brokers, Dealers and Investment Advisers*

Again we begin by considering the nationality test. Clearly a Canadian broker or adviser who carries on business in Canada must comply with whatever registration system is established. If that Canadian broker establishes a branch office in another country, information relating to the operation of the branch should be included in any filings or in any calculation of capital filed in accordance with Canadian requirements since the business is as much affected by its foreign liabilities as it is by its domestic liabilities. A more complex case is presented if the foreign branch is operated not by the Canadian broker but by a foreign subsidiary. Whether the foreign subsidiary itself should register in Canada should depend, in our view, on whether it does business in Canada. Registration should not be required on some theory of affiliated nationality. Whether the position of the subsidiary should be "consolidated" with the position of the parent for the purpose of

196 *See* Panel, *Securities Problems Relative to United States and Canadian Business Transactions*, 31 BUS. LAW. 801 (1976).

registration and purposes such as calculation of minimal capital, in our view should be decided by general legal and accounting principles. For example, if the Canadian parent has no legal responsibility for the liabilities of the foreign subsidiary, then such liabilities should not affect the registration in Canada of the Canadian parent.

The next test of the nationality principle is to consider whether registration should continue to be required when the broker or adviser emigrates from Canada and starts business afresh, for example, in San Diego. Such a person should not be expected to register in Canada unless he is doing business in Canada; in other words he should not be required to register in Canada merely because he is a Canadian citizen who advises Americans in San Diego about the purchase of American stocks. Nor should registration be required if his advice in San Diego is to Canadians resident in San Diego with respect to Canadian stocks. In the case of brokers and investment advisers, we would require that there be a substantial connection with Canada before registration is required on the basis of nationality. A requirement of substantial connection underlay our discussion of the registration of the issuer in chapter VII.C.1 above, but remained implicit because the substantial connection test is always met when a Canadian company issues a security, whether at home or abroad.

Irrespective of nationality, persons who carry on business as brokers, dealers or investment advisers in Canada should register because they are inside Canada and subject to territorial jurisdiction. To give an example, if a broker is required to file a notice of participation in an underwriting then a brokerage firm doing business in Canada should make such a filing, even if it is a completely non-Canadian transaction. The registration and disclosure scheme must be designed to reveal the worldwide position of a registrant and not merely its Canadian activities. The difficult question is the definition of what constitutes doing business in Canada. In deciding whether a foreign broker or adviser is doing business in Canada, one should have regard both to the territorial and impact principles. Whether the Canadian system should require registration of a brokerage firm in Seattle should depend on whether there is significant conduct within Canada by members or employees of that firm and whether, absent any such physical conduct, there is foreseeable impact in Canada of conduct taking place only within the United States. Registration of persons who, while physically outside the country, solicit orders in this country by mail or telephone or give investment advice to persons resident in Canada should be required. We concede that such a requirement might be difficult to enforce and that unthinking extrapolation of

the Canadian system could have absurd consequences, for example, if there were a Canadian ownership or Canadian management requirement for brokers and dealers. However, if the Canadian system establishes rules to protect investors from self-interested touting by a broker with an excessive supply of securities, the investor should be protected whether the touting originates in the same city or crosses an international border. This is an area where close attention will have to be directed to drafting the rules and where time-consuming discussions and negotiations with regulatory agencies in other jurisdictions will have to be undertaken. Again we recommend that Canada follow the American example[197] and require foreign brokers and advisers to file consents to service and to provide the Canadian regulatory authority with financial statements and other types of information as are required of domestic brokers and advisers.

3. *Trading Rules*

To what extent should the trading rules created by a Canadian federal securities law follow Canadians around the world and bind them to Canada's standards of business conduct in their transactions with other persons? It is easy to conclude that a Canadian resident in Toronto who engages in wash trading on the Toronto Stock Exchange should be subject to the Canadian law. But what about the Canadian emigrant living in Manhattan who, to assist some friends in stabilizing a market in shares being traded on the American Stock Exchange engages in wash trading on that exchange? Does Canada wish to claim jurisdiction over this transaction or should it be left to the attention of the New York Regional Office of the SEC? In our view, the requirement of a significant connection with Canada is equally as important in this area as it is in the rules governing brokers and advisers discussed in chapter VII.C.2 above.

The territorial principle should be exploited to the fullest in applying Canada's trading rules. There is already precedent for applying Canadian rules of trading conduct to activity taking place in the jurisdiction even when the victims of the dishonest act are outside it. The U.S. courts have retreated to some degree from this principle, partly as the result of the actions which have been brought in the United States in the IOS affair. In the *Bersch* case,[198] the court went so far as to articulate its concern that the precious resources of the U.S. courts were being unduly burdened

197 *See* text accompanying note 118 *supra*.
198 *See* text accompanying note 135 *supra*.

by foreign plaintiffs. In 1976 an excess of foreign plaintiffs seeking to apply Canadian rules to international transactions is not a burden under which we labour. If it becomes so in the future it can be dealt with at that time.

Our point is that if we have rules about fair dealing by buyers and sellers of securities, then those rules should be applicable for the protection of Canadian buyers and sellers irrespective of whether the other party to the transaction is in Montréal or in Montevideo. We should accept jurisdiction where a person in some other country plans some transaction to take place within Canada which will violate our laws. As we have seen above in chapter V, Parliament has recently amended the Criminal Code to give Canadian courts jurisdiction to try persons who, being abroad, conspire to violate Canadian criminal law.[199]

4. *Stock Exchanges*

A Canadian federal securities law does not need any extraterritorial rules about stock exchanges located in Canada. Stock exchanges may have special rules for foreigners. And one may need rules about the activities of foreigners affecting stock exchanges - for example, listing securities on them, buying and selling the stocks listed on them or affecting takeover bids through Canadian stock exchanges. To some degree such rules can be enforced by sections directed to the exchange in Canada. But these situations are covered by the types of rules we have discussed in C.1, 2 and 3 above and not by stock exchange rules as such.

Nor can a Canadian securities law control in any realistic way a stock exchange located abroad. There may be features about such exchanges which have impact in Canada: if their margin requirements are different from those in Canada, investors or Canadian brokerage houses may be attracted to transactions on those exchanges and the flow of business will have an effect in Canada. However, the way to control such activities is through rules affecting the Canadian investor or broker rather than attempting to regulate the foreign exchange.

In the foregoing pages of this chapter we have described the system of regulation which we think should be established in a Canadian securities law. There is another important feature to any system, namely, the way in which it is administered. Though it makes sense to write a statute claiming broad outreach under international law, it is less reasonable to exercise all of the claimed jurisdiction from the outset. The administrators of a Canadian

199 *See* text accompanying note 145 *supra*.

federal securities law should start with situations in which jurisdiction is least subject to controversy and should pay close attention to the effect of their attempts to apply Canadian rules extraterritorially, keeping in mind that Canada should not claim jurisdiction over persons in other states which it would not want to grant to the other states over persons in Canada.

Part II
International Enforcement

Chapter VIII
Special Characteristics of Securities Offences

In this part we discuss the investigation and enforcement of Canadian securities laws which have application abroad. Although L. H. Leigh's paper in this volume[200] more closely relates to the problems of detecting and punishing offences against existing rules, we include in this paper a brief description of those problems as an introduction to the issue of international enforcement.

A. DIFFICULTY OF INVESTIGATION

Many features of the securities markets make investigation of crimes such as market manipulation difficult. For example, consider the problem of beneficial ownership. Tracing transactions through transfer agents and brokerage houses is laborious even where the records of the transaction reveal the true names of the parties involved. It requires much police work to discover who the real persons behind the trades have been.[201] The difficulty is increased where certificates are in street name[202] and nominee

200 *See, Leigh, Sanctions.*

201 In the United States the SEC has proposed new rules to increase disclosure of beneficial ownership and to require disclosure of foreign ownership. The commission received more than 225 letters of comment on its proposals and expects to take final action by the end of 1976; *see* Hoffman, *Beneficial Ownership*, 8 REV. SEC. REG. 813 (December 16, 1975); *Comment Letters Run Heavily against Commission's Proposals to Expand Disclosure of Beneficial Owners*, 329 BNA SEC. REG. & L. REP., November 26, 1975, at A-1; *The S.E.C.'s Beneficial Ownership Proposals: You Can't See the Forest for the Trees*, 365 BNA SEC. REG. & L. REP., August 11, 1976, at B-1.

202 In the United States, the Securities Reform Act of 1975 authorized the SEC to undertake a study and investigation of the practice of recording ownership in the name of a person other than the beneficial owner of a security. The final report is due in December 1976. In December 1975, the commission filed its preliminary report in which it stated that the practice was necessary to the efficient processing of securities transactions and that, though there might be some abuse of the

accounts are used and by the fact that stock exchanges themselves keep records of trades only by brokerage houses and not beneficial owners. An investigation into manipulation of a stock that trades, for example, on both the Toronto and Vancouver stock exchanges involves combing the records of scores of brokerage houses in two provinces. Even this process can be complicated by jitneyed trades, that is, the practice by which one broker trades on behalf of another. Yet another problem is that many accounts are opened in brokerage houses subject to the condition that persons other than the named customer have the right to authorize trades in them. In addition, Canadian chartered banks often trade on behalf of customers without disclosing beneficial ownership.

Even where persons deal directly in the market it is difficult to follow their transactions. Innocent persons may be used as a screen for fraud as in the device of "warehousing". The organizer of a warehousing scheme bribes individual salesmen in brokerage houses through payment of secret commissions to purchase or sell stocks on behalf of accounts over which they have control, either through their personal relationship with the customer or through some more formal arrangement. Typically the stock is bid up and when it falls, the customer usually does not suspect his broker since most customers accept some losses as well as some gains.[203]

Innocent persons may also be used as a screen for fraud when the manipulator can convince an investment adviser or a publication reporting on business affairs to publish inaccurate information which influences the price of a security; and a financial writer may be bribed to publish false information or use his position of public confidence to influence the price of securities in which he himself has an interest.[204]

Theft of stock is a problem of some significance. If one compares the physical and market characteristics of stock certificates

---

system, the most desirable remedial course of action would be to improve access to the underlying records for those with legitimate concerns rather than to ban the practice or create a new reporting system; SEC, PRELIMINARY REPORT OF THE S.E.C. ON THE PRACTICE OF REVEALING THE OWNERSHIP OF SECURITIES IN THE RECORDS OF THE ISSUER IN OTHER THAN THE NAME OF THE BENEFICIAL OWNER OF SUCH SECURITIES (December 1975).

with those of, say, a television set, the advantages of dealing in stolen securities are obvious particularly at the disposition phase. Securities can be mailed from city to city and even from country to country with virtually no risk of detection. Moreover, as a representative of the American securities industry has pointed out, securities are especially vulnerable to theft because they are constantly in transit for the completion of transactions or for transfer from one person to another.[205]

As of 1976 the most widespread securities offence in Canada is market manipulation.[206] This sin comes in many forms, varying from wash trading to essentially invisible arrangements by which corporations acquire or transfer assets in transactions with their "friends" for dubious consideration. There have been some instances in Canada of a more sophisticated technique which is now the most common type of securities offence in the United States, namely, the use of false assets as collateral to create a credit base with a bank or brokerage institution.[207]

A false asset may be merely a balance sheet of a company whose books show mining claims, notes, mortgages or other assets which are valueless intrinsically or because they, in turn, depend on the credit-worthiness of a shell corporation.[208] Having obtained credit from the institution, a firm may draw funds from the institution itself or use the credit so established as a means of speculating in the stock market. If the speculation is successful the invalidity of the "security" may never come to light. But if it is unsuccessful, the speculator disappears leaving his worthless "security" behind him. The "security" may also be used as the basis for the loan fee swindle, by which one or more potential borrowers put up a loan fee to a supposed lender who then disappears with the fee and never issues the anticipated loan.[209]

Depositing stolen or counterfeit securities with banks or brokerage houses as collateral is easier than transferring them in a

205 *Organized Crime, Securities: Thefts and Frauds: Hearings before the Permanent Subcomm. on Investigations of the Senate Comm. on Government Operations*, 93d Cong., 1st & 2d Sess., 2d ser., pt. 4, at 615 (1973-74) (witness William J. Fitzpatrick) [hereinafter cited as *Organized Crime Senate Hearings*].

206 *See* the description of the mechanics of a typical manipulation in COORDINATED LAW ENFORCEMENT UNIT, INITIAL REPORT ON ORGANIZED CRIME IN B.C. 26-27 (1974).

207 One expert has testified that the pledging of worthless securities at American banks is now declining because it leaves traces of a crime. Most stolen securities are now taken outside the U.S. where tracing is difficult. *See, Organized Crime Senate Hearings, supra* note 205, pt. 2, at 150 (witness L.P. Mastriana).

208 For a general description, *see* the evidence of an investigator for the Senate subcommittee, P.R. Manuel, *Organized Crime Senate Hearings, supra* note 205, pt. 2, at 125-34.

sale. It is becoming increasingly difficult to obtain cash for stolen securities through direct sale, since the brokerage industry is tightening its procedures for detecting worthless securities.[210] Where a brokerage house expects to pay cash to a seller of securities, it normally inquires into his title to them. But current business practice does not always include a thorough inquiry into the ownership of collateral.[211] A number of American banks now follow a procedure by which they transfer securities taken as collateral into the name of the bank itself or the name of a nominee.[212] Canadian banks do not seem to have adopted this procedure. Criminals in the U.S. have reacted in two ways: they now take stolen securities out of the country where tracing is more difficult and they find ways of establishing trust accounts or safekeeping accounts in banks and obtaining receipts or other forms of validation from the bank which can, in turn, be used to obtain credit. Swindlers also put stolen, counterfeit of worthless paper in insurance company portfolios or pension plan funds because of their more relaxed accounting standards.[213] Even in banks the normal practice of bank examiners is to verify the existence but not the validity of securities. One of the difficulties is that banks and brokerage houses in local communities often are hesitant to report securities as stolen until they are certain a theft has occurred because of the possibility of legal liability for inaccurate reporting and also because of adverse public relations.[214]

In the United States there were two separate computer systems to which a person seeking to validate the ownership of stock could turn. The only system now functioning is the Federal Bureau of Investigation's National Crime Information Center (NCIC) which contains information about stolen securities. The estimated value of the stolen securities listed on NCIC in 1973 was approximately $156 million. Law enforcement agencies, including local, state and federal agencies throughout the United States and Canada have direct access to the NCIC and the industry has access

212 *Id.*, pt. 4, at 581. On December 23, 1974, the U.S. Attorney-General, William Saxbe, issued a long press release describing the Department of Justice's recommended methods for detecting forged or stolen securities as well as for preventing other types of securities frauds.

213 *Id.*, pt. 2, at 150. An example of a case in which a swindler cleverly used the problems of international communication to defraud a Swiss bank by transactions in British Columbia is Bank Fur Handel v. Davidson & Co., 46 D.L.R. (3d) 3 (B.C.S.C. 1974), *appeal dismissed* 55 D.L.R. (3d) 303 (B.C.C.A. 1975), *leave to appeal refused,* 5 N.R. 367 (S.C.C. 1975).

214 *Organized Crime Senate Hearings*, *supra* note 205, pt. 4, at 586, 610.

to NCIC only through them.[215] The NCIC system includes securities stolen in Canada.

The other computer system was the Sci-Tek system of the Securities Validation Corporation (SVC) which listed lost and missing certificates as well as stolen ones. The SVC computer facility contained approximately nine times as many items as that of the FBI. Access to the SVC computer was direct but the person seeking the information had to pay a fee. By 1974 the value of the securities in the SVC system had grown to $11.1 billion. In early 1975 it went out of business because of poor broker and bank support.[216] The RCMP is now putting into operation a computer system known as the Canadian Police Information Centre (CPIC) which will list stolen, lost and missing Canadian securities.

Some American estimates suggest that only 10% of the stolen securities are listed on the computer system[217] and the securities industry has not thrown itself wholeheartedly into an effort to make the computerized system work more thoroughly. This results in part from the feeling that more diligent work would be too expensive, in part from the difficulty created by the size of the problem. It is also clear that, as a percentage of sales, the value of lost and stolen securities is fairly low. Though there had been cause for concern in the early 1970s, by 1974 stock thefts had become less of a problem and insurance rates were dropping.[218] Moreover, security systems had become much better by 1974, at least in the bigger brokerage houses.[219] However, there is support in the American securities industry for a mandatory system by which persons who receive negotiable instruments must check their validity against a centralized information system such as the NCIC system.[220] The American banking industry, on the other hand, opposes a system of compulsory validation.[221] The banks argue that mandatory validation would be unwieldy for them, that it would be expensive and would duplicate satisfactory procedures which the banks already have implemented. The banks have experienced fewer incidents of disappearing securities than the brokerage industry and are able to demonstrate that the problem is minor as far as they are concerned.[222] Another argument the

222 The various arguments can be found *id.* at 535-84.

banks advance is that the really sophisticated thief will soon learn that stolen securities can only be passed if they are sold prior to their discovery from the institution in question.[223]

There are allegations that one of the chief reasons for bank opposition to mandatory validation is the fear by the banks that they would lose their status as holder in due course, a change which could cause them significant loss. But the banks have generally denied this has any significant part in their opposition to compulsory validation.[224]

The 1975 amendments to the Securities Act permit the SEC to require brokers and dealers promptly to report missing, lost, or stolen securities, require fingerprinting of all brokers and dealers and permit the SEC to enter into an agreement to use the facilities of the NCIC.[225] A proposed rule would require reporting of lost, counterfeit or stolen securities within a certain time; in addition, specified persons receiving securities would be forced to inquire from a central data bank as to their status. An impact study of the proposed rule, undertaken by the Securities Industry Association, suggests that the proposed reporting requirements would be manageable but urges that the time limit be extended. But the association concluded that the proposed inquiry procedure would be very costly and suggested modifications to reduce the burdens, the cost of which would fall on the retail clients of the firms involved. At the time of writing, the proposed rule has not been adopted by the commission.[226]

An ultimate solution may be to adopt a system in which certificates are never delivered but remain in a centrally located depository. There is wide support for such a system in the United States, based in part on favourable experience with the Federal Reserve Bank depository system for federal government securities.[227]

223 Other reasons for bank opposition to mandatory verification may be found *id.*, pt. 1, at 45.

224 *Id.*, pt. 4, at 485, 584. *See id.* at 494 for a description of the reluctance of some segments of the American securities and banking industries to become involved in the SVC system and for a description of the legal problem concerning holders in due course status. Another factor which contributes in some way to the difficulties of securities enforcement is that it is by reaction to complaints by individuals. Such enforcement, by definition, is after the event, and means that schemes are not apprehended in their formative stages before damage can develop. Some preventive work is being done in Canada through the Crime Investigation Unit of the RCMP, but on the whole, enforcement in this country is by reaction.

B. DIFFICULTY OF PROVING VIOLATION

Under their authority to stop trading,[228] the commissions have the power to act unilaterally and swiftly. However, a cease trading order is often an inappropriate remedy. It does not make sense to stop trading in the shares of MacMillan Bloedel Ltd. because a widow has bought a few hundred shares in a falling market on the representation by a broker that the company has found a way to turn wood into gold. At the other end of the scale, there is no point in stopping trading in a penny mine when its stock returns to the normal trading range after having been run up by a fraudulent scheme. In these situations, it is important to focus on the individual wrongdoers.

Though it is possible to reach individual wrongdoers with individualized administrative sanctions, normally they are inappropriate and one must resort to the criminal law, with all its technical defences for the accused, including the hurdle of proving guilt beyond a reasonable doubt.

Securities offences by their nature are usually complicated, and proving what happened in a manipulation may be very difficult. It is one thing to read an entry on a computer printout which shows the trades which caused the movement of the stock in question. But it is another thing to prove the transactions shown on that tape connecting the principals to the brokerage houses and connecting the documents prepared in them, and in a stock exchange, with the final result on the tape. Bank records, too, are being increasingly computerized and there is little experience in making computer records admissible in courts.[229] Enforcement officers are also concerned about the ease with which evidence on computer tapes can be destroyed.

Enforcement officials point out that disapproval of so-called "white collar" crimes is not as strong as for other offences such as

228 *See e.g.* B.C. Securities Act, s. 77A.

229 Evidentiary problems arising from computer-generated evidence are discussed in

theft and robbery which have the same effect.[230] Sentences often seem light when compared with the amount of money involved. Enforcement officials argue that harsher penalties can be justified in securities cases because the offence normally involves prolonged and consistent criminal intent.

In addition to the factual problems such as those referred to above, securities cases often involve complicated evidentiary and psychological problems of intent. An illustration is the *Lampard* trial.[231] The accused was acquitted after a trial on an indictment containing twenty-nine counts alleging wash trading under section 325(a) (now section 340(a)) of the Criminal Code which provided:

> "Every one who, through the facility of a stock exchange, curb market or other market, with intent to create a false or misleading appearance of active public trading in a security or with intent to create a false or misleading appearance with respect to the market price of a security,
> "(a) effects a transaction in the security that involves no change in the beneficial ownership thereof...
> " is guilty of an indictable offence and is liable to imprisonment for five years."

The accused had been in the brokerage business for many years and was president of a broker-dealer firm Lampard & Company Limited which had two other employees, Teresa Murray, the secretary-bookkeeper and H.K. Roberts who was employed to run a publicity campaign in connection with the shares of Dominion Leaseholds. The Crown showed that on six different days in January and February 1963, large numbers of wash trades were made by the accused in the shares of Dominion Leaseholds. On the buy side the accused employed seven different brokers, and placed orders in the name of Lampard & Company as buyer. Most of the sell orders were by a different brokerage house on the accused's instructions through accounts in the names of the two employees, Murray and Roberts. Murray received payment and transferred it to the accused. The accused established a bank account in the name of Roberts and cheques payable to him were deposited in it and the

231 R. v. Lampard, [1968] 4 C.C.C. 201 (Ont. C.A.), *rev'd*, [1969] 3 C.C.C. 249 (S.C.C.).

proceeds used to pay for purchases of shares in Dominion Leaseholds or were transferred by cheque to Lampard & Company. The trading constituted a significant percentage of the daily trading. On one day the total trading was 152,000 shares and the Lampard trades amounted to 32,000 shares. This was the lowest percentage of "Lampard trades" of the days for which evidence was given. On another day the total trading was 72,000, the wash trades 69,500 and on the four other days the wash trades amounted to more than 75% of the total trading. Over the two-month period the price moved from 48-1/2¢ to 74¢.

The trial judge concluded that the accused effected the transactions without changing beneficial ownership and that he did so intentionally. However, the trial judge decided that there was reasonable doubt whether the accused had committed the foregoing acts with intent to create a false or misleading appearance of active public trading and explained his doubt on the question of intent by referring to three factors. First, he was not convinced of the Crown's theory that the accused was motivated by profit because the judge reasoned that the accused might not be able to dispose of the stock at its highest price. Second, there might be some other motive. Third, the evidence was confined to six of the thirty-one trading days in the period between January 7 and February 18. There being no evidence of the volume of trading on the days other than those specified in the indictment, it was not clear to the trial judge that there was a false and misleading appearance of active public trading over the period.

The Crown appealed the acquittal. The only appeal lay on a question of law. The Ontario Court of Appeal concluded the proper inference to be drawn from the facts in the record was a question of law and reviewed the record. It said:

> "Considering the transactions proved in the twenty-nine counts, their proximity in time, the manner in which they were executed, including the subterfuge with respect to most of the sales, the employment of Roberts to run a publicity campaign with respect to the shares of Dominion Leaseholds, I can come to only one conclusion – and in my opinion it is an irresistible one – that the respondent was engaged in a scheme or plan to create a false and misleading appearance of active public trading in the shares of Dominion Leaseholds."[231a]

However, the Supreme Court of Canada allowed the appeal and restored the verdict of acquittal, holding that the question of the

231a [1968] 4 C.C.C. at 208.

accused's state of mind was purely a factual matter not subject to appeal.[232]

232 Another case illustrating the difficulties caused in securities cases by the elusive criminal law doctrine of intent is R. v. Jay, [1966] 1 C.C.C. 70 (Ont. C.A. 1965) which involved a charge under para. 325(b) of s. 325, now s. 340(b):

> "Every one who, through the facility of a stock exchange, curb market or other market, with intent to create a false or misleading appearance of active public trading in a security or with intent to create a false or misleading appearance with respect to the market price of a security...
> "(b) enters an order for the purchase of a security, knowing that an order of substantially the same size at substantially the same time and at substantially the same price for the sale of the security has been or will be entered by or for the same or different persons,
> "is guilty of an indictable offence and is liable to imprisonment for five years."

Section 325 referred to two types of intent, one to create a false or misleading appearance of active public trading and the other to create a false or misleading appearance with respect to the market price. The accused was convicted by a jury on a charge alleging the former, namely, intent to create a false or misleading appearance of active public trading. During August and September 1960, the accused acquired a substantial number of the shares of National Hosiery Mills Ltd. and in the course of doing so bought and sold extensively pursuant to purchase and sale orders entered by him. In reviewing the evidence, the Court of Appeal compared the purchase and sale orders, and its comparison revealed that in only one instance were there matching orders. Sometimes the orders differed on quantities and at other times on price; many of the purchase orders preceded the sale orders in time. The Court of Appeal, emphasizing the Crown's failure to prove intent, stated that the Crown had not proved its case. The court's comments were somewhat alarming; there was evidence that the accused was seeking election to the board of directors through becoming a holder of a substantial quantity of shares. The stock had been comparatively inactive on the Toronto Stock Exchange. Roach, J.A., said (at 72):

> "A purchaser intending to accumulate a portfolio of shares in a given company at the most advantageous price would be interested in preventing a continuing rise or skyrocketing in the market caused by his own continuing buying and, as a brake against that possible result, would be justified in his own interest in putting some of his own shares on the market in an effort to have the supply offset the demand. In other words he would try to stabilize the price for his own advantage and if that alone was his purpose, then he would not have the intent which is an element of the offence created by 325(b). To put it otherwise, he would not thereby intend to create a false appearance of active public trading. His purposes would be legitimate. There was no evidence in this case to negative that legitimate purpose."

One startling aspect of the foregoing is that s. 325 is also directed at creating a false or misleading appearance with respect to the market price of a security. The Court of Appeal in Jay has stated that manipulating the market is legitimate provided that a person is "stabilizing" it. Surely the evil is as great if the manipulator is thwarting the normal market processes by making the stock price stable as it is if he causes the price to rise or fall? Secondly, the evil inherent in an artificial volume of trading is demonstrated by the Jay case itself, where the increased volume was used as a shield for the price manipulation which so pleased the Ontario Court of Appeal. "Stabilizing" is a virtually essential step in a fixed-price underwriting. Its use to eliminate peaks and valleys in a market is defended and even advocated by distinguished securities law experts whose integrity is beyond question. But "smoothing a valley" is nonetheless manipulating, even if blessed with the appella-

The *Lampard* and *Jay* cases are but illustrations of the difficulties facing enforcement officials. There is insufficient space in this paper to refer to the various other problems but some general points can be referred to in passing. Proving the real value of assets being bought or sold by a corporation in a transaction with another corporation related by common shareholding or even by the "friendliness" of the principals involved may create difficulties. Directors of legitimate businesses must have some discretion in valuing the consideration upon which assets are bought and sold and it is difficult to create a system which prevents the unscrupulous from taking advantage of this leeway. It is also often difficult to prove that certificates have been stolen. While the custodian can testify that a particular certificate now produced is "missing", its officers are often unable to say on oath that the certificate was stolen. Where a stolen certificate is blank, a complication arises from the fact that its intrinsic value is low and, accordingly, the penalty meted out to the thief is lower if he is caught before he has had a chance to fill in a dollar amount or number of shares. Parliament has now dealt with this situation so that there is a sanction available when the police arrive too late and find that the certificates have been sold for cash or find that Canada is being used as a place to "launder" the proceeds of certificates stolen elsewhere. Section 312(1) of the Criminal Code makes it an offence to possess property or any proceeds of such property if it was obtained by conduct constituting an indictable offence whether the conduct took place in or out of Canada.[233]

Difficulties also arise in proving volume. Records are not readily available where a transaction occurs in the over-the-counter market. Though the information turned up by investigations under the securities acts is useful in a subsequent prosecution, it does not itself constitute a "business record" so that it is not admissible as such but must be proved laboriously. Offences involving securities, particularly fraud cases, take a long time to prepare, compared to many other types of criminal case. The amount of legwork is extensive.[234] The investigators must be experienced in the ways of the market and the persons who manipulate it. Many police forces just do not have the resources to be able to take on securities investigations. How much money should be dedicated to

---

tion "stabilizing". We leave to those experts the task of defining permissible manipulation.

233 The then Minister of Justice's remarks on this feature of this legislation (then in bill form) are quoted in part in Mackie, *Gov't Turns in Ticket on "Laundered Money"*, Vancouver Sun, August 1, 1975, at 6.

234 *See* the discussion of the difficulty in marshalling sufficient manpower and resources in COORDINATED LAW ENFORCEMENT UNIT, *supra* note 206, at 27.

the problem of enforcement? It may be cheaper for society as a whole to accept a certain amount of dishonesty in the securities markets than to attempt to stamp it out completely.

Yet there is some reason for optimism. Most experts in the enforcement of securities laws believe that success in prosecution requires only the continued and concentrated attention of enough experienced people,[235] and that a major innovative overhaul of the types of offences is not required. More prosecutions are successful now than they were in the past because there is now greater expertise among investigators and prosecutors. There is also a higher level of enforcement and a greater level of cooperation between the members of the industry, the stock exchanges and the police.

Chapter IX
Special Problems of International Offences

A. STRUCTURAL DIFFERENCES

The special problems of investigation and proof of securities offences referred to in chapter VIII are exacerbated in the international situation. In the domestic situation a great deal of information is obtainable even though combing through it may be time-consuming and proof of an offence may be complicated. For example, the Criminal Code authorizes peace officers to search premises and to seize and retain documents relating to a criminal offence which has been committed or is suspected of having been committed.[236] In domestic cases legislation specifically facilitates proof of financial transactions shown in entries in books or records of deposit-taking institutions incorporated in Canada.[237]

In addition, the provincial securities acts typically contain very broad powers of investigation.[238] Section 23 of the British Columbia Securities Act, for example, authorizes the Superintendent of Brokers to investigate contraventions of the act or the regulations and offences committed under the Criminal Code in

235 *See* on the history of the RCMP Commercial Crime Branch, Moon, *Canada's Top Criminals Move into Big Time Fraud*, The Globe and Mail (Toronto), April 2, 1975, at 3, col. 5.

236 *See* Criminal Code, ss. 443-446.

237 *See e.g.* Canada Evidence Act, s. 29(3).

238 For a more extensive discussion of the process of information collecting *see* Baillie, *Discovery-Type Procedures in Security Fraud Prosecutions*, 50 CAN. B. REV. 496 (1972). Further, the provinces are moving to create a system of interprovincial subpoenas so that witnesses can be subpoenaed in one province to give evidence at a trial in another province; *see* Interprovincial Subpoena Act, Bill 19, 31st Parl. B.C., 1st Sess., 1976.

connection with a trade in securities. The legislation defines the scope of investigation in the following broad language:

> "For the purposes of an investigation ordered under this section, the person appointed to make the investigation may investigate, inquire into, and examine
>
> "(a) the affairs of the person or company in respect of which the investigation is being made and any books, papers, documents, correspondence, communications, negotiations, transactions, investigations, loans, borrowings, and payments to, by, on behalf of, or in relation to or connected with the person or company and any property, assets, or things owned, acquired, or alienated in whole or in part by the person or company or by any person or company acting on behalf of or as agent for the person or company: and
>
> "(b) the assets at any time held, the liabilities, debts, undertakings, and obligations at any time existing, the financial or other conditions at any time prevailing in or in relation to or in connection with the person or company, and the relationship that may at any time exist or have existed between the person or company and any other person or company by reason of investments, commissions promised, secured, or paid, interests held or acquired, the loaning or borrowing of money, stock, or other property, the transfer, negotiation, or holding of stock, interlocking directorates, common control, undue influence, or control or any other relationship."[239]

The legislation vests in an investigator the same power granted to the Supreme Court to summon and enforce the attendance of witnesses and compel them to give evidence on oath or otherwise, and to produce documents, records and things. Failure to testify or to produce information makes a person liable to be committed for contempt by a judge of the Supreme Court.[240] An investigator is also authorized to search for and retain any document, record, security or other property from the person or the company whose affairs are being investigated.[241]

The various filing and disclosure requirements ensure that a great deal of information is available to investigators since the securities commissions collect information on a regular basis for other purposes which is available to investigators. For example, the acts typically require registration of individual persons in-

239 B.C. Securities Act, s. 23(3).

240 *Id.* s. 23(4).

241 *Id.* s. 23(6).

volved in the securities industry[242] and require registration and disclosure by issuing companies.[243] James C. Baillie points out that often companies disclose more than they are legally bound to because of the importance of maintaining good relations with the securities commissions.[244]

The self-regulating organizations within the industry also collect information which is available to the regulatory commissions.[245] And, finally, in major cases, royal commissions have been convened to investigate suspected securities offences.[246]

The situation is rather different when a Canadian enforcement agency wishes to investigate a company incorporated in a foreign jurisdiction.[247] It goes without saying that Canadian subpoenas do not run to foreign jurisdictions. Generally speaking Canadian investigators cannot obtain documentary evidence or testimony from unwilling foreign persons. A Canadian investigator still has access to the foreign disclosure system and in some jurisdictions the information available is even more extensive than that required in Canada of Canadian companies. A familiar anomaly is that a Canadian investor or investigator sometimes can find out more about a Canadian company in the files of the SEC in Washington than he can in Canada.

On the other hand, many foreign jurisdictions require much less disclosure than Canada. Often records of a foreign jurisdiction show only the incorporators of the company; there is no information on the beneficial owners of the shares or even subsequent registered owners. Thus a foreign corporation may carry on an active business in Canada with records showing only the initial nominee subscribers who acted for the incorporating lawyer.[248] Some jurisdictions permit the incorporation of institutions which are named and exist as banks but which in fact are nothing more

242 *Id.* s. 7(1).

245 *Id.* at 498.

246 *Id.* at 497.

247 Obviously the difficulty of obtaining information abroad is not unique to Canadian enforcement agencies. An illustrative account of the difficulties in securing foreign business records relating to the regulation of foreign shipping and of national sensitivity to enforcement of foreign laws may be found in Magnusson, *The Need for International Agreement in Obtaining Evidence from Foreign Countries*, 26 FED. B.J. 232 (1966). As this paper is being written, the SEC is pressing for greater authority and additional sanctions because of the difficulty it is experiencing in enforcing U.S. laws when there is a foreign aspect to a transaction; *see*, *Hills Says S.E.C. Needs More Tools to Catch Securities Violations by Foreign Holders*, The Wall Street Journal, June 29, 1976, at 4.

248 Even when records are available they do not provide essential information such as the identities of controlling shareholders; *see* Starks, *Bahamian Bank Intrigues Canadian Investigators*, The Financial Post (Toronto), February 14, 1975, at 36.

than shells.[249] Finally, nominee shareholders are more common in the international situation. A 1975 study of investment in the United States shows that of $25 billion in stocks held by foreign investors, only $8 billion was registered in the name of foreign persons. About $17 billion was held by United States holders of record. Of this amount, nearly $9 billion was held for foreign nominees and an additional $3.6 billion was held for foreign investment companies and other institutional holders. Foreign resident individuals held $2.5 billion and foreign official institutions $0.8 billion.[250]

B. BANK SECRECY

One of the great difficulties encountered in foreign investigations is bank secrecy. Switzerland is the country normally associated with bank secrecy but in fact many other countries have similar laws. As the bank secrecy laws have made a significant contribution to Switzerland's economy by assisting it in becoming an international banking centre, the trend to bank secrecy is likely to increase. Singapore, for example, recently passed a law similar to that of Switzerland with the express intention of becoming the Switzerland of the Far East. Other examples of countries with bank secrecy laws are Hong Kong, Lebanon and Panama.

Switzerland provides the most convenient example for discussion since so much has been written about it. A secret bank account is useful for a host of things: tax evasion, "cleaning" stolen money, evasion of insider trading and other rules regulating the disclosure of share ownership.[251] The size of foreign holdings in Switzerland is not known, but it has been calculated that Switzerland, a relatively small country, makes about one third of all the purchases in long-term securities by foreigners in the United States and that about one half of European purchases in U.S. securities come from Switzerland as opposed to 20% from Britain and 10% from France, the next two largest purchasers.[252] Even if normal incentives to

251 *See* Ise, *Secret Swiss Bank Accounts As a Mechanism for Violating United States Securities Laws: An Analysis of Proposed Solutions*, 11 B.C. IND. & COMM. L. REV. 194, 203 (1970) for a description of their use to violate securities laws. *See* the references to the use of Swiss bank accounts in *Organized Crime Senate Hearings, supra* note 205, pt. 1, at 59, 60; *see also* the reference to the difficulty of obtaining information because of Bahama banking secrecy *id.* at 27.

252 *See* Ise, *supra* note 251, at 195. Switzerland maintained its lead into 1975; *see*, *Foreign Commissions Reach $20.8M on NYSE*, The Commercial and Financial Chronicle (New York), March 3, 1975, at 1.

bank in a stable country with a strong currency are discounted, it still seems that a large part of this investment must come from the United States through the Swiss banks. The American regulatory authorities are confident that Swiss banks are being used by American residents to evade American securities laws, including the insider trading provisions.[253]

The Swiss banking law derives from a deep-seated historical view that a bank account is merely an extension of the bank customer's personal property, and that it is the customer (not some bank or government official) who shall decide whether it shall be open to another person. That concept of property is the subject of unique protection in Switzerland: Article 47 of the Swiss Banking Law makes it a crime for a banker to divulge information to third parties concerning the account of a client. There are limits to the duty of silence set by the various procedural codes of the Swiss cantons, and these concern bankruptcy, family law and inheritance matters. In Swiss criminal cases, information on a defendant's accounts only may be disclosed; information on persons indirectly affected remain privileged. Switzerland will not provide information to foreign governments in criminal prosecutions unless the matter is also criminal under Swiss criminal legislation. The areas in which information will be given are limited since Switzerland does not have criminal laws corresponding to our conspiracy, securities and tax laws.[254]

Between 1969 and 1973 Switzerland and the United States negotiated a treaty relating to the locating of criminals and the securing of information about criminal activity. The treaty contains provisions which lift to some degree the veil of Swiss bank secrecy. Switzerland delayed approving the treaty until January 1976, and U.S. approval followed swiftly. Instruments of ratifica-

253 *See, Hills Says SEC Needs More Tools to Catch Securities Violations by Foreign Holders, supra* note 247. Hill's statement in its entirety and much additional information on the use of foreign financial facilities are provided in *Oversight Hearings into the Operations of the IRS (Administration of Bank Secrecy and Reporting Act): Hearings before a Subcommittee of the House Committee on Government Operations*, 94th Cong., 2d Sess. (June 28, 29, July 1, 1976).

254 Ise, *supra* note 251, at 201-03: Cutbush, *The Swiss Banking Secret*, [1976] J. Bus. L. 197. It is possible that the Swiss may expand the reach of their criminal law; *see, Switzerland Moves to Make Tax Fraud a Criminal Offense*, The Wall Street Journal, March 18, 1976, at 15. It is interesting to note, by way of comparison, and as an example of a domestic control device that the United States also has a Bank Secrecy Act, 12 U.S.C. ss. 1730d, 1829b, 1951-59 (1970) and 31 U.S.C. ss. 1051-1122 (1970). The statute requires financial institutions to maintain records useful for criminal, tax or regulatory investigations or proceedings (which records are available to the government through the legal process) and requires the institutions and individuals to report certain transactions including transactions with foreign financial institutions. The statute is described in a note on a recent case challenging its constitutionality, Supreme Court, 1973 Term; note, 88 HARV. L. REV. 188 (1974).

tion have been exchanged and the treaty becomes effective on January 23, 1977.[255]

The result of the structural differences between the domestic and international situation is that a number of persons have moved into the international area to operate dishonest and fraudulent schemes. They are aided, not only by the legal differences described above, but also by a number of different features of international life. There is no point in going into great detail in this paper, but we should refer to some of the features briefly.

In his testimony before the U.S. Senate Subcommittee on Organized Crime in 1975, P. Manuel, an investigator for the subcommittee, explained a number of reasons why some sophisticated swindlers were moving into the international area. These include the increasing span of international banking and the necessary reliance of business upon paper credit, the difficulty of verifying the authenticity of assets when such assets are located in a foreign jurisdiction, bank secrecy or lack of government control in offshore jurisdictions, mobility so that a swindler may operate in three or four jurisdictions with no single jurisdiction which effectively can detect and curtail these crimes, and the absence of legal controls on international transactions, under U.S. law and foreign laws.[256] Manuel's testimony was supported by other witnesses who explained the tendency to take stolen securities out of the United States because tracing is more difficult abroad[257] and the difficulty of obtaining credit information and otherwise verifying information when the business or person is abroad.[258]

C. INVESTIGATION AND COLLECTION OF EVIDENCE

In chapter X, we discuss the formal methods by which evidence is collected from abroad. In this chapter we shall deal with informal cooperation among policemen, a method not formally recognized by law. It is useful to discuss this subject here in order to complete the description of the factual context before proceeding to the legislative devices which deal with it.

It is not unusual for the police in one country to convince those

255 Treaty on Mutual Assistance in Criminal Matters, May 25, 1973, U.S.A.-Switzerland, T.I.A.S. no. 8302. Switzerland has come under similar pressure from France; *see*, *Swiss Defend Bank Secrecy*, The Wall Street Journal, August 21, 1975, at 26, col. 1, and under internal pressure caused by the rise of the franc due to capital inflows, *see*, *Pressure in Switzerland*, The Globe and Mail (Toronto), June 18, 1975, at B2, col. 7.

256 *Organized Crime Senate Hearings*, *supra* note 205, at 124-25.

257 *Id.* at 150.

258 *Id.* at 199, 228. *See also* Hutchinson, *Swiss Now Willing to Help in Tracing Chemalloy Funds?*, The Financial Post (Toronto), February 21, 1976, at 36.

of another to undertake an investigation of a person in their country. Information relating to an offence in the latter country may well help the police of the requesting country to obtain evidence against a person being investigated. In some cases working relationships of a permanent nature are established between police forces of different countries.[259] However, the system is far from perfect, as often cooperation depends on personal relationships which are of necessity limited and episodic.

The agency through which most international investigation is conducted is the International Criminal Police Organization, Interpol.[260] Its office and staff are in France and its chief function is to help domestic police forces locate wanted persons. Member countries which are federations, such as Canada and the United States, are represented by the national police, the RCMP and FBI, respectively. In Canada some delay is experienced by local police forces since they cannot work with Interpol directly. Interpol, it should be noted, is interested only in the enforcement of criminal law; it is not concerned with civil law. Its principal aim is exchange of information on subjects such as criminal records and descriptions, stolen property and technical assistance, especially where crimes such as drugs, smuggling, counterfeiting and fraud are international in scope.

Gathering information and evidence abroad, whether through Interpol or through direct contact with foreign policemen, is time-consuming and difficult. Some of the difficulty could be cured by additional training of enforcement personnel or by modest budgetary realignments and increases. For example, one difficulty with foreign enforcement is to obtain funds from the regular enforcement budget to pay for the time spent in investigation in foreign countries and for the assistance of foreign experts. The SEC, as well, is restricted by budget limitations from vigorously pursuing the foreign situations with which it becomes concerned.

It is a fact of international life that some countries do not find such economic crimes as tax evasion and securities fraud as reprehensible as Canadians do. Investigators from this continent often run into lack of sympathy from their counterparts abroad. Foreign police cooperation may depend on whether the crime is referred to in an extradition treaty. Thus a Canadian investigator must

259 *See* G. MUELLER & E. WISE, *supra* note 42, at 429. In one case the Swiss police assisted Canadian police in a Canadian stock fraud case, *see*, *Swiss Bank 'Co-operative' in Aquablast Fraud Case*, The Financial Post (Toronto), July 3, 1975, at 2.

260 *See* International Criminal Police Organization Constitution and General Regulations. For a general description of its activities, *see* INTERPOL, 50TH ANNIVERSARY, 1927-1973 (1973).

prove that the transaction meets the test of double criminality, that is, it violates the laws of Canada and of the other jurisdiction. Unless the Canadian investigator learns the foreign law early in his investigation, he may not obtain evidence that can satisfy the requirements of both jurisdictions. The problem might be solved in part by giving Canadian policemen free access to foreign prosecutors for it is often merely a matter of obtaining foreign legal advice without having to find funds in a domestic budget.

The ease of investigation may therefore depend on the judicial and public prosecution systems of the country in which there is to be an investigation. In England, Canadian police have been given the legal advice they require without charge through English crown attorneys. In the United States, on the other hand, where crime, generally speaking, is a matter of state law, a Canadian prosecutor often has to find a knowledgeable attorney in private practice. Better libraries would help Canadian investigators find out foreign law themselves.

The obstacles described above are often overcome. In many cases Canadian investigators are able to conduct full investigations abroad through the cooperation of foreign institutions or enforcement agencies. But even then technical problems can arise. In one particularly ironic case, a Canadian policeman was allowed to inspect entries in Swiss banking records but he was not qualified to give evidence in a Canadian court about those records since his qualifications were those of a Canadian policeman not of a Swiss banker. This particular problem could be solved in a number of ways: by extending the operation of section 29(3) of the Canada Evidence Act to include foreign institutions or by adopting a system such as that in Switzerland by which certified documents are admissible in court to prove the contents of records. In some cases is would be effective to recognize as a competent witness in a Canadian court an employee or agent in Canada of a foreign corporation or its parent.

D. ENFORCEMENT

The most glaring diffence between the domestic and international situations is the inability of an administrative agency to employ unilaterally the swift and draconian remedies such as cease trading orders,[261] freezing of bank accounts and other property,[262] and *ex parte* appointment of receivers,[263] in the provincial

261 B.C. Securities Act, s. 77A.
262 B.C. Securities Act, s. 28.
263 B.C. Securities Act, s. 29, *See* Re Centennial Mortgage Corporation Ltd., 9 D.L.R.

securities acts. This difficulty with the international situation will remain. A Canadian enforcement agency is not likely to obtain the power to freeze accounts in Lebanese banks unless the Canadian government grants similar authority to the Lebanese with respect to Canadian banks operating in Canada. Such international cooperation seems unlikely.

Chapter X
Obtaining Information from Abroad

There are a number of ways in which existing legal processes can be used to obtain information from persons in foreign jurisdictions. Four of these are discussed below, namely, commission evidence, letters of request, civil actions and Walsh Act proceedings. We also discuss informal cooperation among policemen and international treaties.

A. COMMISSION EVIDENCE

Where the person to be examined is willing to answer questions, the cheapest and most expedient device available to obtain his evidence is the appointment of an examiner or a commissioner. An examiner administers an oath, examines the party on questions prepared by the other party, seals the documents, swears his affidavit and returns the commission. An application for an examiner or a commissioner must be made by a party in a proceeding who bears the burden of showing that the evidence he seeks to obtain is relevant and cannot be obtained in the jurisdiction. He must also show that his request is *bona fide* and likely to result in securing the evidence he needs. Even so, the granting of his request is within the discretion of the court and the court will consider such matters as the importance of credibility and cross-examination and whether the person to be examined is a party or a witness.[264]

Although it is common to appoint a single examiner and to use the procedure described above, it is possible to appoint a commission containing representatives of both parties empowered to conduct *viva voce* examinations. This technique allows a questioner to develop previous answers and thus is more useful.[265]

(3d) 357 (B.C.C.A. 1969) where the section was interpreted as granting the commission authority over private as well as public companies.

264 *See* Castel, *International Civil Procedure*, in CANADIAN PERSPECTIVES ON INTERNATIONAL LAW AND ORGANIZATION, *supra* note 1, at 843-45.

265 *See* for examples of the difference in powers, forms 35, 37 in Appendix K, B.C.S.C.R., Marginal Rules 487, 488.

An interesting combination of the examiner and commissioner methods occurs in the Criminal Code which authorizes a judge to appoint a commissioner to take evidence of a witness out of Canada, and allows him to make provisions for attendance by the accused or his counsel at the examination.[266]

The 1939 Draft Convention on Judicial Assistance prepared by Harvard Reseach in International Law contains a useful additional feature.[267] Article 5(3) provides that a commissioner may petition a competent tribunal in a receiving state to compel the attendance of witnesses and production of evidence. Article 8(2) provides for a similar petition in criminal cases but only in relation to witnesses; the procedure is not available against an accused or in the case of political offences.

The European Convention on Mutual Assistance in Criminal Matters provides that if a requesting state considers a personal appearance of a witness "especially necessary" the requested party "shall invite" the witness to appear.[268] Article 11 of the European Convention provides for the transfer of persons in one state to give evidence before the courts of the requesting state, but only in special circumstances and with the consent of the person examined.[269]

B. LETTERS OF REQUEST

Where a country will not allow the taking of evidence within its jurisdiction by commission or where a witness is unwilling to testify, letters of request or letters rogatory may be used both in criminal and civil cases. Letters rogatory are formal communications through diplomatic channels from one country to another, requesting that the second country use its courts to secure the testimony of an individual or a corporation and return the testimony to the court of the requesting country.[270] The grant of a letter

266 *See* Criminal Code, ss. 637(b), 641; and *see* ss. 640, 642.

267 The text of the draft convention may be found in 33 AM. J. INT'L L. SUPP. 11 (1939), and in G. MUELLER & E. WISE, *supra* note 42, at 375.

268 European Convention on Mutual Assistance in Criminal Matters, *reprinted in* G. MUELLER & E. WISE, *supra* note 42, at 391; Europ. T.S. No. 30, art. 11.

269 European Convention, *supra* note 268, art. 11. The convention is discussed in Mueller, *supra* note 42, at 410. Article 23 of the U.S.-Swiss treaty on Mutual Assistance in Criminal Matters, *supra* note 255, also provides for limited transfer of consenting witnesses.

270 *See e.g.* arts. 3-6, 14-15 of the European Convention on Mutual Assistance in Criminal Matters, G. MUELLER & E. WISE, *supra* note 42, at 391. Under the European convention the communications are between ministries of justice rather than through diplomatic channels. The European convention also provides for the transmission of records and documents to the requesting state. The 1939 Harvard Research Draft Convention on Judicial Assistance provides that letters rogatory

of request is discretionary and is only granted where it is absolutely necessary in the interest of justice.[271] It is expensive and slow and its utility varies with the procedural code of the country where the witness is located.[272] The great advantage of a letter of request is that a witness can be compelled to answer the questions put to him. Canada grants the same right to requests from foreign states in the Canada and provincial evidence acts.[273]

Canada has a number of bilateral conventions on civil procedure which include provisions specifying the form and the authorities to whom letters of request should be addressed. The conventions also provide for use of the requested court's compulsory process, for other matters of procedure and costs.[274]

The Hague Convention on the Taking of Evidence Abroad in Civil or Commercial Matters signed in 1970 is an international master convention which codifies much of the law in this area and will probably be the basis from which new Canadian conventions will be negotiated.[275] Canada is now a member of the Hague Convention and might choose to adopt the Hague Convention on Taking Evidence Abroad, thereby giving us treaties with the approximately twenty members of that conference.

There is a limitation on all of these treaties and conventions that makes them of little use to securities investigators. Assistance in Canada, for example, is only given to a proper foreign court, and this does not include administrative tribunals such as the SEC.[276] Moreover, a witness may only be examined in a trial and

---

may contain, in addition to the usual list of interrogatories to be put to the witnesses, a request for oral examination of the witnesses; *see id.* art. 4(3).

271 *See* Castel, *supra* note 264, at 845-46; B.C.S.C.R., Marginal Rule 488(a) (authorizing Letters of Request). The discretion was not exercised in a recent case; *see* Xerox of Canada Ltd. v. IBM Canada Ltd., [1976] 1 F.C. 213 (F.C.T. 1975).

272 For a description of the American federal and state rules on taking depositions under foreign letters rogatory and commissions, *see* Mueller, *supra* note 42, at 421-25. As one would expect, a witness retains his constitutional right against self-incrimination, *id.* at 424. Mueller discusses the execution of foreign letters rogatory in Italy, *id.* at 425. For a description of the situation in Switzerland, *see* Pohl, *Discovery of Swiss Bank Records: Procedural Tools for Tunnelling into the Bank*, 35 U. PITT. L. REV. 435 (1973).

273 *See* B.C. Evidence Act, R.S.B.C. 1960, c. 174, s. 51; Canada Evidence Act, R.S.C. 1970, c. E-10, ss. 43-48. These rights are not contained in the proposed new Evidence Code; *see* LAW REFORM COMMISSION OF CANADA, REPORT ON EVIDENCE (1975). The commissioners state that the rules that deal with evidence relating to proceedings in courts out of Canada should be retained in a separate statute, *id.* at 108.

274 *See* the examples in Castel, *supra* note 264, at 846, 847.

275 On the subject of the Hague convention generally, *see* Castel, *Canada and the Hague Conference on Private International Law 1893-1967*, 45 CAN. B. REV. 1 (1967). Castel also discusses some of the constitutional problems the signing of the convention would raise.

276 Re McCarthy, 38 D.L.R. (2d) 660 (Ont. C.A. 1963).

not as part of an investigation or pre-trial proceeding such as an examination for discovery.[277]

C. CIVIL ACTIONS

A person can be compelled to provide evidence against himself if a civil action is commenced against him. Thus, when the rules of procedure allow one party in a civil action to compel the other to produce records and documents within his control, the latter person can be required to bring records even from places where bank secrecy prevails. The usual rationale for bank secrecy is that the bank records belong to the customer and not to the bank, and therefore the jurisdiction in which the bank is located has no interest of its own to protect if a customer "voluntarily" reveals his own records.[278] If a non-resident chooses to defy a subpoena or other civil law process for production of information, the judicial system is not entirely powerless. U.S. courts have held under Rule 37 of the Federal Rules of Civil Procedure that they will draw inferences of fact against a party who fails to produce documents and excuses himself on the ground that production is illegal under the law of the state where the documents are located. This indirect method has proved to be a very effective technique to produce records.[279]

277 Re Radio Corp. of America v. Rauland Corporation, 5 D.L.R. (2d) 424 (Ont. H.C. 1956); Re Contesse, 23 D.L.R. (2d) 506 (Ont. H.C. 1960); Re Raychem Corp. v. Canusa Coating Systems Inc., 8 D.L.R. (3d) 614 (Ont. H.C. 1970); Re General Fire Service Ltd. v. Foundation Co. of Canada Ltd., 17 D.L.R. (3d) 501 (Sask. Q.B. 1971).

278 The fact that the client is "master of the secret" and can release it if he wishes is often not appreciated. While Swiss law might not recognize a request for release which has been coerced, it does contain reverse onus laws that encourage a person to disclose facts himself by making presumptions against him which he must rebut by revealing his records. It is possible for the country of the national having the Swiss account to put a great deal of pressure on him to authorize release of his bank information. This can be done by reverse onus clauses or even by more direct sanctions for failure to release information. *See* Mueller, *The Swiss Banking Secret from a Legal View*, 18 INT'L COMP. L.Q. 360 (1969); Pohl, *supra* note 272.

An interesting example of the way in which the use of Swiss banks can be frustrated is *Ruling Pursuant to Section 56 - Undisclosed Principals* B.C. Securities Commission Weekly Summary, July 19, 1974 (Superintendent of Brokers). The ruling concerns purchases by undisclosed principals during primary distribution. The commission refused to allow the purchase as Canadian investors would receive less information if purchasers could use Swiss accounts, however honest the purchasers.

279 *See* the discussion in pt. IV of Smith, *supra* note 82, at 761; *see also* the discussion of the civil antitrust action involving the Beecham companies in Brown, *supra* note 195, at 45-47.

D. AMERICAN WALSH ACT PROCEEDINGS

An interesting way of securing the attendance of witnesses is the U.S. Walsh Act.[280] The act was prompted by the need to investigate a Mr. Blackmer with respect to the Teapot Dome scandal and provides that an American citizen or a person domiciled in the United States can be subpoenaed abroad when the Attorney-General requires his attendance. The subpoena is addressed to the U.S. consul and the consul serves it and tenders expenses. If a witness refuses to attend, he can be judged in contempt and fined up to $100,000 and his property in the United States can be seized to satisfy the judgment.

The act was upheld in *Blackmer v. United States*,[281] an action taken to challenge a fine of $60,000 imposed on Blackmer under the act. The court held that Blackmer had a civic duty to respond to a subpoena, which is not surprising when we consider that states often tax nationals abroad or subject them to criminal penalties.

E. INFORMAL COOPERATION AMONG POLICEMEN

Evidence is obtained by police or other investigating authorities of one country if they convince officers in another country that the latter should undertake investigation of a person in that second country. While this informal cooperation often has satisfactory results in individual cases, there are a number of disadvantages.[282]

F. TREATY

An obvious technique for obtaining evidence abroad is to enter into a treaty aimed precisely at the problem. An example is the Treaty between the United States of America and the Swiss Confederation on Mutual Assistance in Criminal Matters.[283] Beginning with a general elaboration of the duty to assist in investigation and to return property which may have been the subject of an offence,[284] the treaty goes on to establish a duty to testify,[285] to

280 An Act Relating to Contempts, 28 U.S.C. s. 1783 (1970). *See* Dickinson, *Notes: The Recall of Witnesses under the Walsh Act*, 25 AM. J. INT'L L. 723 (1931).

281 284 U.S. 421 (1932).

282 *See* ch. IX *supra* for a more detailed description.

283 The treaty was not approved by the two countries until 1976 but the ratifications were exchanged on July 27, 1976, and the treaty comes into effect on January 23, 1977.

284 U.S.-Swiss Treaty, *supra* note 255, arts. 1, 4.

285 *Id.* art. 10(1).

provide information from bank accounts,[286] formalize arrangements by which police forces assist each other in locating wanted persons,[287] and provide for a wide range of other matters.

Another treaty which is designed to facilitate the obtaining of information and evidence is the European Convention on Mutual Assistance in Criminal Matters. Article 15 of the convention provides for direct communication between judicial authorities in cases of requests for mutual assistance, particularly requests for investigation preliminary to prosecution.

There are not a great number of international treaties in force for mutual assistance in criminal matters.[288] Negotiation by Canada of a series of such treaties, though a slow process, would provide a clearer and firmer foundation for investigative and enforcement programs than the present imperfect collection of devices. A number of European countries have acceded to the European Convention on Mutual Assistance in Criminal Matters mentioned above. As one might expect of such a convention, it is more general than the bilateral Swiss-U.S. treaty but addresses itself to some of the same problems, including providing signatory states with evidence from persons or documents in other countries.[289] An example of a treaty in which Canada is involved is the Canada-U.S. Tax Convention,[290] under which the authorities in each jurisdiction use their domestic investigation powers to obtain information for their foreign counterparts.[291]

There are other agreements and quasi-treaties which provide instructive models. One is the agreement between Canada and the United States known as the Basford-Mitchell Understanding on Antitrust Notification and Consultation Procedure which provides for consultation prior to extraterritorial enforcement of antitrust laws and seems to work well.[292]

286 *Id.* art. 10(2).
287 *Id.* art. 11.
288 *See* Mueller, *supra* note 42, at 410, 411, 414.
289 The text of the convention is contained in G. MUELLER & E. WISE, *supra* note 42, at 391; *see also* Europ. T.S. No. 30.
290 *See* H. STIKEMAN, INCOME TAX ACT 673 (6th ed. 1975-76) (art. XIX, XXI).
291 A recent instance in which these powers were exercised is referred to in CCH CAN. TAX TOPICS, September 10, 1976, at 1-2.
292 Canadian-American procedures for notification in antitrust cases are discussed in two articles; *see* Henry, *The United States Antitrust Laws: A Canadian Viewpoint*, 8 CAN. Y.B. INT'L L. 249, 267 (1970); Henderson, *Foreign Courts and the National Interest*, 3 INT'L BUS. LAW. 133 (1975).

G. CONCLUSION

Perhaps the most significant omission from the methods described above is a procedure for bringing witnesses from one state to give evidence in another. Extradition treaties facilitate the international transfer of accused persons. It would be useful if similar agreements were developed for the international transfer of persons who can give relevant testimony.

Chapter XI
Transferring International Offenders from One State to Another

A. EXTRADITION

The law of extradition is found primarily in bilateral treaties.[293] Extradition has always been regarded as a concession to another state, almost as a derogation of sovereignty, and consequently no uniform practice concerning it has developed in traditional international law. While states realized that international cooperation was necessary for some regulatory purposes and were prepared to make some concessions to cooperation with other states, the concessions were often niggardly and narrow. In addition, criminal law has been extended into areas of economic activity, so that it is no longer referrable to a clearly defined and widely shared moral standard, and this fact has made states even more reluctant to allow extradition of criminal offenders unless the crime is clearly reprehensible by its own standards.

There are a number of general features common to most extradition treaties in force.[294] An extraditable offence is generally defined either by listing the extraditable offences or by providing that only offences involving some minimum penalty are extraditable.[295] The first method is more direct but leads to prob-

293 Extradition between Commonwealth countries is founded not on extradition treaties but on parallel Fugitive Offenders Acts; *see e.g.* R.S.C. 1970, c. F-32.

294 Model extradition treaties, the 1973 Inter-American Convention on Extradition and the 1935 Harvard Research Draft Convention on Extradition are set out conveniently in G. MUELLER & E. WISE, *supra* note 42, at 442.

295 *See e.g.* Treaty on Extradition between Canada and the United States of America, December 3, 1971, *amended by* Exchange of Notes, 1974, in force March 22, 1976, [1976] Can. T.S. No. 3; T.I.A.S. No. 8327 [hereinafter referred to as 1971 Canada-U.S.A. Extradition Treaty] (30 listed offences, one of which is "Offences against federal laws relating to the sale or purchase of securities"); Fugitive Offenders Act, R.S.C. 1970, c. F-32, s. 3 (offences punishable by imprisonment with hard labour for 12 months or more).

lems of definition for it becomes necessary to find general labels for groups of particular crimes.

Most extradition treaties contain the principle of double criminality – that is, the offence for which extradition is requested must be punishable under the criminal law of both the requesting and the requested states.[296] Various treaties limit the right to extradite or rights after extradition in various ways. A common provision requires the requesting state to forego the death penalty, and another to provide due process in regular courts.[297] Also common are exemptions for political crimes, military crimes and fiscal crimes.[298] This last may have been understandable in an era of economic independence of states, but it is rapidly losing whatever justification it had. Extradition is often excluded if the person already has been tried or penalized for the offence in the requested state.[299] One of the most obvious differences between extradition in common law and civil law systems is that many civil law systems will not allow the extradition of nationals and sometimes even residents. This refusal may be tempered by the fact that often their own system allows them to try nationals for offences wherever committed.[300]

B. EXTRADITION FROM CANADA

In the early 1800s Canada surrendered fugitives without a treaty, but the view gradually developed that there should be surrender only by treaty and in accordance with its terms.[301]

296 *See e.g.* 1971 Canada-U.S.A. Extradition Treaty, *supra* note 295, art. 1(1); and *see* the narrow exception *id.* in art. 1(3). On the other hand double criminality specifically is excluded by the Fugitive Offenders Act, R.S.C. 1970, c. F-32, s. 4.

297 1971 Canada-U.S.A. Extradition Treaty, *supra* note 295, art. 6 (no reciprocal death penalty). A short account of extradition procedures from the U.S.A. is contained in G. Mueller & E. Wise, *supra* note 42, at 439-40.

298 1971 Canada-U.S.A. Extradition Treaty, *supra* note 295, art. 4(1)(iii); political offences, military and fiscal crimes are not contained in the schedule.

299 *Id.* art. 4(1)(i).

300 *See* Schultz, *The Principle of the Traditional Law of Extradition*, in Legal Aspects of Extradition among European States (Council of Europe, 1970); Duk, *Principles Underlying the European Convention on Extradition*, *id.* Canadian law on trials in Canada of Canadians abroad is not as wide as the law in most civil law jurisdictions; *see e.g.* R. v. Shulman, [1974] 6 W.W.R. 354 (B.C.S.C.), *aff'd*, 58 D.L.R. (3d) 586, [1975] 4 W.W.R. 490, 23 C.C.C. (2d) 242 (B.C.C.A.). One alternative to extradition that is made necessary by the European practice referred to above is the European Convention on the International Validity of Criminal Judgments (Council of Europe, 1971), which allows the imposition of criminal sanctions by one state if they are directed by another state where extradition is not possible. The convention also grants a measure of effect to judgments of other states in matters of *res judicata* and sentencing.

301 Green, *Immigration, Extradition and Asylum in Canadian Law and Practice*, in

Extradition in the absence of a treaty is dealt with by part II of the Extradition Act of Canada[302] which includes its own schedule of offences for which extradition will be allowed. However, part II has limited application since it has been proclaimed in force only with respect to extradition to the Federal Republic of Germany.[303] Thus, extradition from Canada to countries outside the Commonwealth is governed largely by treaty and in most cases extradition to Canada is also by treaty. The procedure is relatively slow and complex.[304] It requires that the requesting country establish before a Canadian judge that the crime is within the treaty, that it is a crime in the requesting country and that there is evidence sufficient (by Canadian standards) to commit the accused for trial.[305] A number of defences are open to an accused, the most common being that the act was a political crime, that the treaty is invalid or inapplicable or that the offence is not criminal under both the law of Canada and of the requesting state.[306]

In the case of a fugitive from a Commonwealth country, extradition may be ordered when evidence has been presented to the magistrate raising a presumption that the fugitive committed the offence. The act applies to persons who are unlawfully at large after conviction and to persons charged with an offence punishable by imprisonment with hard labour for a term of twelve months or more. The offence need not be an offence under Canadian law and there is no exception for political crimes. However, the magistrate may discharge the fugitive in trivial cases or in cases where it would be "unjust or oppressive or too severe" to return him.[307]

A commentator recently has described the Canadian Fugitive Offenders Act as "quite inadequate" in view of its definition of offences by twelve months' hard labour instead of by listing particular crimes.[308] The more modern practice is to pattern extra-

dition treaties and statutes on the 1957 European Convention on Extradition.[309]

The history of the extradition treaties between the U.S. and Canada with respect to securities is one of frustration. The Webster-Ashburton Treaty of 1842 between the U.S. and Great Britain was amended in 1890, 1922 and 1925. In 1931 Canada took over its own negotiations but not until 1952 were new sections added dealing specifically with false pretences and mail fraud. The change was prompted by the case of *Re Lamar*[310] in which an Alberta extradition judge held that the mail fraud provision of the Securities Act of 1933[311] was not a crime under the treaty nor equivalent to the false pretences section of the Criminal Code. In 1942 a new treaty was negotiated which provided for simplified proof of foreign law and removed the double criminality requirement, but the treaty was not ratified by Canada because of Canadian sensitivity to expansionist pressure from the United States. In 1952 a Supplementary Convention which reworked the previous fraud provisions to make them more explicit was signed instead. The change was made in the expectation that Canadian issuers of securities would be granted the right to use the special short form of registration in the United States, later made available by regulation D.[312]

Although the 1952 convention reduced the promotion of worthless securities by Canadians into the U.S., much of its deterrent effect was removed by the decision in *United States v. Link and Green*.[313] In this case two Canadian defendants were indicted for violation of the U.S. mail fraud statute and the Securities Act of 1933. The judge held that the Canadian and American mail

313 [1955] 3 D.L.R. 386 (Qué. Q.B.) (extradition). An extensive review of the extradition treaties between Canada and the United States and a critique of the *Lamar* decision can be found in Timbers & Pollack, *Extradition from Canada to the United States for Securities Fraud: Frustration of the National Policies of Both Countries*, 24 FORDHAM L. REV. 301 (1955). The article also contains a short history of the problem of "boiler-room" promoters operating from Canada into the U.S. Another article with a tone just as indignant is: note, *Enforcing United States Securities Regulation against Canadians*, 66 HARV. L. REV. 1081 (1953). This article considers the civil remedies open to American investors for frauds committed by Canadians as well as problems with criminal law and extradition. The problem is described from the point of view of the OSC in Bray, *Ontario's Proposed Securities Act: An Overview, Its Purpose and Policy Premises*, [1975] OSC Bull. 235 (October).

fraud provisions were not the same, the Canadian requiring the mailed communication to be fraudulent, the American requiring only that any step be fraudulent in a scheme involving the mail. Because of the double criminality principle extradition for use of the mails can only take place for fraudulent mailings, and most of the cross-border promoters used the mail only to receive funds and not for fraudulent promotion.

Recently the securities commissions have relied less on formal agreements and more on informal cooperation. Improved cooperation from the Ontario and Québec securities commissions has substantially reduced the amount of cross-border fraud and the western provinces have tightened their control in the same way. The 1971 Extradition Treaty attempts to cure the problem found by the *Link and Green* court (see article 2(3)) and specifies a number of offences which might be alleged in a securities fraud case.[314]

Until the creation of the Federal Court of Canada, interpretation of the extradition treaties was the province of single extradition judges with no provision for appeal except on an application for *habeas corpus*. Consequently there was no consistent body of law on the subject. Recent Supreme Court decisions have held that there is an appeal from an extradition judge under section 28 of the Federal Court Act,[315] dealing with review of the decisions of a "federal board, commission or other tribunal".[316] There might now develop a more rational body of precedent in extradition cases involving securities offences.

C. KIDNAPPING

The kidnapping of accused persons in foreign jurisdictions and bringing them to the domestic jurisdiction for trial is a procedure with a longer and rather more distinguished history than one might expect.[317] However, it does not commend itself as a weapon

314 *See* Schedule, items 11 (embezzlement), 12 (false pretences, defrauding the public), 13 (fraud by certain corporate officers), 19 (false affidavits), 27 (mail fraud) and 28 (offences against federal securities laws). which should be included in the armoury of enforcement procedures and devices in a Canadian securities law.

Chapter XII
Enforcement Systems Other Than Criminal Law

A. CIVIL LAW

In the preceding chapters we examined the ways in which Canadian securities laws can be applied through criminal sanctions against persons who are outside Canada. In this chapter we examine the ways in which persons outside Canada who have failed to comply with Canadian securities law can be reached by means of civil law techniques.

Civil claims in contract and in tort must be examined. The tort of deceit, sometimes referred to as false representation or fraud, is most likely to be involved. We shall therefore focus our attention on it as the closest analogy to the type of civil remedy most likely to be granted by a securities statute, namely, the awarding of civil damages where loss has been caused by improper conduct such as misrepresentation.

A civil action can be brought either in Canada or abroad. We examine the former situation first and treat the plaintiff himself as the injured person, though the discussion is equally applicable to a federal administrative agency prosecuting claims on behalf of injured persons, either derivatively or in its own right, under statutory authority.

1. *Suit in Canada*

Three questions arise in a civil suit brought in Canada against a defendant outside Canada: Does the Canadian court have jurisdiction? What law should apply to the transaction? and how will the Canadian judgment be enforced in the jurisdiction where the defendant resides or has assets?

a. *Jurisdiction*

We discussed jurisdiction in chapter III.[318] As we stated there,

is provided in Williams, *Criminal Law - Jurisdiction - Illegal Arrest - Due Process - Violation of International Law*, 53 CAN. B. REV. 404 (1975). A note on two recent cases involving the trial of kidnapped persons in the United States appears at 88 HARV. L. REV. 813 (1975).

318 *See* especially ch. III.B.2, C *supra*.

the *Gibbons*[319] and *Brenner*[320] cases suggest that a securities system might utilize the device of requiring foreign registrants to leave deposits within the jurisdiction to satisfy judgments against them. Canadian courts are prepared to accept jurisdiction on this basis and to recognize it when it is employed by courts in other countries.[321]

There is also general acceptance of the principle that the jurisdiction of incorporation has power to adjudicate with respect to a corporation. In 1883 the Supreme Court of the United States held in *Canada So. Ry. v. Gebhard*[322] that American bondholders of a Canadian railway undergoing a reorganization involving a substitution of bonds could not sue on their bonds in the United States. The court stated:

> "[E]very person who deals with a foreign corporation impliedly subjects himself to such laws of the foreign government, affecting the powers and obligations of the corporation with which he voluntarily contracts, as the known and established policy of that government authorizes. To all intents and purposes, he submits his contract with the corporation to such a policy of the foreign government, and whatever is done by that government in furtherance of that policy which binds those in like situation with himself, who are subjects of the government, in respect to the operation and effect of their contracts with the corporation, will necessarily bind him. He is conclusively presumed to have contracted with a view to such laws of the government, because the corporation must of necessity be controlled by them, and it has no power to contract with a view to any other laws with which they are not in entire harmony. It follows, therefore, that anything done at the legal home of the corporation, under the authority of such laws, which discharges it from liability, there, discharges it everywhere."[323]

The foregoing doctrine was undermined in the United States by the more recent decision in *Kohn v. American Metal Climax, Inc.*[324] The *Kohn* case arose out of misrepresentations in violation of Rule 10b-5 of the Securities Exchange Act of 1934 in connection with a reduction of capital of a Zambian company approved by a Zambian court. Minority shareholders brought the action to recov-

er damages from another American shareholder who had benefitted from the transaction. Although the court held that inquiry into the fairness of the arrangement was foreclosed by the Zambian decree, it found violations of Rule 10b-5 and ordered compensation not only for American minority shareholders but also for all minority shareholders. The case does not purport to invalidate the reduction of capital, but it indicates that the U.S. courts at least are not prepared to accept a foreign judgment in the jurisdiction of incorporation as granting wholesale immunity from U.S. federal securities laws. There is Canadian authority for the proposition that the place of incorporation has jurisdiction over a corporation,[325] but facts similar to those in the *Kohn* case have not as yet arisen.

Another ground for assuming jurisdiction which has broad judicial acceptance is that the foreign party has contracted to submit to the jurisdiction.[326] Provisions requiring non-resident registrants to consent to service in Canada should be included in a Canadian securities law. There is precedent for such a system in that registration as a broker-dealer, salesman or securities adviser under the provincial statutes requires the filing of an address for service; some of these statutes provide that notices may be sent to the special address, others that legal process may be served there. The latter wording implies that registration entails accepting service in the jurisdiction; the former does not.

The American federal securities laws create a more complex procedure. Registration with the SEC entails signing a consent to service which makes the commission an agent of the registrant for the service of process and allows an action to be brought in the United States by serving the SEC and then having it notify the registrant at his most recent address on its files. J. Williamson states that the American consent to service provision has not been tested in a Canadian court.[327] However, there is precedent in other areas of law which suggests that procedures like the SEC's will be approved in Canada. Choice of forum clauses in commercial contracts are generally accepted as valid and J. Castel states that where such contracts provide for service upon a designated person

325 *See* Pickles v. China Mutual Insurance Co., 10 D.L.R. 323 (S.C.C.1913), *aff'g*, 3 D.L.R. 766 (N.S.S.C. 1912).

326 Emanuel v. Symon, [1908] 1 K.B. 302 (C.A.), *foll'd*, Mattar v. Public Trustee, [1951] 3 W.W.R. (N.S.) 287 (Alta. S.C.), *aff'd*, [1952] 3 D.L.R. 399 (Alta. C.A.). These cases are codified to some extent in the Foreign Judgments Act; CONFERENCE OF COMMISSIONS ON UNIFORMITY OF LEGISLATION IN CANADA, MODEL ACTS (1962).

327 J. WILLIAMSON at 221.

the court acquires jurisdiction and the defendant afterward cannot question the validity of the judgment.[328]

In chapter III we also noted that in British Columbia and Ontario contract claims may be brought against persons outside the jurisdiction if a breach has occurred within it. We also described the broader English rule accepting jurisdiction if English law is the proper law of the contract and referred to the *Kleinwort*[329] and *Kahler*[330] cases which demonstrate the possibilities presented by this particular doctrine. Special rules have also been developed in the law of torts. As the discussion in chapter III indicates, there is now a broad range of precedent supporting the proposition that a person who has received false representations or defective material in one jurisdiction can sue there a wrongdoer outside it. The impact theory now seems to be firmly established.

b. *Choice of Law*

Once a court has accepted jurisdiction over a person who is outside the jurisdiction, the question arises as to what law will be applied. Differing results are reached depending on whether the claim is in contract or in tort.

i. *Torts*

The Canadian choice of law rule derives from English law. The rule was first established by Willes, J., in the case of *Phillips v. Eyre*:

> "As a general rule, in order to found a suit in England for a wrong alleged to have been committed abroad, two conditions must be fulfilled. First, the wrong must be of such a character that it would have been actionable if committed in England.... Secondly, the act must not

328 J. Castel, Conflict of Laws, Cases, Notes and Materials 724-25 (1974). Choice of forum clauses were enforced in the following cases: E.K. Motors Ltd. v. Volkswagen Canada Ltd., [1973] 1 W.W.R. 466 (Sask. C.A. 1972); The Eleftheria, [1969] 2 All E.R. 641 (P.D.A.); Bremen v. Zapata Off-Shore Co., 407 U.S. 1 (1972). The court declined to stay proceedings before it and defer to a choice of forum clause in A. S. May & Co. Ltd. v. Robert Reford Co. Ltd., 6 D.L.R. (3d) 288 (Ont. H.C. 1969). An excellent discussion of choice of forum is contained in Cowen & Mendes da Costa, *supra* note 49. Consent to service provisions have had mixed reception in the courts; *see* J. Williamson at 221; *see also* Hughes v. Sharp, 70 D.L.R. (2d) 298 (B.C.S.C. 1968) where the judge of first instance was prepared to enforce a foreign judgment founded on questionable consent to service circumstances. The Court of Appeal reversed on the ground that there was a triable issue of fact whether the defendant had a good defence to the action on the merits; 5 D.L.R. (3d) 760 (B.C.C.A. 1969). English courts give effect to consent to service provisions in contracts; *see* A. Dicey, *supra* note 48, at 168-69.

329 *See* text accompanying note 64 *supra*.

330 *See* note 65 *supra*.

> have been justifiable by the law of the place where it was done."[331]

This rule has been widely attacked by commentators and was reexamined but not clarified in the House of Lords decision in *Chaplin v. Boys.*[332] As a result of *Chaplin v. Boys*, the best that can be said about the English position is that it is not settled; there is support for the *Phillips v. Eyre* test and for a test similar to the American one described below.

Unfortunately some of the confusion of the English law was incorporated into Canadian law by the decision of the Supreme Court in *McLean v. Pettigrew*[333], adopting the *Phillips v. Eyre* formula, as expressed in *Machado v. Fontes.*[334] The substance of the Canadian position is that a foreign tort must be tortious under Canadian law and not innocent by the law of the place where it occurred in order for it to be actionable in Canada.[335]

Until recently the choice of law rule employed in most states in the United States was that the governing law was that of the place where the act occurs. In 1963 the New York Court of Appeals adopted a new approach in *Babcock v. Jackson.*[336] Mr. and Mrs. Jackson were residents of Rochester, New York, and they invited another New Yorker, Miss Babcock, on a weekend drive in Ontario. The car to be used was insured, operated and licensed in New York. While in Ontario, Miss Babcock was injured as a result of Mr. Jackson's negligent driving and she sued him in New York. New York law permitted recovery but the law of Ontario prevented a gratuitous passenger from recovering from a host driver. The court concluded that despite the certainty and ease of application of the *lex loci delicti* rule, the law of the place of the tort should not invariably govern the availability of relief. Fuld, J., offered an alternative rule:

> "Justice, fairness and 'the best practical result' may best be achieved by giving controlling effect to the law of the jurisdiction which, because of its relationship of contact

331 L.R. 6 Q.B. 1, 28-29 (1870). It is noteworthy that by this formula the residence and nationality of the parties are irrelevant.

332 [1969] 3 W.L.R. 322 (H.L.). *See* MORRIS, THE CONFLICT OF LAWS 268-74 (1971) for a summary of the case and references to articles.

333 [1945] 3 D.L.R. 65, [1945] S.C.R. 62.

334 [1897] 2 Q.B. 231.

335 Two recent notes on developments in Canadian law are Baer, *Conflict of Laws - Torts - A Blind Search for a "Proper" Law*, 48 CAN. B. REV. 161 (1970); Castel, *Conflict of Laws - Torts - Time for a Change*, 49 CAN. B. REV. 632 (1971).

336 12 N.Y. 2d 473, 191 N.E. 2d 279 (1963). For collected comments *see* 63 COLUM. L. REV. 1212 (1963).

> with the occurrence or the parties, has the greatest concern with the specific issue raised in the litigation."[337]

This rule, most often called the "most significant connection rule" is now widely accepted in the United States and many scholars favour its incorporation into Canadian law. So far, however, there has been little judicial inclination to accept it.[338]

One problem with the *lex loci delicti* rule and the rule in *Phillips v. Eyre* is that they both require a decision on where the tort occurred. Determining where the tort occurred is especially difficult in economic torts which involve sales and communications across borders. In the United States the general rule is that the place of a tort is the place where the last act is committed. The Canadian cases on the subject relate to service out of the jurisdiction when the plaintiff alleges that a tort has been committed within it. Although these cases offer some guidance to the location of a tort, they do not deal with this problem in relation to choice of law.[339]

As expressed in the cases concerning service out of the jurisdiction, the rules on location of the tort vary for different types of torts. The tort most likely to be relevant in the securities context is deceit. The B.C. Supreme Court has held that deceit occurs where a false statement is acted upon.[340] This decision is in accord with the defamation cases which hold that the tort occurs at the place of publication and not at the place of posting or uttering. However, one should note that the British Columbia decision is contrary to the English rule.[341]

Our conclusion is that a tort action brought in Canada against a violator of Canadian securities laws who is outside the country is a useful though imperfect weapon. As long as the rule in *Phillips v. Eyre* remains in effect, any action will have to be founded upon an act which is wrongful where committed and where the action is brought. Therefore, any statutory civil action will have to be in the simplest and most general terms and not be restricted to particularly complicated or technical provisions.

337 12 N.Y. 2d at 481, 191 N.E. 2d at 283.

338 Some judicial authority for this approach may be found in Gronlund v. Hansen, 69 D.L.R. (2d) 598, 65 W.W.R. 485 (B.C.S.C. 1968), *aff'd on other grounds*, 4 D.L.R. ii. *Contracts*

Determining the proper law to be applied is somewhat simpler if an action is brought in contract. English and American courts at one time relied on the law of the place of contracting as the law governing a contract, but this principle has been supplanted by the proper law doctrine. Lord Wright defined the proper law as:

> "depending on the intention of the parties to be ascertained in each case on a consideration of the terms of the contract, the situation of the parties, and generally on all the surrounding facts. It may be that the parties have in terms in their agreement expressed what law they intend to govern, and in that case *prima facie* their intention will be effectuated by the court. But in most cases they do not do so. The parties may not have thought of the matter at all. Then the court has to impute an intention, or to determine for the parties what is proper law which, as just and reasonable persons, they ought or would have intended if they had thought about the question when they made the contract."[342]

There has been some argument about whether the test is objective or subjective but the common modern approach is to treat it objectively and to use the law by "which the contract was made or with which the transaction had its closest and most real connection".[343] Many factors are considered in determining the proper law; the most significant are the place of contracting, the place of performance, the places of residence or business of the parties and the nature or subject matter of the contract. The proper law of the contract test is also used in Canada.[344]

c. *Enforcement Abroad of a Canadian Judgment*

Like so many areas of private international law, the recognition and enforcement of foreign judgments is very complicated. Of necessity, our discussion will be compact. The problem is to predict whether a judgment by a Canadian court against a non-resident defendant for violation of Canadian securities law would be entered against that non-resident by a court where he resides. To answer that question thoroughly, we would have to study the law

342 Mount Albert Borough Council v. Australasian Assurance Society Ltd., [1938] A.C. 224, 240 (P.C.).

343 Lord Simonds in Bonython v. Commonwealth of Australia, [1951] A.C. 201, 219 (P.C.).

344 *See* Imperial Life v. Colmenares, [1967] S.C.R. 443; Sharn Importing v. Babchuk, 21 D.L.R. (3d) 349, [1971] 4 W.W.R. 517 (B.C.S.C.).

of every jurisdiction from Alabama to Zambia. This we cannot do. But we can offer some useful generalizations.

In deciding whether or not to recognize a foreign judgment, a court will generally not consider the substantive nature of the foreign laws involved, but it will consider the jurisdiction exercised by the foreign court over the parties in dispute.[345]

The foregoing generalization should not be taken to indicate that recognition of foreign judgments is straightforward, logical and free from technicality. To some degree courts have been grudging in that they impose narrower limits of jurisdiction for foreign courts than they claim for themselves.[346] An illustrative Canadian case is *Gyonyor v. Sanjenko*.[347] The defendant, resident and domiciled in Alberta, had been involved in a car accident in Montana. The plaintiff commenced an action in Montana and, pursuant to an order of the Montana court, the defendant was personally served in Alberta, but did not appear and default judgment was entered against him. If the facts had been reversed, an Alberta court would have asserted jurisdiction over the Montana defendant as a result of an accident in Alberta,[348] yet the Alberta court refused to recognize the Montana judgment.

Fortunately there is a trend toward greater acceptance of foreign judgments. English family law cases have firmly established the principle that English courts will recognize foreign decrees in circumstances where they would have asserted jurisdiction to grant the decree had the facts been reversed.[349] An alternative found in Canadian family law cases is the flexible and functional recognition test of looking to see whether there was a "real and substantial connection" between the foreign court and the parties.[350] There is also more legislation designed to facilitate

345 *See* A. Dicey, *supra* note 48, at 1018 (Rule 184); von Mehren & Patterson, *Recognition Enforcement of Foreign Country Judgments in the United States*, 6 L. & Pol. Int'l Bus. 37 (1974); Re Hughes v. Sharp, 70 D.L.R. (2d) 298, 305-06 (B.C.S.C. 1968); J. Williamson at 222; J. Williamson, Supp. at 237. In Canada treatment has varied from province to province, there being greater willingness to inquire into the merits on the part of some Canadian courts.

346 *See e.g.* how much more narrow are the recognition rules set out in A. Dicey *supra* note 48, at 993 than the cases in which courts assert jurisdiction described in ch. III *supra*.

347 23 D.L.R. (3d) 695 (Alta. S.C. 1971).

348 *See* Alta. R.C. 30(h), authorizing service of the writ out of the jurisdiction when a tort has been committed within the jurisdiction.

349 Travers v. Holley, [1953] 2 All E.R. 794 (C.A.); Indyka v. Indyka, [1967] 2 All E.R. 689 (H.L.); and *see* Castel, note, 45 Can. B. Rev. 140 (1967).

350 Bevington v. Hewitson, 47 D.L.R. (3d) 510 (Ont. H.C. 1974); MacNeill v. MacNeill, 6 O.R. (2d) 598 (Co. Ct. 1974).

the enforcement of foreign judgments either generally or with reciprocating jurisdictions.[351]

Our conclusion is that, though there may be technical problems in individual cases, civil actions founded in contract or tort can be used against non-resident defendants as a means of enforcement of Canadian securities laws. Private lawsuits are likely to be brought by private litigants only in cases in which fairly large sums are at stake. It would therefore be useful to insert in any statute which might be enacted provisions authorizing a federal administrative agency to bring such actions or to support them financially or otherwise, when brought by private litigants. The technical difficulties which we have described above could also be minimized by treaties between Canada and other nations.

2. *Suit Abroad*

If a civil suit against a foreign defendant is brought where the defendant resides, there is no problem of jurisdiction and there is no difficulty with enforcing a judgment. The only issue remaining is the choice of law which in this case would mean convincing a foreign court that it ought to apply to one of its residents the securities law of Canada. What would be the result if a Canadian plaintiff went directly to the foreign jurisdiction and brought his action there? Obviously our answer can again be only of the most general kind since the answer will depend on the law of the various jurisdictions. Most jurisdictions have legal rules permitting suits with foreign elements. A Canadian plaintiff can obtain a fairly clear appreciation of his chances of success in a foreign jurisdiction before he commits himself too heavily. Breach of contract or deceit (or a parallel statutory version of the tort of deceit) is likely to give rise to a cause of action in most jurisdictions. The complicated nature of choice of law rules indicates that if there is to be a statutory cause of action designed to permit actions abroad it should be kept simple. We suggest that it be created from the general principles of the tort of deceit. There is little point in attempting to export a technical rule such as a margin requirement but there is every reason to expect that a foreign court will give fair hearing to a case where the plaintiff pleads fraudulent misrepresentation causing damage.

Not every case brought abroad will be won. A Canadian plaintiff suing in a foreign court on a claim founded on a securities

351 *See e.g.* Reciprocal Enforcement of Judgments Act, R.S.B.C. 1960, c. 331 *as amended;* Weser, *Some Reflections on the Draft Treaty on Execution of Judgments in*

law will have to face the judicial hostility which seems to pervade cases in which the economic regulation of one country is considered in another. The English reception of the U.S. antitrust decrees affecting the nylon industry,[352] and the common law rule that domestic courts cannot be used by foreign states to enforce their revenue[353] laws illustrate this hostility. Consequently it would make sense to attempt to conclude treaties with foreign countries so that suits in their courts for recovery of liabilities created by the Canadian securities laws will become treated as though domestic, and hence likely to receive more favourable judicial treatment.

B. ICSID – THE IBRD CONVENTION ON THE SETTLEMENT OF INVESTMENT DISPUTES AND OTHER ARBITRAL SOLUTIONS

In 1966 the International Bank for Reconstruction and Development sponsored a Convention on the Settlement of Investment Disputes. The convention was designed primarily to deal with problems of expropriation and confiscation but it is sufficiently broad that it or one like it might be useful in settling problems of international securities regulation. The convention provides for arbitration and conciliation of investment disputes between states and nationals of other states and it creates an International Center for the Settlement of Investment Disputes (ICSID) with a staff of legally and commercially trained arbitrators.[354] The parties can provide their own procedure and their own substantive rules.

Several benefits could be provided by the convention. It would prevent conflicts over extended claims of national jurisdiction. It might facilitate gathering of information and, by using arbitration, it surmounts the problem of non-recognition and unenforceability of domestic judgments.

Effective use of the convention would require some sort of

---

the E.E.C., in INTERNATIONAL TRADE, INVESTMENT, AND ORGANIZATION 377 (W. LaFave & P. Hay eds. 1967).

352 *See* note 78 *supra*.

353 In U.S.A. v. Harden, [1963] S.C.R. 366, the Court refused leave to permit the U.S. government to enforce a consent judgment under which the taxpayer had agreed to pay a far lesser sum than the amount claimed by the tax authority. Cartwright, J., at 370-71, justifies the rule as one of public policy and neatly buttresses that description by referring to the decision of an American judge. A more recent Canadian decision that is easily distinguishable on its facts displays a less hostile attitude to the revenue laws of another jurisdiction; *see* Weir v. Lohr, 62 W.W.R. 99 (Man. Q.B. 1967).

354 Previous attempts to secure such a convention are discussed in G. SCHWARZENBERGER, FOREIGN INVESTMENTS AND INTERNATIONAL LAW 135-38 (1969).

acquiescence in advance by all investors and corporations buying or selling securities in Canada. A submission to jurisdiction would be operative even if secured in advance of the dispute.[355] It would be possible to require each investor and seller to sign a consent in advance and reserve the consent of Canada until local administrative and judicial remedies have been exhausted.[356] As the convention has yet to be tested on securities matters its utility is still unknown. However, it provides a useful model that at some future time might be used to deal effectively with international securities problems.[357]

Chapter XIII
Conclusions and Recommendations - Part II

In part II we have been concerned with the investigation of violations of securities laws and their enforcement against persons who are outside Canada.

In chapter VIII we discuss the problems of detecting and investigating securities offences to demonstrate their difficulty in the domestic context. We also discuss the application of the judicial process to complex transactions and the difficulty of satisfying a criminal burden of proof.

In chapter IX we consider the difficulties introduced into the investigation and enforcement of securities offences when they occur on an international scale. We outline the problems created by the lack of investigatory powers and by such features of international commerce as bank secrecy.

The problem of obtaining evidence abroad is the great initial hurdle in international securities offences. In chapter X we outline the methods that can be used to obtain such information. The readily available methods, commission evidence, letters of request and civil discoveries all have limited application.

In chapter XI we discuss extradition and the history of frustration in connection with extradition from Canada to the United States for securities offences.

In chapter XII we review the non-criminal approach to enforcement. We examine the civil law and describe how civil actions

355 On jurisdiction generally, *see* Broches, *The Convention on the Settlement of Investment Disputes: Some Observations on Jurisdiction*, 5 COLUM. J. TRANSNAT'L L. 263 (1966).

356 *Report of the Executive Directors of the IBRD*, 60 AM. J. INT'L L. 892 (1966) (¶24).

357 There is also the United Nations Convention on the Recognition and Enforcement of Foreign Arbitral Awards, 330 U.N.T.S. 4739, which might be used in some unusual securities transactions. Some investment contracts provide for arbitration. Some of the case law is discussed in: note, *Arbitration of International Securities Transactions* 16 B.C. IND. & COMM. L. REV. 491 (1975).

can be brought either in Canada or abroad against persons located abroad who have failed to comply with Canadian securities laws. We also examine the IBRD convention as a potential forum for the settlement of some international securities disputes.

There are two themes to our recommendations. The first and most important is that, to the greatest extent possible, international enforcement of a Canadian federal securities law should be capable of being effected unilaterally and domestically. The regulation of international transactions should be part of the regulation of domestic transactions. Local regulation is more certain, easier to change and enforce and speedier than external regulation. It also minimizes conflict with other jurisdictions since it takes place within Canada.

There are some techniques to make a securities law more effective against non-resident participants in the Canadian securities markets. It would be useful to require non-residents trading in Canada to consent to the jurisdiction of the Canadian courts and regulatory agencies. Unfortunately this will be effective only against persons who must comply because they wish to trade in Canada. The technique does not reach a foreign issuer or salesman who remains in a foreign jurisdiction and makes fraudulent solicitations by correspondence or telephone into Canada.[358]

Another weakness with a consent to jurisdiction is that it does nothing toward enforcing a judicial decision by obtaining money or some specific action from the offending person. One way to minimize the difficulty of enforcing a judgment is to require a potential offender to maintain within Canada assets such as a forfeitable deposit or bond which can be used to satisfy a money claim or to substitute for specific performance of obligations. We treat deposits as a suggestion and not as a recommendation. Deposits increase the cost of doing business and thus favour large firms over smaller ones. And like so much of our paternalist legislation, they punish the innocent instead of the guilty since the reputable person complies with the deposit system and the disreputable person, from whom a deposit should be extracted, ignores the requirement just as he ignores other laws designed to promote honesty in dealing. We suggest that the issue of deposits be de-

358 Yet sometimes the domestic law will have practical outreach where it is least expected, for example, where a non-resident's transaction is conducted through an independent agent. For an interesting illustration, see the no action letter granted Morgan Guaranty Trust by the SEC to permit the transmittal of proxy material to holders of ADRs where the matter to be voted on concerned receipt of unregistered shares as a dividend: *see* [1974-1975 Transfer Binder] CCH Fed. Sec. L. Rep. ¶80, 075.

ferred for consideration to a time when specific legislation is being considered.

It is of course essential that international law in this area be developed. International law grows as the practice of states comes to be accepted by the world community. Therefore it is in our own interest to make reasonable and responsible claims with respect to jurisdiction abroad. It is equally in our own interest to accept these claims when made by others. However, in the interests of efficient and effective protection of the Canadian public, we would do well to use, wherever possible, domestic sanctions.

Our second general theme is that Canadian securities laws should be extended in a number of areas by treaty even though the effort may be time-consuming.[359] Treaties would ensure that Canada had some control over non-residents and would reduce the resentment which individual countries manifest about the external regulations of other countries applying within them. In the arena of private lawmaking, it is always preferable to take steps by consent rather than by force. The same preference applies among nations.

We now turn to our specific recommendations. To assist in the collection of information, a useful initial step would be to obtain additional information in Canada on the activities of Canadian residents abroad. The proposed Australian Securities Act has an interesting feature – the requirement that an Australian buying or selling securities keep a record in Australia of all his transactions and notify the Securities Commission of the location of the record. The proposed act would prohibit an Australian in Australia from buying Australian stocks through a foreign intermediary.[360]

The converse of securing information about the activities of nationals abroad is securing information about the activities of non-residents in this country. We suggest that the rules on registration by non-resident persons who do business as brokers, dealers or advisers in this country be expanded. For example, the SEC requires non-resident investment advisers to keep current books and records in the United States and to furnish them on demand.[361] Similarly the right to issue securities or to carry on the business of trading in securities in Canada should be conditional on maintaining in Canada books and records equivalent to those

359 The complications created by the Canadian constitution are discussed by Morris, *Canadian Federalism and International Law*, in CANADIAN PERSPECTIVES ON INTERNATIONAL LAW AND ORGANIZATION, *supra* note 1, at 59.

360 *See* Corporations and Securities Industry Bill, 1974, s. 108 (Commonwealth of Australia).

361 *See* 305 BNA SEC. REG. & L. REP., June 4, 1975, at A-3; *id.* Oct. 1, 1975, at A-16,

which must be maintained by domestic Canadian persons and institutions.

A simple way to improve "access" to foreign information is to amend the provisions of the Canada Evidence Act to simplify the introduction of foreign business records as evidence before Canadian courts. Foreign business records, particularly documents from financial institutions, should be made admissible on the basis of proper certification and reasonable notice to the defence.[362] Another approach would be to recognize as a compellable witness concerning foreign records a person in Canada who is an employee or agent of the foreign organization, its parent or subsidiary. This would shift to the Canadian witness the onus of obtaining from his Canadian employer or principal business records kept outside Canada by the company or its affiliates.

There are also a number of ways in which use of existing sources of information by Canadian enforcement officers can be improved. Existing facts about lost, missing, counterfeit and stolen securities should be gathered. We recommend that a federal administrative agency have the power to create rules relating to reporting of such securities. Although the agency would have to balance the cost of such a requirement against the expected benefits, we believe that criminal activity in securities is sufficiently

---

reporting SEC, Investment Advisors Act of 1940 Release No. 477 (Adoption of Rule 204-2(j)).

362 The Evidence Code proposed in LAW REFORM COMMISSION OF CANADA, *supra* note 273, contains several provisions which may simplify the introduction of foreign business records into evidence before Canadian courts:

"(a) Section 31(a) is perhaps the most important. This section simplifies the law relating to business records and does away with many of the requirements which do not add appreciably to the reliability of the record. Under the proposed Code, reliability is the prime consideration. Thus any foreign record of a fact or opinion (not necessarily even a 'business' record) would be admissible provided that the person making the record made it:
(i) in the course of a regularly conducted activity,
(ii) at or near the time the fact occurred or existed or
(iii) at a subsequent time if compiled from a record so made at or near such time.

"(b) Section 31(g) states that market quotations, tabulations, lists, directories or other compilations generally used and relied upon by the public or by persons in particular occupations are admissible. This section represents a significant addition to the law in that these documents are clearly hearsay. However, the Law Reform Commission considers them sufficiently trustworthy and the inconvenience of obtaining them in other ways so great as to justify an exception.

"(c) Finally, section 47(h) provides that foreign public documents are presumed to be authentic if they are accompanied by the certification specified in the Code. Note that section 47(3) proposes to give a judge the discretion to dispense with the certification if reasonable opportunity has been given to investigate the authenticity and accuracy of the foreign public documents."

widespread to warrant continued supervision of this area by the agency. A great deal of information is accessible if the enforcement officers effectively can match together the domestic sources of information with that already available internationally. Canada has a number of experienced enforcement officers and their work can be made more effective by providing them with more money and resources. Libraries containing better collections of foreign material would be a useful resource. Enforcement officers also need access to attorneys or prosecutors in other countries.

Another useful program, though one which would not become productive for years, would be to work for greater uniformity in legislation among nations. Uniformity would simplify the test of double criminality for the purpose of extradition. It would also provide a greater incentive for enforcement officers of differing nations to cooperate informally with each other if they both consider the same conduct contrary to law.

International investigations would benefit if Canada were to sign the Hague Convention on obtaining evidence abroad and if it were to attempt to work out new bilateral treaties on the model of the U.S.-Swiss treaty. Bilateral treaties would assist in obtaining information about the financial dealings of residents abroad. Such treaties may grant the right to examine business records abroad and oblige nationals of one state to testify in another state. Another well tried government approach to increasing effectiveness would be to hire more staff for international enforcement.

Some changes relating to international securities fraud need not await legislation or treaty. Individuals involved in enforcement in Canada can work in the traditional ways to develop greater cooperation with their counterparts in the enforcement agencies abroad. Another domestic device which would not involve international assistance would be to change domestic laws to require disclosure of transactions involving international elements. For example, it would be possible to require banks to disclose their principal when they act as an agency for a nonresident person. Legislation in Canada similar to the United States Walsh Act is likely to be limited in its usefulness.

Canada's extradition treaties could also be substantially improved, both by expanding the number of offences covered and by increasing the resources put into extradition cases. More particularly, the various extradition treaties and the Fugitive Offenders Act should provide expressly for extradition for securities offences. Of course one should note that this country cannot expect to gain cooperation from foreign countries without an effort to render them the same degree of cooperation.

With respect to sanctions in international securities offences,

it is not our function to decide what sanctions a Canadian federal securities law should include. We believe that the system should contain every conceivable enforcement weapon and that the law should leave to the person having the interest to be enforced the choice of selecting the remedy or group of remedies which appear most appropriate in a given situation. As noted earlier, sanctions are considered by Leonard H. Leigh in his paper in this volume. The discussion of sanctions above and in this chapter does not mesh perfectly with the list of sanctions discussed by Leigh.[363] We think it preferable to describe the general framework in which sanctions will apply internationally rather than to examine the operation of any individual sanction in detail.

We examined the criminal law relating to securities and civil law remedies brought both within and outside Canada by individuals and by the administrative agency on their behalf. Leigh also discusses class actions, administrative sanctions including stop orders, and civil actions brought by the agency to enforce statutory standards even when there is no damage shown to a private person.[364] As we stated above, we believe in the proliferation of remedies and that the general approach should be to apply to non-resident offenders the same sanctions as one applies to domestic offenders, at least to the greatest extent possible.

As we noted in chapters X and XI, it is important that criminal law provisions be retained since the present international system for gathering information and extraditing offenders in foreign countries is geared to the criminal law to maximize compliance by non-residents. Though one of the advantages of the civil law is that it can be enforced without direct cost to the taxpayer through private action, we recommend that the statute provide that the agency can bring actions on behalf of individuals or support suits financially or otherwise. We see a number of advantages in the proposal discussed by Leigh that there be a private remedy for breach of the statute. By itself, this feature might be of limited international effectiveness in view of the complexity of civil actions. To meet the international civil enforcement difficulties we suggest that the statute contain a simplified private remedy analagous to the common law tort of deceit.[365] One of the long-

363 *See, Leigh,* for discussion of specific sanctions.

364 For a recent discussion of American enforcement devices *see* Farrand, *Ancillary Remedies in SEC Civil Enforcement Suits,* 89 HARV. L. REV. 1779 (1976). This article is especially useful for its discussion of the SEC's use of receivers, injunctions and restitutionary remedies.

365 There is some question whether this suggestion can survive the January 1976 decision of the Supreme Court of Canada in MacDonald v. Vapor Canada Ltd., 66 D.L.R. (3d) 1 (S.C.C. 1976), *noted in* Hogg, *Constitutional Law - Trade Marks Act*

term projects of government should be to develop a treaty system which includes civil remedies so that in appropriate cases the Canadian securities laws become, in effect, part of the foreign domestic legal system. The treaty should also provide procedures for simplifying and clarifying the process of enforcing abroad judgments which have been obtained in Canada.

There has been emphasis in the foregoing recommendations on our general theme of accomplishing a number of international enforcement objectives through treaties. But we should keep to the fore our other general assumption: that a great deal can be accomplished in international enforcement entirely within a Canadian domestic system. At the risk of lengthening an already long paper, we wish to demonstrate by an example the extent to which outreach can be obtained without additional treaties. For the purpose of illustration we shall take the first class of rules discussed in the paper, namely, those relating to the registration of an issuing company or of its securities.

We shall take the case of a corporation incorporated in Canada which has no assets and no officers in Canada. Assume that the corporation issues securities abroad and does not comply with a disclosure requirement which under the Canadian law would be applicable. We shall consider the application of each of several types of enforcement device: administrative sanctions, a stop trading order, criminal proceedings, an injunction, a class action brought by the federal regulator for damages on behalf of injured individuals (if any) and private actions for damages and rescission.

(1) Administrative sanctions taken against the company challenging the issue itself, previously existing or newly issued stock, or even the corporate good standing of the company, are likely to have significant practical effect in the jurisdiction where the stock is being issued, especially if the authorities and the people engaged in the securities business there follow the custom of requiring opinions of counsel on the validity of stock and certificates of government authority from the incorporating jurisdiction. Although there may be jurisdictions in which the chilling effect of a negative counsel's opinion or the absence of a government certificate would not stop a transaction, Canada's interest in protecting investors in those countries is probably less strong than it is in countries, such as the United States, where such standards of corporate responsibility are maintained.[366]

Unfair Competition Provisions - Criminal Law and Civil Remedy - Trade and Commerce - Treaty - Stare Decisis, 54 CAN. B. REV. 361 (1976).

366 American attorneys can be expected to be particularly scrupulous in view of their

(2) A stop trading order is a particularly effective type of administrative sanction but deserves slightly different treatment in view of its undisciplined effect.[367] In the present example, the regulatory agency may not wish to cause losses for Canadian investors trading in previously issued securities of the company merely to prevent the company from proceeding with an issue in some distant place. Although the Canadian stop trading order may have no effect abroad, it is likely to be recognized in countries which are desirable as a source of funds.

(3) If Canadians were involved in criminal proceedings, jurisdiction could be claimed on a nationality principle. If not, the claim can be grounded on the impact principle, assuming, of course, that there is significant effect within Canada. However, both the jurisdiction and the extradition hurdles could be insuperable.

(4) An injunction obtained in a Canadian court against the company or an individual director or officer will be effective only if it is either respected by the government or the securities community in the foreign state (if it is against the issuing company) or respected by the individual director or officer because of his ties in this country, that is, ties in the form of assets which can be attached here or in the form of a desire to return to this country. Though we have no statistics on which to base this view, we believe that, in fact, very few people who have family and business connections in this country actually leave to avoid prosecution under the law. The general success of the bail system indicates that most people choose to comply with Canadian laws notwithstanding the ease of foreign travel. These generalizations, of course, are no comfort when the

---

exposure to SEC action; *see, Securities Regulation - Professional Responsibility - An Attorney May Be Enjoined in an Action Brought by the SEC for Negligence in Preparing an Opinion Letter Exempting Stock from Registration under the Securities Act of 1933,* 87 HARV. L. REV. 1860 (1974). It is also possible to secure some control by denying domestic remedies to foreigners suing Canadians where the transaction involves a breach of Canadian law; *see e.g.* the refusal of U.S. courts to allow a suit by a Swiss bank against an American investor where the bank had taken losses on a transaction involving grants of credit in excess of U.S. margin allowances; Ufitec S.A. v. Carter, [1974-1975 Transfer Binder] CCH FED. SEC. L. REP. ¶94, 841 (Cal. Sup. Ct. L.A. Co. 1974).

367 An example of the use by a Canadian regulatory body of its administrative power to prevent international transactions is the cease trading order of the Quebec Securities Commission to United International Bank and Trust Co., a company which was offering securities to European investors but not to Canadians and advertising only in the International Herald Tribune; *see, Q.S.C. Stops Trading in United International,* The Globe and Mail (Toronto), May 7, 1975, at B2, col. 8.

persons engaged in the management of a company have no connection with this country.

(5) Since in the example the issuing company has no assets in Canada with which to satisfy damage claims brought by Canadians, the success of a class action by the regulatory agency for damages on behalf of injured individuals will depend entirely on the foreign rules of recognition of foreign judgments. On the other hand, the rules of the foreign country might permit a class action to be brought there by an individual shareholder for breach of some local requirement of fair dealing and full disclosure if not for breach of the Canadian statute.

(6) A private person suing a Canadian corporation for damages suffered as a result of the corporation's failure to comply with a disclosure law would run into the same difficulty described in (5) above, namely, enforcing his judgment in a jurisdiction where the company has assets. While the success ratio should be high, one cannot assume success in every case.[368]

We conclude that a very large measure of control can be achieved over actions of non-residents by Canadian authorities using Canadian laws. Where these laws will not reach, we must endeavour to secure some protection for Canadians by treaties and reform of our securities law.

368 The other type of remedy, rescission, may prove to be more effective. The right of rescission would be claimed by the Canadian in a foreign action brought to compel him to pay for the stock. This requires convincing a foreign court to apply a choice of law rule by which a Canadian defence can be pleaded. Convincing a foreign court to apply a foreign choice of law rule is easier than asking it to enforce a foreign judgment, since it has the opportunity during the case itself to monitor whether the application of that rule coincides with its own public policy and sense of fairness.

Appendix
List of Persons Interviewed

We express our gratitude to the persons listed below for their assistance in providing us with information and comments on the problem of international enforcement of securities laws. Neither of us has had any practical experience in the area and we sought to mitigate this deficiency by interviewing people who had had a wealth of such experience.

None of the persons referred to has had the opportunity to review our paper. Hence we must accept full responsibility for all errors of fact and interpretation and, in particular, for any change in circumstances which may have occurred between the interview dates in August 1974 and the submission of this paper in December 1976.

Chapter I
Introduction: The Goals of Licensing

It is now well accepted in North America that various participants in the securities markets – generally (though not precisely) speaking, those who make a "business" of participating in the securities markets – must be licensed by the state as a precondition to carrying on their activities. Furthermore, mythology notwithstanding, securities market licensing statutes in North America antedated the Great Depression by a good many years, although the rapid-fire succession of economic calamities following October 1929 did give birth to much more elaborate licensing schemes than theretofore known.[1] The first Canadian province to impose a licensing requirement for the sale of securities was Manitoba, in the Sale of Shares Act of 1912, which required agents of issuers and other sellers of securities to obtain licences.[2] Manitoba's Act followed by one year the first of the "blue sky" statutes in the United

1 *See* 1 L. Loss at 3-22. Throughout this paper the term "licensing" is used to refer to licensing of those engaged in the securities business - for example, brokers, dealers, salesmen, investment advisers and underwriters - and not to encompass the prospectus requirement, compliance with which might aptly be said to confer a "licence" to issue securities to the public.

2 J. Williamson at 12. Ch. 1 of Williamson's book gives the history of provincial licensing statutes in considerable detail.

States, that of Kansas.[3] By 1930, all of the then nine Canadian provinces had statutes imposing a licensing requirement on sellers of securities,[4] and the near half century intervening has seen a spate of securities market licensing statutes and amendments throughout North America and elsewhere.[5]

In the face of the apparently complete acceptance in concerned quarters today of the fact that the securities market occupations are subject to a licensing requirement,[6] and since the occasion for this paper is the proposal to fashion yet another statute which may well regulate those occupations, it is well to bear in mind that licensing is in fact a deprivation of individual freedom. In a "free enterprise" economy, such as Canada's, as a rule the individual is at liberty to make his living at whatever occupation he chooses;[7] the constraints or barriers to entry are not by way of a legislatively decreed exclusivity but rather are of a financial or know-how nature imposed by market forces. One is at liberty to choose his occupation, subject of course to the risk of failure. This is not the case, obviously, with the licensed occupations: one enters into them only with the positive permission of the state or, as in the case of law and other "professions", with the permission of a nongovernmental self-regulatory body. As the Ontario Royal Commission Inquiry into Civil Rights (McRuer Commission) stated:

> "We start from this basic premise. It is an infringement of the civil rights of an individual to prohibit him, without government approval, from engaging in a lawful activity....
>
> "As a general principle that which is not prohibited is, in the eyes of the law, permitted. There is a personal and public interest that the law should not unnecessarily

3 *Id.* at 11.

4 *Id.* at 11-28.

5 One of the more notable recent examples is the U.S. Securities Reform Act of 1975 which amended substantially the licensing provisions of the Securities Exchange Act of 1934. Ontario's proposed new Securities Act, Bill 7, would make a number of quite important changes in the licensing area. Provisions of both the recent U.S. legislation and the Ontario bill (as at 1st Reading, February 28, 1978) are referred to throughout this paper. *See also* SECRETARY OF STATE FOR TRADE, AMENDMENTS TO THE PREVENTION OF FRAUD (INVESTMENTS) ACT 1958, A CONSULTATIVE DOCUMENT, CMD. No. 6893 (U.K. July 1977).

6 *But see* M. FRIEDMAN, CAPITALISM AND FREEDOM 137-60 (1962).

7 *But see* Trebilcock, *Winners and Losers in the Modern Regulatory System: Must the Consumer Always Lose?*, 13 OSGOODE HALL L. J. 619, 627 (1975):

> "Three myths surrounding the present nature of public regulation widely persist. The first is that our economy is largely unregulated and is disciplined mainly by competitive forces. In fact, in Canada, there are over one hundred Federal regulatory agencies and in most provinces more than fifty regulatory agencies."

> fetter the individual's basic right to engage in any lawful means of earning a livelihood that he sees fit and to develop what ever talents he may have to this end. This principle bears on both the basic legislative decision to license and on the standards which should be imposed to implement the licensing power."[8]

The trend toward restricting entry into various occupations by means of licensing appears definitely to be up; and in the province of Ontario alone there are scores of occupations for which a licence is necessary.[9] These go well beyond such traditional professions as law, medicine, architecture, and engineering.

The growth of the licensing requirement sharply inhibits personal mobility in the geographical as well as in the occupational sense. Professor W. Gellhorn has noted disapprovingly this restriction of mobility with respect to licensing statutes in the United States.

> "Movement from place to place to place in pursuit of advancement or congeniality has always been an American prerogative. Observers from more static societies, noting our mobility, think of us as almost rootless. But licensing laws may soon anchor Americans to a degree not otherwise experienced. Despite occasional judicial remonstrance, many statutes and ordinances require antecedent local residence as a condition of license eligibility."[10]

The sentiments expressed would appear equally applicable to Canada, where mobility is no less prized and no less a part of the national tradition than in the United States. Furthermore, the hobbling of individual occupational and geographic mobility may be costly in terms not only of individual freedom but for the economy as a whole.

Gellhorn has pointed out that occupational licensing may diminish "the right not to conform" because the licensing authori-

8 ONTARIO ROYAL COMMISSION INQUIRY INTO CIVIL RIGHTS, 3 REPORT NO. 1 at 1095-96 (1968) [hereinafter MCRUER REPORT].

9 According to MCRUER REPORT, *supra* note 8, at 1095, more than 60 trades or occupations are required to be licensed under by-laws passed under the authority of the Ontario Municipal Act, R.S.O. 1970, c. 284. There are also a number of separate licensing statutes such as the Ontario Securities Act; the Farm Products Marketing Act, R.S.O. 1970, c. 162; the Real Estate and Business Brokers Act, R.S.O. 1970, c. 401; the Mortgage Brokers Act, R.S.O. 1970, c. 278, *etc.* Finally MCRUER REPORT, *supra* note 8, at 1160, lists 22 self-governing professions and occupations. At the time of writing, a Professional Organizations Committee has been constituted in the Ministry of the Attorney-General of Ontario. This committee is expected to report sometime in 1978 or 1979 and doubtless will have a great deal to say about the operation of occupational licensing statutes in the province.

10 W. GELLHORN, INDIVIDUAL FREEDOM AND GOVERNMENTAL RESTRAINTS 126 (1968).

ties may demand a kind of "normalcy" in the candidate that has little or nothing to do with the skill required to practice the occupation.[11] This pressure toward "normalcy" may exist in any licensing scheme where the general character of the applicant is made an issue and where the discretion of the licensing authority in terms of evaluating suitability is broad, as, for example, under section 7(1) of the Ontario Securities Act, (OSA), which provides: "The Director shall grant registration or renewal of registration to an applicant where in the opinion of the Director the applicant is suitable for registration and the proposed registration is not objectionable."[12] Section 24 of the Quebec Securities Act (QSA) is

11 Gellhorn, *Occupational Licensing - A National Dilemma*, 109 J. ACCOUNTANCY 39 (1959).

12 There may be some cause for concern that a type of nonconformity has upon occasion been costly to registrants in Ontario. Thus, in *In re* Michael Avram Thomas, [1972] OSC Bull. 118 (June), a registered salesman took a vacation abroad, during which time his registration lapsed. Upon return to Ontario, he applied for and was granted reregistration. It then developed that on the application for reregistration he had answered "no" to the question "has the applicant... ever been charged, indicted or convicted under the law of any province, state or country... in any part of the world?" In fact while travelling in Afghanistan the applicant had been taken into custody for possession of marijuana and had to pay a sum of money to secure his release. Upon revelation of these facts, the commission cancelled Thomas' registration as a salesman, not, the opinion is careful to point out, for possession of marijuana in Afghanistan but for lack of candor in the application and equivocation in his testimony at the revocation proceeding concerning the events in Afghanistan. The commission said, "We cannot be certain that he will not apply the same standards in his dealings with the public." With respect, it seems that the commission, if it was indeed satisfied that the events in Afghanistan could not reasonably be denominated anything other than a charge or a conviction, might have been on firmer ground had it looked to Thomas' history as a salesman to determine the appropriate sanction, and it appears that that cancellation of registration was an unduly severe penalty. While there is a well established and eminently reasonable rule that failure to disclose prior convictions will itself be a bar to registration in Ontario, *see* Cowan, *The Discretion of the Director of the Ontario Securities Commission*, 13 OSGOODE HALL L.J. 735, 751 n. 118 (1975), where a party is already registered the commission has at its disposal better grounds than a rule of thumb for determining the appropriate sanction, if any.

In *In re* Lafferty, Harwood & Partners Ltd., [1974] OSC Bull. 125 (June), *aff'd*, 8 O.R. (2d) 604 (Div'l Ct. 1975), an applicant for membership in the Toronto Stock Exchange appealed under OSA, s. 140(3) from an adverse decision of the exchange's board of governors. The board of governors had made their decision ostensibly on the basis of certain conduct of the applicant firm occurring several years earlier involving, in one instance, window dressing financial statements in order to deceive the Montreal Stock Exchange as to the applicant's capital position and, in the other instance, public criticism impugning the integrity of an Ontario judge. Despite the applicant's good record in the intervening years and its president's expressed contrition for the prior offensive acts, the Toronto exchange refused to admit the firm to membership and the commission declined to disturb the exchange's decision. The applicant claimed that the real reason why the exchange had denied it membership was its president's public record of vigorous criticism of various segments of the Canadian financial establishment.

Probably the most notorious example of the pressure for "normalcy" in a licensee

phrased even more broadly: "The granting or renewal of registration is at the discretion of the Director."[13]

Gellhorn would reserve imposition of the individual and societal costs of licensing for occupations which meet two criteria: first, that consumers of the service in question cannot judge its quality at the time of consumption; and, second, that the harm that may reasonably be expected from dishonest or incompetent performance is grievous.[14] That the activities of selling and advising upon the merits of securities bear these characteristics is amply testified to by history and by reference to the disciplinary proceedings before any securities commission.

The goals of licensing of securities market participants are usually expressed as the achievement of a triumvirate of values: honesty, competence and financial responsibility.[15] In *Lymburn v. Mayland*,[16] in which the Privy Council upheld as *intra vires* the investigatory powers of the Alberta Attorney-General derived from that province's Security Frauds Prevention Act, Lord Atkin said: "There is no reason to doubt that the main object sought to be secured in this part of the Act is to secure that persons who carry on the business of dealing in securities shall be honest and of good repute, and in this way to protect the public from being defrauded."[17]

In an article on the unfixing of commission rates on stock exchanges in the United States, Professor Baxter has summarized the preventive goals of exchange oversight of their members in a manner that equally well describes some of the salient goals of licensing. He writes:

> "Exchange regulations must guard against several types of potential evil: First, unduly thin capitalization of member firms poses the risk that investors might find themselves in the position of unsecured creditors of an insol-

---

occurred in a nonsecurities context. In Roncarelli v. Duplessis, [1959] S.C.R. 121, the Premier of Québec had ordered that province's liquor commission to revoke a restaurateur's liquor licence because the restaurateur had served as surety bail for a great number of Jehovah's Witnesses who had been arrested for distributing their proselytizing literature. The Witnesses' religion was anathema to the province's Roman Catholics.

15 "[R]egistration is used to ensure the adequacy of capital of persons dealing with the public in securities; to prevent untrained persons from engaging in such dealings; to impose operational and procedural rules considered necessary in the public interests; and to enforce compliance with certain ethical standards"; Toronto Stock Exchange, Submission to the Ontario Securities Commission on Bill 75, the Securities Act, 1974, at 34 (October 11, 1974).

16 [1932] A.C. 318 (P.C.)

17 *Id.* at 324.

vent brokerage house; second, brokerage houses might abuse their fiduciary relationships and sell to investors, at unreasonably high prices, securities owned either by the brokerage house or by a favoured customer, or they might misappropriate the funds or securities left in their custody by customers; and third, members, having direct access to the exchange mechanisms, might engage in manipulation of those facilities, generate ticker indications of security value that did not correspond to 'true' value, and then turn such indications to the manipulator's advantage in other transactions. *To guard against the evils of insolvency, dishonesty and manipulation,* the exchanges have customarily exercised supervisory control over those members of the industry who deal with customers and have access to the exchange mechanisms."[18]

In addition, licensing seeks to protect brokerage firms' customers against the dangers that the broker will recommend to and purchase for the customer securities not appropriate to the customer's financial situation and investment objectives; that the broker, whose fee is based on commission, will cause excessive trading in the customer's account; and that the broker will be just plain incompetent in securing prompt and accurate execution of a customer's order.

Numerous commentators have criticized the trend toward licensing requirements in an increasing number of occupations as indicative of a desire of those already in an occupation to gain a public mark of "professional" status – and to keep others out.[19]

18 Baxter, *NYSE Fixed Commission Rates: A Private Cartel Goes Public,* 22 STAN. L. REV. 675, 680 (1970) (emphasis added). The possibility of manipulation of "market" price is not limited to securities traded on exchanges. Dealers in the over-the-counter market have upon occasion caused to be published fictitious bid and ask quotations bearing no relationship to any independent market price for the security. *See e.g. In re* Goldmack Securities Corp. Ltd., [1966] OSC Bull. 14 (January); *In re* W.D. Latimer Co. Ltd., [1967] OSC Bull. 9 (August).

19 *See e.g.* W. GELLHORN, *supra* note 10; Gellhorn, *supra* note 11; M. FRIEDMAN, *supra* note 6; Trebilcock, *supra* note 7; Reich, *The New Property,* 73 YALE L.J. 733, 766 (1964); Moore, *The Purpose of Licensing,* 4 J.L. & ECON. 93 (1961); *see also* MCRUER REPORT, *supra* note 8, at 1172, where the following observations are made concerning the self-governing occupations:

> "We have made it clear that the power to admit a licensee is not conferred to protect the economic welfare of the profession or occupation. Those professions or occupations which are granted self-governing status are charged with a responsibility not only to see that persons licensed are qualified, but that all qualified applicants are licensed....
>
> "[I]t must be recognized that each of the self-governing bodies has been given a statutory monopoly through its licensing powers. What has to be guarded against is the use of the powers of license for purposes other than

That is, licensing requirements are seen to be a result of pressure from those within the occupation to upgrade their economic and social standing rather than as responsive to a public need for protection. It does not appear that such a view of licensing in the securities industry would be historically accurate; rather licensing appears to serve legitimate needs of public protection.

Participants in the securities industry, or at least certain of them, do, however, wish to think of themselves as "professionals" and seek to project a "professional" image. For example, the *Manual for Registered Representatives*, a publication of the Canadian Securities Institute,[20] in the section on "Code of Ethics and Conduct for Registered Representatives" states that "the representative should fit himself to the best of his ability for his profession".[21] Typically the term "registered representative" is used in industry sponsored publications, as opposed to the word "salesman" used in the relevant statutes.[22] A publication of the New York Stock Exchange states: "Like a doctor or lawyer, the representative should determine pertinent facts concerning his client's situation prior to giving advice."[23] Some years ago, in a criminal prosecution in the United States involving securities fraud, the former president of the National Association of Securities Dealers testified for the government as follows:

> "Q: Is the securities business a specialized business or not, in your opinion?
>
> "A: I think it is a profession like medicine or the law.... I think you have a fiduciary relationship with your customers which is a position of trust with them, and that is where it distinguishes it from any other business."[24]

One team of commentators in the United States has proposed the "professionalization of the stockbroker" as a guide toward resolv-

---

establishing and preserving standards of character, competence and skill."

24 Testimony of Harold E. Wood in United States v. Pandolfo, Crim. Nos. 95, 105 (D.N.D. September 28, 1959), *quoted in* Mundheim, *Professional Responsibilities of Broker-Dealers: the Suitability Doctrine*, [1965] DUKE L.J. 445, 447 n. 4. *See also* Ontario District of the Investment Dealers Association of Canada, Submission to the Industry Ownership Study of the Ontario Securities Commission 8-13 (1971).

ing the various conflicts or roles and consequent conflicts of interests faced by the stockbroker.[25]

If thinking of their occupation in terms of a profession increases the sense of a fiduciary relationship with their clients in the minds of securities salesmen and underwriters and other licensed members of the securities industry, that is all to the good. It is only realistic, however, for securities market licensees, their regulators and, most importantly, their customers (or "clients") to bear in mind that at bottom the securities business is a merchandizing business.[26]

A commentator in the United States has put succinctly the dilemma inherent in considering the securities industry licensed occupations as professions:

> "Basically the industry is a merchandizing industry, and it's hard to consider it professional no matter how well qualified its personnel may be, because there is an ever present conflict of interest. This is true even in pure brokerage transactions. By stressing the idea of living up to a professional image, the regulatory authorities may be doing a disservice to the investing public if that professional status is not there."[27]

Chapter II
The Licensed Activities

In Ontario and the other provinces the activities in the securities market generally subject to a licensing requirement are three: trading in securities, whether as principal or agent; underwriting securities issues; and advising with respect to the merits of investing in securities.[28] Section 6 of the OSA provides that no person or company shall engage in any of these activities unless such person or company is registered with the Ontario Securities Commission (OSC) to carry on the particular activity.

A. TRADING

"Trading" is defined in OSA section 1(1)24 to include "any sale or disposition of or other dealing in or any

25 Levin & Evan, *supra* note 23, at 350-54.

26 *See* Mundheim, *supra* note 24, at 446; SECURITIES AND EXCHANGE COMMISSION, REPORT OF THE SPECIAL STUDY OF SECURITIES MARKETS 240-42 (1963) [hereinafter SEC SPECIAL STUDY].

27 Remarks of Harry Heller in CONFERENCE ON SECURITIES REGULATION 100 (R. Mundheim ed. 1965), *quoted in* Spiro, *Securities Salesmen, Investor Protection and Professional Responsibility*, OSGOODE HALL L.J. 431, 457 (1970).

28 OSA, s. 6(1).

solicitation in respect of a security for valuable consideration...and any act, advertisement, conduct or negotiation in furtherance of any of the foregoing."

The definition appears to encompass only the sale side of securities transactions, to the exclusion of the purchase side, although the concept of purchase could obviously fall within the literal reach of "other dealing in".[29] In *Prudential Trust Co. Ltd. v. Forseth,*[30] the Supreme Court of Canada said that the definitions of "trade" in the Saskatchewan Securities Act, which is very similar in this respect to the Ontario Act, "seem to contemplate the soliciting of subscriptions for or the making of sales of securities by the person trading and do not contemplate the soliciting for or making of purchases of securities by such a person".[31] This construction appears correct, since, had the legislature intended to include purchases within the coverage of "trade", one would have expected it to insert the words "purchase or" immediately before the word "sale" in the definition and not to rely upon the vague phrase "or other dealing" to do the job. Bill 7, the proposed new Securities Act for Ontario, is explicit on this point. Section 1(1)42 states that "trade" includes "any sale or disposition of a security for valuable consideration...but does not include a purchase of a security...".[32] As a practical matter, the inclusion or non-inclusion of "purchase" may be of little importance since those persons whose business is the trading of securities (and, as discussed below, it is the *business* of trading that triggers the licensing requirement) must buy *and* sell securities.

In United States federal securities regulation, the definitional focus for licensing purposes is not on the concept "trade" but rather on the concepts of broker and dealer. The Securities Exchange Act of 1934 (Exchange Act) defines a broker to be "any person engaged in the business of effecting transactions in securities for the account of others" and a dealer to be "any person engaged in the business of buying and selling securities for his

29 *See* J. WILLIAMSON, SUPP. at 116.

30 [1960] S.C.R. 210, 30 W.W.R. (N.S.) 241, 21 D.L.R. (2d) 587.

31 21 D.L.R. (2d) at 601. The definition of "trade" in the Saskatchewan Securities Act, s. 2, included "any solicitation or obtaining of a subscription to, disposition of, transaction in, or attempt to deal in, sell or dispose of a security or interest in or option upon a security, for valuable consideration...and any underwriting of an issue or part of an issue of a security, and any act, advertisement, conduct or negotiation directly or indirectly designated as 'trade' or 'trading' in the regulation".

32 *See* Bray, *Ontario's Proposed Securities Act: An Overview, Its Purpose and Policy Premises,* [1975] OSC Bull. 235, 261 (October). Under the Québec Securities Act, s. 14, "trading in securites" is "any alienation or disposal, for a valuable consideration, of a security" - again equating "trade" with "sell".

own account".[33] Under section 15(a) of the Exchange Act, it is unlawful "for any broker or dealer...to effect any transactions in, or to induce or attempt to induce the purchase or sale of, any security...unless such broker or dealer is registered" with the Securities and Exchange Commission (SEC).[34] Thus there emerge two distinctions between the United States and the Canadian approaches to licensed securities activities. First, the distinction between trading for one's own account (dealer) and trading for the account of others (broker) has greater importance in the structure of the United States securities legislation than in the Canadian legislation. The triggering definition in the licensing parts of the Canadian securities statutes makes no such distinction.[35] More importantly, by limiting the coverage of the terms broker and dealer to those engaged *in the business of* effecting transactions in securities, the Exchange Act's definitions do much of the work left for the exceedingly lengthy exemptions catalogues in the Canadian statutes.[36]

33 15 U.S.C. ss. 78c(4), (5) (1970).

34 Until the Securities Reform Act of 1975, brokers and dealers who conducted their businesses exclusively on an exchange which was registered with the commission (pursuant to s. 6 of the Exchange Act) did not themselves have to be registered with the commission. Registration with the commission was required only for those brokers and dealers who transacted business in the over-the-counter market. Since the vast majority of exchange members also conduct some business in the over-the-counter market, even under the pre-1975 law most exchange members as well, of course, as all nonmember brokers and dealers, had to be registered with the commission. In practice, under the prior law such exchange members as floor traders, specialists and odd-lot dealers were not registered with the commission. These members did not carry accounts for the public; *see* Cohen & Rabin, *Broker-Dealer Selling Practice Standards: The Importance of Administrative Adjudication in their Development*, 29 LAW & CONTEMP. PROBS. 691, 697 (1964). The requirement in the 1975 amendments that all brokers and dealers be registered with the commission is characteristic of two themes of the recent U.S. legislation: first, a decided shift in the balance of power between self-regulatory organizations and the commission toward the latter and, second, the concept that all persons enjoying similar privileges in the securities industry, performing similar functions, and having the potential for similar market impact should be treated equally; *see* SENATE COMM. ON BANKING, HOUSING AND URBAN AFFAIRS, S. REP. No. 94-75, 94th Cong., 1st Sess. 15-16, 22-23 (1975).

35 Until amendments passed in 1968 (S.O. 1968-69, c. 116), however, s. 6 of the Ontario Securities Act did distinguish between brokers and dealers. Now, categorization of traders has been left to the regulations; *see* discussion in Ch. III.B *infra*. Other provincial acts continue to distinguish between broker and dealer in the statutes themselves. In a variety of particulars, however, the Ontario act continues to observe the distinction between agency (broker) and principal (dealer) transactions. Thus, confirmations of trades must disclose whether the registrant has acted as principal or as agent, OSA, s. 67(1), and where a registrant proposes to act as a principal in a transaction, he must so state in any written solicitation; OSA, s. 70. The distinction between whether a registrant has traded as principal or as agent is important in connection with determining the limitations periods on its customers' rights of withdrawal and rescission under OSA, ss. 64(5), 65(6).

36 *See* J. WILLIAMSON, SUPP. at 117-18. What constitutes "the business of effecting

The Exchange Act in the United States appears to pose the question "Is the person proposing to trade in the business of trading securities?", whereas the approach of the Canadian statutes, when the terms of coverage are read together with the exemptions, is to pose the question "Does the person proposing to trade need the intermediation of a person whose business it is to trade securities?".

Under the Canadian statutes the exemptions from the requirement that a person trading securities be registered or licensed are defined in terms of one or a combination of three variables: the identity of the person trading, the identity of the person to whom the trade is made, and the nature of the security being traded.

1. *Persons Who May Trade without Registration*

The exemptions in Ontario that relate primarily to the identity of the person trading are as follows:

(1) a trade by an executor, administrator, guardian, committee, trustee or assignee or by a receiver or custodian under the Bankruptcy Act or by a receiver under the Judicature Act or by a liquidator under the Corporations Act, the Business Corporations Act or the Winding-up Act;[37]
(2) an isolated trade in a specific security by or on behalf of the owner and not made by a person or company whose usual business is trading in securities;[38]
(3) a trade where one of the parties is a chartered bank, a loan corporation, a trust company, an insurance company or a government agency;[39]
(4) a trade of a pledged security to liquidate a *bona fide* debt;[40]
(5) an occasional trade in a security by employees of a registrant who do not ordinarily sell securities to the public and who have therefore been designated as "non-trading" employees by the OSC director;[41]

---

transactions in securities" under the Exchange Act is discussed in Rice, *The Expanding Requirement for Registration as a "Broker-Dealer" Under the Securities Exchange Act of 1934*, 50 NOTRE DAME LAW. 201 (1974); Kirshberg & Schild, *What is a Broker?*, 6 REV. SEC. REG. 844 (1973).

37 OSA, s. 19(1)1.

38 OSA, s. 19(1)(2). *See* R. v. McKillop, [1972] 1 O.R. 164 (Prov. Ct.).

39 OSA, s. 19(1)3.

40 OSA, s. 19(1)4.

41 OSA, s. 19(1)5.

(6) a trade to an underwriter acting as purchaser, and trades between underwriters;[42]

(7) a trade in a security by a person or company acting through a registrant.[43]

It appears that all of the second, fourth, fifth and seventh exemptions listed above could be dispensed with in a statute which defined the activity subject to licensing as the *business of* trading in securities.[44] With respect to the first exemption, certain of the professional executors and trustees (*e.g.*, trust companies) and certain frequently appointed receivers (*e.g.*, trust companies and firms of chartered accountants) might well trade securities in these capacities with sufficient regularity such as to be considered to be "in the business of" trading securities. Similarly, the sixth category of exempt persons, underwriters, most certainly are "in the business of" securities trading, although the exemption is necessary only for those very few underwriters who do not also hold registration in one or more trading capacities.

Probably the most important and certainly the most controversial of the exemptions relating to the identity of the trader is the third, insofar as it exempts trades where one of the parties is a chartered bank, a loan or trust company or an insurance company.[45] At first blush, the exemption might appear necessary to enable the financial institutions to deal directly with their customers in the ordinary course of business, without need either to be registered themselves under the Securities Act or to deal through registered intermediaries, since the investment devices initiated by these institutions would appear to be, at least in some cases,

42 OSA, s. 19(1)6.

43 OSA, s. 19(1)7.

44 Under the U.S. Exchange Act, however, where there is no exemption similar to the s. 19(1)7 exemption in Ontario, difficult questions may arise as to whether certain persons who deal with registered broker-dealers on behalf of others are themselves brokers or dealers, *e.g.* corporate treasurers who purchase stock in the market for company employees pursuant to a stock purchase plan, trustees who have basic responsibility for managing the portfolios of trust estates to which they have title as trustees, and investment advisers who act as intermediaries for their customers in placing orders with the customers' brokers and dealers; *see* E. Weiss, Registration and Regulation of Brokers and Dealers 6-7 (1965).

45 OSA, s. 19(1)3 provides that "registration is not required in respect of a trade where one of the parties is a bank to which the Bank Act applies, or the Industrial Development Bank incorporated under the Industrial Development Bank Act (Canada), or a loan corporation or trust company registered under the Loan and Trust Corporations Act, or an insurance company licensed under The Insurance Act, or is an officer or employee, in the performance of his duties as such, of Her Majesty in right of Canada, or of any province or territory of Canada, or of any municipal corporation or public board or commission in Canada, or any other trade where the purchaser or proposed purchaser is a person, other than an individual, or a company recognized by the commission as an exempt purchaser".

securities under the legislation.[46] Debt instruments of or guaranteed by a chartered bank, trust company, loan corporation or insurance company are, however, exempt securities under OSA section 19(2)1 and therefore registration is not required to trade in such instruments.[47]

Whatever might be the need to exempt financial institutions from the registration provisions in order to leave them unimpeded in offering investment opportunities originated by them to their customers, that is not what makes the exemption controversial or, more accurately phrased, unpopular with the investment industry.[48] The sticking point is that the term "party" to a trade in section 19(1)3 includes not only buyer and seller but also *agent.* The fear of the brokerage industry in Ontario and of the Toronto Stock Exchange (TSE) is that the broad terms of the exemption would enable the exempted institutions, more particularly the banks,

46 *E.g.* a guaranteed investment certificate issued by a trust company or a similar type of term instrument issued by a chartered bank would appear to be a "document constituting evidence of...interest in the capital, assets, property, profits or earnings" of the issuing institution (OSA, s. 1(1)22.ii), if not an "instrument ...commonly known as security" (OSA, s. 1(1)22.i). An investment certificate may also be viewed as a species of promissory note issued by a bank or trust company, as the case may be (OSA, s. 1(1)22.v). In the United States, where the definitions of the term "security" in the Securities Act of 1933 and in the Securities Exchange Act of 1934 are very similar to that in the OSA, inconsistent results have been reached on the question whether a certificate of deposit or other term savings instrument issued by a financial institution is a security. The affirmative answer has been given in SEC v. First American Bank & Trust Co., 481 F.2d 673, 678 (8th Cir. 1973) (Securities Act); Garner v. Pearson, 374 F. Supp. 591, 596 (M.D. Fla. 1974) (Exchange Act). *Contra,* Burrus, Cootes & Burrus v. MacKethan, 537 F.2d 1262 (4th Cir. 1976) (Exchange Act); Bellah v. First National Bank of Hereford, 495 F.2d 1109 (5th Cir. 1974) (Exchange Act).

47 As for insurance companies, in particular, the expression "document constituting evidence of ...interest in the capital, assets, property, profits, earnings or royalties of any person or company" (OSA, s. 1(1)22.ii) would appear to include a contract of straight life insurance, although "any income or annuity contract...issued by an insurance company" is specifically excluded from the definition of security (OSA, s. 1(1)22.xii). On the other hand, Ontario's Bill 7 provides specifically in s. 34(2)2 that registration *is* required to trade in those variable payment contracts issued by insurance companies that do not guarantee to return on the termination of the policy an amount equal to at least 3/4 of the premiums paid up to the date of termination. This provision is a codification of an understanding reached among the life insurance industry, the insurance regulatory authorities and the securities regulatory authorities after variable insurance contracts first appeared in Canada in the 1960s to the effect that a variable insurance contract that guaranteed at death or maturity a return of at least 75% of premiums paid would be deemed to contain a guarantee of sufficient substance to include it in the securities acts' exemptions for debt obligations guaranteed by an insurance company. *See generally* Memorandum of the Canadian Life Insurance Association to the Ontario Securities Commission Re Bill 75 (1974); Ontario Securities Regulations, Form No. 19.

48 The following observations are made without reference to the constitutional difficulties that might stand in the way of the provinces seeking through their securities statutes to regulate the activities of federally chartered financial institutions.

with their vastly greater financial resources as compared with brokerage firms, to enter the brokerage business, no holds barred.[49] The banks do in fact accept orders to buy and sell securities for their customers; they claim that they accept orders on an unsolicited basis only and that they always execute transactions through the medium of a registrant, with no part of the brokerage commission accruing to the bank.[50] Indeed, in the case of transactions on an exchange, the banks would have to buy or sell through a registrant since only members or their representatives may trade on an exchange[51] and no entity is eligible for exchange membership unless its principal business is that of a broker or dealer in securities.[52] Furthermore, there is not in Canada, as there is in the United States, much of a third market – that is, an over-the-counter market in exchange-listed securities.[53]

In Bill 75, an earlier version of the currently proposed OSA amendments, the trading exemption for the banks, insurance companies, and loan and trust companies was limited to trades where they purchase as principal.[54] The bankers' brief argued for the economic necessity of the banks' providing a brokerage service in the smaller communities where securities brokers do not maintain offices. The brief asserted that to require all the officers, and perhaps even tellers, in the banks' thousands of branches to register as securities salesmen under the non-exemption that would have been established by Bill 75 would have been totally impractical. Furthermore, the bankers made a not too heavily veiled threat of constitutional challenge to Bill 75, presumably on the ground that it constituted provincial interference with the powers of federally chartered and comprehensively regulated entities.[55]

In Ontario Bill 7, the exemption has been liberalized to a form which is not so broad as in the present act but which conforms to what the banks claim to be their actual practice. In addition to the exemption allowed in Bill 75, section 34(1)11 of Bill 7 exempts from the registration requirement

53 ONTARIO SECURITIES COMMISSION, REPORT OF THE SECURITIES INDUSTRY OWNERSHIP COMMITTEE 43 (1972) [hereinafter OSC OWNERSHIP REPORT]. Furthermore, the development of such a third market is effectively thwarted by rules of the exchanges that generally prohibit their members from participating in a transaction in a listed security anywhere except on the floor of an exchange whereon the security is listed. *See e.g.* TSE by-laws, ss. 11.01, 12.01, 3 CCH CAN. SEC. L. REP. ¶¶ 89-391, 89-496.

54 Ontario Bill 75, s. 35(3).

55 Canadian Bankers' Association Brief, *supra* note 50, at 3-6, 8-9, 33.

> "the execution of an unsolicited order to purchase or sell through a registered dealer by a bank to which the *Bank Act* (Canada) applies or a trust company registered under *The Loan and Trust Corporations Act* as agent for a person or company and the trade by such person or company in placing the unsolicited order with the bank or trust company."

Thus the insurance companies and loan companies are excluded from the brokerage business (if ever there was any chance of their entering it) and the banks and trust companies are limited for the future to provision of the service that the banks now claim to provide.

The issue of banks' participation in the securities business arose before the OSC in 1974 in *In re Canada Development Corporation*.[56] The Canada Development Corporation (CDC) is a government sponsored corporation established "to assist in the creation or development of business...of Canada" and "to expand, widen and develop opportunities for Canadians to participate in the economic development of Canada" by making investments in business enterprises in Canada.[57] The corporation planned in the spring of 1974 to sell its securities to Canadian citizens and, in order to obtain the widest dissemination among eligible residents of Canada, it proposed to distribute its securities through the network of offices of the Canadian chartered banks as well as through the normal channels of registered dealers. In brief, the banks were to act as part of the underwriters' selling group, a prospect likely to be a source of scant comfort to the traditional, licensed investment community. It is not clear from the commission's opinion whether and in what amount the banks were to be compensated for selling the CDC securities. After describing briefly the protections that are supposed to flow to investors from the requirement that securities dealers be licensed under the Securities Act and the role that banks usually take in selling securities (in accordance with what has been described above), the commission proceeded to place its *imprimatur* on the proposed distribution scheme. The order was styled as an exemption under section 20 of the Securities Act, but the applicability of that section is not entirely clear. Under section 20, the securities commission may, where in its opinion such action is not prejudicial to the public interest and subject to such terms and conditions as it may impose, order that section 6 does not apply to a trade, security or company, as the case may be. However, as we have seen, section 6 does not in

56 [1974] OSC Bull. 76 (April).

57 Canada Development Corporation Act, S.C. 1970-71-72, c. 49, s. 6.

any event apply to a trade where one of the parties is a bank, and if the banks' role was viewed as that of "underwriters", banks are free to act as underwriters without registration by the terms of OSA section 6(d).[58]

The commission's order was, nonetheless, remarkable in its permissive breadth. For the banks were to be permitted to act as the "underwriters' agents" in the sale of the securities without any obligation to comply with the "know-your-client" or "suitability" rules for the protection of securities purchasers,[59] notwithstanding that the securities were described with prospectus as "speculative".[60] The riskiness of CDC common stock may be contrasted, for example, to Canada Saving Bonds which also are distributed through the chartered banks. While the banks' role in the sale was to be limited to distribution of the prospectus and acceptance of orders - and in particular the banks were not to make purchase recommendations - one could well imagine that in the minds of many of the banks' customers a "blue chip" halo would surround the securities simply as a result of the banks' participation in the distribution.

The approach of the Exchange Act in the United States is specifically to exclude banks, but not loan or insurance companies, from the definitions of broker and dealer.[61] Most deposit-taking financial institutions styled "trust companies" would also be excluded from the definitions of broker and dealer by virtue of the very wide definition given to the term "bank" in the Exchange Act.[62] In the U.S. there is not the sharp distinction between banks and trust companies that exists in Canada and most banks in the U.S. perform the full range of fiduciary services reserved to trust companies in Canada. Under provisions of the Banking Act of 1933 (popularly known as the "Glass Steagall Act"), national banks and state banks that are members of the Federal Reserve System or are insured by the Federal Deposit Insurance Corporation are generally excluded from the business of brokering, dealing and underwriting securities, except that they may engage in all of these functions insofar as securities representing obligations of the federal, state and municipal governments are concerned and

58 Moreover, viewed as participants in a selling group, the banks' role would not seem to bring them within the definition of "underwriter" in s. 1(1)25 of the act since presumably their compensation, if any, would be "limited to receiving the usual and customary distributors' or sellers' commission payable by an underwriter"; OSA, s. 1(1)25.

59 These rules for the conduct of brokers and dealers are described in Ch. IV.C.2, IV.E.2 *infra.*

60 [1974] OSC Bull. 77 (April).

61 Exchange Act, ss. 3(a)(4), (5).

62 Exchange Act, s. 3(a)(6).

they may purchase and sell securities "solely upon the order and for the account of customers".[63] Notwithstanding statutory provisions that appear sharply to limit it, the participation of banks in the securities industry is as perennially contentious a topic in the U.S. as in Canada.[64]

2. *Persons to Whom Trades May Be Made without Registration*

The exemptions that are a function primarily of the identity of the party to whom the trade is made are, in Ontario, as follows:

(1) a trade by a company of securities of its own issue to holders of its securities as a stock dividend, or pursuant to the exercise of a right to purchase additional securities;[65]
(2) a trade by a company of securities, whether of its own issue or not, pursuant to a *bona fide* reorganization or winding up;[66]
(3) a trade by a company of securities of its own issue to its promoters or employees;[67]
(4) a trade to a purchaser whom the Commission has declared to be an exempt purchaser;[68]
(5) a trade to a purchaser, who takes for investment and not with a view to resale securities having an acquistion cost of at least $97,000;[69]

63 12 U.S.C. ss. 24, 378 (1970), *See* Investment Company Institute v. Camp, 401 U.S. 617 (1972) (a national bank may not offer its customers opportunity to invest in a stock fund created and operated by the bank).

64 *See* REPORT OF THE SENATE-HOUSE CONFERENCE COMMITTEE ON BILL S. 249, H. REP. No. 94-229, 94th Cong., 1st Sess. 110-11 (1975); *Banks and Brokers: Wall Street's Competitive Mismatch*, 285 BNA SEC. REG. & L. REP., January 15, 1975, at 1; Lybecker, *Bank-Sponsored Investment Management Services: A Legal History and Statutory Interpretative Analysis*, 5 SEC. REG. L.J. 110, 195 (1976) (for pts. I and II respectively).

65 OSA, ss. 19(1)8.i, iii. Issuance of a stock dividend would not appear to be a trade at all since no consideration is received by the issuer. In the case of a rights exercise, presumably the antecedent transaction in which the right is issued is exempt also, a point made explicit in Ontario Bill 7, s. 34(1)14. *See* Dey, *Exemptions under the Securities Act of Ontario*, in LAW SOCIETY OF UPPER CANADA, SPECIAL LECTURES: CORPORATE AND SECURITIES LAW 127, 156 (1972). For the rights exemption to operate, there must be advance notice given to the commission of the intention to distribute securities in this way. The commission may object; OSA, s. 19(1)8.iii.

66 OSA, s. 19(1)8.ii. No commission or other remuneration may be paid "to others" in connection with the transaction, "except for ministerial or professional services or for services performed by a person or company registered for trading".

67 OSA, ss. 19(1)9c and 10. The employee must not be induced to purchase "by expectation of employment or continued employment"; OSA, s. 19(1)10.

68 OSA, s. 19(1)3. Such purchaser cannot be an individual.

69 OSA, s. 19(3). The purchaser cannot be an individual - a restriction that would be removed in Ontario Bill 7, s. 34(1)5. This is the so-called "private placement" exemption; Ontario Bill 7, s. 34(1)21 would introduce an additional, much expanded private placement exemption that could involve up to 25 purchasers with no required minimum value.

(6) trades in the context of various types of corporate acquisitions and amalgamations, specifically:
(a) a trade in a security of a company made by that company to another company or the latter's shareholders in connection with any form of statutory amalgamation or merger procedure or a takeover bid;[70]
(b) a trade in a security of a company in connection with an offer to purchase shares by way of private agreement with fewer than fifteen shareholders, or an offer to purchase all of the shares in a private company;[71]
(c) a trade in a security of a company in consideration for assets of a fair market value of at least $100,000 where the person or company taking the securities agrees to hold them for investment only and not with a view to resale.[72]

There is a catch-all exemption for "trades in respect of which the regulations provide that registration is not required", [73] but to date no such regulations have been promulgated in Ontario.

Presumably the requirement that securities transactions be conducted through licensed intermediaries evidences beliefs that licensees will possess the qualities of honesty, competence and financial responsibility in high degree and that these qualities in an intermediary are essential protections for the purchasers (and sellers) of securities. If that is the rationale, then the drafting of various of the exemptions from licensure includes many irrelevant elements. These exemptions appear to be based either upon the degree of sophistication of the purchaser or else upon his familiarity with the issuer or at least with the party trading the security to him. These transactions are almost face-to-face, and that may indicate a lack of need for a licensed intermediary. Of what relevance to determining the existence of such a need (as opposed to the need for prospectus disclosure), however, is the intention of the recipient with respect to holding or selling the securities he receives,[74] the expectations or motivations of an employee in purchasing securities issued by his employer,[75] or whether promotional expenses have been paid in connection with a trade?[76] The interjection of irrelevant criteria for determining when trades

70 OSA, s. 19(1)9. A takeover bid often will involve a registrant as representative of the offeror.

71 OSA, s. 1.19(1)9a.

72 OSA, s. 19(1)9b. The person or company acquiring the securities under s. 19(1)9b may not be an individual, a limitation that has been removed in the corresponding registration exemption provision of Ontario Bill 7, s. 34(1)18.

73 OSA, s. 19(1)11.

74 OSA, s. 19(1)9b.

75 OSA, s. 19(1)10.

76 OSA, ss. 19(1)8.i and ii.

may be effectuated without the intervention of a licensee may result from the fact that exemptive categories are forced to do an inappropriate double duty. They determine the question of licensing and, via incorporation into OSA section 58, the very different question of the need for prospectus disclosure. Any new legislation should keep the different questions distinct.[77]

If new legislation were to adopt the approach of licensing those whose *business* is the trading of securities, then the need for the above exemptions would probably disappear because trading securities would not be the *business* of the companies effectuating the trades in question.[78] Companies trading securities either as stock dividends or in connection with a corporate acquisition or to their employees or promoters are likely to be industrial companies – not brokerage firms.

3. *Securities That May Be Traded without Registration*

In addition to the various exemptions that relate primarily to the identity of the trader or of the purchaser, there are a number of licensing exemptions in the Canadian legislation that relate primarily to the character of the security being traded. In the order of the various subclauses of OSA section 19(2) in which they are contained, these exemptions are:

(1) debt instruments of or guaranteed by:(a) a municipality, a province or the government of Canada or the government of any foreign country or political division thereof; (b) a federally chartered bank, a trust company or loan corporation, or an insurance company; (c) the International Bank for Reconstruction and Development;
(2) guaranteed investment certificates issued by a trust company;[79]
(3) commercial paper of less than one year maturity so long as, where traded to an individual, it has a face amount of at least $50,000;[80]
(4) mortgages not offered for public sale except by a person or

77 In Ontario Bill 7, the incorporation by reference has been eliminated and in the case of the stock traded in consideration of assets of $100,000 or over value (s. 19(1)9b of the present act) the requirement of investment intent has been removed from the registration exemption.

78 Unless they happen to be brokerage firms or mutual fund management companies.

79 This exemption appears redundant in the light of (1) above.

80 The requirement of a minimum dollar value in the case of sales to individuals was added in 1963 (S.O. 1962-63, c. 131) as a response to the activities of a number of sales finance companies that sold short term securities to the public promising high rates of interest but with little or no disclosure about the financial affairs of the compa-

company registered under The Real Estate and Business Brokers Act;[81]

(5) securities collateralizing indebtedness due under a conditional sales contract where the securities are not offered for sale to the public;

(6) securities issued by a person or corporation not organized for profit where no part of the net earnings of such person or corporation enure to the benefit of any securityholder;

(7) securities issued by cooperative corporations;

(8) credit union shares;

(9) securities of a private company;

(10), (11), (12) securities issued by a prospector or a prospecting syndicate under certain conditions relating to disclosure and to the number of persons to whom the securities are sold;

(12a) securities issued by a mining company to a vendor of mining claims where the shares are subject to an escrow agreement.

There is a catch-all exemption for "securities in respect of which the regulations provide that registration is not required".[82] A regulation has been made for the conversion of convertible securities of an issuer that is subject to continuous disclosure obligations.[83]

Under the Exchange Act in the United States, there is similarly an exempted class of securities, so that to the extent that a person in the business of trading securities trades only the exempt class, he need not be licensed to do so. The exempt group however is much smaller than under the Canadian statutes. It includes debt obligations of or guaranteed by the United States or any corporation in which the United States has a direct or indirect interest.[84] By virtue of the fact that the definitions of "broker" and "dealer" exclude banks, there is effectively in the Exchange Act an exemption for any bank-issued security not traded in a secondary market. Also exempt are certain "industrial development bonds", and interests in common trust funds maintained by banks as trustees or maintained by banks or insurance companies in connection with a stock bonus, pension, profit-sharing or annuity plan that qualifies for favourable treatment under the Internal

---

nies themselves. The most notorious was Prudential Finance Corporation Ltd.; *see* Bray, *supra* note 32; D. JOHNSTON at 457-62.

81 It is generally thought that registrants under the Mortgage Brokers Registration Act, R.S.O. 1970, c. 278, were meant to be included also, as they have been in Ontario Bill 7, s. 34(2)6; *see* Dey, *supra* note 65; *In re* Western Ontario Credit Corp. Ltd., [1974] OSC Bull. 87 (May).

82 OSA, s. 19(2)13.

83 Ontario Securities Regulations, s. 87.

84 Exchange Act, s. 3(a)(12).

Revenue Code.[85] Commercial paper with a maturity when issued of nine months or less is excluded altogether from the definition "security" in the Exchange Act.[86]

Until recently, municipal securities, that is, debt obligations of state and local governments, were exempted securities under section 3(a)(12) of the Exchange Act. Therefore, the business of trading municipal securities did not attract registration requirements as a broker or dealer, although the securities themselves were subject to the antifraud provisions of the Exchange Act. In the 1975 amendments,[87] municipal securities were deleted from the exempt class, although they continue to be exempt from the prospectus requirement of the Securities Act.[88] Municipal debt financing accounts for a very large part of the total of new securities issues in the United States each year.[89] In considering amendments to the securities laws in the early 1970s, Congress concluded that there had been a sufficient record of abuses in the trading markets for municipal securities to warrant federal regulation of the municipal securities business.[90] Such regulation, how-

85 *Id.*

86 Exchange Act, s. 3(a)(10). The statutory language exempts "any note...which has a maturity at the time of issuance of not exceeding nine months". The exclusion has been interpreted with a restrictiveness that its language, taken alone, would not imply. The SEC has said that the exclusion "applies only to prime quality negotiable paper of a type not ordinarily purchased by the general public, that is, paper used to facilitate well recognized types of current operational business requirements and of a type eligible for discounting by Federal Reserve banks"; SEC, Securities Act of 1933 Release No. 4412, September 20, 1961, 26 Fed. Reg. 9158 (1961). Courts, in turn, have construed the exclusion as referring to "commercial paper" and not "investment paper" - a rather tortured distinction that attempts *post facto* to place promissory notes issued by individuals or corporations in precarious financial condition outside of the exclusion and thus under the jurisdiction of the Exchange Act and thus to give purchasers of such paper access to the considerable remedies available under that act. *See* Zeller v. Bogue Electric Manufacturing Corp., 476 F.2d 795 (2nd Cir.) *cert. denied*, 414 U.S. 908 (1973); Sanders v. John Nuveen & Co., Inc., 463 F.2d 1075 (7th Cir. 1972), *cert. denied*, 409 U.S. 1009 (1972); Bellah v. First National Bank of Hereford, 495 F.2d 1109 (5th Cir. 1976). *Contrast* the approach taken in Ontario; *see* note 80 and accompanying text *supra*. Section 3(a)(12) of the Exchange Act grants to the SEC, as do the Canadian acts to the provincial securities commissions, a regulatory authority to create new classes of exempt security. This authority has been used to permit trading without a licence in certain mortgages, 17 C.F.R. s. 240.3a12-1 (1977), and in certain obligations of issuers whose businesses are managed by a state or a political subdivision thereof; 17 C.F.R. s. 240.3a12-2 (1977).

87 Securities Reform Act of 1975, s. 3(3) *amending* Exchange Act s. 3(a)(12).

88 Securities Act of 1933, s. 3(a)(2).

89 For example, in 1974 approximately $86 face amount of long term municipal securities were issued per $100 of new corporate debt and equity; Senate Committee on Banking, Housing and Urban Affairs, *supra* note 34, at 39. Very likely the amount of new municipal financings has fallen off, however, in the wake of the New York City crisis.

90 Senate Committee on Banking, Housing and Urban Affairs, *supra* note 34, at 43 states:

ever, is a delicate business for at least two reasons: first, the political sensitivity of federal regulation of the manner in which the states and localities raise money, and, second, the predominance of commercial banks as investors in and underwriters of municipal securities and the disinclination of the bank regulatory agencies to see the SEC in their domains.[91]

Under the 1975 amendments, all brokers and dealers in municipal securities are to be registered with the SEC.[92] The Act establishes a Municipal Securities Rulemaking Board, which subject to commission oversight, is to establish rules for trading in municipal securities including rules relating to, *inter alia,* standards of competence, just and equitable principles of trade and financial responsibility.[93] The commission has plenary enforcement power over all municipal securities brokers and dealers.[94] For those that are banks or departments of banks, the appropriate bank regulatory agency also has enforcement powers[95] and the statute appears to contemplate that the enforcement initiative with respect to banks will be taken by those agencies.[96]

The list in the provincial securities acts of securities tradeable without registration is decidedly a random smorgasbord. It is hard to discern among all the exempt securities a common characteristic that decisively negatives the need to control trading in them through licensure. Probably the most generally shared characteristic is the absence of a secondary market for the exempt securities. This would eliminate some of the concerns that prompt licensing, for example, the possibility of market manipulation. In the absence of a secondary market, there is nothing much to manipulate. Also, securities for which there is little secondary market are not likely to be traded on margin or to be left with a securities dealer as collateral. That substantially reduces the potential problems of misappropriation by dealers and of the exposed position of

---

"Fraud actions against municipal securities professionals during the last four years reveal that unwary investors are often exposed to sharp and illegal practices.... Perusal of the [Securities and Exchange] Commission's complaints in these actions...reveals a disturbing pattern of professional misconduct by a significant number of broker-dealers. This pattern is characterized by unconscionable mark-ups, churning of customers' accounts, misrepresentations concerning the nature and value of municipal securities, disregard of suitability standards, and scandalous high-pressure sales techniques."

91 *Id.* at 44, 46.
92 Exchange Act, s. 15B(a)(1).
93 Exchange Act, s. 15B(b).
94 Exchange Act, ss. 15B(c)(2), (4), (6)(A).
95 Exchange Act, s. 15B(c)(5).
96 Exchange Act, ss. 15B(c)(5), (6).

customers' securities in the event of a dealer's financial failure. On the other hand, in the absence of a secondary market for securities, one would think that the question of their suitability for different types of investors would become more acute. Also, to the extent that there does exist a secondary market for the exempt securities, say for certain debt issues of the governments of Canada and the provinces, one could hardly be confident that if people were free to hawk such securities on street corners they would always be offered at a fair price.

Some of the exemptions are drafted specifically so as to be available only where the purchasers will be knowledgeable about the issuer or sophisticated generally. These are the exemptions for commercial paper, collateral for conditional sales contracts, securities of private companies and certain securities of mining and prospecting companies. Effectively, these exemptions are conditional upon the identity of the purchaser. Since these exemptions do not adhere to the securities irrespective of the circumstances of the trade, the writer does not have serious reservations about their appropriateness on grounds of policy.

Other exemptions do attach to the security once and for all, and the wisdom of some of these is doubtful. Trading in some types of securities is exempt from licensing apparently on the basis of the safety of the investment and the presence of alternate systems of regulation. These include the exemptions for government issues, mortgages, guaranteed investment certificates issued by trust companies and the shares of cooperatives and credit unions. The propriety of the exemption for trust company certificates is beyond cavil, based both on the safety of the certificates themselves, which in most cases are backed by the guarantee of the federal government, and on the fact that they are offered for sale exclusively by the trust companies themselves which are highly regulated entities.

Certain reservations concerning the exemption enjoyed by government issues have been expressed above. As we shade off from securities of the federal government to those of the provinces, the question of safety perhaps requires more examination, but for constitutional reasons, if for no others, the provincial exemption will have to be maintained, especially in a federal statute. The wisdom of the present exemption insofar as it applies to the securities of or guaranteed by foreign governments and political divisions thereof is problematical indeed. This is a point that need not be laboured by extensive annotation of the financial problems of New York City. It should suffice to point out, for example, that at the present moment American municipal securi-

ties may be sold in Canada with a freedom from regulatory constraint that they do not enjoy in the United States.[97]

With respect to mortgages and to the securities issued by cooperatives and credit unions one can do little more than counsel caution in the absence of empirical study of the safety of such investments and the adequacy from an investor protection point of view of the legislation governing issuers of them. On mortgages, however, it can be noted that while securities legislation defers to the control of brokers effectuated under the Real Estate and Business Brokers Act,[98] that act, insofar as investor protection is concerned, is not *in pari materia* with the Securities Act.

Finally, there is the trading exemption enjoyed by not-for-profit corporations "where no part of the net earnings of such person or company enure to the benefit of any securityholder ". Here again, the writer would counsel caution in writing trading exemptions into the statute. Even on the assumption that a prospectus exemption for a particular class of security may be warranted, or perhaps especially in that case, licensing of traders may have an important role to play in investor protection. It may be more desirable to handle some kinds of exemptions on a case-by-case basis through the dispensing power of a securities commission rather than by the generality of the statute itself.

B. UNDERWRITING

Under the Canadian provincial securities statutes, underwriting is a separate activity, apart from trading, that is subject to a licensing requirement.[99] In the United States, by way of contrast, although the concept of underwriting is key in the scheme of securities regulation, it is not a licensing category.[100] An underwriter is defined by OSA section 1(1)25 to be:

97 *See* text accompanying notes 87-96 *supra*.

98 R.S.O. 1970, c. 401.

99 OSA, s. 6(1) (d).

100 Obviously, however, a person who is in the business of underwriting in the United States, since he of necessity is in the business of trading securities as principal ("firm commitment" underwriting) or as agent ("best efforts" underwriting) must have the appropriate registration as a broker or dealer - usually both.

The concept "underwriter" is important chiefly as a trigger for the registration of securities and prospectus requirements of the Securities Act, s. 5 which provides that it is unlawful to sell or to attempt to sell a security by the jurisdictional means unless a registration statement is in effect as to that security. A prospectus must be filed as part of the registration statement; Securities Act, s. 10(b). Section 4 of the act exempts from the registration and prospectus requirements all transactions except those involving a public offer by an issuer, an underwriter or a dealer. Thus where securities are being sold without a registration statement, it may become critical to determine whether an underwriter is involved. Generally, an

"a person or company who, as principal, purchases securities from a person or company with a view to, or who as agent for a person or company offers for sale or sells securities in connection with, a distribution to the public of such securities, and includes a person or company who has a direct or indirect participation in any such distribution, but does not include a person or company whose interest in the transaction is limited to receiving the usual and customary distributors' or sellers' commission payable by an underwriter."[101]

Thus, underwriting as defined is a particular form of trading: trading is a primary distribution. The only provision of the Ontario regulations bearing on the status of underwriter provides that "every person or company granted registration as a broker-dealer, investment dealer or securities dealer shall be deemed to have been granted registration as an underwriter".[102] While at first blush it is difficult to conceptualize the status of underwriter without a concomitant ability to deal in securities either as principal or agent, there are in Ontario a few registrants as underwriter only. Such registrants obviously cannot deal with the public. Their activities apparently consist in taking down securities from an issuer and then attempting to interest a registered dealer in distributing the securities.

Underwriter is not a controlled occupation in the sense that trading is. For example, there are no behavioural or educational prerequisites for underwriter registration apart from those that apply to the activity of trading in securities.

Any underwriter in a contractual relationship with an issuer

---

underwriter is any person or company who takes securities from an issuer with a view to distributing them; Securities Act, s. 2(11).

101 This definition is in substance identical to the definition of underwriter in s. 2(11) of the U.S. Securities Act and in s. 2(a)(20) of the Investment Advisers Act of 1940 [hereinafter Advisers Act]. The last clause of the Canadian definition, "but does not include...", is a good example of the sometimes indiscriminate and inappropriate copying of American regulatory statutes into Canadian statute books. Underwriters in Canada are not compensated on a commission basis. In Canada, the underwriter sells to the banking group, which sells to the selling group, which sells to the public. The underwriter pays no one but the issuer, and the compensation at each level is in the form of a discount between the buying and the selling price.

102 Ontario Securities Regulations, s. 2(3). This means that a person or company whose sole registration is as a broker, under Ontario Securities Regulations, s. 2(1)1, which in turn is defined as a member of a recognized stock exchange registered exclusively to trade in securities in the capacity of agent, may not act as an underwriter - even on a "best efforts" (agency) basis. There is a similar regulation in Québec providing that registration as an investment dealer or as a securities dealer includes registration as an underwriter; *see* Quebec Securities Commission, Policy Statement No. 21, October 1, 1973, art. 2.2, 3 CCH CAN. SEC. L. REP. ¶66-032 ("conditions of Registration of Brokers").

whose securities are being offered by a prospectus must sign a certificate in the prospectus stating that to the best of the underwriter's knowledge, the prospectus constitutes full, true and plain disclosure of all material facts relating to the securities being offered.[103] However, underwriters are not presently within the ambit of statutory civil liability for damages for a material false statement in a prospectus.[104] Exposure of the underwriter to civil liability in such a case is expressly provided for in Ontario Bill 7, section 126.

The definition of underwriter in OSA section 1(1)25 specifically excludes banks. The major underwriting activity of the chartered banks is in the area of government debt issues, but apparently the banks do some corporate underwriting as well.[105] In Bill 7, section 1(1)43iv, banks have been exempted from the definition of underwriter only with respect to their activities in connection with the debt issues of or guaranteed by governments, banks themselves, trust companies, loan companies and insurance companies – in other words, that class of securities for which a *trading* exemption is recognized in the present act.[106]

C. ADVISING

A securities adviser is a person engaged in "the business of advising others as to the advisability of investing in or buying or

103 OSA, s. 53(1).

104 OSA, s. 142. It is possible that there could be liability for fraud at common law, however, where an underwriter makes a false certificate in a prospectus which certificate is relied upon by a purchaser of the securities. *Compare* Hedley, Byrne & Co. Ltd. v. Heller & Partners Ltd., [1964] A.C. 465 (H.L.) *with* Toromont Industrial Holdings Ltd. v. Thorne, Gunn, Helliwell & Christenson 10 O.R. (2d) 65, 86-95 (H.C. 1975), *reversed on other grounds,* 14 O.R. (2d) 87 (C.A., 1976).

105 Canadian Bankers' Association, *supra* note 50, at 10 fudges this point a bit. It states:

> "The participation of the banks in the area of underwriting has been largely centered on provincial and municipal issues. While the banks have acted as underwriters in the area of corporate securities to a lesser extent, this is also a significant activity, particularly in the case of issues of bank affiliated companies and funds which have been sponsored by banks."

The funds referred to presumably are bank-sponsored mutual funds and real estate investment trusts. The identity of the affiliated companies is not made very specific. At p. 14 of the brief there appears the following:

> "Through the establishment of affiliated companies, the banks have been instrumental in the provision of substantial funds to the mortgage market and increased liquidity of mortgages. The banks have also developed, and continue to develop through affiliated companies, the provision of funds for other related banking functions such as the leasing industry in Canada." *Id.* at 14.

106 OSA, s. 19(2)1. In Ontario Bill 75 the underwriting exemption for banks was eliminated completely.

selling securities".[107] It is unlawful for a person or company to act as a securities adviser unless registered with the commission as such.[108] There are, however, many exemptions from the licensing requirement for advisers. Chartered banks, loan corporations, trust companies and insurance companies are exempt.[109] So are lawyers, accountants, engineers and teachers whose performance of advisory services is solely incidental to the practice of their professions.[110] Also exempt are the publishers of (and presumably, although the statute doesn't say so, financial writers in) *bona fide* news magazines or business or financial publications of general and regular paid circulation who give advice only through such publications, have no interest in the securities advised upon and receive no commission or consideration for giving the advice, and who give the advice solely as incidental to the conduct of the publishing business.[111]

In practice, probably the most important single exemption is that available to "a person or company registered for trading in securities..., or any partner, officer or employee thereof, whose performance of [advisory] services is solely incidental to" the trading business.[112] The meaning of "solely incidental" in this context is not entirely clear. Until 1966, the licensed traders' exemption specified, in addition to the advisory services being solely incidental, that no special compensation be paid to the registrant therefor.[113] The absence of special compensation for the advisory services continues to be the test of "solely incidental" in the broker-dealers' exemption from the registration requirement of the U.S. Investment Advisers Act of 1940.[114]

107 OSA, s. 1(1)1. The definition in s. 2(11) of the U.S. Advisers Act is practically the same. Investment adviser means "any person who, for compensation, engages in the business of advising others, either directly or through publications or writings, as to the value of securities or as to the advisability of investing in, purchasing, or selling securities, or who, for compensation and as part of a regular business, issues or promulgates analyses or reports concerning securities ...".

108 OSA, s. 6(1)(e).

109 OSA, s. 18(a).

110 OSA, s. 18(b). D. Johnston at 120 n. 158 notes an anomaly in the exemption for lawyers in that "the compensation fund maintained by the profession's governing body and the compulsory insurance program in which its members are enrolled will not compensate a client for moneys he has lost by following his lawyer's advice on securities investments, whether or not the advice was given as solely incidental to the practice".

111 OSA, s. 18(d).

112 OSA, s. 18 (c). The commission may designate by regulations other exempt persons and companies.

113 *See* R.S.O. 1960, c. 363, s. 18 (c); *replaced by* S.O. 1966, c. 142, s. 18 (c).

114 In the Advisers Act, s. 202 (a) (11), exemptions generally similar to those in Ontario are provided by way of exclusion from the definition of adviser. With the introduction of fully negotiated commission rates in the U.S., however, there has been a sharp trend toward the unbundling of commission rates. That is, the charges for various services performed by broker-dealers have been separated and levied in

Until recently in Ontario the practice was that persons and companies holding registration in a trading category, no matter how substantial an advisory business they engaged in and irrespective of whether they charged separately for such services, almost never held separate registration as advisers,[115] and in fact they were prohibited by the commission from holding separate adviser registration.[116] Thus, the "solely incidental" proviso was read out of the exemption for trading registrants. In fact, there are only a handful of registrants in either of the traditional adviser categories: "investment counsel", a registrant primarily engaged in giving continuous investment advice on the basis of the individual needs of each client, and "securities adviser", a registrant giving non-differentiated advice on the merits of investing in or purchasing or selling specific securities.[117] In 1976 the OSC introduced a new category of adviser registration: "portfolio manager".[118] A portfolio manager is a registrant with the qualifications of an investment counsel who manages the investment portfolios of clients through discretionary authority granted by the clients. As an investment adviser with discretionary management authority, the portfolio manager is functionally as much a trader as an adviser;[119] in fact the number of registered portfolios managers dwarfs the other two adviser categories and many portfolio managers are affiliates of investment dealers.[120]

To the extent that an adviser in fact exercises management authority over clients' funds, the adviser is obviously a fiduciary in the most traditional, duty-laden sense of the word. This is true whether we call the adviser an investment counsel, or a portfolio adviser or a management company. As professional fiduciaries it is not difficult to see why managing advisers may appropriately be subjected to licensing control. To the extent that persons or companies licensed to trade securities also give investment advice, the multifarious conflicts of interest to which they may be subject

their constituent parts. Therefore, many broker-dealers who under fixed rates did not receive separate compensation for advisory services now do so and therefore they must be separately registered under the Advisers Act.

115 In 1972, approximately half of Ontario's registered investment dealers also carried on advisory functions for which they charged a separate fee; OSC OWNERSHIP REPORT, *supra* note 53, at 65, 169.

116 *In re* C.J. Hodgson & Co. Ltd., [1969] OSC Bull. 190 (December).

119 It was for precisely this reason that the separate registration category was introduced; *see In re* Fiscal Consultants Ltd., [1974] OSC Bull. 139 (June).

120 In the regulation governing portfolio managers, there is no prohibition against a portfolio manager executing transactions for managed accounts through an affiliated trading registrant; Ontario Securities Regulations, s. 6(20b).

probably also warrant control of the advising function, although obviously there is plenary authority to control the advising function of such persons and companies through their registration to trade.

What is not so clear to this writer is that the advising function taken alone, stripped of power to trade and of discretionary management, should be subject to licensing. Concededly, the merits of advice on securities are difficult to measure, as many securities analysts and mutual fund shareholders have discovered to their chagrin. That fact, standing alone, however, does not warrant the social and private costs of licensing - especially with the value of free speech standing in the background. Nothing could be more hazardous than predictions as to the state of the economy or of the weather, but so far neither economists nor meteorologists have to be licensed to ply their predictions. One does fear, of course, the scalping problem: that unregulated advisers would tailor their advice to what would aid their own, personal securities portfolios. We apparently are not overly worried by this problem at present, however, in the case of unlicensed advisers, such as the financial columnists in newspapers.[121] Moreover, there may be a relatively easy way around it: keep the "pure" adviser unlicensed but keep him "pure" by a rule to the effect that any person or company that regularly issues investment advice to others and that also holds securities for his, her or its own account, is, by definition, in the business of trading securities and therefore must be licensed as such.

The point is that the function of advising alone, shorn of the conflict of interests problems presented when it is coupled with trading or managing, is not an activity that should be regulated. Phrased differently, it may be reasonable through licensing to legislate against advice that is not *bona fide*, but not against advice that is simply incompetent. After all, at the end of several decades of regulating the advising function, we are left with a substantial body of literature which suggests that the entire search for undervalued securities is by definition incompetent.[122]

D. SHOULD WE HAVE FEDERAL LICENSING?

Perhaps the greatest weakness in the provincial system of licensing is the fact that a firm must be separately licensed to trade in each province in which it physically carries on busi-

121 *But see, Financial Columnist Agrees to Injunction Against "Further" Securities Violations,* The Wall Street Journal, October 24, 1974, at 10.

122 This literature is summarized in Pozen, *Money Managers and Securities Research,* 51 N.Y.U.L. Rev. 923 (1976).

ness,[123] and in each province where its customers reside.[124] Thus, interprovincial trading requires a licence from each province concerned, and, as a practical matter, the conduct of a substantial securities business in Canada may require a licence from each, or at least most, of the ten provinces. At the same time, the provincial securities acts typically reserve the right not to license non-residents. For example, OSA, section 14(1), provides that

> "[t]he Director may refuse registration to a person...if he is not a resident of Ontario at the date of such application unless at the time of such application such person is registered in a capacity corresponding to that of a dealer, adviser, underwriter, or salesman under the securities laws of the jurisdiction in which he last resided and has been so registered for a period of not less than one year...."

Similarly, with regard to registration of firms, section 14(2) provides that

> "[t]he Director may refuse registration to a company or partnership if every officer and director or every partner...is not a resident of Ontario at the date of such application unless at the time of such application he is registered in a capacity corresponding to that of a dealer, adviser, underwriter or salesman under the securities laws of the jurisdiction in which he last resided and has been so registered for a period of not less than one year."[125]

The use of the past tense, "last resided", seems to contemplate that the director may insist that the individual registrant or each

123 In Gregory and Co. Inc. v. Quebec Securities Commission, [1961] S.C.R. 584, it was held that a broker who maintained his office, books, records and bank account in the Province of Québec and from there by mail and by telephone initiated transactions exclusively with nonresidents of the province was subject to the jurisdiction of the Quebec Securities Commission. At that time (and presently) QSA, s. 50 provided that a sale made in any part of the province to a purchaser having its residence outside the province would be deemed to be a sale within the province, but no explicit reference was made in the opinion of the court to this provision, and it seems likely that even provinces which do not have similar statutory provisions would seek to assert jurisdiction over brokers in analogous situations.

124 In R. v. McKenzie Securities Ltd., 55 W.W.R. (N.S.) 157, 56 D.L.R. (2d) 56 (Man. C.A. 1966), it was held that an Ontario-registered broker who by mail and telephone from Ontario made a sale of securities to a resident of Manitoba was obligated to be licensed in Manitoba. *See also* R. v. Jaasma, [1974] 1 W.W.R. 245 (Alta. Prov'l Ct.).

125 *See also* Saskatchewan Securities Act, s. 15(1), which provides that "registration may, in the absolute discretion of the commission, be refused to any individual who has not been a resident of Saskatchewan for at least one year, with the intention of making his permanent home in Saskatchewan ... unless ... the individual is registered ... under the securities laws of the jurisdiction in which he last resided ...".

officer or director of a corporate registrant or each partner of a partnership registrant, as a condition of individual or firm registration, must take up residence in Ontario. That the Ontario Director has not so insisted, at least in the case of officers, directors, and partners of registered firms, may be inferred from OSA Policy 3-08, which provides that where a dealer is registered in more than one province, an officer of such dealer who does not reside in Ontario may be considered for registration in Ontario where special circumstances warrant.

In actual practice a non-resident will not be registered as a salesman in Ontario, except that Ontario and Québec will license reciprocally salesmen living in the communities contiguous to their mutual border, such as Hull and Ottawa. While a salesman may not solicit customers in a province where he is not registered, there is no law prohibiting an individual from having an account with a non-resident (and therefore non-registered) dealer. The provincial securities commissions may have little choice therefore other than to look the other way where non-resident dealers are doing business with the particular province's residents – so long as the dealer does not solicit the business.

Firms with extraprovincial head offices may usually obtain registration in a given province by opening a branch office there, but they must maintain physically within the particular province complete records of each transaction "from or within that province".[126] Presumably the purpose of the requirement is to make effective provisions such as OSA section 21(6) which provides that a person appointed to make an investigation may seize any documents or records of the person or company being investigated.

As J. Williamson suggests,[127] the prospect that a province may shut off interprovincial trade across its borders by insisting that registration is needed to sell securities even by mail or telephone into the province and then refusing to register non-residents is a disquieting one, and a federal licensing scheme for interprovincial securities transactions may be the best solution, assuming that a scheme that would survive constitutional challenge could be devised. Furthermore, a federal licensing scheme would not be an impediment to geographic mobility of licensees, at least insofar as they are engaged exclusively in interprovincial business, and, as suggested above, geographic mobility is a value worth preserving. On the other hand, even if a federal securities statute does include a licensing provision, it is unrealistic to expect that all of the provinces would abrogate their own licensing requirements, al-

126 National Policy No. 16, April 1971, 2 CCH CAN. SEC. L. REP. ¶54-853.
127 J. WILLIAMSON, SUPP. at 227.

though some of the smaller ones might. The end result will be to add another requirement without subtracting any, and the situation will be very much like that in the United States, where, in addition to SEC (and self-regulatory organizations) registration, securities market actors must also be licensed by the "blue sky" commissions in the states where they operate.

Chapter III
The Licensing Process

A. SOURCES OF LAW FOR THE LICENSING DECISION

The Canadian securities acts are anything but specific as to the prerequisites for registration. Ontario is typical of most provinces: OSA, section 7, provides simply that "[t]he Director shall grant registration or renewal of registration to an applicant where in the opinion of the Director the applicant is suitable for registration and the proposed registration is not objectionable". The Québec wording is pithier but to the same effect: "The granting or renewal of registration is at the discretion of the Director."[128] The grant of discretion in the Nova Scotia Act is simply extravagant: "The Minister may order that...any application for registration...shall or shall not be granted for any reason which he may deem sufficient."[129]

In fact, the directorial discretion is neither so broad nor so unguided as the statutory language might suggest. It has been held that where a statute commits to an agency's discretion, without more, the decision to grant, deny or revoke a licence, that discretion is not absolute. At a minimum there is implied an obligation upon the agency to discharge its public duty in good faith and to base its decision "upon a weighing of considerations pertinent to the object of the administration".[130] Furthermore, the prerequisites that must be complied with by an applicant for securities registration have to some extent been spelled out in regulations, in forms for applications and in policy statements. The commission itself has no rule-making power under the OSA but section 147 gives to the Lieutenant Governor in Council power, in terms of great breadth, to make regulations in respect of such matters as applications, renewals and expiration of registrations; classifying registrants into categories and prescribing the terms and conditions of registration in each category; regulating trad-

ing of securities in the over-the-counter market; prescribing forms, fees and reports to be filed by registrants; and, generally, respecting any matter necessary or advisable to carry out effectively the intent and purposes of the act.[131] The rule-making power under the Québec act is almost exactly the same.[132] In Ontario, the rule-making power of the Lieutenant Governor in Council (Cabinet) has been used to establish registration categories, designate application forms, and establish net capital rules and rules for foreign ownership of securities firms.[133]

There are three types of policy statements under the Ontario Securities Act: national policies, of which there are about thirty, promulgated simultaneously by the securities commissions of each of the ten provinces; uniform act policies, promulgated simultaneously by the commissions in the "uniform act" provinces: Ontario, Manitoba, Alberta, Saskatchewan and British Columbia; and Ontario policies, promulgated from time to time by the OSC. The legal force of the policy statements, although not as yet challenged in litigation, is at best nebulous since the securities commissions are without rule-making power. To the extent that policy statements attempt not just simple clarification of existing legislative objectives but rather the enunciation of additional policies of the promulgator's making, their validity may be doubted.[134] While an agency may formulate guidelines in advance, it must not fetter its discretion by a rigid policy that prevents the agency from exercising its discretion in light of the facts of individual cases.[135] Legislation and validly enacted regulations must bind the agency's discretion; policy statements must not do so.[136] For the most part, the policy statements are either expressed as "guidelines"- with the

136 Re Hopedale Investments Ltd. v. Oakville, [1965] 1 O.R. 259 (C.A.); *see also* Molot, *supra* note 134, at 315, 330. As Molot observes, an agency's practice of adhering to a rule established by its prior decisions can present many of the same problems as are presented where the agency decides in the light of its own policy statements. *See also In re* Alan G. Gould, B.C. Corp. & Fin. Serv. Comm'n Weekly Summary, April 9, 1976, at 3; Getz, *The Corporate and Financial Services Commission - Reflections upon a Statutory Tribunal*, 11 U.B.C.L. Rev. 1 (1976). The adherence to prior agency decisions may, however, be more congenial to lawyers than adherence to policy statements since the former is an application of the well-known legal principle of *stare decisis* to administrative proceedings.

notation that the director will continue to exercise his discretion in accordance with the facts of individual cases[137] – or are merely declaratory of the policy obviously existing in the legislation. A notable exception is the series of national policy statements on mutual funds, which establish quite a full code of their own for that type of issuer – in the absence of legislation.[138]

A more typical example is Ontario Policy No. 3-10 on dual registration. That policy, which refers to "the following guidelines" states that registration may be held simultaneously as broker, broker-dealer and investment dealer; that registered salesmen may not hold any other class of registration and may not act as officers of a corporate registrant; that companies registered in the various dealer categories may not hold a second registration in the same category; that registered dealers and advisers may not hold separate underwriter registration; and that registered dealers may not hold separate adviser registration. In *C.J. Hodgson & Co., Ltd.* a registered investment dealer and broker set up a wholly owned subsidiary that applied for registration as an investment counsel.[139] The separate registration was desired because of a tax ruling that taxpayers could not deduct as business expenses fees paid for investment advice unless the principal business of the payee was advisory. The director refused registration on the basis of the policy statement. The commission reversed, holding that in the circumstances of the particular case there was a legitimate business need for the separate registration and that OSA, sections 70-72, and applicant's membership in a self-regulatory organization provided adequate safeguards against conflict of interest, the danger which the policy against this particular type of dual registration was designed to avert.[140] The commission here not only declined to be limited by the policy statement but in fact announced an amendment to it, so that henceforth registered dealers who were members of the Investment Dealers Association (IDA) (dealers) or the TSE (brokers) would be able to hold separate adviser registration.

A more recent decision of the Corporate and Financial Serv-

ices Commission of British Columbia illustrates, in the securities licensing context, the maximum legal force that may properly be attributed to policy statements. In the matter of *Alan G. Gould*,[141] the commission reviewed a decision of the Superintendent of Brokers revoking the registration of a securities salesman who was found knowingly to have aided a well-known stock swindler in a market manipulation. The commission, in affirming the sanction, expressly found one of the superintendent's grounds to be unsupportable. The superintendent had taken the position that whenever a registrant knew of specific fraudulent activity in the marketplace, the registrant was under a duty to advice the authorities of what he knew, notwithstanding that the registrant himself was in no way implicated. Failure so to notify the authorities would, *ipso facto*, result in revocation of registration. The commission pointed out that the duty that the superintendent was enunciating was to be found nowhere in the legislation and that for the superintendent on his own authority to announce that on a given set of facts he would always cancel a registration conflicted with the superintendent's duty as a judicial officer to consider each case on its individual merits.

> "The point is that...the superintendent is entrusted with a quasi-judicial, not a rule-making function, and he cannot carry out the latter function disguised as the former."[142]

On the other hand, the commission said that is was "entirely proper for the superintendent to warn registrants that concealment of knowledge of manipulative schemes is *a factor* that will be taken into account in determining fitness for continued registration".[143]

Recently the OSC's policy statements on educational qualifications of salesmen (No. 3-06) and on part-time salesmen (No. 3-07) have been repealed and replaced by regulations promulgated by the Lieutenant Governor in Council.[144] The change signifies that the commission's positions in these matters have advanced in status from guidelines to firm rules.

In the United States, the SEC, which unlike Canadian securities commissions, may itself promulgate rules,[145] is no less fond of

s. 72 compels an investment adviser to disclose his financial interest in any securities he refers to in his advice or in any transactions he recommends.

145 Exchange Act, s. 23(a).

policy statements, called by the SEC "interpretive releases", than are its Canadian counterparts.[146] While all the same observations as to the legally nonbinding nature of these policy statements may be made as with the Canadian policy statements, the SEC is liberal in citing them as authority in its adjudicatory opinions and in briefs to the courts, and sometimes the courts themselves will cite SEC releases as precedential authority.[147] The use by the SEC of interpretive releases has been criticized as an attempt to make rules without observing the procedural requirements laid down in the Administrative Procedure Act.[148]

In addition to the generalized policy statements issued by the commission itself, the staff of the SEC issues "no-action" letters. Most frequently, a no-action letter is solicited by – or by counsel on behalf of – a person who wishes to sell securities without filing a prospectus under the Securities Act of 1933. In other situations issuers, broker-dealers or securities advisers may request no-action letters as well, inquiring whether a proposed course of action would in the staff's view involve a violation of the federal securities laws. A favourable response from the SEC staff would recapitulate the facts recited in the applicant's letter and then state that, on the basis of the facts as stated, the staff would not recommend to the commission that enforcement action be taken if the proposed course of action were carried out. The commission appears to take the position that the staff's no-action letters are not binding upon it as precedent.[149] At the same time, it would be inconceivable for

146 Examples would include SEC, Securities Act of 1933 Release No. 5168, July 7, 1971, 2 CCH FED. SEC. L. REP. ¶22,760 and SEC, Securities Act of 1933 Release No. 4445, February 2, 1962, 2 CCH FED. SEC. L. REP. ¶¶22-753-22-759 (obligations of broker-dealers and others in connection with distributions of unregistered securities). Also noteworthy is the series known as the Accounting Series Releases, which deal generally with acceptable accounting procedures in documents filed with the commission.

147 *See e.g.* Mitzner v. Cardet International, Inc., 358 F. Supp. 1262, 1267 (N.D. Ill. 1973) (*citing* Securities Act of 1933 Release No. 5211 for the proposition that pyramid sales plans often involve the sale of securities); SEC v. M.A. Lundy Associates, 362 F. Supp. 226, 231 (D.R.I. 1973) (quoting approvingly the interpretation found in Securities Act of 1933 Release No. 4412 of the commercial paper exemption from the prospectus requirement). Occasionally one of the SEC's interpretative releases comes back to haunt it, as in United Housing Foundation Inc. v. Forman, 421 U.S. 837 (1975). There the SEC appeared *amicus curiae* to urge that shares in a cooperative housing corporation constituted securities under the federal securities laws. But the Supreme Court noted that the commission's *amicus* position flatly contradicted a position it had taken two years earlier in an interpretative release; 421 U.S. at 858 n. 25.

148 5 U.S.C. ss. 551 ff. (1970). These are, principally, publications in the Federal Register of a general notice of the proposed rule and opportunity for interested persons to make submissions; *see*, Cohen & Rabin, *supra* note 34, at 719 n. 189.

149 *See* Lockhart, *SEC No-Action Letters: Informal Advice as a Discretionary Administrative Clearance*, 37 LAW & CONTEMP. PROBS. 95, 96 (1972).

enforcement action to be undertaken contradictory to a no-action letter – so long, of course, as the facts do not deviate from those stated in the request for the letter.[150] Since, however, all requests for no-action letters as well as the responses thereto have been made public by the SEC for some time,[151] one would expect the responses to begin to take on some precedential value for the securities bar generally as they always have had for the SEC staff.[152]

B. THE REGISTRATION CATEGORIES

There are no less than six separate categories of securities dealer registration for persons or companies in Ontario.[153] These are (1) broker, a stock exchange member registered to trade exclusively in an agency capacity; (2) broker-dealer, a member of the Broker-Dealers' Association of Ontario (BDA) registered to trade as agent or principal; (3) investment dealer, a member of the Investment Dealers Association of Canada registered to trade as agent or principal; (4) securities dealer, registered to trade as agent or principal but not a member of a self-regulatory organization; (5) mutual fund dealer and (6) scholarship plan dealer.[154] In Québec the categories of dealer registration are similar, but there is no category of broker-dealer since the Broker-Dealers' Association is a self-regulatory creation of the Ontario legislature.[155] Also in Québec there are two categories of registration to trade in mutual funds – mutual fund broker and mutual fund dealer.[156]

Finally, both Ontario and Québec have a registration category of securities issuer, a person or company registered to trade securities exclusively of its own issue.[157] In Ontario this is not a very significant category because any issuer that distributes its securities through a registrant does not itself have to be registered to trade under the act, by virtue of the section 19(1)7 exemption. In the Québec Securities Act, on the other hand, there is no similar

150 *Id.*

151 17 C.F.R. s. 200.81 (1977). This policy was initiated in 1970; SEC, Securities Act of 1933 Release No. 5098, October 29, 1970, [1970-1971 Transfer Binder] CCH FED. SEC. L. REP. ¶77,921.

152 Lockhart, *supra* note 149, at 122.

153 "Person" is defined in OSA, s. 1(1)12 to include both natural persons and partnerships; "company" means an incorporated body; OSA, s. 1(1)4. In this paper, the word "person" is used to denote natural person and "firm" is used to signify a partnership or a corporation.

exemption, although the statute provides that the commission *may* grant an exemption from registration in the case of an issue of securities sold *en bloc* to one or more registered brokers.[158] In both Ontario and Québec registration as an investment dealer or securities dealer (and, in Ontario, broker-dealer) is deemed to include registration as an underwriter.[159]

As noted above, there are two categories of investment adviser registration in Ontario: securities adviser, a registrant who advises generally as to the merits of investing in specific securities; and investment counsel, a registrant who gives advice tailored to the individual needs of different clients. In Québec all advisers are termed "investment counsel", and there are two categories of investment counsel: securities adviser, a term which has the same meaning as under the Ontario regulations, and investment adviser, which has the same meaning as investment counsel under the Ontario regulations.[160]

Partners and officers of a registrant must have the approval of the director in order to act in the registered capacity – trading, advising or underwriting.[161] Ontario Bill 7 is more stringent in this regard: a partner or officer of a dealer may not trade and a partner or officer of an adviser may not advise unless such partner or officer is registered as such with the commission.[162] Bill 75, a predecessor to Bill 7, was even more stringent; it provided that directors of a registrant had to be approved as such by the director of the commission.[163] This latter proposal was withdrawn in the face of claims that in the case of corporate registrants approval of directors by the OSC director amount to a usurpation by that official of the functions of a company's shareholders.[164]

Finally, of course, all securities salesmen, that is, the trading employees of registered firms, must be registered as such and this is by far the largest category of registration. A salesman's registration lapses automatically when he ceases to work for a given employer and it is not reinstated until the director has approved the salesman's employment by a new registrant-employer.[165] Ap-

proval of a change in employer is by no means automatic, and the occasion has been used by at least the Ontario Securities Commission for a full scale review of the salesman's record.[166] Generally speaking, registration in any category must be renewed annually.

In the United States federal regulatory scheme, there are not the elaborate categories of registration as in the Canadian statutes. The only trading categories are broker and dealer. In fact, the form of registration is for the status "broker-dealer". A mutual fund distribution company, as with any firm whose business is trading securities, must be registered as a broker-dealer under section 15(b) of the Exchange Act.[167] After the 1975 Exchange Act amendments, municipal securities brokers and dealers that are banks or bank affiliates must register under section 15B of the Exchange Act.[168] Nonbank municipal securities brokers and dealers, like brokers and dealers generally, must register under section 15(b).

While there is no dealer category of "securities issuer" in the United States, an issuer which chooses to distribute securities of its own issue without the intervention of a registered intermediary would itself have to be registered as a broker-dealer if it were "in the business of effecting transactions in securities".[169] Generally speaking neither such an issuer nor such of its officers, directors and employees as actually sell its securities will be deemed to be in the business of effecting transactions in securities where the issuer does not hire employees especially for that purpose and where it does not give its regular officers or employees special compensation for selling its securities.[170]

Unlike the scheme of the Canadian statutes, wherein both the trading firms and their salesmen are registrants, under the Exchange Act in the U.S. only the brokers and dealers themselves,

166 *See In re* James Jeffrey Forsythe, [1972] OSC Bull. 167 (August) (transfer approval denied where salesman had participated in a public distribution of securities for which no prospectus had been filed); *In re* Harry Ramras, [1972] OSC Bull. 123 (June) (transfer approval denied where salesman had defrauded his previous employer, had failed to observe the know-your-client rule, had failed in a primary distribution to provide his customers with a prospectus, and had a very unstable employment record - 14 employers in six years); OSC, Policy Statement No. 3-09, April 5, 1971, 2 CCH CAN. SEC. L. REP. ¶54-903 (frequent transfers by registered salesmen from dealer to dealer are not considered consistent with the best interest of the public). *Compare In re* John A. Sherman and Samuel Boltman, [1949] OSC Bull. 11 (January) (salesmen whose registration had lapsed by virtue of cancellation of their employer's registration where the employer had been engaged in high pressure sales tactics not involving these salesmen would be granted reregistration under the auspices of a more responsible employer).

generally corporations or partnerships, are registered directly with the commission. Applications by brokers and dealers for registration must disclose, however, full information concerning "associated persons".[171] These include all partners, officers, directors and employees of a broker-dealer, other than clerical employees, as well as all persons controlling, controlled by or under common control with the broker-dealer.[172] The activities of associated persons can be a ground for denying registration and for disciplining a registrant.[173] Furthermore, the commission has a statutory power to discipline an associated person independent of its authority to discipline the registrant with which such person is associated.[174] The Canadian approach, wherein securities salesmen themselves are registered with the commission, appears preferable because it makes clear the commission's authority over salesmen, and it should be retained in any new legislation. The SEC's *Special Study of the Securities Markets* had recommended that salesmen and other key securities personnel be registed directly with the commission[175] but this recommendation was not acted upon in either the 1964 or the 1975 amendments to the Exchange Act.[176]

C. QUALIFICATIONS FOR LICENSURE

The form of application for registration as adviser, dealer or underwriter seeks to elicit in some detail the applicant's history in the securities business and in any other licensed occupation in Canada or elsewhere, applicant's criminal record (if any), whether applicant has ever been accused of fraud in a civil action, the identity of each partner, officer or director of an applicant firm, and applicant's capitalization and the owners thereof.[177] An information statement to be completed by the proprietor of a sole proprietorship applicant and by each partner, officer and director of a firm applicant covers the individual's history in the securities business and in any other licensed occupation in Canada or elsewhere, criminal record (if any) as well as whether the individual has ever been accused of fraud in a civil action, a fifteen-year employment history, and character references.[178] The form for

178 *Id.*, Form No. 2.

application for registration as a salesman[179] is practically identical in content to the information statement for proprietors, partners, officers and directors. The salesman application in addition requires a certification from the applicant's prospective employer stating that the employer has made "due and diligent inquiry" into the background of the applicant on the basis of which the employer believes the applicant to be of good character and reputation.

Fees for registration and renewal of registration range from a low of $75 for a salesman to a high of $500 for adviser registration of an applicant other than an individual.[180]

A variety of educational, general character and financial qualifications are requisites for registration in the various categories.

1. *Standards Relating to Education, Training, Experience*

All applicants for registration as salesmen must have successfully completed the Canadian securities course[181] – a basic course on capital markets, investment instruments and strategy and securities salesmanship administered by the Canadian Securities Insititute. The course is basic but it appears that anyone who comprehends all the materials in it is reasonably well equipped at least to start as a salesman. A salesman restricted to selling mutual funds must have successfully completed either the Canadian securities course or the Canadian mutual funds course.[182] The latter course, administered by the Canadian Mutual Funds Association,[183] is about as sophisticated as an automobile driver's exami-

179 *Id.*, Form No. 5. None of the questions on any of the forms would seem to elicit whether an applicant had ever been found by a court or other competent tribunal to have sold securities in violation of a prospectus requirement, except where such a finding was made in a criminal action (ques. 8(a)) or where such finding had led to revocation or suspension of a licence or of membership in a self-regulatory association (ques. 6). Thus, for example, where an applicant who had never been licensed in the securities markets had been found in an SEC injunctive action to have violated s. 5 of the Securities Act of 1933 (registration of securities) that fact would not have to be revealed on the Ontario application. Presumably this is an unintended omission in the forms.

180 Ontario Securities Regulations, s. 8(1). Where an application is refused, the director of the commission may recommend to the provincial treasurer that the application fee or a part thereof be refunded; OSA, s. 17.

182 *Id.* s. 6 (15).

183 As its name implies, the CMFA is an association of mutual funds qualified for sale in Canada. As of 1969, its membership was constituted of about 1/3 by number of all mutual funds qualified for sale in Canada, but these funds accounted for the great majority of mutual fund assets by dollar value; CANADIAN MUTUAL FUND REPORT, ch. 19.

nation and could probably be dealt with successfully by the average high school student with a bit of preparation.[184] Altogether, the course would not inspire confidence in the knowledge and professionalism of a salesman whose only qualification was successful completion of it. An individual applying for registration as a salesman with a broker or investment dealer must have successfully completed, in addition to the Canadian securities course, the registered representatives examination.[185] That examination is based on the materials in the *Manual for Registered Representatives*, a publication of the Canadian Securities Institute, which summarizes generally the accepted ethical practices among members of the IDA and the Canadian stock exchanges and identifies the requirements of provincial securities legislation and of the self-regulatory organizations which may affect registered representatives in their relations with clients.[186]

An individual applicant for registration as broker, broker-dealer, investment dealer or securities dealer or an individual on whose behalf designation or approval is sought as a partner or officer of one of the foregoing must have completed successfully the new partners', directors' and senior officers' qualifying examination, also administered by the Canadian Securities Institute.[187]

An individual applying for registration as a securities adviser, or on whose behalf designation or approval is sought as a partner or officer of an adviser, must have successfully completed the Canadian securities course and the more advanced Canadian in-

184 *See* the evaluation of the mutual funds course in the CANADIAN MUTUAL FUND REPORT ¶¶14.18-14.20. Sample questions from the mutual funds course examination include the following: (Answer yes or no). "May a representative commence selling once his application for registration has been filed with the Commission?"; "Are mutual fund shares traded on a stock exchange?"; "Can a representative guarantee that the shares will be redeemed at a specific price?"; "Can the future performance of a mutual fund be guaranteed?".

185 Ontario Securities Regulations, s. 6(16).

186 CANADIAN SECURITIES INSTITUTE, *supra* note 21, at iii (Foreword).

187 *Compare In re* Liberty Securities Ltd., [1966] OSC Bull. 4 (September). At a time when there had been promulgated no specific qualifications for officers of applicant firms, the director turned down an application for broker-dealer registration because of what he deemed to be the officers' lack of experience in the securities industry and in supervisory executive capacities. On appeal to the commission registration was granted. The BDA had established a minimum guideline of two years experience for each officer, and it had accepted the applicant for membership. The commission found the BDA's favourable action to be a convincing, though not a conclusive, factor. The commission said, "it is not necessary that the experience of each officer be substantial, so long as their combined experience be substantial". It found that the applicant complied with the test as so stated.

The education requirement for approved partners or officers of or individuals registered as mutual fund dealers, scholarship plan dealer or security issuer is "such qualification and experience as in the opinion of the director is appropriate";

vestment finance course and must have performed research involving the financial analysis of investments under supervision of an adviser for at least five years.[188] These requirements, particularly the last one, are fairly rigorous and ought to be sufficient to produce at least a minimally proficient adviser.[189] For the investment counsel category the same courses are required plus at least the first year of the chartered financial analysts course. The experience requirement is similar to that for advisers with the additional requirement that there be three years of supervision by an adviser having responsibility for portfolios of aggregate value of at least $1 million.[190] Since the new Ontario category of portfolio manager is defined as a species of investment counsel,[191] an individual portfolio manager and the partners or officers of a firm must meet the qualifications for investment counsel registration. In Québec, the educational requisites for registration as investment adviser (equivalent to investment counsel in Ontario) are even more rigorous. The applicant must have five years experience in financial analysis and must either have a university degree in a related field or have obtained the title of Chartered Financial Analyst.[192] Only an investment adviser may administer discretionary accounts in Québec.[193]

2. *Good Character*

The second type of qualification, for registration generally – good character – is implicit in the statutory standard that the applicant be "suitable for registration" and that the registration be "not objectionable". It would be difficult to state the standard with more precision, although lack of suitable character has fre-

---

Ontario Securities Regulations, s. 6(13). Presumably in the case of a mutual fund dealer that would be no less than the qualification for a mutual fund salesman.

188 Ontario Securities Regulations, s. 6(10). These are practically the same requirements as apply in Québec for securities adviser registration, except that in Québec the experience requirement is three rather than five years. Also in Québec the educational requirement is extended to those employees of the securities adviser who analyze securities markets; QSC, Revised Policy Statement No. 19, *supra* note 160, art. 8.

189 For registration under the Investment Advisers Act of 1940 in the United States there are no prior professional qualifications or standards; Lybecker, *Advisers Act Developments*, 8 Rev. Sec. Reg. 927 (1975). There are, on the other hand, a variety of statutory disqualifications; Advisers Act, s. 203(e).

190 Ontario Securities Regulations, s. 6(11). Any of the educational and experience requirements may be waived by the director where he is satisfied that the individual has equivalent qualifications; *id.* s. 6(17); QSC, Revised Policy Statement No. 19, *supra* note 160, art. 8(8).

191 Ontario Securities Regulations, s. 2(2)1a.

193 *Id.* art. 15(1).

quently been a ground of denial of registration.[194] At a minimum, good character comprehends observance of the securities laws.

3. *Financial Qualifications*

The third type of qualification for licensing as a securities market actor is financial, commonly known as the "net capital rules".[195] The financial condition of securities dealers is a matter of regulatory concern because the customers of a firm may be at risk with respect to their cash or securities in the event of failure of the firm. That is to say, the business of securities dealers includes important banking functions.[196] Securities dealers lend money to margin purchasers, retaining the purchased securities as collateral, or more usually, rehypothecating them at commercial banks. They receive and retain "free credit balances" in the accounts of customers. Free credit balances are those amounts of cash owed by securities dealers to customers which the customers have an immediate right to withdraw. They generally arise when a customer gives cash to a securities dealer to hold pending receipt of instructions to purchase securities, when a customer's fully paid-for securities are sold and the proceeds are held pending further investment or further instructions from the customer, or from interest or dividends on the customer's securities held by the dealer.[197] Unless restricted from doing so by the applicable regulations,[198] dealers use these funds in their own businesses. They frequently hold customers' fully paid securities either for safekeeping or pending delivery to the customers or as excess collateral not needed to secure customers' margin accounts.

In Ontario each category of dealer registrant, other than security issuer, must maintain at all times a net free capital of at least 10% of the first $2,500,000 of adjusted liabilities plus 8% of the next $2,500,000, 7% of the next $2,500,000, 6% of the next $2,500,000, plus 5% of adjusted liabilities in excess of $10,000,000 but in no event less than $25,000.[199]

Adjusted liabilities are total liabilities (but not considering subordinated debt as a liability) less certain very liquid assets:

194 *See* notes 230-36 and accompanying text *infra*.

195 For a full treatment of the topic of registrants' financial responsibility, *see*, *Honsberger*.

199 Ontario Securities Regulations, s. 6(1)(a).

cash; cash surrender value of life insurance; accounts receivable from governments, chartered banks, loan, trust and insurance companies and credit unions; debt obligations of or guaranteed by the governments of Canada, the United States, a Canadian province or municipality; commercial paper; commercial bonds maturing within three years; bank deposit certificates and trust company guaranteed investment certificates.[200]

Net free capital is all capital (as opposed to nonsubordinated debt) employed in the firm's business, less fixed assets and assets not readily convertible into cash and less amounts required to margin fully securities in firm and customers' accounts.[201]

The margin requirement for a particular security is the dollar amount of cash or cash-equivalent assets that a customer must have in its account with a securities firm, expressed as a percentage of the market value of the security in question, in order to purchase that security on margin – as opposed to a cash basis. Margin requirements therefore control the amount of credit, and hence the amount of speculation, available for securities transactions. Setting margin requirements is therefore as much a central banking function as a function pertaining to securities regulation.[202] The difference between the margin requirement and the purchase price of the security is, of course, a loan from the securities dealer to the customer. In turn, the practice of most dealers is to obtain credit from a commercial bank on the collateral strength of the securities purchased for the margin customers. Therefore the ultimate source of credit for margin transactions is the bank rather than the securities dealer. If the value of the securities purchased on margin declines to a level below the value assigned to them as collateral, the bank will demand increased collateral for its loan to the dealer or that the loan balance be reduced and, in either event, the dealer will make a margin "call" (call for increased margin) from its customer.[203]

Margin accounts are highly profitable to brokers and are encouraged by them. One source of profit is the difference be-

200 OSC Conditions of Registration, *supra* note 197, app. 1 and schedule 1 thereto; REPORT OF THE COMMITTEE TO STUDY THE REQUIREMENTS AND SOURCES OF CAPITAL AND THE IMPLICATIONS OF NON-RESIDENT CAPITAL FOR THE CANADIAN SECURITIES INDUSTRY 44, 50 (1970) [hereinafter cited as MOORE COMMITTEE REPORT].

201 *Id.*

202 In fact, in the United States s. 7 of the Exchange Act grants authority to set margin requirements for securities transactions not to the SEC but rather to the Board of Governors of the Federal Reserve System. The margin requirements as thus set are known as Regulation T and are contained in 12 C.F.R. ss. 220.1-220.8 (1977). In Canada the central bank has no such power to set margin requirements. *See*, BANK OF CANADA ANNUAL REPORT (1956), at 34.

203 The operation of a margin account is described in Dominick Corp. of Canada v. George, 15 D.L.R. (3d) 596 (B.C.C.A. 1970).

tween the interest rate the bank charges the broker and what the broker charges its customer. Registrants who are members of the TSE or the IDA, are free to use customers' free credit balances in their business without paying interest.[204] To the extent they use such funds to finance margin accounts, the interest charge to customers is all profit. Use of margin enables customers to hold larger securities accounts than would otherwise be possible, and this obviously contributes to brokers' profits. Finally, margin accounts tend to trade with a higher turnover rate than cash accounts, thus generating increased commissions for brokers.[205]

Margin requirements are also an important determinant of the question whether a registrant is in compliance with net capital rules. The OSC rules require that in the computation of net free capital there be deducted from a registrant's liquid capital that amount of cash required to margin fully securities in firm and customer accounts. The margin requirements set by the OSC range, for example, from a low of under 1% for federal and provincial government obligations due within a year to between 5% and 10% for longer term government instruments and commercial bonds up to not less than 50% for listed securities and 100% for nonlisted securities - which means in effect that the last-mentioned group cannot be carried on margin.[206] The TSE has its own margin requirements that are at least as strict as those of the OSC.[207]

For persons and firms registered solely as underwriters the minimum net free capital requirement is $10,000;[208] for advisers it is $5,000, which in the director's discretion may be raised to up to $25,000.[209] For advisers, net free capital is defined as working capital, that is, the excess of current assets over current liabilities.[210] It is by no means apparent just why "pure" advisers - ones that do not manage customers' funds - should be subject to any minimum capital requirement. The reason may be to weed out fly-by-night operations.

Each category of registrant is subject to bonding requirements and each category of dealer, except security issuers, must

participate in a trust fund for the compensation of customers established either by a self-regulatory organization or, in the cases of registrants not members of a self-regulatory organization, by a trustee with the approval of the commission.[211]

D. THE HEARING

OSA section 7(2) provides that the director shall not refuse registration without giving the applicant an opportunity to be heard. One commentator has described the section 7 hearing thus:

> "Hearings under section 7 tend to be informal and they seem to more closely resemble an investigation than a hearing. Hearsay evidence is often presented to the Director. The commission counsel will very often refuse to disclose the source of his information. The applicant accordingly does not have an opportunity to cross-examine the real witnesses against him but, of course, can challenge whatever allegation of fact is presented. The practical effect of the introduction of some kind of an allegation of misconduct unsupported by a person having personal knowledge is to call for some kind of an explanation or denial from the applicant".[212]

From an adverse decision of the director in a section 7 hearing, the applicant may appeal to the commission and is entitled to a hearing and review by the commission of the director's decision.[213] The procedure for hearing and review, as opposed to an appeal, means that the commission may hear new evidence.[214] The commission may confirm the decision under review "or may make such other... decision...as the commission considers proper".[215] The commission's review function has been held to go "far beyond appellate jurisdiction in the strict sense of deciding merely whether a lower decision be right or wrong".[216]

From the commission, an unsuccessful applicant may appeal to the Supreme Court of the province.[217] The reviewing court's jurisdiction, in turn, has been said to be broader than on an appeal

217 OSA, s. 29(1).

from a lower court because the securities acts give the reviewing courts the power to confirm or set aside the order appealed from or to order the commission to make such other order "as the court considers proper".[218] In other words, the court on appeal from the commission has the same discretionary power as the commission has on appeal from the director.[219] As might be expected, however, the courts have shown much greater deference to the commissions than the commissions have shown to decisions of their directors.[220] The standard of judicial review of a decision of a securities commission that is plainly within the commission's power to make, such as a decision on registration, has been said to be that the court will uphold the commission unless there has been either a failure of natural justice in the proceedings before the commission or else the commission has made a plain and vital mistake as to the facts.[221] In *Re The Securities Commission and Mitchell*, the Ontario Court of Appeal, *per* Laidlaw, J., stated:

> "The opinion of the commission should not be set aside or altered upon an appeal unless the commission has erred in some principle of law or unless it appears that the commission has not proceeded to form its opinion in a judicial manner or unless it appears that the opinion of the commission is so clearly wrong as to amount to an injustice requiring a remedy on appeal".[222]

There is only one reported case where an unsuccessful applicant for registration succeeded in having the commission's determination overturned by a court. In *Re Larrimore Securities*,[223] the commission had refused an application for registration as a broker-dealer on the sole ground that the applicant had been refused membership in the Broker-Dealers' Association.[224] At that time

224 *See In re* Dolford Trading Ltd., [1956] OSC Bull. 1 (July-August), where the

the statute defined a broker-dealer as "any person or company that is a member of the Broker-Dealers' Association...or that is recognized by the commission as a broker-dealer".[225] The court held that the commission had applied an erroneous standard in denying the application on the sole basis of the action of the BDA since the standards of the BDA and the standards of the commission were not necessarily the same and the proceeding before the commission was not a review of the action of the association. For one thing, the court pointed out, the commission was to determine the registration question in the public interest, and the BDA in considering applications for membership was to act in the best interests of the association.[226]

Upon remand, the commission declined again to grant registration on the basis of "indisputable evidence" that applicant was unfit for "the double privilege, first, of being licensed to trade in securities as a principal, and the further and special privilege of being allowed to trade free from the control and supervision of any branch of the organized securities industry...".[227] The commission's description of the licence as a privilege is disturbing if it meant to imply that acceptance of the application for registration was in some sense a matter of grace, a matter of governmental generosity. It is unacceptable for a government to declare that a person may not pursue a certain legitimate means of earning a livelihood except under licence and then to suggest that the grant of the licence is somehow an act of governmental generosity.[228] If, on the other hand, the commission used the world "privilege" as a shorthand means to indicate that because the character qualifications for registration cannot neatly be expressed in a verbal formula the commission has therefore, of necessity, some amount of discretion in making a determination of suitability, then it would be hard to quibble.

Under OSA, section 7(3), the director may restrict a registration by imposing terms and conditions on its grant. Frequently imposed conditions include restrictions upon the licences of mutual fund salesmen to sell only mutual fund shares and upon the licences of exchange floor traders to engage in that activity only. The power to condition a registration has been used also to enforce

commission similarly denied registration on the sole basis of a refusal of membership by the BDA.

the commission's policy against part-time registration of salesmen.[229]

The very broad discretion of the director in the registration process appears on the whole to have been exercised with restraint and along lines consistent with the underlying purposes behind the licensing requirement in the securities industry.[230] Denials of registration have been made for such reasons as criminal record,[231] previous bad record in the securities industry,[232] failure to make disclosures called for on the application form[233] and violations of the securities laws of other jurisdictions.[234] In a few of the early cases, denial appeared to turn, at least in part, upon an

229 Ontario Securities Regulations, s. 6(18) (formerly OSC Policy Statement 3-07). In *In re* Michael W.E. Blum, [1971] OSC Bull. 18 (February) the registration of a professional football player as a salesman was conditioned so as to be suspended during the football season with reinstatement at the end thereof.

230 *But see* Cowan, *supra* note 12, at 749-54, 761-65.

231 *In re* William Arthur Pike, [1966] OSC Bull. 5 (November). In *In re* Argosy Finance Co. Ltd., [1978] OSC Bull. 96 (March), the commission confronted the question of the point in time at which the disability of a criminal conviction may be overcome by a record of ways mended. In Argosy the director had refused issuer registration and a prospectus receipt to a finance company for the sole reason that the company's general manager and principal shareholder had been convicted on a guilty plea of theft by conversion seven years earlier. At the time of the conviction, the trial judge had not seen fit to impose a prison sentence. The commission concluded that the conviction should not be an absolute bar to registration. It was satisfied that the general manager had been demonstrated to be honest and of good repute.

232 *In re* Tuina Enterprises Ltd., [1968] OSC Bull. 35 (March) (decision of the commission); *In re* Robert Maurice Thorwood, [1951] OSC Bull. 12 (February); *In re* Drawson Red Lake Gold Mines Ltd., [1951] OSC Bull. 1 (January); *In re* J. Dewar McLean, [1950] OSC Bull. 8 (February); *In re* James W. Armstrong, [1950] OSC Bull. 6 (February); *In re* Sigma Securities, [1968] OSC Bull. 94 (April) (decision of the director followed by review by the commission). Sigma is an interesting case because the disabling conduct in question was on the borderline. The principal of an applicant for underwriter registration, one Fidler, had purchased some highly speculative securities in his own name; when the securities declined in value the following day, he assigned them to the account of certain public companies for which he had authority to trade. The commission concluded that while Fidler had done nothing illegal, there was at least a lingering doubt that he would have assigned the securities to the companies had their value risen. *Compare In re* Alfred Joseph Lewis, [1958] OSC Bull. 1 (October) (commission reverses director and grants salesman registration where applicant relied upon a lawyer's advice as to the legality and propriety of the prior conduct which the director had found to be a bar to registration); *In re* Percy Brand, [1965] OSC Bull. 5 (November), [1966] OSC Bull. 16 (July) (granting application for reregistration nine years after cancellation of salesman registration); *In re* Harry Price, [1952] OSC Bull. 1 (March), [1962] OSC Bull. 1 (November), [1964] OSC Bull. 3 (June) (applicant granted salesman registration 14 years after cancellation of broker-dealer registration, with a good record as a real estate salesman in the interim).

233 *In re* Edward Francis Loughrey, [1967] OSC Bull. 27 (January); *In re* Norman John Hebscher, [1950] OSC Bull. 1 (December); *In re* Francis Benedict Bianchi, [1950] OSC Bull. 2 (September); *In re* Frank Lindover, [1950] OSC Bull. 7 (February); *In re* Yvon Fradette, 9 QSC Bull., No. 8 (Decision No. 5442 February 27, 1978).

assessment by the director, without benefit of hard evidence, that the applicant was not of a character suitable for registration.[235] In one of the early cases, however, the full commission reversed the director, specifically distinguishing between evidence of wrongdoing and mere bad reputation.[236] Now that there are specific educational and/or experience qualifications in most of the registration categories the director will have less need for recourse to general but unsubstantiated character considerations.

E. COMPARATIVE NOTE ON THE U.S.

Among the many 1975 amendments to the licensing provisions of the United States Exchange Act is a provision that for the first time grants the commission authority to establish mandatory "standards of training, experience and competence and...other qualifications" for all registered brokers and dealers and their associated persons.[237] Under the prior law, the commission had authority to establish such standards only for brokers and dealers (and their associated persons) who were members neither of any exchange nor of the National Association of Securities Dealers (NASD). Such brokers and dealers are known as "SEC only" or "SECO" broker-dealers. Otherwise, the establishment of competence standards was entirely within the province of the self-regulatory organizations.

With respect to financial responsibility, under the prior law the commission's authority to establish rules extended to all brokers and dealers, but in practice the exchanges were allocated sole responsibility over their members in this regard. Congress, in considering the 1975 amendments, expressed strong dissatisfaction with this state of affairs; it concluded that an important contributing factor to the securities industry crisis of the 1969–71 period was the self-regulatory organizations' laxity in the enforcement of their own financial responsibility rules.[238] In order to

237 Exchange Act, s. 15(b)7. *See* SEC, Securities Exchange Act of 1934 Release No. 13679, June 27, 1977, [1977-1978 Transfer Binder] CCH FED. SEC. L. REP. ¶ 81,219 announcing a proposed rule which would establish minimum qualification requirements for all registered brokers and dealers and their associated persons. In general, the commission's proposals rely heavily on the courses and examinations presently administered by the major self-regulatory organizations, fulfillment of whose requirements would also satisfy the commission requirements.

238 HOUSE COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE, H.R. REP. No. 94-123, 94th Cong., 1st Sess. 76 (1975).

avoid a recurrence of this problem, the amended Exchange Act, in section 15(c)(3),[239] directs the commission to establish minimum financial responsibility requirements for all brokers and dealers. The commission has adopted a uniform net capital rule, effective January 1, 1976.[240] While the commission retains an exemptive power, its use is expected to be severely limited.[241]

The United States Exchange Act goes into much more detail than do the Canadian provincial statutes on the grounds upon which registration as a broker or dealer may be denied. Section 15(b) provides that a broker or dealer may be registered by filing with the commission an application accompanied by such information as to the applicant and any associated persons of the applicant as the commission may prescribe. Within forty-five days the commission shall either grant registration or institute proceedings to determine whether registration should be denied.[242] The commission "*shall* grant such registration if it finds that the requirements of this section are satisfied".[243] The "requirements of the section" refers to the various standards of operational capability, training, experience and competence that the commission is to promulgate by rule. None of the standards contemplated would appear to be as vague as "good character" or "suitability", and since they must be promulgated in advance, applicants will know the standards they must meet. The commission *shall* deny registration if either: (1) it does not find that the requirements are satisfied, or (2) it finds that if registration were granted the registration would be subject to suspension or revocation. A registration would be subject to suspension or revocation, in turn, where the commission had found such discipline to be in the public interest *and* that the registrant or a person associated with it:

(1) has willfully made a material false statement in an application for registration or in a proceeding before the commission;[244]
(2) has within the ten years preceding the application been con-

239 Exchange Act, s. 15(c)(3).

241 H.R. REP. No. 94-123, *supra* note 238, at 77.
242 Under the prior law registration was automatic if the commission took no action within 30 days from the application. In considering amendments Congress determined that all registrations should require affirmative action by the commission; H.R. REP. No. 94-123, *supra* note 238, at 75.
243 Exchange Act, s. 15(b)(1) (emphasis added).
244 "Willfully" has been construed to require that the act in question be done consciously or intentionally. It does not connote any consciousness on the part of the actor that the act is unlawful; E. WEISS, *supra* note 44, at 206; Tager v. SEC, 344 F.2d 5, 8 (2d Cir. 1965); Lipper v. SEC, 547 F.2d 171, 180 (2d Cir. 1976); Hanly v. SEC, 415 F.2d 589, 597 (2d Cir. 1969).

victed of a crime involving the securities business or involving any type of fraud, larceny, perjury or bribery;

(3) has been enjoined by a court from acting in one of the licensed occupations in the securities business or from being an employee of a bank or an insurance company or from engaging in any conduct in connection with the purchase or sale of securities;

(4) has willfully violated, or is unable to comply with, any provision of the federal securities laws or the rules and regulations thereunder;

(5) has willfully aided or abetted a violation of, or has failed reasonably to supervise another person who is subject to his supervision and who has violated, any provision of the federal securities laws or the rules and regulations thereunder.[245]

Because a registrant is subject to discipline only where he has committed one of the substantive acts *and* the commission finds such discipline to be in the public interest, a useful degree of ameliorative discretion is preserved to the commission in licensing (as in licence revocation): it might determine to permit the registration of an applicant that had incurred one of the five listed disabilities because the commission felt that issuance of the licence would nonetheless be consistent with the public interest.

As stated above, the writer does not have grounds to believe that the record of Canadian securities administrators in exercising the extremely broad and quite unguided licensing discretion committed to them by the provincial securities acts has been other than reasonably satisfactory. Nonetheless, the American approach of specifying the grounds upon which registration will be denied is an appealing alternative to committing to an administrator a broad discretion to be exercised within only the vaguest constraints. First, it is correct to start from the assumption that all applicants *shall* be licensed. The right to earn a living is not an act of governmental generosity. Second, it is desirable that applicants be made aware in a source of easy reference what attributes would likely prove to be disabilities. Third, it is preferable that the necessarily vague standard, "the public interest", be a matter to which the administrator must address himself in dealing with a presumptively unqualified applicant rather than a hurdle to be cleared by each applicant.[246]

245 Exchange Act, s. 15(b)(4). Upon precisely the same grounds registration as an investment adviser will be denied; Advisers Act, ss.203(c)(2), 203(e).

246 *See also* McRuer Report, *supra* note 8, at 1105, which found the OSA, s. 7 standard - "where in the opinion of the director the applicant is suitable for registration and the proposed registration is not objectionable" - itself objectionable. "Ideally", says

Chapter IV
Standards of Conduct and Their Enforcement

Obviously the rules of behaviour laid down for securities market participants do not fit into neat, mutually exclusive boxes labelled "honesty", "competence" and "financial responsibility", as have been designated in chapter III of this paper the "triumvirate of values" sought to be advanced by licensing. For example, while rights and obligations of the brokerage firm with respect to customers' cash and securities is treated below as an aspect of the firm's financial condition,[247] obviously the purport of the applicable rules is to prevent misappropriation by the firm, which would be a fraud against its customers. Another example is to be found in the dual aspect of the know-your-client rule which is designed simultaneously to protect clients from unsuitable recommendations by the firm and the firm from unscrupulous clients who do not have a *bona fide* intent to make good on their commitments to the firm and who could thereby endanger its capital position. Further illustrative of the interrelationships among the various values to be furthered by the standards of conduct is the very hazy line that emerges in the annals of enforcement proceedings between advice that is incompetent and advice that is fraudulent.

Just as standards of conduct for licensees in general cannot accurately be fitted into the mutually exclusive pigeonholes of honesty, competence and financial responsibility, so also it is artificial in discussing standards of conduct to break off the trading from the advising function. Categories must be made, however, and hopefully the result is not positively misleading. This section attempts to classify and discuss standards of conduct in terms of functions of licensees and not in terms of licensing categories. This is particularly important in those parts dealing with the advising function. Unless otherwise indicated, the advising standards discussed are as much applicable to trading registrants as to registered advisers.

The term "broker-dealer" is used in this section to describe generally a person or firm registered to trade in securities. Broker-dealer is in fact a fairly minor category of registrant in

---

the REPORT, "legislation should establish licensing schemes wherein licences can be refused or revoked only on a basis of objective grounds clearly set out in the statute"; *id.* at 1105-06. The REPORT would tolerate what it calls "the subjective expression of licensing standards" only where absolutely necessary; *id.* at 1105. That such a standard is not absolutely necessary in securities licensing is demonstrated by the Exchange Act in the U.S.

247 Ch. IV.B *infra.*

Ontario[248] where the term originates in Canada (it is really American terminology) but it is useful because it briefly describes the two possible roles of the registered trader – principal and agent.

In this part of the paper readers of footnotes will observe the important role in the U.S., as opposed to Canada, that private litigation has played in defining the standards to be observed by registrants. This is due in the main to the receptivity of the American courts to the notion of implied private causes of action for damages arising out of breach of the anti-fraud provisions of the securities laws, especially section 10(b) of the Exchange Act[249] and Rule 10b-5 thereunder.[250] By contrast, Canadian courts seem inhospitable, if not hostile, to the implication of private remedies for breaches of the provincial securities acts.[251] Largely as a result of this difference in the availability of private causes of action as between the jurisdictions, the standards of behaviour to

248 A broker-dealer is a registrant that is a member of the Broker-Dealers' Association; Ontario Securities Regulations, s. 2(1)2. As of June 30, 1976, there were only 13 members of the BDA; [1976] OSC Bull. 192 (July). Broker-dealers have traditionally concentrated their trading in the shares of junior mining companies, and the decline in importance of the type of trader reflects a corresponding decline in importance of that class of issuer in Ontario.

249 Exchange Act, s. 10(b) provides: "It shall be unlawful for any person, directly or indirectly... [by use of the jurisdictional means] (b) to use or employ in connection with the purchase or sale of any security... any manipulative or deceptive device or contrivance in contravention of such rules and regulations as the commission may prescribe as necessary or appropriate in the public interest or for the protection of investors."

250 In 17 C.F.R. s. 240.10b-5 (1977) the commission has prescribed that it shall be unlawful for any person, directly or indirectly [by use of the jurisdictional means]:

"(1) to employ any device, scheme, or artifice to defraud;

"(2) to make any untrue statement of a material fact or to omit to state a material fact necessary in order to make the statements made, in the light of the circumstances under which they were made, not misleading, or

"(3) to engage in any act, practice, or course of business which operates or would operate as a fraud or deceit upon any person, in connection with the purchase or sale of any security."

The cases recognizing private causes of action under the Rule are legion, the principal ones in the Supreme Court being Superintendent of Insurance v. Bankers' Life & Casualty Co., 404 U.S. 6 (1971); Affiliated Ute Citizens of Utah v. United States, 406 U.S. 128, 150-54 (1972). The scope of Rule 10b-5 as an investor remedy, and even a remedy for traditional corporate mismanagement, appeared to be ever-expanding until a recent series of Supreme Court decisions limited the availability of private actions under the rule to situations involving something close to common law fraud, *see* Ernst & Ernst v. Hochfelder, 425 U.S. 185 (1976); Santa Fe Industries, Inc. v. Green, 430 U.S. 462 (1977), and restricted the parties to whom the remedy would be available; *see* Piper Aircraft Corp. v. Chris Craft Industries, 430 U.S. 1 (1977); Blue Chip Stamps v. Manor Drug Stores, 421 U.S. 723 (1975). *See generally* Castruccio, *Developments in Federal Securities Regulation – 1976*, 32 Bus. Law. 1537 (1977).

251 *E.g.* Ames v. Investo Plan Ltd., 35 D.L.R. (3d) 613 (B.C.C.A. 1973), commented upon critically in Beck, Comment, 52 Can.B. Rev. 589 (1974).

be observed by securities industry licensees are much more developed in the U.S. than in Canada.

A. NOTE ON THE INTERPLAY BETWEEN THE REGULATORY AGENCY AND THE SELF-REGULATORY ORGANIZATIONS

Although another paper in this group deals exhaustively with the subject of self-regulation in the securities industry, some mention of the relationship between licensees and the self-regulatory organizations must be made here. At least in theory, the self-regulatory organizations in the securities industry enforce against their member-licensees standards of ethical conduct; and, from the licensee's perspective, its relationship to the self-regulatory organization may be of as much practical importance as its relationship to the securities commission.

The self-regulatory organizations in Canada are the Toronto, Montreal, Vancouver, Alberta and Winnipeg stock exchanges, the Investment Dealers Association and, in Ontario, the Broker-Dealers' Association.[252] In none of the Canadian provinces is membership in one or more of the self-regulatory organizations a prerequisite to obtaining a license as a securities market participant. With respect to Ontario, Baillie has stated that there was a "self-regulatory structure envisaged by the Securities Act" which "to some extent has broken down partly because of the failure of the OSC to insist that all registrants be members of the appropriate self-regulatory organization".[253] In fact, it is highly doubtful that under present legislation it is within the regulatory authority of securities commissions to insist that all registrants must be members of a self-regulatory organization.[254] However that may be,

252 The Canadian Mutual Funds Association was at one time recognized by the OSC as a self-regulatory organization for purposes of audit responsibilities for its members; *see* OSC Conditions of Registration, *supra* note 197, Reg. 6(6) (Preparation of Financial Statements). In April 1976, however, the CMFA decided to relinquish its self-regulatory responsibility for auditing; *see* D. JOHNSTON at 112 n. 122. Earlier, the CMFA had been found in the CANADIAN MUTUAL FUND REPORT ¶¶ 19.27–19.36 not to meet the minimum requirements for recognition as a self-regulatory organization.

253 Baillie, *supra* note 134, 8 CAN. PUB. ADMIN. at 241–42.

254 *Cf.* Re Larrimore Securities, 4 D.L.R. (2d) 757 (Ont. C.A. 1956). In the United States, similarly, membership in a self-regulatory organization is not compulsory for securities market licences. The SEC SPECIAL STUDY, *supra* note 26, at 45, recommended in 1963 compulsory membership in the NASD for all broker-dealers doing an over-the-counter business, and in its legislative recommendations to Congress the commission so proposed. Congress did not adopt these recommendations in the Securities Acts Amendments of 1964, apparently as a result of opposition from non-NASD-member broker-dealers. Instead, in 1964 Congress provided the commission with rule-making authority over SECO broker-dealers parallel to the

certainly the self-regulatory organizations can take up a substantial portion of the burden of policing participants in the securities markets that otherwise would fall to the governmental regulatory agency. A good example of this is the responsibility of the TSE, the IDA, and the BDA in Ontario for the audits of their members.[255] If it were to be concluded that self-regulation has "broken down", certainly some of the blame would have to be laid upon the drafting of the statutes themselves since, apart from the audit function, they do not bestow upon the self-regulatory organizations clear responsibility for enforcing rules of good conduct as against their members.

One may contrast in this regard the role assigned to the NASD under section 15A of the Exchange Act in the United States.[256] Section 15A provides that no national securities association shall be registered – and the NASD is the only one so registered – unless the SEC is satisfied: that the association will be truly representative of the industry on a national basis; that membership is open to all registered brokers and dealers;[257] that the association has the capacity to enforce compliance by its members with the Exchange Act and with the association's own rules; that the rules of the association are designed to prevent fraudulent and manipulative practices and to promote just and equitable principles of trade; and that the rules provide that members shall be disciplined for violations of the act and the association's rules and provide a fair procedure for discipline.

The SEC has a review jurisdiction over NASD disciplinary proceedings and over proceedings wherein membership is denied or a person is barred from being associated with a member.[258] Rules of the NASD must be approved in advance by the SEC[259] and the commission has itself a reserve power to alter these rules.[260]

The effect of the 1975 Exchange Act amendments with respect to the self-regulatory role of exchanges is dramatic. For the

256 Exchange Act, s. 15A. This section, popularly known as the Maloney Act, was enacted in 1938 – some four years after the original Exchange Act.

257 Membership must be open to all registered brokers and dealers except those which: are under a statutory disqualification (meaning generally the commission of a prohibited act); do not meet standards prescribed by the association relating to financial or operational capability or to training, experience or competence; or have engaged or are reasonably likely again to engage in acts or practices inconsistent with just and equitable principles of trade; Exchange Act, ss. 3(a)(39), 15A(g).

258 Exchange Act, ss. 19(d), (e), (f).

259 Exchange Act, s. 19(b).

260 Exchange Act, s. 19(c).

first time the exchanges are placed on a footing vis-a-vis the commission analagous to that established by the Maloney Act for the NASD. The commission now has a direct review power over the exchanges' admissions and disciplinary decisions.[261] Rules of the exchanges must receive prior approval of the commission, and the commission has a reserve power to make rules for the exchanges.[262]

The OSA gives to the Ontario Securities Commission authority over the Toronto Stock Exchange as full as that recently acquired by the SEC over U.S. exchanges.[263] Under OSA, section 140(2) the commission may make any direction, order, determination or ruling that it deems to be in the public interest with respect to: (a) the manner in which an exchange carries on business; (b) any by-law, ruling or regulation of the exchange; and (c) trading on the exchange and the securities traded on it – in short, with respect to virtually everything that an exchange does.[264] Furthermore, the commission, at the instance of a "person aggrieved", has a power of hearing and review over exchange membership and disciplinary proceedings.[265]

While traditionally the OSC has had a much more ample statutory authority over securities exchanges than the SEC, judging from the publicly available record of proceedings (that is, without regard to informal, non-public interventions), the Ontario Commission does not appear to have used this authority on the whole in a very active way. The commission has said in connection with its review of exchange disciplinary proceedings that since the

261 Exchange Act, ss. 19(d), (e), (f). Under the pre-1975 law, the commission had no authority with respect to these matters.

262 Exchange Act, ss. 19(b), (c). Under the old s. 19(b) the commission had no general approval authority over exchange rules. It was empowered, however, with respect to twelve designated subjects and similar matters to alter or supplement the rules of an exchange after making an unavailing written request to the exchange that it alter its own rules, and after notice and hearing, and after determining that such changes were necessary or appropriate for the protection of investors or to insure fair dealing upon or fair administration of such exchange. This authority was very rarely used by the commission. *See generally* PBW Stock Exchange, Inc. v. SEC, 485 F.2d 718 (3d Cir. 1973), *cert. denied*, 416 U.S. 969 (1974); Werner, *Adventure in Social Control of Finance: The National Market System for Securities*, 75 COLUM. L. REV. 1233 (1975).

263 The Ontario legislature has managed to express in about a dozen lines of print a relationship between regulatory and self-regulatory organizations that at bottom is very similar to the one that in the United States act is spread over page after page of highly convoluted verbiage; *compare* OSA, s. 140 *with* Exchange Act, s. 19.

264 *See e.g. In re* Part XV of the By-Laws of the Toronto Stock Exchange, [1976] OSC Bull. 289 (November).

exchange under its enabling legislation has power to impose additional or higher standards on its members than simple compliance with the Securities Acts[266] the commission would not substitute its discretion for that of the exchange governors so long as the exchange's standards are neither inconsistent with the public interest nor applied unfairly.[267]

Generally the following sections of this paper emphasize the standards enumerated in the licensing legislation and the regulations under it and in the course of disciplinary proceedings and private civil litigation. The standards established by the self-regulatory organizations generally are not dealt with, although they are footnoted where appropriate.

B. STANDARDS OF FINANCIAL RESPONSIBILITY

There have been mentioned above the matters of minimum free capital and margin accounts.[268] Other rules relating to financial responsibility of registrants concern settlement of cash accounts, segregation of customers' securities and free credit balances and audits.

When a broker buys or sells securities on behalf of a customer, the broker becomes obligated to deliver the cash or the securities, as the case may be, to the broker on the other side, and this obligation is not conditioned upon the customer completing his obligations to his own broker. The rules on settlement of cash accounts are in reality rules which seek to control extension of credit by brokers to their cash customers. That is, since the broker by virtue of executing a transaction assumes a direct obligation to make delivery of cash or securities, he will be in the position of extending credit to his customers unless they, in turn, make delivery to him on or before the settlement date, which is ordinarily three business days after the transaction. The rules set out the circumstances under which extensions beyond the settlement date may be granted to customers, and provide that otherwise the registrant is to "sell out" (sell an equivalent number of securities

266 Toronto Stock Exchange Act, R.S.O. 1970, c. 465, s. 4(3).

267 *In re* Edward A.P. Williams, *supra* note 265, at 87; *cf. In re* Lafferty, Harwood & Partners Ltd., *supra* note 265 at 126, where the commission said that it would not exercise its review jurisdiction by interfering with an exchange decision denying membership merely on the basis that the commission would have reached a different decision, but only where

> "the Exchange has proceeded on some incorrect principle or has erred in law or has overlooked some material evidence or some new and compelling evidence ... was presented to us that was not presented to the Exchange."

But see In re Baker Weeks of Canada Ltd., *supra* note 265, discussed in ch. V *infra*.

268 *See* ch. III.C.3 *supra*.

for an account where the customer has not delivered cash on a purchase order) or "buy in" (purchase an equivalent number of securities to those sold on behalf of a customer who has not delivered them) the account or convert it to a margin account.[269]

The remaining standards promulgated by the OSC relating to financial responsibility of registrants are those concerning segregation of customers' fully paid securities and free credit balances. Customers' fully paid securities must be segregated physically and held in trust for the customers – that is, they are not available to be considered as part of the registrant's net capital.[270] Similarly, customers' free credit balances must either be covered by a bonding or insurance arrangement approved by the Commission or must be deposited in a "client's trust account". [271] Where there are either funds or securities held by the registrant on a continuing basis, at least once every three months the registrant must send to the customer a statement of account showing the debit or credit balance and the details of the securities held.[272]

The rules as to segregation of customers' securities and funds have been expressly made non-applicable to members of the TSE and the IDA "in light of the adequate compensation funds maintained by both organizations, the standards of self-regulation established and the custom of the business in the United States, the United Kingdom and Canada".[273]

The rules of the TSE and the IDA themselves compel segregation of customers' fully paid securities.[274] The important difference is with respect to free credit balances; they need not be placed in a trust account and may be used in the conduct of the member's business. The rules of the TSE and the IDA provide, however, that any member which does not segregate its clients' free credit balances must send quarterly statements of the balance to clients with a notation that clients' funds are not segregated and may be used in the conduct of the firm's business.[275] In addition to the

274 TSE by-laws, s. 16.12, 3 CCH CAN. SEC. L. REP. ¶ 89-632; IDA, THE BLUE BOOK 439 (1977) (by-law 17.3).

275 TSE by-laws, s. 16.08, 3 CCH CAN. SEC. L. REP. ¶ 89-628; IDA, THE BLUE BOOK, 540 (1976) (Reg. 1400.2).

explicit warning concerning free credit balances on periodic statements to clients, both the TSE and the IDA require their members to make available to their customers, upon request, a statement of their financial condition as of the close of their latest financial year.[276] Furthermore, the TSE and the IDA each maintain compensation funds for the benefit of their members' customers, although the associations do not recognize any legally binding obligations upon themselves to compensate the customers of failed members. In the light of this attitude by the associations, it is doubtful that their members ought to be granted the privilege of using customers' funds in the conduct of the members' businesses.[277]

To ensure their compliance with the various rules relating to financial responsibility, all registrants must subject themselves to an audited examination of their financial affairs at least annually. Procedures are quite different as between members and non-members of the self-regulatory organizations. The self-regulatory organizations are responsible for the audits of their members.[278] Each self-regulatory organization selects a panel of experienced auditors and causes each of its members to select one from the panel of auditors to make such examination of the financial affairs of the member as is required under the rules and regulations of the organization, which rules and regulations must be satisfactory to the commission.[279] The panel auditor making the examination reports the results thereof to the exchange auditor or the association auditor, as the case may be.[280] The exchange or association auditor also is appointed by the relevant self-regulatory organization, subject to the approval of the commission.[281] This procedure, whereby the self-regulatory organizations designate the persons to make audits, the rules and regulations under which they are made and the official to receive the audit reports, effectively relieves the commission of all responsibility for enforcement of standards of financial responsiblity with respect to members of the self-regulatory organizations. The commission has a residual power, however, to make an examination itself or to appoint any person to make an examination of the financial affairs of any

276 TSE by-laws, s. 18.05A, 3 CCH CAN. SEC. L. REP. ¶ 89-754A; IDA, THE BLUE BOOK, 542-43 (1976) (Reg. 1600). Under the 1975 amendments to the U.S. Exchange Act, it is mandatory for all brokers and dealers to file annually a certified balance sheet and such other financial information as the commission may prescribe; Exchange Act, s. 17(e)(1)(A).

registrant, whether member or non-member of a self-regulatory organization.[282] Thus it can be seen that from the commission's point of view, membership of registrants in a self-regulatory organization is to be prized.

As for non-member registrants, they are obligated to file annually and at such other times as the commission may require a financial statement certified by the registrant or an officer or partner thereof and reported upon by an independent auditor.[283] The registrant must issue standing instructions to its auditor to act at the request of the commission or the director in making an interim audit.[284]

A registrant which maintains its books and records in such manner that they are not capable of being audited will have its registration cancelled,[285] as will a registrant operating in violation of the net capital rules.[286]

C. BEHAVIOURAL STANDARDS FOR BROKER-DEALERS

1. *Shingle Theory*

The broker-dealer, by setting up business, by mounting his "shingle", makes a broad, basic representation to the public at large "that he will deal fairly with his customers and that [their] transactions will be handled promptly in the usual manner, in accordance with trade custom".[287] The application of the shingle theory to a given transaction is not predicated upon the existence of a common law fiduciary obligation on the part of the broker-dealer toward his customer, and in fact it has been applied to transactions where the broker-dealer acts as principal.[288] In substance the shingle theory represents standards of professional conduct.[289] Even though the theory is one of implied representation, it is doubtful that disclosure by a broker-dealer that he was not in fact acting in accordance with professional standards would

Legis. 1 (1975); Jacobs, *The Impact of Securities Exchange Act Rule 10b-5 on Broker-Dealers*, 57 Cornell L. Rev. 869, 876-81 (1972); Spiro, *supra* note 27, at 447.

288 E. Weiss, *supra* note 44, at 171; *In re* Harold Grill, 41 SEC 321, 325 (1963); *In re* William Harrison Keller, 38 SEC 900, 905 (1959).

289 E. Weiss, *supra* note 44, at 171.

excuse him.[290] The shingle theory has been adopted by the OSC in disciplinary proceedings arising out of the operations of classic "boiler shops", that is, brokerage firms that specialize in the distribution to unsophisticated investors of highly speculative, unseasoned issues via high pressure telephone sales campaigns.[291] In disciplinary proceedings before the SEC it has been used as a handle to condemn diverse types of objectionable conduct engaged in by broker-dealers, including: failure by a dealer to disclose the charging or paying of a price for a security not reasonably related to the prevailing market price for that security;[292] failure to pay for securities sold and delivered by a customer to a broker-dealer and failure to make timely delivery of a security sold to and paid for by a customer;[293] engaging in business while insolvent.[294] Under the shingle theory, the SEC has held that a broker-dealer impliedly represents that he is not engaged in boiler room activities;[295] that he will not misappropriate customers' funds or securities;[296] that he will not churn a customer's account – that is, cause a volume of trading in the account that is excessive in the light of the customer's investment

290 Cohen & Rabin, *supra* note 34, at 703.

291 Typical boiler shop activities are described in *In re* Adelaide Securities Ltd., [1968] OSC Bull. 57 (March); *In re* Goldmack Securities Corp. Ltd., [1966] OSC Bull. 21 (January).

292 In addition, the NASD has specific responsibility to make rules concerning accurate quotations of prices of securities in the over-the-counter market at the wholesale and retail levels; Exchange Act, s. 15A(b)(12). *Compare* OSC Conditions of Registration, 2 CCH CAN. SEC. L. REP. ¶ 54,935 (Over-the-Counter Trading Reports and OTC Manual for Registrants). The NASD also has promulgated policies relating to fair dealer markups, that is, the amount above the market price that a dealer may charge for a security, and markdowns, the amount below market price at which a dealer may purchase from his customer; *see* NASD Rules of Fair Practice, art. III, s. 4, CCH NASD MANUAL ¶2154. The SEC has adopted the NASD rules as applicable to SECO broker-dealers; SEC, Securities Exchange Act of 1934 Release No. 9420, Dec. 20, 1971. *See In re* Managed Investment Programs, 37 SEC 783 (1957). Mark-up policy is concerned with the difference between the market price and what the dealer charges and not the difference between what he pays and what he charges. If, for example, a dealer has held securities in inventory for a time and the market has risen in the interim, he can quite properly sell the securities at the current market; *see* Jacobs, *supra* note 287, at 939-40.

293 *In re* Reynolds & Co., 39 SEC 902, 913 (1960); *In re* W.R. Cromwell, 38 SEC 913, 915 (1959); *In re* C.J. Bliedung, 38 SEC 518, 521 (1958); *In re* L.H. Ankeny, 29 SEC 514, 516 (1949). *See also* Laskin v. Bache & Co., [1972] 1 O.R. 465 (C.A.) (without mentioning shingle theory, court awards damages to customer of broker-dealer firm where firm fails to deliver securities paid for by customer, thereby causing customer to lose advantageous opportunity to dispose of securities).

294 *In re* Thompson & Sloan, Inc., 40 SEC 451, 454 (1961); *In re* E.L. Robbins, 39 SEC 847, 849 (1960); *In re* Batkin & Co., 38 SEC 436, 446 (1958). Such conduct also would violate the applicable net capital rules.

295 *In re* Seabord Securities Corp., 43 SEC 118 (1966); *In re* MacRobbins & Co., *supra* note 287.

296 *In re* Thompson & Sloan, Inc., *supra* note 294; *In re* W.R. Cromwell, *supra* note 293.

objectives and the main purpose of which is to earn commissions for the broker.[297]

Indeed, the shingle theory might well be called the "shingle roof theory", for it capaciously houses just about every ethical shortcoming a broker-dealer could possibly be guilty of – including a number treated herein under different headings. As one commentator has aptly phrased it: the shingle theory is "ubiquitous".[298]

2. *Know-Your-Client*

The know-your-client rule is designed both to protect the broker-dealer from an unscrupulous customer who might leave the broker-dealer prey to financial loss or involve him unwittingly in improper market activity, and to ensure that the broker-dealer does not make investment recommendations to the customer that are not suitable for the customer's financial position and investment objectives.[299] Violations of the rule have frequently given rise to disciplinary proceedings in fact situations involving each of the rule's aspects.[300] The client protection aspect of the rule is considered later in this paper in connection with behavioural standards relating to the advising function.

Facts in the recent *W.D. Latimer Co. Ltd.* proceeding provide a classic illustration of the need for the firm to know its client in order to protect itself.[301] Latimer Co. is a wholesale dealer; it deals with other dealers as opposed to the public and it is one of the largest, if not the largest, market-makers in unlisted securities in Canada. The proceeding was concerned with the propriety of the firm having allowed a direct telephone wire to be installed between itself and the offices of one Gould. Gould and his friends manipulated the market for the stock of Santack Mining Co. by trading it through Latimer Co. to nominee accounts they had opened at a number of brokerage houses in Toronto. The accounts

with the brokerage houses were on a delivery against payment basis, each broker having agreed to purchase Santack for a particular account and to deliver it to a bank against payment. When the Gould group failed to induce the public to purchase Santack stock, it simply walked away from the accounts. No arrangements having been made with the banks to pay for the stock, the banks refused to accept delivery. Meanwhile, the brokers, having placed orders for the stock with Latimer Co. and being obligated to accept it, had to suffer the loss – amounting to several thousand dollars. The loss was attributable in large part to the brokers' failure to verify the credit-worthiness of their clients in the nominee accounts.

3. *Supervision*

The duty of supervision encompasses the notion that a registrant is responsible for ensuring compliance within the firm with the law and all applicable ethical standards.[302] The duty of supervision will encompass such matters, among others, as: review and approval by a partner or officer of the firm of the opening of new accounts; ensuring that full and accurate information has been obtained about the client and that the arrangements, if any, for credit to be extended to the client are within the firm's policies; daily review of all transactions for the accounts of customers and for firm accounts and the accounts of partners, officers and employees of the firm; monthly review of all active accounts; and on-the-job training of salesmen and supervision of the representations they make.[303] Failure to supervise has been the subject of a large number of disciplinary proceedings against broker-dealer firms[304] – in fact, just about any dereliction by a registrant's

302 *See generally* E. Weiss, *supra* note 44, at 34-35; OSC Conditions of Registration, *supra* note 197, app. 5, schedule 2 (The Supervision of Account Activity – A Management Function). Failure reasonably to supervise a person who, while subject to one's supervision, has committed a violation of the federal securities laws is made a specific ground under the Exchange Act for denial, suspension, or revocation of registration as a broker-dealer; Exchange Act, s. 15(b)(5)(E). No person shall be found to have failed in his duty of supervision, however, where at the time of the underlying violation there had been established procedures which would reasonably have been expected to prevent such violations and the person carried out his duties under these procedures without reasonable grounds to believe that they were not being complied with; *id.*

303 OSC Conditions of Registration, *supra* note 197, app. 5, schedules 1, 2. The partner or director designated to supervise account activity shall ensure that the handling of client business is within the bounds of ethical conduct consistent with just and equitable principles of trade and not detrimental to the interests of the securities industry; *id.*

304 *In re* W.D. Latimer Co. Ltd., *supra* note 301; *In re* Diversified Investment Services Ltd., [1969] OSC Bull. 140 (July); *In re* Martell Investment Co. Ltd., [1969] OSC Bull.

employee must raise the question of adequacy of supervision. In the *Davidson & Co.* proceeding,[305] the OSC canvassed the duty of supervision thoroughly. One Williamson, a salesman at Davidson & Co., unwittingly allowed himself to be used in a scheme whereby certain senior salesmen of a mutual fund distribution company persuaded their customers to purchase shares in the fund's management company and in an affiliated life insurance company.[306] The fund salesmen, only one of whom Williamson had ever met, opened through Williamson accounts at Davidson & Co. in the names of the fund shareholders, and the fund salesmen instructed Williamson to purchase shares in the management and insurance companies for the new accounts, often on margin with the fund shares as collateral. Williamson asked next to nothing about the customers in these new accounts. Delighted with the extraordinary amount of commission revenue he was suddenly earning, Williamson was content to "hear no evil, speak no evil, see no evil". In considering the matter of Williamson's supervision by Davidson & Co., the commission absolved the partner in charge of client accounts on the grounds that when he noticed Williamson's uncharacteristically large number of new accounts he asked Williamson whether he was in touch with all his new clients and received an affirmative answer. The partner in charge of salesmen, who had the basic responsibility for approving new account cards, asked Williamson almost nothing about his extraordinary number of new accounts; in particular, although the clients were listed on the cards as "referrals", the partner did not inquire as to who had referred them. The partner in charge of the order room was found to have been lax in not having looked into a certain "office cross" that Williamson asked him to put through.[307] Finally, the managing partner was found to have violated the duty of supervision in having failed to make clear precisely who among the different partners had responsibility for what.[308]

123 (July); *In re* Frederick D. Litman, *supra*, note 300; *In re* Robertson, Malone & Co. Ltd., [1968] OSC Bull. 254 (November); *In re* James Stewart Ltd., [1967] OSC Bull. 30 (June).

307 The seller of the shares in the management and insurance companies who was chief architect and principal beneficiary of the scheme had deposited them for sale through Davidson & Co.

308 Each of the three partners found to have been guilty of inadequate supervision was suspended from taking any part in the firm's activities for periods ranging from one to three weeks; [1972] OSC Bull. at 11.

4. *Record Keeping*

The rules governing the making, keeping and preserving of specified books and records by a broker-dealer are perhaps the most fundamental type of regulation enabling the regulatory authority to carry out its administrative and enforcement functions.[309] The necessity of properly maintained books and records for the conduct of audits and investigations is obvious. In Ontario, broker-dealers must make and maintain for specified periods records covering *inter alia* the following matters: daily blotters reflecting all purchases, sales, receipts and deliveries of securities and receipts and disbursements of cash and the accounts for which the transactions are effected; ledger accounts reflecting all assets and liabilities and income and expenses; records showing all securities borrowed, loaned, in transfer, failed to receive and failed to deliver; records of all securities long and short in customer and firm accounts; memoranda of instructions for all transactions in securities; detailed records on each margin account maintained.[310]

5. *Antimanipulative Rules*

A variety of rules may conveniently, if rather miscellaneously, be grouped under the heading "prohibitions against market manipulations". Such prohibitions seek to keep the market free and open and to prevent interested parties from manipulating market price to their own advantage. To state that market manipulations are prohibited might appear to belabour the obvious, since it is a necessary condition for the efficient functioning of an auction trading market that prices quotations be determined through the operation of impersonal forces of supply and demand and that they should in no sense be rigged.

As an example of antimanipulative rules, under the Exchange Act in the United States there are a series of rather complicated rules prohibiting persons "interested in a distribution" from dealing for their own accounts in the securities being distributed and from paying others to procure the purchase of such securities on an exchange.[311] These rules have no precise analogue in Canada

309 E. WEISS, *supra* note 44, at 39.

310 Ontario Securities Regulations, s. 6(5); OSC Conditions of Registration, *supra* note 197, app. 5 (Business Records and Procedures). In fact, the incidence of the record-keeping requirement is upon all registrants and not just those registered to trade. But, as can been seen from the list, fulfilling the requirements is most onerous for those who trade.

311 Rules 10b-6 and 10b-2, respectively, under the Exchange Act, 17 C.F.R. ss. 240.10b-6, 240.10b-2 (1977). These rules literally applied would effectively make any distri-

among rules promulgated by the regulatory authorities. A number of administrative proceedings, however, have dealt with situations wherein, in connection with a distribution, a false appearance of a market was created, for example, by publication of non *bona fide* quotations.[312] An interrelated series of disciplinary proceedings against broker-dealers in British Columbia recently has detailed the colourful and blatantly fraudulent activities of a self-confessed stock swindler named Danielson to manipulate the market for various securities on the Vancouver Stock Exchange by paying secret commissions to securities salesmen to "blow off" the stock, that is, peddle it to their customers.[313]

Stock market manipulation is the subject of two provisions of the Criminal Code: section 338(2), which makes it an indictable offence by fraudulent means to affect the public market price of securities, and section 340, prohibiting "wash trading" and matched orders.[314] "Wash trading" is the practice of entering buy and sell orders simultaneously, so that there is an appearance of market activity without any change in beneficial ownership. A matched order is a variant on the same practice; orders for offsetting transactions for a given amount of a given security are entered for different accounts under common control at the same time and the same price.

Not all tampering with free market forces receives the sinister epithet "manipulation". "Stabilization" of the market price of a security is a form of manipulation permitted during a distribution.[315] Stabilization consists in the buying of a security for the limited purpose of preventing or retarding a decline in its price in the open market. The ability to engage in stabilization enables underwriters to protect themselves against the risk of a break in

---

bution of securities impossible and there are a variety of exemptions from their coverage. *See generally*, E. WEISS, *supra* note 44, at 112-55; Wolfson, *Rule 10b-6; The Illusory Search for Certainty*, 25 STAN. L. REV. 809 (1972).

312 *In re* W.D. Latimer Co., [1967] OSC Bull. 9 (August); *In re* Goldmack Securities Co., [1966] OSC Bull. 47 (January). In the more recent proceeding involving Latimer Co., *supra* note 301, the OSC prohibited the registrants from having direct telephone lines to underwriters and promoters.

314 *See also* Criminal Code, s. 341, prohibiting "Bucketing" (entering an order to purchase or sell stock without intention of paying for it or receiving delivery of it, with intent to make a profit from the rise or fall in price of the stock).

315 *See* Wolfson, *supra* note 311, at 813-14; Klein, *Stabilizing Securities Prices*, 5 SEC. REG. L.J. 13 (1977).

the market which would be a normal result of the selling pressure involved in a distribution. To prevent ostensible stabilization from being used to *raise* the price of the security, the applicable rules provide generally that a stabilizing bid or purchase may not be made at a price exceeding the last preceding independent transaction in the security, and in no event at a price in excess of the offering price.[316] In the United States, rules concerning the prices at which stabilizing bids may be made have not been left to the self-regulatory organizations but have been promulgated by the SEC itself.[317]

6. *Short Selling*

Short selling, the selling of a security that the vendor does not own (in the expectation that it can be purchased later at a lower price in time to make delivery), presents problems that are in a sense opposite to those involved in stabilization. Short selling can be a self-fulfilling prophecy. Those who have sold short have a vested – and urgent – interest in seeing the price of the stock decline, and the pressure on a stock's price from short selling in large amounts can be severe. Considering the practice's potential for wreaking havoc with the market, its regulation is surprisingly sparse. Under OSA section 79 any person or company who places an order through a registrant to sell a security that at the time of placing the order he does not own shall, at the time of placing the order, so declare to the registrant. Exactly what this declaration is supposed to achieve is not clear, but Uniform Act Policy 2-08 "requests" registrants to record and maintain for inspection a list of declared short sales and to report to the commission sales that were not declared as short but which a subsequent failure to deliver by a customer suggests may have been short. In order to control the downward price pressure that may be exerted by short sales, the rules of the TSE stipulate that no short sale may be made below the price of the last sale of a board lot of the security, or even at such price unless that price was above the price of the board lot before it.[318] A member receiving an order for a short sale must so indicate on his order slip and keep a record of all short trades at least for a year.[319]

A registrant may not sell short securities of the same class as

316 TSE by-laws, s. 11.11, 3 CCH CAN. SEC. L. REP. ¶ 89-401.

317 Rule 10b-7 under the Exchange Act, 17 C.F.R. s. 240.10b-7 (1977).

318 TSE by-laws, s. 11.27, 3 CCH CAN. SEC. L. REP. ¶ 89-426.

319 *Id.* In the United States the almost identical rule has been promulgated by the SEC with respect to short sales on a national securities exchange; Rule 10a-1 under the Exchange Act, 17 C.F.R. s. 240.10a-1 (1977).

are held in customers' margin accounts. OSA section 78 prohibits the partners, officers and employees of a registrant which carries margin accounts from selling, for an account in which any one of them has a beneficial interest, securities of the same issuer as are carried in the margin accounts "if the effect of such sale would, otherwise than unintentionally, be to reduce the amount of such securities in the hands of the [registrant] ... below the amount of such securities that he should be carrying for all customers". Such sales obviously would amount to the registrant betting against his customers' positions. A margin customer may void his contract with a registrant who violates section 78 and may recover all monies paid with interest thereon or securities deposited to the margin account.[320] The conduct prohibited by section 78 is in the same words made an offence under section 342 of the Criminal Code.

7. *Prohibited Representations*

OSA section 69 prohibits any person or company, not just registrants, from making three specific types of representations with the intention of effecting a trade in a security. First, except in the case of securities carrying a right of redemption or repurchase by the issuer, no representation that any person will resell, repurchase or refund the purchase price of any security may be made.[321] Second, "undertakings" as to the future value or price of a security are prohibited.[322] Third, except with the written permission of the director, representations that a security will be listed on a stock exchange or that an application to list it has been or will be made are prohibited.[323]

OSA, section 68, contains a general prohibition against any person or company calling at any residence or telephoning to any residence for the purpose of trading in any security with any

320 It is by no means apparent just how the customer is supposed to discover that s. 78 has been violated. Also unclear from the statutory language is whether the option of voiding the contract is available to all margin customers or only to those who have purchased on margin securities of the same description as those the registrant has sold.

321 OSA, s. 69(1). For a case involving violation of this prohibition, *see In re* Rosmar Corp. Ltd., [1975] OSC Bull. 30 (January). This prohibition does not apply where there is a written agreement signed by the person intending to make the trade, and the purchaser is not an individual, and the acquisition cost of the security is in excess of $50,000; OSA, s. 69(1).

322 OSA, s. 69(2). One may guess that this particular prohibition is violated with great frequence in "boiler room" type operations. *See In re* Harold D. Reynolds, [1965] OSC Bull. 1 (July-August).

323 OSA, s. 69(3). *See* Culling v. Sansai Securities, [1974] 3 W.W.R. 686, 45 D.L.R. (3d) 456 (B.C.S.C.).

member of the public.[324] There are exceptions: permitting personal or telephone calls in connection with a trade for which registration is not required; to a close personal friend, business associate or customer with whom the caller has been in the habit of trading in securities; and to a person who has requested in writing that information on a specific security be furnished to him (but the call is permitted only with reference to that security).[325] Presumably the purpose of the prohibition is to put a damper on "boiler room" activities. In Bill 7, Ontario proposes to liberalize the rule greatly: personal and telephone calls to a residence would be permitted subject to a power in the commission, to be exercised only after opportunity for hearing, to "suspend, cancel, restrict or impose terms and conditions upon the right of any person or company" to make such calls for the purpose of trading in securities.[326] The proposal seems to be an improvement as it would allow for control of high-pressure sales techniques at the same time as it would take reputable broker-dealers out of a straitjacket.

A new provision in Bill 7 will enable the OSC under certain circumstances to control all advertising and sales literature used by broker-dealers. Under proposed section 49 the commission may, after giving the registrant an opportunity to be heard, and upon concluding that the registrant's past use of advertising and sales literature makes it in the public interest to do so, order the registrant to deliver to the commission at least seven days in advance all advertising and sales literature (not including prospectuses and preliminary prospectuses) proposed to be used by the registrant.[327] Where the commission has issued such an order the director may prohibit the use of the material or require changes in it.

8. *Confirmations*

A broker-dealer must send its customer a written confirmation of each transaction in securities setting forth the quantity and description of the security; the consideration and the commis-

324 *See In re* Robert Ginetti, B.C. Corp. & Fin. Serv. Comm'n Weekly Summary, July 12, 1975, at 1.

325 OSA, ss. 68(2), (3). The last mentioned exemption has proven to be the most important one as it enables a registrant to send out cards to its entire mailing list in the form: "Are you interested in learning more about the securities of Company X? If so, sign and return this card." Once the card is returned, the registrant may then telephone the customer.

326 Ontario Bill 7, s. 36. Note that this power is reserved to the commission and not the director.

327 In Ontario Bill 75 the requirement concerning the registrant's past conduct was not included, and the TSE, *supra* note 15, at 21-22, criticized the lack of a standard.

sion, if any; whether the registrant acted as principal or as agent; the day and name of the stock exchange, if any, on which the transaction took place; the name of the salesman, if any; and, for stock exchange transactions, the name of the person or company on the other side of the transaction.[328] Also, where a broker-dealer sends written material for the purpose of effecting a transaction in securities wherein he intends to act as principal, OSA section 70(1) requires him in the written transmission to state such intention to act in that role. Where he makes an oral communication with intention to effect a trade in securities in which he intends to act as principal, he must under section 70(2) disclose in a written confirmation that he has acted as principal.[329] Violation of section 70 gives the customer a right of rescission.[330]

9. *Fiduciary Obligations*

To a lawyer, perhaps the most significant fact revealed by the confirmation slip in a securities transaction is the capacity in which the registrant has acted: principal or agent. Clearly a broker in a securities transaction, as an agent, has fiduciary obligations – as distinct from mere contractual obligations – that may be enforced by his client.[331] The extent, however, of the fiduciary obligations chargeable to the broker in a given transaction will vary according to the facts of that transaction. "To say that a man is a fiduciary only begins analysis."[332] Furthermore, as enforced by regulatory agencies many of the duties of licensed securities traders (*e.g.* shingle theory, know-your-client, net capital rules) operate irrespective of the capacity in which the licensee has operated.

And even in private damage actions, courts have held registrants to a standard of fiduciary-type obligations where the registrant, although having plainly disclosed to the customer that it was acting as a principal in the transaction, induced the customer to rely on the registrant's advice. For example, in *Burke v. Cory*,[333] the defendant broker-dealer made certain representations to the plaintiff, a doctor by profession, concerning the advisability of investing in certain mining shares. The plaintiff bought the shares, and the representations turned out to be false and the

328 OSA, s. 67. The names of the salesman and of the person on the other side of a stock exchange transaction would be of little practical use to the customer since these items may be expressed in codes which need be revealed to the commission only.

329 Section 70(2) is redundant in the light of OSA, s. 67.

330 OSA, s. 71.

331 Laskin v. Bache & Co., [1972] 1 O.R. 465 (C.A.).

332 SEC v. Chenery Corp., 318 U.S. 80, 85-86 (1943) (*per* Frankfurter, J.).

333 19 D.L.R. (2d) 253 (Ont. C.A. 1959).

shares worthless.[334] The court found that the defendant had made it clear to plaintiff that the defendant was acting as agent for the vendor, but that, notwithstanding, the defendant had assumed fiduciary obligations toward the plaintiff because the defendant

> "went to great pains to convince the defendant [sic] of his pre-eminent qualifications as an 'investment counsellor' and of his possession of vital private information in relation to the stocks which he was advising him to buy.... In fact, he went to greatest lengths to gain the plaintiff's confidence...."[335]

Speaking of the functional approach to regulating the activities of broker-dealers in the United States, a commentator there has made the following observation which, while it may not yet accurately describe the Canadian situation, represents a goal to be hoped for:

> "[A] system of regulation has been developed, through adoption of regulations and by judicial and administrative decisions, which recognizes the facts of life in the securities business: (1) that the form of a particular transaction, whether agency or principal, is in large measure accidental and under the control of the broker-dealer; and (2) that, to the extent the public requires protection against the possibility that the broker-dealer, for reasons of financial self-interest, may induce transactions improperly, such protection is required regardless of the form of the transaction. In the aggregate this system imposes a duty on the broker-dealer to act fairly in all transactions with customers regardless of the form of the transaction."[336]

While at first it may appear odd to allow the combination within a single firm of the functions of agent and principal, so long as the regulatory structure imposes a code of ethics regardless of the form of a particular transaction the conflicts of interest that result from the mixing of functions will be potentialities only. Since 1936, when the SEC decided against recommending to Congress the enforced separation of brokerage and dealership functions,[337]

334 The court found, *id.* at 256-57, that the representations made by the defendant would have supported an action for deceit, but fraud was not pleaded.

335 19 D.L.R. (2d) at 260. *See* Chasins v. Smith, Barney & Co., 438 F.2d 1167 (2d Cir. 1970) (dealer that failed to disclose its status as a market-maker in an issue it advised its customer to purchase held liable, even though confirmations revealed dealer's status as principal). *See also* Levin & Evan, *supra* note 23, at 347; Cohen & Rabin, *supra* note 34, at 703; E. 337 SEC, REPORT ON THE FEASIBILITY AND ADVISABILITY OF THE COMPLETE SEGREGATION OF THE FUNCTIONS OF DEALER AND BROKER (1936).

such a separation has not seriously been pressed.[338] In fact, the most important Canadian agency market, the Toronto Stock Exchange, probably has taken a pronounced step toward "dealerization" with the reduction in the liability trading limit from $400,000 to $100,000.[339] The small investor may think that whenever he places an order for securities that order is matched against some other small investor's opposite order. The truth often is far from that, but the lack of congruence between popular image and reality may not be important so long as the dealing is in fact fair. The dealing is decidedly not fair in those situations, encountered frequently in the reports of disciplinary proceedings, where the registrant tells his customer that "the market" price of the securities is X, whereas in fact the only "market" is what the dealer chooses to make. In such a situation the dealer is capitalizing on the public misconception of how securities markets work.

D. STANDARDS APPLICABLE TO THE ACTIVITY OF UNDERWRITING

The major responsibility of the underwriter from the regulatory point of view is signing the certificate in the prospectus stating that to the best of the underwriter's knowledge, information and belief the prospectus constitutes "full, true and plain disclosure of all material facts relating to the securities offered".[340] To the extent the underwriter is exposed either to administrative sanctions or damage actions for the truth of its representation in the prospectus, it has a strong interest in keeping the issuer "clean".[341]

In the only significant proceedings to date involving the responsibilities of an underwriter in connection with signing the section 53 certificate in a prospectus, an administrative proceed-

338 Segregation of dealer from broker functions on the TSE was recommended in the WINDFALL REPORT at 109. The recommendation, however, was premised explicitly on a perceived lack of adequate power in the OSC to regulate the conduct of business of the TSE. Since amendments to the Ontario Securities Act made after the date of the WINDFALL REPORT considerably strengthened the OSC's powers over the exchange, that recommendation would appear to have lost much of its force.

339 *See In re* By-Law 153 of the Toronto Stock Exchange, [1977] OSC Bull. 171 (July). In liability trading, an exchange member will actually purchase as principal part or all of a block of listed securities, usually from an institutional investor. The broker will later resell the securities when and as the market can absorb them without price depressing effects. The willingness of brokers to engage in liability trading in a thin market adds greatly to the liquidity of large holdings.

340 OSA, s. 53.

341 Ontario Bill 7, s. 126 fixes any underwriter who is required to sign the prospectus with liability to purchasers for rescission or damages where the prospectus contains a misrepresentation.

ing before the OSC,[342] the commission found that the president of an underwriting firm had, on the firm's behalf, caused the certificate to be signed under circumstances where a statement in the prospectus, to the effect that the underwriters had agreed not to sell to or for the account of residents of the United States, was not true.[343] The president was found not to have shown "the degree of care and diligence that is required in such a situation by the responsible trading officer of an underwriting firm". The sanction imposed against the president was a one week suspension from association with the firm. There was no sanction against the firm.[344] The chief significance of the case for present purposes is that it provided an opportunity for the commission to outline the standard of conduct it expects of an underwriter. The commission said:

> "The phrases 'to the best of our knowledge and belief' and 'full, true and plain disclosure', required by section 53 of The Securities Act, are not just pious passages that appear as a matter of form at the end of every prospectus. Each word in both phrases has a specific meaning behind which must lie a course of conduct by an underwriter before he can affirm them. The underwriter stands between the issuer and the public as an independent, expert party in bringing new securities to the market. In a sense the underwriter and the issuer are joint-venturers, but in another and more important sense they must be adversaries. That is, the underwriter must seek out and question all relevant and material facts concerning the issuer and reasonably ensure himself that these facts are fully

342 *In re* A.E. Ames & Co. Limited, [1972] OSC Bull. 98 (June).

343 A.E. Ames was the managing underwriter for an offering of common stock of Kaiser Resources Ltd., which was controlled by an American parent, Kaiser Steel Co. Because the parent and one of the lead underwriters were American and because the securities would not be qualified for sale under the U.S. Securities Act, the issuer prevailed upon Ames to insert in the prospectus the clause concerning no sale to Americans. However, American directors of the parent wished to purchase part of the offering and exclusively for this purpose the issuer's Canadian counsel caused to be incorporated a Canadian investment corporation. The investment corporation purchased a portion of the shares offered by the prospectus and the American directors purchased a corresponding number of shares in the investment company (all of its outstanding shares). The commission found that the corporate entity of the Canadian investment company was ignored by its shareholders and that they had used it as a mere agent to purchase Kaiser Resources shares for themselves. Curiously, the commission's opinion does not discuss whether the undisclosed arrangement was material to the affairs of the issuer.

344 A reprimand was issued against the firm's vice-president in charge of sales who was in charge of the distribution and sale of the issue in question; the commission found that he ordered the firm's salesmen to distribute the issue notwithstanding his knowledge of the inaccuracy in the prospectus.

and truly set before the investing public. The underwriter cannot and must not merely rely on the statements and opinions of the issuer's directors, officers and counsel. He must make such independent investigation as will entitle him to say 'to the best of my knowledge information and belief...'. Certainly the underwriter will have to, and is entitled to, rely on the issuer and its officers at many points in the investigation, but such reliance cannot be an easy, automatic thing resulting in blithe acceptance at all points. Some matters and some circumstances will call for question, challenge and thorough investigation. It is not possible in one opinion to detail all such matters and circumstances. Each case will depend on its particular facts."[345]

The concept that the underwriter in a sense polices, or at least stands behind, the integrity of the issue may provide the conceptual basis to explain why underwriting should be a licensed activity separate from the necessarily concomitant activity of trading.

There are a few other provisions of the act (in addition, of course, to the substantive regulations as to contents of a prospectus) that are of particular concern to underwriters and to members of the banking and selling groups that underwriters put together for a particular distribution. In the first place is the relief provided by OSA, section 36, from the prohibition in section 35 against trading in a security until the preliminary and final prospectuses have been filed with the director and receipts issued therefor. Section 36 provides generally that in the interval between issuance by the director of receipts for the preliminary prospectus and for the prospectus it shall be permissible to advertise the forthcoming offering and to seek expressions of interest, so long as prospective purchasers are provided with a copy of the preliminary prospectus.

Under section 54 OSA, any person engaged in distribution of a security to which the prospectus requirements are applicable must notify the director of his intention to engage in the distribution and must notify the director when he has ceased to engage in the distribution.

A person who receives a purchase order for a security in the course of a primary distribution must, unless he is acting as agent for the purchaser, deliver a prospectus to the purchaser or to his

345 [1972] OSC Bull. at 112-13. The quoted language is remarkably similar to that in the celebrated American case of Escott v. BarChris Construction Corp., 283 F. Supp. 643, 696-97 (S.D.N.Y. 1968).

agent either before making an agreement or not later than midnight of the second day after entering into an agreement of purchase and sale.[346] The purchaser has a right to withdraw from the transaction until midnight of the second day after he or his agent receives the prospectus.[347] For these purposes a person who receives any compensation from the vendor may not be considered an agent of the purchaser.[348]

The question of the mode of distribution by an underwriter arose recently in an administrative proceeding in British Columbia, in the matter of *Fisher Securities Corp.*[349] The registrant was the underwriter of shares of a mining exploration company distributed through the facilities of the Vancouver Stock Exchange. In the statement of material facts it was stated that "the shares underwritten will be sold to the public through the facilities of the Vancouver Stock Exchange". In fact, by prearrangement, the shares were sold *in toto* to sixteen purchasers who were all either insiders of the issuer or persons under the control of insiders. Thus, there was no distribution "to the public" and in fact it is doubtful that what was involved was an underwriting at all since the underwriter, Fisher Securities Corp., was at no time at risk with respect to any of the securities.[350] On the question of public distribution the B.C. Commission said:

> "[W]hen a company purports to raise funds by means of what is described as a distribution of its shares to the public..., and the funds are in fact put up by a small group of insiders and their associates, a misleading impression is capable of being conveyed to the outside investing public at large that some part of that outside investing public has had confidence in the value of those securities, when in fact that is not true."[351]

346 OSA, ss. 64(1), (5).

347 OSA, ss. 64(2), (5).

348 OSA, s. 64(7). In mining issues the custom is for the underwriter to "paper the street" with prospectuses or statements of material fact (*see* OSA, s. 58(2)(b)), that is, distribute them to all the brokers, several days in advance of the sale date. Section 64(5) provides that a purchaser shall be deemed to have received a prospectus or a statement of material facts on the date when it was received by any person who thereafter begins to act as the purchaser's agent in the transaction. The net effect, and indeed the purpose, of the practice is that the purchaser's right of withdrawal has lapsed before he even makes a purchase order. Without such arrangements in mining offerings - which are usually highly speculative - a purchaser would simply wait to see what the stock's price was at the end of the second day and decide accordingly whether to exercise his automatic right of withdrawal.

349 B.C. Corp. & Fin. Serv. Comm'n Weekly Summary, September 3, 1976, at 1.

350 The Commission made no finding on the issue of whether or not there was an underwriting.

351 *In re* Fisher Securities, *supra* note 349, at 8.

In short, a distribution that purports to be made to the public but that in fact is made to insiders of the issuer or to persons under the control of the issuer or the underwriter may be the opening step in a price manipulation.

In the *Fisher* opinion, the Corporate and Financial Services Commission castigated the Vancouver Stock Exchange for total failure to enforce its own rules which require that at least 20% of a new issue distributed through the exchange must be made available by the underwriter to other brokers for the latters' customers.

E. STANDARDS APPLICABLE TO THE ACTIVITY OF ADVISING

1. *Competence*

A cardinal rule of advising is that the adviser must have an adequate factual basis upon which to make statements as to the investment merits of particular securities.[352] This means, in particular, that he may not publish advice on the basis of unsubstantiated tips and that he must verify such facts as are subject to verification.[353] Both registered advisers and registered dealers have been the subjects of disciplinary proceedings for failure to have proper factual foundations for their recommendations.[354] The rule is an element of competence – an end sought to be served more generally by the educational and experience requirements for adviser registration discussed earlier.[355] Since registered dealers generally do not have to be separately registered as advisers in order to dispense investment advice to their clients, they are not subject to educational prerequisites in their advising capacity. It would appear, however, that a registered dealer who gives advice tailored to the needs of its individual clients and who managed clients' portfolios in accord with such advice, that is, who fits within the definition of investment counsel in Ontario and investment adviser in Québec, is not rendering advice solely incidental

352 The investment counsel shall have a reasonable and objective basis for investment recommendations or opinions, which shall be supported by appropriate research; QSC, Revised Policy Statement No. 19, *supra* note 160, art. 17(1) (Concerning Conditions of Registration of Investment Counsel). *See In re* Mitchell of Canada, [1956] OSC Bull. 5 (October), *aff'd sub nom.* Re The Securities Commission and Mitchell, [1957] O.W.N. 595 (C.A.) (single judge).

353 *In re* James Stewart Ltd., [1967] OSC Bull. 30 (June); *In re* Southern Brokerage and Holding Co. Ltd., [1967] OSC Bull. 3 (February); *In re* L. & M. Securities Ltd., [1965] OSC Bull. 6 (October); *In re* Mitchell of Canada, *supra* note 352.

354 Advisers: *see In re* Southern Brokerage and Holding Co. Ltd., *supra* note 353; *In re* Mitchell of Canada, *supra* note 352. Dealers: *see In re* James Stewart Ltd., *supra* note 353; *In re* L. & M. Securities Ltd., *supra* note 353.

355 *See* ch. III.C.1 *supra.*

to its business as dealer, and thus must be registered separately in the appropriate adviser category and meet the educational and other prerequisites thereof.

Ontario and Québec are well ahead of the United States in terms of imposing qualifications upon advisers. There are no educational or other competence related qualifications for registration under the United States Advisers Act, nor are advisers under that act required to file financial statements or periodic reports with the SEC.[356] To say that there are no qualifications in the United States is not, of course, to say that there are no standards of performance. For example, a registered broker-dealer or a registered adviser who makes specific recommendations not factually supported may be found to have violated the anti-fraud prohibitions of the respective acts.[357]

2. *Suitability*

Reference to the suitability rule is a shorthand method of expressing the principle, well recognized in securities regulation, that a broker-dealer or other registrant that gives individualized securities advice may not recommend to a customer any security which he knows, or should know, on the basis of information he has concerning the customer's net worth, obligations and investment objectives, would be unsuitable for the customer.[358] The rule has its origins in U.S. federal securities regulation, principally in disciplinary proceedings arising out of "boiler room" operations; it is now a fixture of Canadian securities regulations as well.[359]

356 In 1975 and 1976 bills to amend the Investment Advisers Act were introduced in both Houses of Congress. These bills would have given the SEC broad authority to set standards for advisers; *see generally* Lybecker, *Advisers Act Amendments*, 9 Rev. Sec. Reg. 919 (1976). The bills died in Congress and the commission's ardour for new legislation has apparently cooled; *see* 1385 BNA Sec. Reg. & L. Rep., January 12, 1977, at A-4.

357 For registered broker-dealers: Exchange Act, ss. 10b, 15(c)(1) and rules 10b-5, 15cl-2; *see* Hanly v. Securities and Exchange Commission, 415 F.2d 589 (2d Cir. 1969); Dlugush v. Securities and Exchange Commission, 373 F.2d 107 (2d Cir. 1967). For registered advisers: Advisers Act, s. 206(1); *see In re* Shortline Reports Inc., SEC, Securities Exchange Act of 1934 Release No. 9084, February 21, 1971, [1970-1971 Transfer Binder] CCH Fed. Sec. L. Rep. ¶ 77,962; *In re* Capital Gains Institute, Inc., 42 SEC 373 (1964); *In re* Bridwell & Co. Inc., SEC, Investment Advisers Act of 1940 Release No. 180, December 18, 1964, [1964-1966 Transfer Binder] CCH Fed. Sec. L. Rep. ¶ 77,183.

358 *See generally* 6 L. Loss at 3708-23; Mundheim, *supra* note 24; Bines, *Setting Investment Objectives: The Suitability Doctrine* (pts. 1-2), 4 Sec. Reg. L.J. 276, 418 (1976).

359 *See* OSC Conditions of Registration, *supra* note 197, app. 5, schedule 1 (New Account Approval - Know-Your-Client); *id.* schedule 2 (The Supervision of Account Activity). A suitability rule appears to be imported into the definition of an investment counsel as a person or company that gives advice "on the basis of the individual needs of each client"; Ontario Securities Regulations, s. 2(2). Oblique statutory

The suitability rule could not successfully be avoided by a broker-dealer by the expedient of asking nothing about the client's situation because the know-your-client rule explicitly directs the broker-dealer to obtain information on the client's net worth and earnings, investment knowledge and investment objectives.[360] It is unclear what, if any, obligations the broker-dealer has in formulating suitable investment objectives for clients, as opposed to making recommendations consistent with those objectives. May the broker-dealer simply accept without question the investment objectives as stated by the client? Suppose, for example, that a low income wage earner or retired person tells the broker-dealer that he or she wishes to devote his or her entire savings to speculation? For an investment counsel or a portfolio manager, a registrant that holds itself out as being in the business of rendering advice or management based on clients' *individual needs*, it would appear reasonable to impose some affirmative obligations in setting prudent investment objectives for clients (although perhaps not for clients that are trusteed funds; in such cases the trustees may be relied upon to set investment objectives) as well as in selecting investments that will correspond to those objectives.[361] As one commentator has stated:

> "[T]he law places some limits on an investment manager's power to let his clients be foolhardy. Thus, the question is, given the degree of control the client contractually retains, how great a burden should the law impose on the manager to assure that the investment objectives agreed upon are in fact appropriate for the client."[362]

Returning to the broker-dealer context in particular, some clients may ask for execution only and may express no interest in

---

recognition of a suitability rule would be provided in the provision of Ontario Bill 7 creating a new private placement exemption from the prospectus requirement: a placement without a prospectus may be made to up to 25 purchasers who are able to evaluate the investment "by virtue of net worth and investment experience or by virtue of consultation with or advice from a registered adviser"; Ontario Bill 7, s. 71(1)(p).

360 OSC Conditions of Registration, *supra* note 197.

361 *See generally* Bines, *supra* note 358, pt. 1. Bines suggests that the suitability rule as developed for broker-dealers ought not automatically be applied to investment managers. He argues that the suitability rule developed out of a recognition of the fact that whenever a broker-dealer makes an investment recommendation he automatically is placed in a situation of a potential conflict of interest because his compensation is dependent upon the client acting upon the recommendation. This is not necessarily true for investment managers. Investment managers that are not themselves broker-dealers "sell performance, not securities, and they earn the same fee, usually a percentage of the assets under management...whatever securities they put into the portfolios they control"; *id.* at 286.

362 *Id.* at 277.

investment advice. This situation would likely become much more common under a regime of negotiated commission rates where each separate service of the firm was charged for separately. Does that client preference relieve the broker-dealer of all suitability-type obligations if the client places an unsolicited order for a security which the broker-dealer does not believe to be suitable for that client? The OSC's know-your-client rule fudges this question by stating: "It is appreciated that some accounts require less direction than others as the client may require only prompt execution of his order rather than an investment recommendation."[363] But is the client to be the sole arbiter of what the client requires? Probably the safest solution is to say that the broker-dealer, in opening a new account, must always obtain a basic minimum of information concerning his client and the client's investment objectives, and then if the client wishes to invest in a security that the registrant feels is not suitable for him, the registrant should so advise the client but may then execute the transaction if the client persists.[364]

The problem of the unsolicited transaction in an unsuitable security arose in the case of *R.H. Deacon & Co. Ltd. v. Varga*,[365] an action by a broker against its customer for money owed. The customer called the broker, with whom he had been in the habit of dealing, and placed an order for a large number of shares of Revenue Properties Companies Ltd. The broker advised the customer that the securities in question were very speculative and suggested alternative investments, but the customer indicated that he was interested only in Revenue Properties. The broker thereupon filled the customer's order. Immediately thereafter the price of the securities dropped precipitously, and the customer refused to pay for them. In the broker's action, the customer's defence was that the broker had failed to communicate to the customer a fact known to the broker but not to the customer: that Revenue Properties was in "a highly unstable and unsatisfactory financial position".[366] The jury found that indeed the broker had had such knowledge and had failed to communicate it but it also found that the customer had not relied on the broker "to discover and make disclosure of facts necessary to enable him to give

363 OSC Conditions of Registration, *supra* note 197.

informed instructions".[367] Judgment was entered for the plaintiff broker. The Court of Appeal affirmed, reasoning that where the principal was not relying on the agent for advice the agent's fiduciary duties did not encompass revealing to his principal negative facts known to the agent but not to the principal concerning the advisability of the transaction proposed by the principal. The holding, it is respectfully submitted, is incorrect, and it is not supported by the sole authority cited by the Court of Appeal, the case of *Commerce Realty Ltd. v. Olenyk*.[368] For while the *Olenyk* case does indeed stand for the proposition that "if the principal authorizes his agent to act imprudently or if he acts upon his own decision without relying on his agent's advice, then he cannot complain about any resulting loss", neither *Olenyk* nor the leading English case, *Overend & Gurney Co. v. Gibb*,[369] involved an agent who failed to disclose to his principal facts known solely to the agent. The better rule would appear to be that any contract of agency must, at the least, contain an implied term that the agent will disclose to the principal all facts known to the agent that are material to the prudence of the transaction. The question that should have been asked in *R.H. Deacon* was not "did the customer rely on the broker *to discover and* make disclosure of facts necessary to enable him to give informed instructions",[370] but rather "did the customer reasonably expect the broker to reveal all facts material to the transaction *known to the broker when the customer proposed the transaction*"? The answer to the latter question, it is submitted, would be affirmative. Certainly for the broker to have stated that the proposed transaction was "very speculative" was not the same as stating "the issuer is in a highly unstable and unsatisfactory financial position".

Had the facts in the *R.H. Deacon* case been presented in the context of a disciplinary proceeding one would expect a Canadian securities commission to take the view that, under the suitability doctrine,[371] a registrant is always under an obligation to disclose

367 *Id.* at 655.

368 8 D.L.R. (2d) 60 (B.C.S.C. 1957).

369 L.R. 5 H.L. 480 (1872).

370 30 D.L.R. (3d) at 655 (emphasis added).

371 Professor Johnston says of the R.H. Deacon case: "[It] is an unfortunate blow to the extension of the know-your-client principle to the area of civil consequences and imposes a greater regulatory load on the conditions of registration"; D. JOHNSTON at 111 n. 117. *But see* Weinrib, *The Fiduciary Obligation*, 25 U. TORONTO L.J. 1, 4 (1975), wherein the author expresses the view that the R.H. Deacon case was rightly decided because, since the client gave very precise instructions to the stockbroker, the stockbroker had no discretion and therefore no fiduciary obligation.

to a customer all facts known to the registrant material to the transaction.[372]

3. *Allocation of Investment Opportunities*

Fair allocation of limited investment opportunities among many different clients can be a serious problem for securities advisers. Investment counsel registrants in Ontario and investment advisers in Québec (the types of adviser registrants in the respective province who may have managerial authority over clients' accounts) must maintain standards for ensuring fairness in allocating investment opportunities among their various clients and must file with the commission and furnish to each client a copy of the policies.[373]

The SEC in a disciplinary proceeding has taken the position that a broker-dealer firm that changes its views on the merits of a security as to which it has an outstanding buy recommendation may not communicate the change selectively only to some of its customers.[374]

F. CONFLICTS OF INTEREST IN THE SECURITIES INDUSTRY OCCUPATIONS

Because licensed securities firms and the individuals in them perform for a multiplicity of clients a multiplicity of functions – brokerage, principal dealing, underwriting and private placements, advising and investment management – the securities market participants will often find themselves in positions of conflict of interest. The term "conflict of interest" has been defined by a prominent American securities lawyer as a situation

> "involving an actual or potential preferment of one's own interest to that of another person where the former owes some type of duty to the latter. It is not essential...that a

372 A caveat must here be added: the agent has a duty of disclosure to his principal provided he is under no conflicting obligation to preserve confidentiality. *See* discussion in ch. IV.F.1 *infra*. Although the court in R.H. Deacon did not reach the issue, there could have been a conflicting duty of confidentiality in that case because a director of the brokerage firm was also a director of the issuer. If the broker's negative information concerning the issuer was confidential inside information, then he was under a duty not to disclose it; *see* National Policy No. 18, April 1971, 2 CCH CAN. SEC. L. REP. ¶ 54-855 (Registrants Acting as Corporate Directors).

373 Ontario Securities Regulations, ss. 6(20)a, 6(20b)2; QSC, Revised Policy Statement No. 19, *supra* note 160, art. 17(1).

374 *In re* Butcher & Sherrerd, SEC, Securities Exchange Act of 1934 Release No. 9894, December 11, 1972, [1972-1973 Transfer Binder] CCH FED. SEC. L. REP. ¶ 79,135. *But see* PLI THIRD ANNUAL INSTITUTE ON SECURITIES REGULATION 293, 308 n. 25 (R. Mundheim, A. Fleischer eds. 1972).

> fiduciary relationship exist before a conflict of interest is presented. Conflicts can stem from the existence of duties which fall short of fiduciary responsibilities, but exist nevertheless as a matter of law, custom or business practice."[375]

For purposes of the discussion that follows, I would emphasize that the term "conflict of interest" describes a situation giving rise to an actual *or potential* breach of obligation. The term describes a temptation, not necessarily a yielding. A conflict situation may arise either because the party owing the duty has inconsistent interests of his own to protect – as in the conflict that arises from the commission method of compensating broker-dealers – or because the party owing the duty owes an inconsistent duty to a third party. This latter is the classic conundrum encountered by anyone who attempts to serve two masters. An example is the stockbroker who is an officer of a securities issuer.

In the discussion that follows the many conflict situations that may confront securities firms have been divided into three groups: the problem of registrants' use of inside information; the temptation to churn customers' accounts, so as to maximize profits for the registrant rather than the customer; and the problem of investment advice or investment management that is not disinterested because of the registrant's own positions in securities.

1. *Registrants with Inside Information*

As has been argued earlier in this paper,[376] a broker-dealer is generally under an obligation to disclose to its customer all material facts known to it concerning securities which it is contemplated that the customer will sell or buy. While the parameters of this obligation may be unclear with respect to transactions proposed *by* the customer where the customer is not relying on the broker-dealer for advice, the obligation is clearly spelled out under the shingle theory and the suitability and reasonable basis rules with respect to transactions proposed to the customer by the broker. In fact, where a broker-dealer makes a recommendation on a security, its obligation to disclose relevant facts concerning the issuer is not merely passive – to disclose what it happens to know – but positive – to make an investigation of the issuer.

A contrary obligation of nondisclosure is imposed, however, upon a broker-dealer that learns of material, confidential, undisclosed information (hereafter "inside information") concerning

375 Panel Discussion, *supra* note 336, at 545 (statement by K.I. Bialkin).
376 *See* text accompanying notes 365-72 *supra*.

the issuer either because the broker-dealer is an officer or director of the issuer, or because it has entered into an investment banking relationship with the issuer. A broker-dealer that learns inside information not because of a confidential relationship with the issuer but as a mere "tippee" probably is also under an obligation of nondisclosure.[377] It is to the confidential relationship problems that this discussion is directed.

The broker-director conflict is addressed by National Policy

377 The statement in the text appears to be the law in the United States pursuant to Rule 10b-5 under the Exchange Act; it appears to be a correct statement of the position under the Canada Business Corporations Act but not under the present Ontario Securities Act, which imposes no liability for tipping. The situation under Ontario Bill 7 is doubtful.

In SEC v. Lum's Inc., 365 F. Supp. 1046 (S.D.N.Y. 1973), the court considered the Rule 10b-5 liability of a brokerage firm whose salesman received adverse inside information from the president of an issuer and passed it on to certain mutual fund managers who sold out the fund's shares in the issuer on the basis of the tip. Neither the brokerage firm nor its salesman earned any revenues from the trades. The court found that the brokerage *firm* had not violated the rule because it had not failed in its duty to supervise the salesman, but the court stated repeatedly and without discussion that the salesman (not a defendant) had violated the rule.

Under s. 125 of the Canada Business Corporations Act, a person who receives specific confidential information about a corporation from a person whom the former person knows to be an insider or a tippee would be civilly liable to the corporation and to a person trading its shares where he "makes use of" the information "for his own benefit or advantage ... in connection with a transaction in a security of the corporation". Where a broker tips, it seems reasonable to hold that he is using the information for "his own benefit or advantage", at least where he expects to earn a commission or perhaps even just the tippee's good will (which may result in income for the broker later). *See generally, Anisman* at 222-25.

Section 75(1)(b) of Ontario Bill 7 provides that no person or company shall inform another person or company about an undisclosed material fact or material change in the affairs of an issuer "other than in the necessary course of business". Violation of s. 75(1)(b) is made a quasi-criminal offence by s. 118. Section 132 imposes liability in damages upon a tipper where a trade results from the tip:

> "Every person or company who sells or purchases the securities of a reporting issuer with [inside information] and every person who, directly or indirectly, knowingly informs the vendor or purchaser of the [inside information] other than in the necessary course of business is liable to compensate the purchaser or vendor for damages as a result of the trade...."

Practically speaking in a given situation the difficult point is likely to be what is "in the necessary course of business"? Since a broker-dealer is in the business of advising its clients on securities transactions, could it succeed in an argument that tipping is always in the necessary course of its business?

Ontario Bill 30, Bill 7's most recent predecessor was much clearer in this regard - if draconian. Section 77(3) of Bill 30 provided that "no person shall advise another person or company to buy, sell, hold or exchange securities of the reporting issuer with knowledge of a material change in the affairs of the reporting issuer that he knew or ought reasonably to have known had not been generally disclosed". This provision, had it been enacted, would have subjected registrants to severe difficulties. In effect, it would have prohibited not just tipping but any recommendation concerning securities of an issuer concerning which the communicator possessed

No. 18, which in turn adopts a policy of the TSE unequivocally declaring the "first responsibility" of a partner, officer or employee of a member organization that is also a director of an issuing corporation, and in that capacity privy to inside information concerning the issuer, to be to the issuing corporation.[378] An agent's duty to make full disclosure to his principal is not operative where the agent is under a superior duty of silence.[379] As between conflicting common law fiduciary duties, identifying which one is superior could be a difficult problem indeed. Where, however, one of the two duties is reflected in legislation, for example, statutory prohibitions against insider trading that effectively underscore the director's obligation to preserve corporate confidences, the legislation would appear to identify the superior duty and to amend *pro tanto* the duty that would otherwise conflict.

In the famous *Cady, Roberts* disciplinary proceeding, one Cowdin, a registered representative with a broker-dealer firm, was a director of a public corporation, Curtiss-Wright. Cowdin learned material, undisclosed, adverse information concerning the issuer. He communicated this information to Gintel, a partner in the broker-dealer firm. Gintel promptly sold the issuer's securities for accounts over which he had discretionary authority. In a proceeding against the firm and Gintel,[380] the commission first implied that Gintel, as tippee, was under a fiduciary obligation to the issuer similar to those of its director, Cowdin. Then, in language which supports the TSE position that the "higher" fiduciary duty is to the corporation, the SEC rejected as a defense the fiduciary duty owed by Gintel to the firm's customers.

> "[W]hile Gintel undoubtedly occupied a fiduciary relationship to his customers, this relationship could not justify any actions by him contrary to law. Even if we assume the existence of conflicting fiduciary obligations, there

---

inside information, regardless of whether or not the inside information was an element in the formulation of the recommendation.

378 TSE, MEMBERS' MANUAL, policy 5.01 (December 5, 1968), 3 CCH CAN. SEC. L. REP. ¶92-036.

379 RESTATEMENT (SECOND) OF AGENCY, s. 381, comment E (1958).

380 *In re* Cady, Roberts & Co., 40 SEC 907 (1961); *see also In re* Shearson, Hamill & Co. Inc., SEC, Securities Exchange Act of 1934 Release No. 7743, November 12, 1965, [1964-1966 Transfer Binder] CCH FED. SEC. L. REP. ¶ 77,306. In Shearson, Dunbar, a partner of the firm, was also a director of the issuer. He learned certain adverse inside information which was contrary to highly favourable evaluations of the issuer being disseminated by the brokerage firm's salesmen. Dunbar thereupon sold his own securities in the issuer and advised certain of his customers to do likewise. All the securities were sold to the customers of other salesmen in the firm. The purchasers recovered their damages from the firm in an action based on breach of fiduciary duty owed by the firm to them; *see* Black v. Shearson, Hamill & Co. Inc., 266 Cal. App. 2d 362, 72 Cal. Rptr. 157 (Dist. Ct. App. 1968).

can be no doubt which is primary here. On these facts, clients may not expect of a broker the benefits of his inside information at the expense of the public generally."[381]

There is perhaps a touch of circularity in the SEC's reasoning in *Cady, Roberts*. If one is to conclude that Gintel's action in selling Curtiss-Wright shares was "contrary to law" or in breach of a fiduciary duty, such a conclusion cannot be reached by attaching to Gintel the obligations that Cowdin, the director, owed to Curtiss-Wright. For while Curtiss-Wright could successfully maintain an action for breach of fiduciary duty against Cowdin,[382] it is highly doubtful that it could do so as against Gintel.[383] Therefore Gintel's action could only be contrary to law if it amounted to a manipulative or deceptive device in contravention of section 10(b) and Rule 10b-5 under the Exchange Act, the point the SEC was attempting to demonstrate.Gintel's conduct was contrary to law precisely because in the SEC's view trading on the basis of inside information violates the Exchange Act.

It may be very well for a regulatory or a self-regulatory agency to decree that as between the fiduciary duties owed by a director to his corporation and those owed by a broker-dealer to his customers, the former shall prevail. In reality, however, it is doubtful that: (1) corporate directors who are also securities registrants will usually be able to resist the temptations to trade for their own or their best customers' accounts; and (2) the customers of brokerage firms understand that they may receive investment advice that is contrary to facts known to persons in the firm. An altogether neater solution would appear to be elimination of the conflict by a prohibition against partners, officers, directors and salesmen of securities registrants serving as directors of public companies. This appears to be the solution favoured by the British Columbia Superintendent of Brokers as well as by the Corporate and Financial Services Commission of that province, which pointed out that the practical difficulty with conflict of interest situations is in determining, *post facto*, that the conflicting obligations are conscientiously discharged "or, more accurately, to determine that they have not been conscientiously discharged".[384] The language of an opinion of the California Court of Appeals, in a case involving a director of an issuer who was also a partner of a broker-dealer

384 *In re* John D. Gunther, B.C. Corp. & Fin. Serv. Comm'n Weekly Summary, June 25, 1976, at 3.

firm making a market in that issuer's securities, would appear to mandate a prohibition:

> "[W]e have been given no sufficient reason for permitting a person to avoid one fiduciary obligation by accepting another which conflicts with it.... [The problem] should not be resolved by weighing the conflicting duties; it should be avoided in advance...or terminated when it appears."[385]

While the prohibition against securities registrants and their associated persons serving as officers[386] or directors of public companies would be a simple solution to that particular conflict of interest problem, it might be undesirable from the point of view of the economy as a whole. Certain issuers, and perhaps most of all junior ones, may be greatly aided by having among their directors persons expert in matters of securities and finance. Supposedly Canadian business suffers from a relative dearth of managerial talent. Therefore proposals to prohibit any class of commercially sophisticated persons from serving on boards of directors will not be greeted with much enthusiasm. Finally, a prohibition might seem to be a rather ineffectual, half-hearted attack on the conflicts problem since an equal, if not greater, opportunity for abuse of inside information exists in the fact that broker-dealer firms also underwrite new issues and perform other investment banking functions for public companies. The author is not aware of serious suggestions that the underwriting activity should be split off from broker-dealer firms.[387] On the other hand, competition among a larger number of such firms for underwriting business is seen by many as an important goal for Canadian capital markets.

Whenever a securities firm enters into an investment banking relationship with a company, whether that relationship be for purposes of underwriting a public distribution of the company's

385 Black v. Shearson, Hamill & Co., Inc., *supra* note 380, 72 Cal. Rptr. at 161. The exact significance of the quoted language has been vigorously debated by the American securities bar; *see* Chazen, *Reinforcing the Chinese Wall: A Response*, 51 N.Y.U.L. Rev. 552, 561 (1976). The California court held that the firm's duty to make full disclosure concerning securities it recommended to its clients outweighed the director's duty to maintain the confidentiality of adverse corporate information. The director also liquidated his own holdings in reliance on the inside information.

386 Service by registrants as officers of public corporations is presumably not too common since salesmen must generally be employed full-time in the securities industry (Ontario Securities Regulations, s. 6(18)) and rules of the self-regulatory organizations specify that generally the officers or partners of their members must be engaged full-time in the securities business.

387 The undesirability of such a separation was recently asserted in SEC, Statement on the Future Structure of the Securities Markets, [1972] CCH Fed. Sec. L. Rep. (Special Report). *See* Lipton & Mazur, *The Chinese Wall Solution to the Conflict*

securities or arranging for private financing or putting together a takeover deal, the securities firm is highly likely to become privy to material undisclosed information concerning its client.[388] Even though in most situations this information will be publicly disclosed before the objective of the investment banking relationship is attained, because of the "full, true and plain disclosure" requirements of the securities laws, in the interim confidentiality would be an implied term of the contract of service between the securities firm and its client.

In a leading underwriter-broker conflict case, a securities firm, Merrill Lynch, Pierce, Fenner & Smith, was the lead underwriter on a new issue of convertible debentures of the Douglas Aircraft Corporation. After the filing of the registration statement but before its effective date, Merrill Lynch was informed by Douglas management of a sharp downward revision in Douglas' publicly released earnings forecasts. Individuals in the underwriting department of Merrill Lynch, knowing that the adverse information had not been publicly disclosed, tipped certain of Merrill Lynch's institutional customers, who promptly sold large blocks of Douglas common stock through Merrill Lynch. Merrill Lynch was found to have violated SEC Rule 10b-5 in a disciplinary proceeding,[389] and investors who purchased Douglas securities between the time Merrill Lynch tipped its customers and the time the information was publicly disclosed also succeeded in a Rule 10b-5 action against the firm.[390]

After the Merrill Lynch-Douglas affair, diversified securities firms in the U.S. tended to rely upon the "Chinese wall" as a solution to the investment banking-brokerage conflicts.[391] A firm with a Chinese wall prohibits all communications from the invest-

---

Problems of Securities Firms, 50 N.Y.U.L. Rev. 459, 495 (1975). *But see* M. Mayer, *supra* note 205, at 63.

388 In representing a potential acquirer in a takeover situation, the securities firm will of necessity learn material, and indeed the most material, undisclosed information concerning the target company.

389 *In re* Merrill Lynch, Pierce, Fenner & Smith Inc., SEC, Securities Exchange Act of 1934 Release No. 8459, November 25, 1968, [1967-1969 Transfer Binder] CCH Fed. Sec. L. Rep. ¶77,629. The fund's management company also was disciplined; *see In re* Investors Management Company, SEC, Securities Exchange Act of 1934 Release No. 9267, July 29, 1971, [1970-1971 Transfer Binder] CCH Fed. Sec. L. Rep. ¶78,163.

390 Shapiro v. Merrill Lynch, Pierce, Fenner & Smith Inc., 495 F.2d 228 (2d Cir. 1974). Since there is presumably no requirement of contractual privity in a rule 10b-5 action (*but cf.* Ernst & Ernst v. Hochfelder, *supra* note 250), potential liabilities of Merrill Lynch were truly staggering - surely far in excess of its profits as underwriter to Douglas. *Contrast* Ontario Bill 7, s. 132.

391 Erection of a Chinese wall was part of Merrill Lynch's consent decree negotiated with the SEC in the Douglas affair; *see supra* note 389.

ment banking department to the research and trading departments concerning issuers with which the firm has entered into an investment banking relationship. The effectiveness of the Chinese wall assumes, of course, the complete separation of functions between personnel in the investment banking department and those in all other departments. The confidence of the securities industry in the Chinese wall as a complete defense to Rule 10b-5 actions was shaken, however, by the decision of the trial court denying the defendant's motion for summary judgment in *Slade v. Shearson Hamill & Co., Inc.*[392] The plaintiff-investors had purchased shares of an issuer on the recommendation of Shearson's salesman made at a time when the firm's investment banking department possessed information which contradicted the publicly available information upon which the salesmen's buy recommendations were based. The securities firm had a Chinese wall policy prohibiting interdepartmental communications. Shearson's policies also prohibited *the firm* – as distinct from its salesmen – from recommending the securities of investment banking clients, although it is not clear in the particular case that the firm's customers were made aware of the somewhat subtle distinction. The *Slade* decision implies that a securities firm with inside information in one of its departments may not permit its personnel in other departments to solicit transactions that are imprudent in the light of the information.[393] What is the integrated firm to do, then, since clearly it may not utilize the inside information to benefit its trading clients?

Some have suggested that the answer lies in utilization of a "reinforced" Chinese wall.[394] The reinforced Chinese wall would in reality be a list of restricted securities. The firm would announce to its clients that it and its personnel would decline to offer any advice, including in particular modification of prior outstanding advice, on securities whose issuers appeared on the firm's restricted list, although the firm would continue to execute unsolicited transactions in such securities. As soon as the firm entered into a relationship with an issuer likely to make the firm privy to inside

392 [1973-1974 Transfer Binder] CCH FED. SEC. L. REP. ¶¶ 94,329, 94,439 (S.D.N.Y. 1974).

393 The *Slade* case is still in litigation. An interlocutory appeal from the district court's denial of summary judgment was taken, but the Court of Appeal refused to rule on the merits because the record on appeal revealed unresolved factual questions, concerning principally the impermeability of Shearson's Chinese wall; 517 F.2d 398 (2d Cir. 1974). The intriguing question which the appellate court declined to answer was: "Is an investment banker/securities broker who receives adverse material nonpublic information about an investment banking client precluded from soliciting customers for that client's securities on the basis of public information which (because of its possession of inside information) it knows to be false or misleading?"; 517 F.2d at 399.

394 *See* Lipton & Mazur, *supra* note 387.

information, it would place the issuer on the restricted list. It would be essential to trigger the restricted list procedure when the relationship was entered into, rather than when and if the inside information actually materialized, to minimize the possibility that the very appearance of an issuer on the restricted list could be interpreted as a tip. One of the relationships that might cause a securities firm to place an issuer on its restricted list, in addition to the various types of investment banking relationships, might be assumption of a directorship by a person in the firm. If so, that would be a strong disincentive to registrants serving as corporate directors.

The reinforced Chinese wall effectively places securities firms that do a substantial investment banking business at a competitive disadvantage in the trading function vis-a-vis firms that are not investment bankers.[395] The inhibiting effect on the broker-dealer activities of investment banking firms would be felt particularly strongly in Canada, where four firms are said to dominate the underwriting field (apart from junior mining issues) and those four plus another half dozen firms manage virtually all such underwritings.[396] Therefore each firm doing an underwriting business might have a substantial number of publicly traded Canadian companies on its restricted list at a given time. Taken to an extreme, the reinforced Chinese wall could mandate a virtual divorcement of the underwriting from the trading business.

At bottom, the standard of behaviour to be chosen (assuming that we do not wish a total separation of the underwriting and trading businesses) must require that reasonable customer expectations be fulfilled at the same time that inside information is not in fact used to render advice or effectuate trades in securities. Whatever customers *in fact* expect, it seems impracticable to do more than declare, as a rule of law, that "clients *may not* expect of a broker the benefits of his inside information at the expense of the public generally"[397] and that clients, at least if so advised by their securities brokers, *must* expect that advice they receive is based exclusively on publicly available data and may at times be inconsistent with confidential information known to some persons in the firm who are not at liberty to disclose it.

In the long run, the most satisfactory solution to these securities firm conflict problems, as well as to insider trading problems more generally, may lie along the affirmative path of compelling

prompt disclosure of material changes in the affairs of publicly held companies. Also, human nature being what it is, we must anticipate that registrants will, from time to time, yield to the temptation to use inside information for themselves and favoured clients. It is doubtful that we have seen the last of the Merrill Lynch-Douglas type cases. If not, and if we are serious in prohibiting trading use of inside information, then the most realistic solution may simply be draconian sanctions against registrants when those cases come to light.

2. *Churning*

The compensation earned by a broker-dealer firm is a direct function of the quantity of buy and sell transactions conducted through the firm by its customers. This is as true for dealer transactions, in which the firm is compensated by the spread between its buy and sell prices, as for brokerage transactions, where the firm is compensated by commissions, although discussions of churning usually are in the context of agency transactions. Firms, in turn, compensate their salesmen largely, if not exclusively, on a commission basis. Firms and their salesmen are therefore under a strong economic pressure to maximize the amount of trading in the accounts of clients. Obviously, however, the profitability of the account to the client over time is not necessarily positively correlated with the volume of transactions in the account, and quite the opposite may hold. Hence the method by which securities trading firms and their personnel are compensated establishes a conflict of interest with the customers.

When a registrant, for the purpose of maximizing its profits, induces an amount of trading in a customer's account that is excessive in the light of the character of the account, the registrant is said to be guilty of "churning".[398] Although the law of churning has its origin in discretionary accounts, it is not necessary that the registrant have a formal discretionary power over the account in order that a charge of churning can be sustained.[399] If a registrant has *de facto* control over investment decisions for the account, as where its owner, while retaining the formal power to authorize trades, is in the habit of following the registrant's advice without question, a case of churning should be

398 Comment, *Private Actions for the Broker's Churning of a Securities Account*, 40 Mo. L. Rev. 281 (1975).

399 E. Weiss, *supra* note 44, at 109; comment, *supra* note 398, at 282; Newburger, Loeb & Co. v. Gross, 563 F.2d 1057, 1069-70 (2d cir. 1977). SEC rule 15cl-7, 17 C.F.R. s. 240 15cl-7 (1977), governing churning in the over-the-counter markets, appears to be directed at situations involving formal discretion.

able to be made out where the trading is excessive. Where at common law a registrant would be found to have fiduciary obligations toward its client, churning would be a violation of those obligations since the principal is advancing its own interests ahead of the inconsistent ones of its client.[400] In addition to the element of *de facto* control by the registrant, there must, of course, be established that the amount of trading was excessive in the light of the objectives of the particular account. A quantum of trading activity that would be excessive in the account of a retired person seeking security of principal and regular dividend income might not be excessive in the account of a speculator seeking profits from quick in-and-out trading.

The Toronto Stock Exchange permits only partners and directors of members to exercise discretion in handling the account of a customer.[401] While such a rule is worthwhile in alleviating churning problems induced by over-zealous salesmen in formally discretionary accounts, it cannot be completely effective to eradicate churning possibilities because firms themselves, and not just their salesmen, have a direct pecuniary interest in encouraging trading. Also, the rule prohibits formal discretion in salesmen but does not (and could not) prohibit the *de facto* control that may arise from the trust and confidence that a particular client may place in the advice of a particular salesman.

Any proposal to force securities firms to compensate their personnel on a basis of straight salary rather than commissions would seem grossly unfair to the firms, if not simply impossible, since the firms' own compensation is on a commission basis.[402] Although a number of securities firms do compensate their salesmen in part by salary, it is doubtful that any firm dependent for its own existence on commissions could long remain viable without some method of strongly encouraging its sales personnel to produce commission revenues.[403] To the extent that the danger of

400 Comment, *supra* note 398, at 294-95.

401 TSE by-laws, s. 8.31, 3 CCH CAN. SEC. L. REP. ¶89-345.

402 *But see, Let's Put Brokers on a Straight Salary,* The New York Times, September 4, 1977, at 7. The author argues that not only does the commission method of compensation present brokers with an often irresistible temptation to prefer their own to their clients' interests, but that the system is doubly iniquitous since brokers often earn the largest commissions for pushing the least attractive stocks, especially in connection with primary distributions.

403 This point is well illustrated by the example of Merrill Lynch, the largest stock brokerage firm in the world. Merrill Lynch claimed to reward its salesmen not on a straight commission basis but rather on over-all performance; Levin & Evan, *supra* note 23, at 353 n. 56. Yet the firm maintained for its salesmen a sales quota system and mandatory weekend sales solicitation sessions. Pressured to produce commission revenues, some salesmen encouraged their customers to liquidate positions in securities which were contemporaneously on the firm's own buy or hold

churning is a function of the facts that securities firms live by commissions and people trust their stockbrokers, the danger is simply a fact of life and probably little can be done about it other than to impose meaningful sanctions when the danger becomes an actuality.

On the other hand, something might have been (but is not) done in Canada to split off persons *in the business of* discretionary management from persons with a direct interest in the generation of commission revenues. For example, in Ontario's draft proposed regulation on "portfolio managers" – defined as investment counsel registered for the purpose of managing the investment portfolios of clients through discretionary authority granted by the clients – transactions were to be executed through a registrant *other than* the portfolio manager.[404] In the regulation as adopted the words "other than the portfolio manager" were dropped,[405] and in fact a number of portfolio manager registrants are affiliates of brokerage firms.[406] Similarly, Ontario's policy concerning dealer-managed mutual funds clearly contemplates that the fund's brokerage transactions will be made through the affiliated dealer.[407] Where a mutual fund manager is affiliated with a securities dealer, a possible incentive to churn the fund's assets is not the only problem to worry about. The manager that directs all of the fund's portfolio brokerage to an affiliate is foregoing the opportunity to use the fund's brokerage commissions to purchase investment advice for the fund from a variety of brokers.[408] The *Canadian Mutual Fund Report* took no position on the question whether dealers should be permitted to manage mutual funds, although it pointed up a number of problems that inhere in such arrangements.[409] The report did point up the anomaly in permitting brokers to manage mutual funds while mutual fund management companies were prohibited from joining securities exchanges.[410]

Professors D. Shaw and R. Archibald, in their study for the TSE on the future structure of Canadian securities markets, recommended that securities firms be prohibited from managing

410 *Id.*

pooled accounts.[411] Of course, so long as there are maintained in Canada fixed rates of securities brokerage commissions which yield high profits on large trades, it may be impossible completely to split the exercise of discretion for pooled accounts from the receipt of commissions. This is so because brokers will always have an incentive to kick back part of their revenues on such profitable business to the persons who direct such business to them.[412]

In the United States, effective May 1, 1978, section 11(a) of the amended Exchange Act makes it "unlawful for any member of a national securities exchange to effect any transaction on such exchange for...an account with respect to which it or an associated person thereof exercises investment discretion".[413] The basic prohibition is subject to numerous exceptions, and it may never, in fact, take effect in a manner to force anything like a complete divestiture between money management and brokerage activities. Originally section 11(a) was passed as part of the 1975 amendments with the support of the brokerage industry. It was pushed by that industry as a sort of *quid pro quo* for the abolition of fixed rates of commission that also was legislated in the same act.[414] The basic purpose from the brokers' point of view was to prohibit institutional money managers from joining exchanges. Control of churning was another purpose but a decidedly subsidiary one, as may be gathered from an exception permitting brokerage and discretionary management to be combined in respect of "any

411 8 D. SHAW & R. ARCHIBALD, *supra* note 396, at 95. *But see* REPORT OF THE JOINT INDUSTRY COMMITTEE ON GUIDELINES FOR DIVERSIFICATION OF THE SECURITIES INDUSTRY (Sept. 23, 1976).

412 The processes by which brokers kick back some of their excess profits are called generically "soft-dollar" deals. Canadian stock exchanges generally have rules that attempt to prohibit such deals; *e.g.* TSE by-laws, s. 15.01, 3 CCH CAN. SEC. L. REP. ¶89-566; *see also* TSE, Policy on Commission Dollars, 3 CCH CAN. SEC. L. REP. ¶92-070; MSE by-law IV, s. 4401, 3 CCH CAN. SEC. L. REP. ¶85-501. The effectiveness of such rules is a matter of some doubt. *See generally* Connelly, *Fixed versus Negotiated Commission Rates on the Toronto Stock Exchange*, 2 CAN. BUS. L.J. 244(1977).

The classic situation of conflict of interest in the allocation of brokerage by a discretionary manager arises in the case of the mutual fund manager whose compensation is computed as a percentage of the fund's assets and who therefore has a direct pecuniary interest in the sale of fund shares. The manager has an incentive to direct the fund's portfolio brokerage as additional compensation to brokers who are particularly energetic in selling the fund's shares. The interest of the fund's shareholders, as opposed to its management, in the size of the fund is doubtful. *See* CANADIAN MUTUAL FUND REPORT, ¶¶ 3.65-3.71. Allocation of brokerage to benefit the fund's manager would presumably come within the prohibition of Ontario Bill 7, s. 111 against a mutual fund making any investment "in consequence of which a related person or company of the fund will receive any... compensation except ... pursuant to a contract which is disclosed in any ... prospectus...".

413 Exchange Act, s. 11(a), *as amended by* Securities Reform Act of 1975, s. 6(2).

transaction for the account of a natural person".[415] As it turned out after the introduction of negotiated rates, the brokerage community had made a bad bargain. Abolition of fixed commission rates removed the incentive for the institutions to seek membership in the exchanges, but the anticipated loss of money management revenues threatened the economic viability of a number of brokerage firms for whom brokerage taken alone had become suddenly much less profitable.[416] At the time of writing, the SEC has come to the rescue of the brokers by the adoption of rules under section 11(a) that define the terms "investment discretion" and "effect" a transaction so as to blunt the prohibitory impact of the statutory provision.[417] Under the rules, a broker will be deemed not to exercise investment discretion with respect to any transaction that requires the prior approval of the owner of the account; and a broker will not be held to "effect" a transaction where he sends it to another exchange member for execution, even though the forwarding broker may, where he has disclosed to the owner of the account that he will do so, share in the brokerage commission.[418] It thus appears that the attempted legislative separation of brokerage from money management services in the U.S. is well on its way to becoming a total donnybrook. The House of Representatives has passed a bill to delay the effective date of section 11(a), and the rancour in the committee proceedings has been extreme.[419]

With respect to compensation of advisers exercising managerial responsibilities over clients' portfolios, both Ontario and Québec provide that it may be based on the value of the portfolio but not on the value or number of transactions in the portfolio – the obvious purpose of the prohibition being to remove an incentive to churning.[420] In Ontario, it is provided that compensation based upon the performance of the portfolio may be charged only

upon the express written consent of the client.[421] Québec is silent on this point.

3. *Advice or Discretionary Management That Is Not Fully Disinterested*

A securities industry registrant that undertakes to give advice as to the merits of investing (or disinvesting) in particular securities thereby undertakes fiduciary obligations.[422] But be-

421 Ontario Securities Regulations, s. 6(20b) 3; With respect to mutual funds, the CANADIAN MUTUAL FUND REPORT ¶¶11.45-11.56 opted for a prohibition of performance based fees. The committee's reasoning is complex and based on technical factors, and the reader is referred to the REPORT for an explication. In brief the committee's objections to performance based fees are based on three factors: (1) it is inaccurate to judge management's success solely in terms of rate of return, especially if measured at short intervals; (2) it would be difficult to find an indicator or yardstick against which to measure the fund's performance that would be exactly comparable to the objectives of the fund; and (3) it would be virtually impossible to calculate the fee in such a way as to be completely equitable as among all of the fund's shareholders regardless of when they purchase and redeem fund shares.

422 SEC v. Capital Gains Research Bureau, 375 U.S. 180, 189-94 (1963) (registered adviser); Burke v. Cory, 19 D.L.R. (2d) 252 (Ont. C.A. 1959) (a securities dealer who referred to himself as an "investment counsellor" thereby undertook fiduciary obligations toward his customer); Elderkin v. Merrill Lynch, Royal Securities Ltd., 80 D.L.R. (3d) 313 (N.S.C.A. 1977). The facts in Burke v. Cory had a strong odour of fraud about them, but fraud was not pleaded. In the Elderkin case there was no suggestion of fraud.

In Elderkin, each one of the plaintiffs opened an account with the defendant brokerage firm and informed the firm that he would rely heavily on its advice. The firm assigned the defendant Lacas to service the plaintiffs' accounts. Each of the plaintiffs did in fact rely very heavily on Lacas's advice, although the plaintiffs retained authority to authorize each transaction and they occasionally refrained from buying a security recommended by Lacas. The trading activity in the plaintiffs' accounts was very substantial. A year or more after the plaintiffs opened their accounts, Lacas virtually besieged them with favourable reports about a new company called Multico. Each of the plaintiffs bought substantial amounts of the Multico stock on Lacas's recommendation. Much of the information about Multico turned out to be false, including, in particular, various statements made in a letter from Lacas to one of the plaintiffs in which Lacas sought (successfully) to dissuade the particular plaintiff from selling his Multico shares. The plaintiffs held on, in reliance upon the false information being communicated to them by Lacas. Ultimately the shares became worthless. Knowledge of the falsity on Lacas's part was not alleged but he made absolutely no effort to check the correctness of favourable information being fed to him by Multico insiders.

The appellate division, reversing the trial court, found that a fiduciary relationship existed between Lacas and the plaintiffs. With the fiduciary label attached, Lacas was found to have a duty to advise the client "carefully" and to have breached this duty; 80 D.L.R. (3d) at 323. Oddly, the court appears to find the fiduciary character of the relationship not so much in the general character of the securities advisory relationship between the parties as in the fact that, with respect to Multico, Lacas "represented that he was in close touch with the officers of Multico and in effect that he had inside information with respect to the company"; 80 D.L.R. (3d) at 325. The court did not explore the host of securities law problems that

cause advising registrants generally are free to invest for their own accounts in securities, including securities in which their clients are interested, they may frequently find themselves in positions of conflict of interest.[423] For example, in *Glennie v. McDougall & Cowans Holdings Ltd.*,[424] a customer requested his broker to sell out the customer's account in a certain security. The broker persuaded the customer not to sell, without disclosing that the broker itself had an enormous position in the securities of the same issuer. The Supreme Court of Canada held the broker liable for the loss occasioned to the customer by the fact that he did not sell when he was inclined to do so.

Another classic example of a conflict of interest in the advising function is the practice known as "scalping", in which an adviser purchases shares for his own account shortly before recommending the security to his clients and then immediately sells the shares at a profit upon the rise in market price following the recommendation. The practice has been held, at least in the absence of disclosure of such practice by the adviser to his clients, to be a violation of the general anti-fraud provision of the United States Investment Advisers Act of 1940.[425] The rule against scalp-

---

would have been posed if Lacas had in fact been conveying true inside information. As an independent basis for Lacas's liability, the court cited (*id.* at 325) the duty of care that the House of Lords in Hedley, Byrne & Co. Ltd. v. Heller & Partners Ltd. said will arise "if someone possessed of a special skill undertakes, quite irrespective of contract, to apply that skill for the assistance of another person who relies upon such skill"; [1964] A.C. 465, 502-03 (*per* Lord Morris of Borth-y-Gest).

It is interesting to note that in Elderkin the defendant Lacas did not earn any compensation from his Multico advice since the transactions were put through a firm other than his employer. At the same time he and his family made substantial investments in Multico stock and this may have had something to do with his desire to see his clients stay with their positions in it.

In the trial court, Merrill Lynch's liability was not analyzed separately from that of its employee and in the appellate division the firm conceded that a finding with respect to the employee would be determinative with respect to itself. This may have been conceding rather too much. The firm had a policy of not acting as broker on stocks trading under $2. During most of the relevant period Multico traded at under $2 and Lacas told the plaintiffs that a broker other than Merrill Lynch would have to handle their purchases. Also, at least in the letter mentioned above if not earlier, Lacas made it clear that Multico was his personal recommendation and not that of the firm. When the firm's manager learned of the Multico purchases induced by Lacas, the manager told him - to no avail - to get the plaintiffs out of the stock. On these facts it would appear that Merrill Lynch might have been able to sustain a claim that it was not implicated in its employee's actions.

423 The U.S. Supreme Court in the *Capital Gains* decision, *supra* note 422, cites some legislative history of the Advisers Act to the effect that at least certain elements of the investment advisory industry would have supported a flat prohibition against investment counsellors trading in securities in which their clients were interested; 375 U.S. at 189.

424 [1935] 2 D.L.R. 561 (S.C.C.).

425 SEC v. Capital Gains Research Bureau, *supra* note 422. Presumably scalping could

ing is at bottom simply a recognition of the fact that advisers with a large following are often in a position to create their own inside information.

Notable in this regard would be the position of newspaper financial columnists who have in practice in both the United States and Canada been subsumed under the adviser registration exemption for newspaper publishers.[426] Recently a financial writer for a Los Angeles newspaper has been enjoined from scalping and that has led to a reconsideration of the exemption.[427] Ontario's Bill 7 specifically includes writers within the scope of the exemption for financial publishers, but a writer who engaged in scalping might thereby place himself outside the registration exemption, one of the requirements of which is that the writer "has no interest either directly or indirectly in any of the securities upon which advice is given".[428]

Ontario's regulation dealing with portfolio managers provides that the portfolio manager and its "responsible persons" may not trade for their own accounts "in reliance upon information as to trades made or to be made for the account of clients of the portfolio manager".[429] Of course, the regulation is narrower than the anti-scalping rule since it applies only to portfolio managers, that is, advisers who manage the investment portfolios of clients, and it prohibits them only from trading in anticipation of trades for their clients as opposed to a broader prohibition against trading in anticipation of one's own advice. However, governed by the rather elastic standard of "the public interest" in disciplinary proceedings, there is probably room for the securities regulatory authorities to make the type of scalping noted in *SEC v. Capital Gains Research Bureau* a prohibited practice in Canada. More importantly, it is less likely that scalping can occur if the adviser must make full disclosure of his interest in securities recommended.

The "black letter" rule is that a registrant rendering advice concerning securities must make disclosure of any interest he may have in the securities advised upon.[430] Such disclosure must be

---

be worked in reverse also; first a short sale, then a sell recommendation, then covering the short sale.

426 OSA, s. 18(d); Investment Advisers Act of 1940, s. 202(a)(11)(D).

427 Lybecker, *supra* note 189, at 930. In the U.S. there would presumably be substantial constitutional objections to a proposal to license newspaper financial columnists. *See U.S. Const.*, amend. I. *See also* editorials in The Wall Street Journal, August 5, 1976, at 8, col. 1; *id.*, September 20, 1977, at 24, col. 1.

428 Ontario Bill 7, s. 33(d).

429 OSC Conditions of Registration, *supra* note 197; Ontario Securities Regulations, s. 6(20b)6.

430 Burke v. Cory, *supra* note 422; Glennie v. McDougall & Cowans Holdings Ltd., *supra*

made at the time the advice is rendered; it is not sufficient that, where the customer acts upon the advice by placing a trade through the registrant, the registrant's interest may be revealed *post facto* in a confirmation which states that the registrant has acted as principal.[431]

To the extent that the rule of full disclosure of interest in connection with investment advice has been codified, it operates more strictly against registered advisers than against registered traders who also give advice.

For example, OSA, section 72, requires a registered adviser to make in every writing he issues "a full and complete statement of any financial or other interest that he may have either directly or indirectly in any securities referred to therein or in the sale or purchase thereof". The interests that must be disclosed include: ownership of or options upon the securities; any remuneration the adviser expects to receive in connection with a trade in the securities; and any financial arrangement relating to the securities that the adviser may have with a registrant, an underwriter or any other person or company with an interest in the securities. In other words, the adviser must make full disclosure of any interest. By thinly veiled threats of revocation of registration, National Policy Statement No. 25 attempts to extend the legislation to "all classes of registrant when they recommend the purchase or sale of a security in which they have a material interest".[432] But, insofar as the statute itself is concerned, a trading registrant's only disclosure obligation is to disclose in any written solicitation of a trade the registrant's intention to act as principal, if such be the case.

---

note 424; *In re* A.A. Nicholson [1952] OSC Bull. 3 (December) (revocation of registration where securities salesmen received secret compensation from issuer for touting stock); *In re* Frank S. Tobin, [1952] OSC Bull. 6 (October) (similar to Nicholson); *In re* J.H. Black, [1952] OSC Bull. 3 (July - August) (similar to Nicholson); *In re* R.H. Brondyke, [1976] Alta. Sec. Comm'n Bull. 5 (October) (salesmen suspended for recommending securities to clients without disclosure of personal holdings in and capacity as financial adviser to issuer); *In re* John D. Gunther, *supra* note 384; Chasins v. Smith, Barney & Co., 438 F.2d 1167 (2d Cir. 1970) (customer's rule 10b-5 action succeeds where broker-dealer failed to reveal status as market-maker).

431 *See* Burke v. Cory, *supra* note 422. With respect to advice contained in a writing, s. 70(1) of the OSA provides that where a person or company registered to trade in securities issues, publishes or sends a writing soliciting a transaction in respect of which the registrant proposes to act as principal, the writing must state this intention. With respect to an oral solicitation made with the intention of acting as principal, s. 70(2) provides that the written confirmation must disclose the capacity in which the registrant has acted. Section 70(2) adds nothing to the basic confirmation requirement contained in s. 67.

432 The policy goes on to state that the situation of a registrant having a material interest in a security that it recommends for purchase or sale will arise most frequently where the registrant represents a party in a takeover bid, a share exchange offer or a purchase of an issue offered through a rights offering.

In Ontario Bill 7, the disclosure rule mandated for registered advisers in their written communications has been amended in two respects, both improvements. The rule has been narrowed to apply only to securities "recommended", and it has been broadened to compel disclosure of the interests not just of the adviser itself but also of directors, officers, partners and controlling persons of the adviser.[433]

The disclosures that Bill 7 would require of registered traders making written recommendations are less onerous than in the case of advisers.[434] A trading registrant would be required to make disclosures concerning itself and its officers and directors, but it would have to disclose only whether any of those would receive fees as a result of the recommended action (presumably meaning fees other than normal brokerage commissions) or was acting or had acted within the previous year as "financial adviser" to the issuer.[435] Unlike the registered adviser, the registered trader would not be obligated under Bill 7 to disclose its ownership of securities that it recommends, unless, of course, it intended to act as principal in the recommended transaction.[436] The bill, then, does not mandate the sort of disclosure by a broker-dealer the absence of which was a predicate for the imposition of civil liability in the *Glennie* case.[437] Under Bill 7, section 40, a broker-dealer firm would not have to disclose, were such the case, that its president was the promotor or a director or had significant financial transactions with the issuer. The firm would not even have to disclose its own ownership of securities of the same issuer so long as the firm did not propose to deal as principal and was not an underwriter. Furthermore, it is highly doubtful that meaningful disclosure is conveyed in the typical "hedge clause" that reputable broker-dealers as a matter of course place on their market letters to the effect that:

433 Ontario Bill 7, s. 39.

434 In Ontario Bill 75, a predecessor to Bill 7, the rule that advisers were to disclose their interests in all securities referred to was continued and the rule for advisers was extended, without modification, to trading registrants. The TSE and the IDA in their submissions on Bill 75 opposed vehemently this extension of disclosure obligations to their members. They claimed that such onerous disclosure requirements were administratively unworkable, considering especially the enormous volumes of literature sent by many dealers to their customers and prospective customers in the form of bond letters, weekly market summaries, monthly statistical summaries and so forth. Now that the disclosure requirements for advisers are proposed to be restricted to securities as to which a recommendation is made, it is doubtful that a strong case can be made for giving more favourable treatment to trading registrants.

435 Ontario Bill 7, s. 40.

436 Bill 7, s. 38, continuing OSA, s. 70(1).

437 Glennie v. McDougall & Cowans Holdings Ltd., *supra* note 424.

"This firm and/or its individual officers and directors may from time to time have a position in the securities recommended herein and may make purchases or sales of these securities from time to time in the open market or otherwise."

There are not presently, and there would not be under Bill 7, any statutory controls on disclosure of interest when the advice is rendered orally - whether by a registered adviser or by a broker-dealer. Of course the regulatory agencies are not limited to consideration of statutory violations in weighing a registrant's continued fitness for registration "in the public interest",[438] and in a private action for damages where the plaintiff had relied to his detriment upon dishonest oral advice rendered by his broker, a court presumably would not accept as a defense the absence of statutory violation.[439]

Whatever conflicts of interest may arise in the advisory function will be accentuated in the case of discretionary management. For a registrant exercising a discretionary management role, by definition, will himself make the investment choices for the managed accounts. It is not a situation where a client weighs the value of advice based on what he is informed of concerning the adviser's interest. We would therefore expect the conflict of interest controls on registrant's exercise of investment discretion to be stringent. So they are, for *some* registrants.

In Ontario, portfolio managers and dealers who manage mutual funds are subject to the following restrictions on the manner in which they cause investments to be made for managed accounts. First, trades between the managed account on the one side and the manager or an associated person of the manager in the role of principal, on the other, are prohibited.[440] This is a more stringent rule than what applies in the U.S. where, under the Investment Advisers Act of 1940, the adviser who exercises management discretion may sell securities to or purchase securities from the client, if before the transaction the adviser makes disclosure to and obtains the written consent of the client.[441] The

440 Ontario Securities Regulations, s. 6(20b)7; OSC, Policy No. 3-32, July 1975, 2 CCH CAN. SEC. L. REP. ¶54-957 (Dealer Managed Mutual Funds); Ontario Bill 7, s. 114 (portfolio managers).

441 Investment Advisers Act of 1940, s. 206(3). Following the introduction in the U.S. of negotiated rates of commission large numbers of broker-dealers had, for the first time, to secure registration as investment advisers because, to the extent that

American rule for advisers is analogous to the rule for corporate directors: the director may deal as principal with the corporation upon full disclosure in advance and approval of the transaction by a majority of the directors with the interested director abstaining, but the transaction is still subject to being set aside if not reasonable.[442]

There is much appeal to the flat Ontario prohibition, at least with respect to the managed accounts of natural persons. Even recognizing that investors with portfolios large enough to be committed to the individual management of a registered adviser are very likely not to be naïve little old ladies, it appears nonetheless that on the whole they would be less able to defend their interests against an overreaching manager than corporate directors are to be able to defend the corporation's interests against an overreaching colleague. Allowing advisers to trade as principals with managed accounts creates an unnecessary possibility for abuse. Where the fund under management is governed by trustees or directors who are independent of the adviser, however, one might be prepared to opt for the more lenient American rule. This might be the case of some pension funds, for example.[443]

The U.S. rule for managers trading as principal, that it is permissible with disclosure and written consent, also governs trades between different accounts under common management.[444] This is a matter on which Canadian regulation has heretofore been silent, but perhaps not wisely so. One can well imagine

---

broker-dealers charged separate fees for different services in the regime of negotiated rates, they lost their exclusion from the definition of "investment adviser" under the Advisers Act. That exclusion had required that the broker-dealer not charge a separate fee for advisory services. In response to the new situation, the SEC promulgated a regulation exempting investment advisers who are registered brokers or dealers from the full rigours of the prohibitions in s. 206(3) of the Advisers Act against trading with clients as principal and against representing more than one client in a transaction except upon the basis of prior written disclosure and consent. In substance rule 206(3)-1, 17 C.F.R. s. 275.206(3)-1 (1977), exempts broker-dealers from having to comply with s. 206(3) with respect to any transaction wherein the broker-dealer is acting as an investment adviser solely by means of written or oral statements which do not purport to meet the objectives or needs of specific individuals or accounts. Even so, in any such written or oral statement the broker-dealer must disclose that it may act as principal for its own account or as agent for another person.

442 *See e.g.* Canada Business Corporations Act, s. 115; Ontario Business Corporations Act, s. 134. *See also* Howard, *Directors and Officers in the Context of the Canada Business Corporations Act*, in MEREDITH MEMORIAL LECTURES 1975: CANADA BUSINESS CORPORATIONS ACT 282, 292-93 (1976).

443 In this connection it is of interest that the CANADIAN MUTUAL FUND REPORT did not place much stock in the notion of directors independent of the management company as a solution to conflict of interest problems; CANADIAN MUTUAL FUND REPORT ¶¶6.31-6.44.

444 *See* materials in note 441 *supra*.

that an investment manager would be tempted, for example, to move investments that turned out poorly from accounts whose beneficiaries kept a close watch on the manager to those whose beneficiaries were more passive, at a price that would be unduly favourable to the former at the expense of the latter. "The wheel that squeaks the loudest gets the most grease."

Portfolio managers and dealers who manage mutual funds are prohibited from causing funds under management to make a loan to the manager or an associated person.[445] Except upon prior disclosure to and written consent from the client, neither type of manager may cause a fund under management to invest in an issuer of which an associated person of the manager is an officer or director.[446] Finally, a dealer-manager of a mutual fund may not place in the fund the securities of an issuer for whom the manager has acted as an underwriter, within sixty days following the conclusion of the distribution of the securities underwritten.[447] There is no restriction upon a portfolio manager or mutual fund manager causing a fund to invest in an issuer of which the manager or an associate is a shareholder, even a controlling shareholder, or with respect to which the manager or an associate stands in a debtor-creditor relationship.[448]

The rule on conflict of interest for managing advisers in Québec is a good deal less certain than in Ontario and the United States, and while its phraseology is an admirable restatement of the law of agency *in vacuo*, it appears to be a studied attempt to avoid coming down on one side or another of the issue. It is provided that "an investment adviser shall not give, buy or sell orders on behalf of a discretionary account when he is in a position of conflict of interest", and he is in a position of conflict of interest "when the situation is such that he can reasonably assume that his personal interest will affect his ability to act with impartiality and objectivity".[449] While an investment adviser can, indeed must, assume that where he proposes to deal for his own account with a managed portfolio his personal interest *may* affect his ability to

445 *See* materials in note 440 *supra*.

446 *Id.*

447 OSC, Policy No. 3-32, *supra* note 440. A similar prohibition does not, but should, attach to portfolio managers. A portfolio manager might well be under common control with an underwriter that from time to time might wish to place "sticky" issues through its associated portfolio manager. *See generally* N. WOLFSON, CONFLICTS OF INTEREST: INVESTMENT BANKING 53 (1976).

448 *Contrast* Ontario Bill 7, s. 107(3)(c) which would prevent a mutual fund from making an investment in an issuer in which any officer or director of the fund, its management or distribution company or an associate of any of them has a significant interest. A significant interest is ownership of more than 10% of the shares of an issuer; Ontario Bill 7, s. 106(b).

449 QSC, Revised Policy Statement No. 19, *supra* note 160, art. 18.

act with impartiality and objectivity, it is hard to say when he would have to conclude that his ability *will* be affected.[450]

In Ontario the conflict of interest rules for portfolio managers and dealer-managed mutual funds leave a great many discretionary accounts outside of their ambit namely, all discretionary accounts (apart from mutual funds) managed by broker-dealer firms. This is so because the only persons or companies required to register as portfolio managers are investment counsels registered for the purpose of managing accounts through discretionary authority.[451] Broker-dealer firms who manage discretionary accounts need not be registered as investment counsels, by the exemption in OSA, section 18, and therefore need not be registered as portfolio managers. In the result, individuals who have discretionary accounts with broker-dealers are left relatively unprotected against conflicts of interest in the management of their accounts. So far as the legislation and regulations are concerned, broker-dealers managing such accounts would be free, for example, to place in the accounts "sticky" issues they have underwritten or securities they have block positioned.[452] Where these practices resulted in detriment to managed accounts (and where the account owners were litigious) the practices would presumably be found to violate common law fiduciary duties.

In the event that fixed rates of commission on stock exchanges were to be abandoned, allocation of brokerage for discretionary accounts could become a fertile ground of conflict of interest for managers. So long as commission rates are fixed, and assuming equal competence among brokers, customers' interests (apart from avoidance of churning) are not influenced by choice of brokers and, in particular, by the choice of a broker affiliated with the manager. If commission rates were to become subject to negotiation, then, presumably, the manager would be required to select brokers on the basis of cost.[453]

450 Would it be hairsplitting to say that whenever he proposes to deal for his own account, the adviser can assume that his *ability* to act with impartiality will be *affected*, even though he believes that he can compensate for those effects and thus act with impartiality?

451 *See* definition of portfolio manager, text accompanying note 404 *supra*.

452 The CANADIAN MUTUAL FUND REPORT ¶9.07, stated that in large numbers of cases mutual funds had purchased securities underwritten by associated brokerage firms and that such transactions are particularly susceptible of abuse. *See generally* N. WOLFSON, *supra* note 447.

The temptation to place block positioned securities in discretionary accounts will presumably become more severe as a consequence of the recent lowering of liability trading limits on the Toronto Stock Exchange; *see* note 339 *supra*.

453 *But see* s. 28(e) of the Exchange Act, added by the 1975 amendments, which provides that no person having investment discretion with respect to an account shall be deemed to have breached a fiduciary duty solely by reason of having caused the

In Québec, it is prohibited for an investment counsel at any time to be in possession of or to have charge of securities or funds belonging to clients.[454] This rule would effectively prohibit an investment counsel, even if registered to trade, from itself executing transactions for clients.[455]

G. GENERAL OBSERVATIONS ON THE ENFORCEMENT PROCESS

Under the Ontario Securities Act, "the commission, after giving the registrant an opportunity to be heard, shall suspend or cancel any registration where in its opinion such action is in the public interest".[456] Just as the standards for licensing are completely general, in contrast, for example, to the United States federal legislation, so also with the grounds for disciplinary proceedings. Where in the opinion of the commission the delay necessary for a hearing would be against the public interest, the commission may make an emergency suspension without hearing, provided that it sets the matter for hearing within fifteen days.[457] As in the case of denial of registration, a decision of the director suspending or revoking registration is, at the option of the respondent, subject to hearing and review by the commission and thence by way of appeal from the commission to the Supreme Court of the province.[458] A petition for hearing and review from the director's decision to the commission does not act as a stay of that decision unless the commission rules otherwise, and, similarly, an appeal to the Supreme Court does not act as a stay of the commission's order absent grant of a stay by the commission or the divisional court.[459]

The grounds which may give rise to a disciplinary proceeding

account to pay a broker or dealer an amount of commission for effecting a securities transaction in excess of the commission another broker-dealer might have charged for effecting the transaction so long as the investment adviser or fiduciary determines in good faith that the commission was reasonable in relation to the value of the brokerage and research services provided by such broker or dealer. The provision is criticized as excessively permissive in Pozen, *supra* note 122, at 954-80. *See also* SENATE COMM. ON BANKING, HOUSING AND URBAN AFFAIRS, *supra* note 34, at 69-71.

454 QSC, Revised Policy Statement No. 19, *supra* note 160, art. 16. Furthermore, any contract between an investment adviser and a client for management of a discretionary account must provide for a named depository, such as a bank or trust company, to hold the client's funds and securities; *id.* art. 15(2).

455 If the investment counsel may not be in possession of customer's funds and securities, then in Québec the requirement that that class of registrant comply with net capital rules seems unnecessary.

and result in cancellation or suspension of a licence are as numerous as the imaginable violations of the securities laws and, in fact, more so since, when considering whether a registration should be terminated "in the public interest", the regulatory agency is not limited to considering only statutory violations.[460]

Registration will be suspended or cancelled where the registrant has been dishonest in his application or in a commission investigation.[461]

The OSC has announced that the laying of criminal charges, particularly involving fraud or theft, may be considered as grounds for suspension of registration without prior hearing under OSA, section 8(2).[462]

Where a firm was suspended from the TSE, the commission contemporaneously suspended the firm's registration as a broker and as an investment dealer for the asserted reason that the effect of the suspension by the TSE was to cause a condition of the firm's registration with the commission no longer to exist.[463] That was doubtless so as to the firm's registration in the broker category,[464] but such reasoning does not support the suspension as an investment dealer since, so far as appears from the commission's terse announcement, the IDA had taken no action against the registrant. Perhaps what underlay the commission's decision was an unarticulated policy that registration in *any* category should be suspended or cancelled automatically where suspension or cancellation has been imposed by a self-regulatory organization. If that is the policy, then the validity and reliability of the proceedings before the self-regulatory organizations is automatically assumed. Presumably, however, the action of the self-regulatory organization does not dispense with the requirement that the commission must grant the registrant at some point opportunity for a hearing under section 8; at that point the registrant could attack the proceeding before the self-regulatory organization.[465] Furthermore, an automatic acceptance by the commission as a

462 OSC, Policy No. 3-30, November 1974, 2 CCH CAN. SEC. L. REP. ¶54-955. The policy states that in order not to prejudice a fair trial of the criminal charges ordinarily the commission will accede to a request made under the Statutory Powers Procedure Act, S.O. 1971, c. 47, s. 9(1), that the hearing be held *in camera*.

463 *In re* Wisener, McKellar & Co. Ltd., [1972] OSC Bull. 158 (July).

464 A broker is defined in Ontario Securities Regulations, s. 2 to be "a member of a stock exchange in Ontario recognized by the commission".

465 There may be some question, however, as to whether the registrant may attack the proceeding before the TSE collaterally in the s. 8 proceeding, where he has not taken the appeal to the commission permitted under OSA, s. 140(3).

basis for its action of the evaluation of facts made by a self-regulatory organization was disapproved by the Ontario Court of Appeal in the *Larrimore* case.[466]

According to National Policy No. 17, "violations of the securities laws of any jurisdiction is considered in principle to be prejudicial to the public interest and may affect fitness for continued registration". The practice of the OSC in cases where registrants have violated the securities laws of other jurisdictions appears to involve not an automatic rule but a determination on the facts of each case.[467]

In a disciplinary proceeding, in addition to the sanction of suspension or revocation of a licence, the commission may also condition a registration under OSA, section 7(3).[468]

The securities commissions in Canada do not have any power to impose fines in disciplinary proceedings.[469] Such a power would be desirable because fines can be graded infinitely to fit the exact circumstances of a case, and at present at least the commission in Ontario appears hesitant to impose even a brief suspension upon a firm because of the consequent prejudice to innocent parties in it and to customers.[470]

The enforcement of the licensing requirements involves not only the aspect of controlling the behaviour of licensees but also preventing nonlicensed persons from engaging in activities that require a licence. Proceedings against such persons would be brought under OSA, section 137, which makes contravention of any other section of the act (for example, section 6, trading, advising or underwriting without registration) or of the regula-

467 As indeed must be the case if the commission is not to be guilty of fettering its discretion in advance; *see* discussion in ch. III.A *supra*. *Compare In re* Alexander & Associates Ltd., [1953] OSC Bull. 3 (June) *with In re* David L. Rotenberg, [1967] OSC Bull. 28, 44 (September); *and In re* Canadian-American Securities Service Ltd., [1968] OSC Bull. 230 (October).

468 *In re* Hevenor Co. Ltd., [1971] OSC Bull. 50 (April). A favoured disciplinary sanction of the SEC in the United States is to prohibit a person from being associated with a broker-dealer "except in a non-supervisory capacity and subject to adequate supervision".

469 The TSE (by-laws, s. 17.10, 3 CCH CAN. SEC. L. REP. ¶89-730) and the IDA (by-law 19, s. 7), on the other hand, do have the power to impose fines as a disciplinary sanction. Like the OSC the SEC has no such power. An argument against a fining power in a regulatory agency might be made on the basis that a fine is a criminal sanction and therefore is not an appropriate sanction to be imposed by an agency, as opposed to a court. If the matter is looked at functionally rather than theoretically, however, it appears that a fine may be a good deal less severe a sanction than a suspension or revocation; therefore a body that can be trusted with the power to impose the latter sanction can be trusted with the former.

470 *See* materials in note 489 and accompanying text *infra*.

tions an offence punishable by fine up to $2,000 or imprisonment up to one year, or both.[471]

As an aid in enforcement, the provincial securities commissions have quite extraordinary powers of investigation. These powers have been considered by the courts on numerous occasions and their validity sustained.[472] Either the commission or the minister may appoint any person to make such investigation as it or he "considers expedient for the due administration of this Act or into any matter relating to trading in securities, and in such order shall determine and prescribe the scope of the investigation".[473] The permissible scope of the investigation may be just about anything conceivably related to trading in securites.[474] The person making the investigation has the same power to summon witnesses, to give evidence and to produce documents as is vested in the Supreme Court for the trial of civil actions.[475] A witness in an investigation may be represented by counsel[476] but there is no provision permitting a party whose affairs are being investigated from having counsel present at any but his own testimony. No person may, without the consent of the commission, disclose to anybody other than his own counsel any evidence or the name of any witness.[477] The person making the investigation may seize and take possession of any documents or records of the person being investigated.[478]

The most far-reaching power of all is that the commission, in connection with an investigation or in connection with a ruling affecting the right of a person or company to trade in securities or in connection with criminal proceedings for a violation of the Securities Act, may order a freeze on all the assets of the subject of

471 For prosecutions brought under analogous provisions of securities acts of other provinces; *see* R. v. W. McKenzie Securities Ltd., 56 D.L.R. (2d) 56 (Man. C.A. 1966); Gregory & Co. Inc. v. Quebec Securities Commission, [1961] S.C.R. 584; R. v. Brown, 16 D.L.R. (3d) 350 (B.C.S.C. 1970).

472 Lymburn v. Mayland, [1932] 2 D.L.R. 6 (P.C.); International Claim Brokers v. Kinsey, 57 D.L.R. (2d) 357 (B.C.C.A. 1966); Re Williams and Williams and Mid-Erie Acceptance Corp. Ltd., [1961] O.R. 657 (C.A.); Torny Financial Corp. Ltd. v. Marcus, [1951] 4 D.L.R. 762 (Ont. H.C.). In the Kinsey case, the B.C. legislation was upheld as *intra vires*, although the provincial Attorney-General was found to have exceeded his powers under the statute in various ways. On investigations *see generally* Baillie *supra* note 220.

473 OSA, ss. 21(2), 23. In the statute at issue in the Kinsey case, *supra* note 472, the investigatory power defined by the statute was "into any matter relating to a trade" and the court concluded that the act did not authorize the Attorney-General to make an investigation into trading generally.

the proceeding in the hands of anyone.[479] Finally, in the same circumstances as would enable it to impose a freeze order, the commission may apply to a judge of the Supreme Court for the appointment of a receiver or trustee of the property of the subject person or company.[480]

In looking at the OSC's disciplinary proceedings over a number of years, as reported in the monthly bulletins, one cannot help but note what appears to be a complete lack of standards in fitting the sanction to the violation. It would seem that a registrant going into a hearing at which charges concerning certain specified types of alleged misconduct were to be aired, having read all the OSC monthly bulletins and assuming that the commission would be satisfied of the truth of the charges, would not have the slightest idea what sort of sanction to expect: his registration might be suspended for a couple of days or cancelled. For example, in 1965, the registration of *Harold N. Reynolds*[481] as a salesman was cancelled on the basis that he had made a representation prohibited by OSA, section 69, namely, that an investor's money would double in a certain stock. Ten years later *Rosmar Corporation Limited*,[482] a promoter of speculative mining stocks, and certain of its principals had their registrations suspended for five days upon proof that they had made another representation prohibited by section 69, that they would buy back securities from the persons to whom they were selling them, and had committed what is probably the cardinal sin of securities law: engaging in a distribution of securities for which there had been no prospectus filed. *Michael A. Thomas*[483] had his registration as a salesman cancelled for having lied about a pot-smoking incident in Afghanistan; *Goldmack Securities*[484] received a two month suspension for participating in a market manipulation of over-the-counter mining stocks. *Ross McGroarty*[485] had his registration suspended for a year – and not revoked – after it was proved that he had repeatedly ordered securities for clients' accounts without the permission of the clients, where the securities were highly unsuited for some of the clients and where the securities were being touted by the registrant on the basis of little or no research.

Not infrequently, the issues of proof of offense and sanction have been confused, and the commission has referred to the evi-

dence being uncertain and then proceeded to impose a light sanction, possibly in the expectation that there would be no appeal.[486] James Baillie has made this observation on OSC disciplinary proceedings:

> "The wide range of grounds upon which a denial or suspension of registration may be based, combined with judicial reluctance to review the merits of such a denial or suspension mean that the effective constraints on the exercise by the commissions of this power are very limited. These considerations, combined with the fact that the commissions are not bound by legal or technical rules of evidence, result in considerable temptation to rely on suspension of registration in cases where there is doubt whether a suspected fraud can be successfully proven in court."[487]

On the other hand, the B.C. Corporate and Financial Services Commission appears to take great pains in reviewing the findings of the Superintendent of Brokers of that province and not infrequently it disagrees with the superintendent.[488]

In the case of a large firm, even where the Ontario commission finds a violation on the part of a firm (often failure to supervise), it consistently fails to impose any penalty at all against the firm, on the grounds that a suspension would be unfair to the innocent people in the firm and inconvenient to its customers.[489] The prob-

486 *In re* Lionel Richmond, Henry Collins, Donald F. Greco, [1968] OSC Bull. 222 (September); *In re* MacDougall & Co. However, in one case in which the director had imposed sanctions in the absence of evidence in support of allegations, the commission reversed for that reason; *In re* Murray Kadis, [1969] OSC Bull. 129 (July).

487 Baillie, *supra* note 220, at 500.

488 *E.g. In re* Alan Gould, *supra* note 136; *In re* Fisher Securities Corp., *supra* note 349; *In re* Alan Savage, B.C. Corp. & Fin. Serv. Comm'n Weekly Summary, April 23, 1976, at 11; *In re* Larry Groberman, B.C. Corp. & Fin. Serv. Comm'n Weekly Summary, January 9, 1976, at 7. In disciplinary matters, the structure of adjudication in British Columbia is different from that of Ontario. The power to suspend or to cancel a registration in Ontario is given by the act (s.8) to the commission, rather than to the director, and the commission has not delegated this power. In B.C., on the other hand, disciplinary hearings are conducted first before the Superintendent (or Deputy Superintendent) of Brokers, an office equivalent to that of the director in Ontario, and then an appeal lies to the Corporate and Financial Services Commission, under British Columbia Securities Act, s. 30(1). *See generally* Getz, *supra* note 136.

489 *In re* W.D. Latimer Co. Ltd., [1975] OSC Bull. 102 (March); *In re* United Investment Services Ltd., [1972] OSC Bull. 20 (February); *In re* Davidson & Co., [1972] OSC Bull. 7 (January); *In re* Robertson, Malone & Co. Ltd., [1968] OSC Bull. 254 (November); *In re* Goodwin, Harris & Co. Ltd., [1968] OSC Bull. 266 (November); *In re* J.F. Simard Co. Ltd., [1961] OSC Bull. 1 (November). The reluctance to discipline firms, as opposed to the individuals in them is not peculiar to the OSC. It is shared by the SEC; *see e.g. In re* Shearson, Hamill & Co., Inc., [1964-1966 Transfer Binder] CCH FED. SEC. L. REP. ¶77,306 (1964), detailing one of the more blatant securities frauds in

lem with such an approach is that it seems to sanction one rule for the large firms and another for small ones; in the process of doing so it may give the large firms almost a *carte blanche.* A commission that had the power to impose fines, and not just suspensions and revocations, would be able to discipline firms at least without inconvenience to their customers.

Chapter V
Public and Foreign Ownership of Securities Licensees

The topics of foreign ownership and public ownership of licensees in the securities industry in Canada were first brought together in 1970, in the *Report of the Committee to Study the Requirements and Sources of Capital and the Implications of Non-Resident Capital for the Canadian Securities Industry (Moore Committee Report).*[490] That report concluded generally that for the medium term the traditional sources of capital for the securities industry, that is, partners, officers and directors and their trusts and estates, would be sufficient to meet the projected needs of securities firms.[491] The *Report of the Securities Industry Ownership Committee of the Ontario Securities Commission (OSC Ownership Report)*, published some two years after the *Moore Committee Report*, concluded that additional sources of capital were needed in the industry, taking specific issue in this respect with the conclusions of the earlier report.[492] The more liberal attitude of the *OSC Ownership Report* as compared with the *Moore Committee Report* toward the question of public ownership of licensees (discussed

---

modern annals. The registrant underwrote an issue without filing a prospectus, touted the securities to its customers and then, on the basis of highly adverse, undisclosed inside information, bailed out of its own position in the securities - all the while publishing bid and ask quotations for the securities, notwithstanding its refusal to accept sell orders from other brokers or from its own customers. The SEC imposed no sanction against the firm.

One careful study of SEC disciplinary sanctions has revealed a gross disparity in sanctions as between members of the New York Stock Exchange and their associated persons and non-NYSE members and their associated persons, with the sanctions far lighter for the former group. Thomforde, *Patterns of Disparity in SEC Administrative Sanctioning Practice*, 42 TENN. L. REV. 465 (1975). The same author has suggested that the commission should channel its own discretion in choice of sanctions by adopting a rule that would spell out explicitly the factors to be taken into account in determining the sanction; Thomforde, *Controlling Administrative Sanctions* 74 MICH. L. REV. 709, 716-33 (1976).

490 The committee was established by the IDA and the Canadian, Montreal, Toronto and Vancouver stock exchanges. Its chairman was Trevor H. Moore.

491 MOORE COMMITTEE REPORT, *supra* note 200, at 57. The report's projections and conclusions were for the "medium term future" which as defined therein would have expired about 1974-75; *id.* at 54.

492 OSC OWNERSHIP REPORT, *supra* note 53, at 7, 94.

below) no doubt reflected the different appraisals of the two reports of the need for additional sources of capital generally in the industry.

The Moore committee was established largely in reaction to the takeover in 1969 of a substantial Canadian firm, Royal Securities Corporation Ltd., by the largest American securities firm, Merrill Lynch, Pierce, Fenner & Smith Inc.,[493] and so it was inevitable that in considering sources of capital for the Canadian securities industry generally, the Moore committee would give particular attention to the question of foreign ownership.

A. PUBLIC OWNERSHIP

On the issue of public ownership of securities firms, the *Moore Committee Report* declined to adopt the very liberal stance that in the United States had initially been proposed by the Midwest Stock Exchange and ultimately was adopted by the SEC.[494] The chief cause of concern to the Moore committee in liberal public ownership rules was the possible loss of meaningful control over firms by the persons responsible for their day-to-day affairs. It was feared that this loss of control might be reflected in a decline in the standards observed by and services provided by securities firms.[495] Under the Moore proposals, all the world would have been divided into industry investors, being persons active in the day-to-day affairs of securities firms and the trusts and estates of such persons, and nonindustry investors, meaning everyone else. In order to invest in a securities firm, a nonindustry investor would have to be approved by the appropriate self-regulatory organizations. No single approved investor could hold more than 10% of the voting or participating securities of a firm, and approved investors in the aggregate were limited to 25% of such securities.[496] The requirement that any nonindustry investor, no matter how small his investment, would have to be approved would effectively prevent the development of a public market for the securities of securities firms. The *Report of the Joint Industry Committee to Study the Moore Report* (the Joint Industry committee being con-

493 MOORE COMMITTEE REPORT, *supra* note 200, at 1; OSC OWNERSHIP REPORT, *supra* note 53, at 13, 98.

494 MOORE COMMITTEE REPORT, *supra* note 200, at 39-41. The Midwest Stock Exchange proposals were that outside ownership of securities firms be permitted without limitation as to the percentage of a firm's capital that could be owned by outsiders in the aggregate, although any outside investor holding more than 5% of the capital of a securities firm would have to be approved by the exchange.

495 *Id.* at 60-62.

496 *Id.* at 101-04. Up to 40% of a firm's total capital, including subordinated debt and equity, could be held by approved investors.

stituted by the same organizations as had commissioned the *Moore Committee Report*) was released in July 1971 and was in substantial agreement with the Moore recommendations on public ownership.

Finally, there were released in 1972 in Ontario and in Québec reports of government-sponsored committees that dealt with the questions of public and foreign ownership of securities licensees. The *OSC Ownership Report* went much farther in its recommendations on permissible public ownership than had the Moore and Joint Industry committees. The OSC committee noted that there had never been any explicit prohibition against public financing of securities firms but that such a prohibition had been implicit in the registration process in the manner in which the commission examines an applicant firm's sources of capital to guard against the entry of criminal or otherwise undesirable elements.[497] The OSC committee was of the view that there was a fairly pressing need for new sources of capital to become available to the securities industry. On the evidentiary basis of a questionnaire sent to licensees, it concluded that some firms were impeded by insufficient capital from engaging in activities necessary to vigorous capital formation in Canada: notably underwriting.[498] It also saw the turnover problem as a drain on "working capital available for innovation and expansion": that is, the recurring need for juniors to buy out senior officers or partners wishing to retire.[499] The *OSC Ownership Report* recommended that a registrant able to meet the NYSE - NASD requirements, chief of which was $2 million in capital before the public offering, should be allowed to go public by filing a prospectus, much as any other issuer.[500] By virtue of filing a prospectus, such a registrant would become a reporting issuer. Smaller or less well established firms would be able to raise outside capital along the lines proposed in the *Moore Committee Report*.[501] On the public ownership question the *Report of the Québec Ministerial Committee* adopted a stance less restrictive than Moore but more restrictive than the OSC.[502] It proposed to allow securities firms to sell not more than 50% of their voting securities to third parties, with the proviso that any one third party be limited to not more than 10% of the voting securities of a securities firm.[503] In addition, firms would be allowed to issue to

third parties various types of nonvoting capital stock and long-term bonds.[504]

The hard times prevailing in the securities industry over the past several years has made public ownership of securities firms much less of a hot topic than it once was.[505] But even bad times hopefully are not permanent and it therefore appears appropriate to make yet one more comment on the matter. In the writer's view, the approach and the reasoning of the *OSC Ownership Report* are the most persuasive that have emerged thus far in Canada on the public ownership debate. Securities firms should be permitted generally to seek capital from such sources as they see fit and it is not against the public interest that there should develop a public market for such securities.[506]

The basic argument against public ownership of securities firms, that control of firms may slip away from persons who are actively engaged in the industry and are amenable to the control of regulatory and self-regulatory agencies and that control could fall into the hands of irresponsible or undesirable elements, is not compelling upon examination. With liberal public ownership rules, such as those prevailing in the United States and proposed for large Ontario firms by the OSC Ownership committee, it is true that voting control could be lost by those who are responsible for a firm's day-to-day management. That is true of any public company. Yet it is widely accepted that managers of public companies, as opposed to their owners, may maintain the effective control.[507] Furthermore, the approval of regulatory and self-regulatory agencies could be required as a precondition to the acquisition of, say, 5% or 10% or more of a firm's voting capital by a nonindustry investor. The regulations might require that where approval, once given, is withdrawn, there must be a forced divestiture to put the

504 *Id.*

505 No public ownership rules were made by the OSC or the QSC. But the TSE has adopted public ownership rules, TSE by-laws, ss. 5.06-5.22, 3 CCH CAN. SEC. L. REP. ¶¶89-276-89-282, following closely the proposals of the MOORE COMMITTEE REPORT, *supra* note 200. Nonindustry investors are limited in the aggregate to 25% of the participating voting securities of a member firm, and individual nonindustry investors are limited to 10%. The total permissible number of such investors in a given firm is 50. Nonindustry investors in a member's equity or subordinated debt must be approved by the exchange. Not more than 40% of the value of all investments in the firm (including equity and subordinated debt) may be owned by nonindustry investors. The Montreal Stock Exchange has adopted an almost identical rule; MSE rule IX, 3 CCH CAN. SEC. L. REP. ¶87-784.

506 Shaw and Archibald, in their final study for the TSE recommend "the elimination of those rules in Canada which prohibit securities firms from issuing their securities to the public"; 8 D. SHAW & R. ARCHIBALD, *supra* note 396, at 110.

507 A. BERLE & G. MEANS, THE MODERN CORPORATION AND PRIVATE PROPERTY (1932) (especially 119-25, 233-46).

investor under the threshold percentage requiring approval.[508] Although it would be unusual for a publicly held company, there could be a requirement that the selection of directors and/or officers be subject to regulatory approval.[509] In any event, as the *OSC Ownership Report* cogently observes,[510] other highly regulated financial institutions, such as banks, trust companies and insurance companies, have not become disabled from responsible functioning by virtue of obtaining their capital from the general public.

A securities firm's principal asset is its licence, and regulatory authorities can control the behaviour of licensees no matter who owns them. As for the possibility that regulatory authorities would be hesitant strongly to discipline publicly owned licensees because of the adverse effects upon their public investors, that would represent no change from the present situation, where regulatory authorities are excessively hesitant to discipline substantial securities firms.[511] It may well be, of course, that for investors who are unsophisticated or of modest means securities firms are not suitable investments, not only because their licences to engage in business are subject to the disciplinary power of a regulatory agency, but also because their earnings are notoriously unstable. These are matters best dealt with in terms of prospectus disclosure and the obligations of registrants under the suitability rule.

There is at least one sense, however, in which the question of public ownership of securities firms is more complex than has been indicated here. The matter of public ownership introduces the problems of institutional membership on securities exchanges and, indeed, of fixed rates of commission. For while it is easy enough to suggest that securities commissions and exchanges should be able to restrain "undesirable elements" from gaining control of securities firms by having a power to disapprove the acquisition of more than a given percentage of a securities firm's voting shares by a nonindustry investor, that hardly answers the question whether it is undesirable to allow trust companies or insurance companies or mutual fund management companies to purchase securities firms in order that these institutions can execute their own transactions and avoid fixed rates of commission. The precise question of the appropriateness of institutional investors owning securities firms, as opposed to the general appropriateness of public ownership, may be much influenced by the out-

come of the current debate on the future of fixed rates of commission.[512]

B. FOREIGN OWNERSHIP

Foreign ownership of Canadian securities firms is a question closely related to public ownership, since both are in reality subparts of a more general question: what sources of capital should be available to be drawn upon by securities firms licensed to operate in Canada? This paper attempts nothing more than an overview description of the current state of the debate on foreign ownership in the securities industry. No recommendations on foreign ownership are offered here because: first, the writer believes that the matter of foreign investment in the securities industry must be resolved as a political question and does not pertain to the realm of securities regulation; second, the Foreign Investment Review Act established a regime of control of foreign investment that is much broader than but includes the securities industry; and, third, at least for Ontario the issue of what to do about existing foreign control of securities licensees has been effectively settled by regulations adopted on an interim basis in 1971[513] and on a permanent basis in 1974.[514]

The proposals of the *Moore Committee Report* with respect to foreign ownership would have treated the securities industry in the pattern that has been established by "key sector" legislation – that is, subjecting foreign investment in the securities industry to a 25%–10% rule. Foreigners in the aggregate could invest in the voting or participating securities of a Canadian securities firm up to a total of 25% and any individual foreigner would be limited to a 10% interest.[515] Foreign controlled securities *firms*, as opposed to foreigners generally, were to be prohibited from making any investment in a Canadian securities firm.[516] Probably the most contentious issue that had to be dealt with by the Moore committee was what to do about foreign controlled firms already doing business in Canada at the time the Moore recommendations were made. These were about fifteen in number; they included some of

512 Shaw and Archibald, who favour un-fixing commission rates, advocate keeping institutional investors out of the brokerage business; 8 D. SHAW & R. ARCHIBALD, *supra* note 396, at 95, 101. Their recommendations are in accord with the Exchange Act in the U.S., as amended, whereby fixed rates of commission are abolished (s. 6 (e)) and financial institutions are to be prohibited from executing brokerage transactions on their own behalf (s. 11(a)).

513 O. Reg. 296/71, in force July 14, 1971.

514 O. Reg. 600/74, now ss. 6a to 6f of the Ontario Securities Regulations.

515 MOORE COMMITTEE REPORT, *supra* note 200, at 147 (recommendation 2).

516 *Id.* at 148 (recommendations 4, 5).

the largest firms operating in Canada.[517] The committee opted for a "grandfather" exemption for those foreign controlled firms that would have allowed them to do a securities business in Canada with no restrictions not faced by Canadian owned firms, so long as control of the foreign controlled firm did not pass to other foreigners.[518]

The *Report* of the Joint Industry committee opposed the grandfather exemption. The Joint Industry committee recommended that firms already foreign controlled should have their capital frozen and should be able to expand their capital bases by addition thereto of not more than 10% of their earnings each year. Expansion at a greater rate would have been permitted for foreign controlled firms that would embark on a program of Canadianization so as to become 75% Canadian owned over a period of fifteen years. On the other hand, the Joint Industry committee would have permitted investments in Canada securities firms by foreign securities firms to the same extent as by other foreigners.

In July 1971, the Ontario government promulgated a regulation restricting foreign ownership of securities firms.[519] Simultaneously a committee of the OSC was struck to make an investigation of ownership of the securities industry. The OSC committee reported in 1972, and in 1974 a permanent rule was adopted which closely followed the report of the Ownership committee and which also was quite similar to the earlier regulation.[520]

The ownership limitation uses the key sector approach allowing for a maximum foreign investment in a securities firm of 25% aggregate and 10% for any single investor. All capital, and not just voting shares, is included in these percentages. A grandfather clause was included which, while more restrictive than the Moore recommendations, was still quite generous. What the complicated rules in substance provide is that firms more than 25% foreign controlled at the time the regulations were adopted may augment their base capital in either or both of two ways. First, they may sell equity to Canadians. Second, the capital employed in the foreign controlled firm's business may be augmented solely out of its

517 Of these 15 firms, nine were members of the TSE. Today, owing largely to the contraction of the American securities industry, only four TSE members are foreign controlled; *see In re* Baker Weeks of Canada Ltd., [1977] OSC Bull. at 41 (February).

518 Moore Committee Report, *supra* note 200, at 149 (recommendation 9). A foreign controlled firm which, after the date of publication of the *Report*, made a wide public distribution of its securities in its home jurisdiction or that of its parent would have obtained capital in a manner significantly different from that permitted for Canadian securities firms and by so doing would have lost its grandfather exemption.

519 O. Reg. 296/71, in force July 14, 1971.

520 O. Reg. 600/74, now ss. 6a to 6f of the Ontario Securities Regulations.

retained earnings (that is, no new injections of capital from the foreign parent) at a percentage rate not greater than the rate of growth of capital of the largest Canadian owned investment dealers.

On the other hand, quite a restrictive rule was adopted with respect to the transfer of control of a foreign controlled firm to other foreigners. The commission was empowered to approve such a transfer in control if – and only if – the commission found that: the foreign controlled registrant provided "material or unique service to Ontario investors not substantially available...through other registrants"; that this service would be continued under the new foreign control; that either the service was dependent upon continued foreign control or that efforts to find Canadian purchasers had been unavailing; and, in addition to all of the foregoing, that the change in control would not otherwise be prejudicial to the public interest.

The OSC has considered an application for a transfer of control of a registrant among foreigners on four occasions: it approved two of the applications[521] and denied two.[522] One of two recent applications for approval of a new foreign controller of a foreign-controlled registrant provoked a head-on confrontation between the TSE and the OSC. The exchange lost.

Baker Weeks of Canada Ltd., a wholly owned subsidiary of a U.S. parent corporation of similar name, applied to the OSC for approval of a change in control to another U.S. securities firm, Reynolds Securities Inc., which had bought the registrant's American parent firm. The OSC, over the opposition of the TSE and the IDA, approved the application, finding that the capacity for research (presumably into U.S. securities) provided by Baker Weeks was a "unique" service to Ontario investors and dependent for its continuation upon Baker Weeks being part of a strong, foreign controlled securities firm such as Reynolds Securities.[523] For reasons not expressed in its opinion (although probably an effort to draw the teeth from the opposition to the application from the self-regulatory organizations) the commission conditioned its approval upon Baker Weeks not entering the underwriting business in Canada.[524]

521 *In re* Laidlaw Securities Canada Ltd., [1973] OSC Bull. 100 (July) (finding of unique access to the New York Stock Exchange for Ontario investors); *In re* Baker Weeks of Canada Ltd., [1976] OSC Bull. 284 (November) (discussed *infra*).

522 *In re* DuPont Glore Forgan Canada Ltd., [1974] OSC Bull. 133 (June); *In re* Reynolds Securities (Canada) Ltd., [1978] OSC Bull. 101 (March).

523 *In re* Laidlaw Securities Canada Ltd., *supra* note 521.

524 The wisdom of imposition of this restriction is questionable from a public policy viewpoint since in the underwriting field there is probably no meaningful competition in Canada today; *see* text accompanying note 396 *supra*.

The board of governors of the TSE, under its by-laws,[525] was also called upon to consider the proposed change in control and it refused approval. Baker Weeks took an appeal from the board of governors to the commission under OSA, section 140(2).[526] The commission allowed the appeal and compelled the exchange to approve the application for change in control under the exchange by-laws.[527] The commission found, in sum, that its adoption of regulations on the foreign ownership question pretermitted any further consideration of that question by the TSE in the context of an application for approval of a change in control of a member.[528]

The victory of Reynolds Securities (Canada) Ltd., as the Canadian Baker Weeks organization came to be known, may prove to have been short-lived. Scarcely one year after the commission ordered the exchange to accept the transfer of control of Baker Weeks to Reynolds Securities (Canada), Reynold's American parent was taken over by Dean Witter & Co., another very large U.S. brokerage house. And so the whole process started again as Reynolds Securities (Canada) sought approval from the OSC for a change in control of the registrant from the former U.S. Reynolds organization to the newly created entity, Dean Witter Reynolds Organization Inc. (DWRO). The TSE had learned its lessons well in the previous go-around and this time it marshalled its evidence against the foreigners in the OSC approval proceeding rather than relying upon its own power to approve or not a change in the control of its member. The OSC denied the application for approval.[529] The commission was unable to satisfy itself: (1), that the services provided to Ontario investors by Reynolds Securities

525 TSE by-laws, ss. 5.03, 3.18, 3 CCH CAN. SEC. L. REP. ¶¶89-273, 89-219.

526 Section 140(2) provides that "[t]he Commission may, where it appears to be in the public interest, make any direction, order, determination or ruling...with respect to any by-law, ruling, instruction or regulation" of the TSE.

527 [1977] OSC Bull. 32 (February).

528 [1977] OSC Bull. at 47-48. For the commission's reasoning, the reader is referred to the opinion. While one may sympathize with the commission's evident annoyance at the exchange for what appears to have been a naked attempt on the part of the exchange members to eliminate some of their competition, the commission's conclusion that the government's regulation ousts TSE jurisdiction to make its own determinations on foreign ownership is of doubtful validity in the light of the Toronto Stock Exchange Act, R.S.O. 1970, c. 465, s. 4(3) which provides that the exchange may impose "any additional or higher requirement [than is mandated by the OSA] within its jurisdiction". The commission appears to be on stronger ground, however, in an alternative holding that the rule of the board of governors adopting the recommendations of the MOORE COMMITTEE REPORT on foreign ownership was not validly adopted in the absence of a by-law, as appears to be required under s. 10 of the TSE Act. In denying Baker Weeks' application, the board of governors claimed to be following the Moore recommendations, by which the board claimed to be bound.

529 *In re* Reynolds Securities (Canada) Ltd., [1978] OSC Bull. 101 (March), 3 CCH CAN. SEC. L. REP. ¶70,098.

(Canada) continued to be either material or unique and (2), even assuming that they were "material", that they were not substantially available from other registrants. The commission noted that "if the present application is successful, the parent firm whose Canadian subsidiary will benefit is a very different firm from that which controlled the originally grandfathered firm".[530] The massive, publicly-held Dean Witter is not the small, institutionally-specialized, research-oriented Baker Weeks. In the intervening year since the original takeover by Reynolds Securities (Canada) had been approved, the Canadian registrant had lost its entire Canadian research capacity, apparently due to the regulatory quagmire in which the registrant was continually immersed.[531] As far as research into American securities was concerned, the commission could find nothing unique about the services of Reynolds Securities (Canada) as distinguished from those of a variety of other Ontario registrants, both Canadian and foreign controlled.

Those findings settled the issue, insofar as the commission's power to grant the application was concerned.

The commission went on, however, to make a separate finding on the public interest question. It found that the continued registration of Reynolds Securities (Canada) under its new ownership would be in the public interest because it was desirable "to provide the discipline of an additional approach and a fresh perspective" to the securities industry by the presence of a number of foreign-controlled registrants.[532] The public interest element of the foreign ownership regulation is cumulative and not alternative to the other factors, however, and therefore the commission was left with no course but to suggest to the applicant that it might appeal to the provincial cabinet for an *ad hoc* change in the regulation to permit the applicant's continued registration.[533]

Looking at the whole course of Baker Weeks proceedings, one is tempted to the observation that the TSE has won the battle (assuming Reynolds Securities (Canada) does not successfully appeal to Cabinet) but lost the war. It has succeeded in eliminating an unwelcome foreign controlled member, but at the same time it has been put very firmly in a subsidiary place to the commission in determining its own membership.

Back in 1972, shortly before the OSC Ownership committee published its report, the Québec Government's *Study of the Securities Industry* was published.[534] That report declined to recommend

534 Bouchard Report, *supra* note 502.

any substantial restrictions on non-Canadian control of securities firms. It did recommend, however, that a minimum of 25% of the voting capital stock of all securities firms operating in Québec be held by officers or employees resident in Québec.[535] Just as the *Ontario Ownership Report* concentrated on the danger of a dominance by foreign (read "American") securities firms over Canadian (read "Ontario") firms, so the Québec study concentrated upon the position of dominance of Ontario-based firms doing business in Québec over the Québec-based firms.[536] The concern expressed in the Québec study over the dominance of non-Canadian firms was minimal as compared with concern over the position of Canadian non-Québec firms.

Since publication of the Québec and Ontario reports dealing with ownership of licensees, there has, of course, been a major initiative on the part of the federal government in the form of the Foreign Investment Review Act (FIRA).[537] The screening mechanism of FIRA, operative where non-Canadian interests seek to acquire a Canadian business enterprise or to establish a new business in Canada not related to some business that such foreign interests already are conducting here, will be fully applicable to the securities industry. The act specifies that in determining whether a proposed investment meets the designated test for approval, "significant benefit to Canada", the Foreign Investment Review Agency and the cabinet shall take into account, *inter alia*, "industrial and economic policy objectives of any province likely to be significantly affected by the acquisition or establishment".[538] It therefore incorporates an apt mechanism for taking into account in the securities industry context the quite different views on foreign ownership prevalent in Ontario and in Québec.

On the other hand, FIRA leaves untouched expansion by foreign-controlled securities firms already doing a securities business in Canada on the effective date of Stage II of the act (review of new business establishments) so long as such expansion does not involve acquisition of an existing business enterprise. Furthermore the threshold purchase that will be deemed acquisition of control of a Canadian business enterprise is 20% of the voting shares[539] – a level twice as high as that considered acceptable by

535 *Id.* at 134.

539 "[T]he acquisition by any person or group of persons of shares of a corporation to which are attached ... (ii) 20% or more of the voting rights ordinarily exercisable at meetings of shareholders of the corporation, in the case of a corporation the shares of which are not publicly traded, shall, unless the

the Moore, Joint Industry and OSC committees for ownership by a single foreign interest. If the existing federal controls on foreign investment are more permissive than some of the provinces deem suitable with respect to the securities industry, there appears no reason why such provinces cannot enforce their own more restrictive rules – as is being done presently in Ontario. In fact, the Federal government under FIRA took no action on Dean Witter's application to take over Reynolds Securities (Canada) and, as a result,[540] Dean Witter's application was deemed approved under FIRA.[541]

The vital importance of the securities industry to Canada's economic welfare cannot be gainsaid and thus the securities industry, like other areas of the financial industry,[542] may with particular appropriateness be treated as a key sector for purposes of prohibitions on foreign control, as is urged in the *Moore Committee Report*.[543] At least a certain symmetry would be achieved. However, no such recommendation is made in this paper because the question of the desirability or not of a foreign presence in the securities industry, and how much of a one, pertains to the world of politics and not that of securities regulation. It is a question that is part of a much larger framework: that defining Canada's economic independence or interdependence. It is not a question susceptible of empirical demonstration. Also, it is a question on which there is a very marked difference of opinion between Canada's two most important financial centers, Québec and Ontario, as is demonstrated by the Quebec Securities Commission's recent order to the Montreal Stock Exchange to approve the transfer of control of Reynolds Securities (Canada) to Dean Witter.[544] Finally the question of what to do about foreign-controlled securities firms already registered here has, in the writer's view, in effect been settled for

contrary is established, be deemed to constitute the acquisition of control...".

Foreign Investment Review Act, S.C. 1973-74, c. 46, s. 3(3)(c). The threshold level for publicly traded corporations is 5%, but at present there are no publicly traded securities brokers and dealers in Canada. Acquisition of control of a firm not organized as a corporation may be acquired only by acquiring all or substantially all of the property used to carry on its business; *id.* s. 3(3)(a). There are a few securities firms organized as partnerships rather than corporations. However, all nonresident controlled companies registered to trade in Ontario must be incorporated in Canada; Ontario Securities Regulations, s. 6c(c); OSC OWNERSHIP REPORT, *supra* note 53 at 52.

544 9 QSC Bull. No. 9 (Decision No. 5460, March 7, 1978).

Ontario, the dominant Canadian province in securities matters, by the 1972 regulations.[545] The question was ventilated and reventilated and certain rules were adopted. As a practical matter, it would be exceedingly difficult, if not unfair, to establish more restrictive rules now.[546]

Chapter VI
Recommendations

The following recommendations take account only of changes that the writer would make in the present licensing system for the securities occupations in Canada. Hopefully all of the recommendations flow, at least implicitly, from the foregoing paper. References to the parts of the paper most relevant to each recommendation follows it in parentheses.

(1) A federal licensing initiative in the securities area appears warranted. This conclusion, it must be confessed, is advanced with hesitation. After all, as the foregoing paper indicates, the present provincial licensing system is by no means demonstrably inadequate. The standards of the Canadian securities marketplace at the present moment do not appear to the writer to be shockingly low by any means even though the junior mining and exploration marketplace in the West appears wild and woolly indeed. The writer is not competent to perform an economically accurate cost-benefit analysis concerning introduction of a federal licensing requirement, but we can be sure that there will be substantial costs – both public and private. It might well be possible to have federal securities legislation covering a number of substantive areas and yet to leave licensing as is: exclusively in provincial hands. Even if there is to be federal licensing it will very likely duplicate, not oust, provincial regimes. While a federally granted licence might well be made a necessary condition for the conduct of a given securities market business interprovincially, it probably could not be made a sufficient condition for the conduct of that business within a province which also chose to license it.

545 O. Reg. 600/74, now ss. 6a to 6f of the Ontario Securities Regulations.

546 Recently the OSC has announced an inquiry into the activities of nonresident, nonregistered brokerage houses in Ontario; [1978] OSC Bull. 17 (February). While the announcement states that the commission does not plan to re-examine the issue of foreign control of registrants, in actuality the two issues may prove inseparable. If foreign controlled firms are now carrying on business in Ontario without registration under the umbrella of the very broad exemptions in OSA, s. 19 and if it is proposed to limit these exemptions insofar as foreign-controlled firms are concerned, then either the firms will have to be allowed to register, albeit in a limited way, or else they will have to cease their activities.

Why, then, federal licensing? First and foremost, to the writer the securities markets appear to be a matter eminently of national and not just local concern. It is important to have uniform and uniformly high standards imposed and observed across Canada. Second, while federal licensing will not *ipso facto* oust the provinces, a likely scenario would call for many of the provinces, especially the smaller ones, to drop out of securities regulation altogether over time. Duplication will not, in fact, be complete and those provinces that wished to opt out of the field in reliance upon the federal regulatory regime could do so without sacrificing the interests of their residents. Third, the present provincial statutes appear effectively to reserve to the particular province the right to shut off interprovincial securities trade across its borders, at least so long as the essential powers of federally chartered companies are not sterilized in the process. Such a situation is barely tolerable in a nationally integrated economy (*passim*, especially chapter II.D).

(2) Adoption of the approach of the American federal legislation to defining those persons who must be licensed in order to trade securities as persons "in the business of" trading securities is recommended. Such an approach would cut back drastically on the number of exemptions needed. Those exemptions that would still be deemed desirable, such as exemptions relating to the types of securities traded, should be stated separately from the exemptions from the prospectus requirement. The drafting technique of Ontario's Bill 7 is to be commended in this latter regard (chapter II.A).

(3) In the matter of exemptions to trade certain types of securities, a more discriminating approach than is evidenced in the present acts would be appropriate. There is, for example, no justification for the exemption enjoyed by securities issued by non-Canadian governments. Also suspect in the writer's view are the exemptions for mortgages, and for securities issued by cooperatives and by not-for-profit corporations. It must be added, however, that the foregoing paper does not demonstrate the inappropriateness of these exemptions. A caveat concerning them is perhaps all that is appropriate (chapter II.A.3).

(4) There does not appear to exist any compelling reason to license the business of advising others as to the merits of securities investments when the advising is carried on by a person who is not licensed to trade securities and who does not provide investment management, as opposed to investment advice. There are very few such pure adviser registrants at

present. Subjecting the writer of market letters to licensing while leaving publishers of and writers in newspapers of general circulation outside the pale does not seem rational. Furthermore, even granting that the persons at whom securities advice is aimed may well have a much harder time evaluating its merits than they would have evaluating advice concerning consumer tangibles, it is not apparent that the state either can or should protect its citizens against incompetent advice. This view relates, it is worth emphasizing, only to advice taken alone. When the advising is done by a person in the business of trading in securities or assumes the form of discretionary management, then the opportunities for conflicts of interest or even abuse of trust become sufficient to warrant a state role in their control (chapters II.C and IV.F).

(5) There is not much cause to believe that the extremely broad and legislatively unguided discretion that has been committed to securities administrators in the licensing decision has been abused or that licences have often been denied to people who should have received them. Nonetheless, a seemingly boundless discretion committed to licensing authorities does not appear to the writer to be an attractive legislative technique. It may be neither possible nor desirable to set out disqualifications with precision, but the statute should at least be cast in the form "The [administrator] shall grant the licence unless he finds that...". Then disqualifications could be listed, albeit broadly: fails to meet educational or training prerequisites; fails to meet capital requirements; has been convicted of a crime involving moral turpitude within past [x] time period; has been found to have violated the securities laws of a Canadian jurisdiction or a foreign jurisdiction imposing a similar scheme of regulation within past [x] time period. One might even be prepared to add a catch-all disqualification: not otherwise of good character, although this with hesitancy. In any case, "the public interest" is far too general a standard (chapter III).

(6) With respect to grounds for disciplinary action, some meaningful attempt at specification should be made. Arguably greater precision and greater procedural safeguards should be demanded in the decision to suspend or revoke a licence than in the licensing decision itself since taking away an extant means of livelihood is a more devastating decision than shutting off one of a great number of avenues in a person's future. The record of securities regulators in disciplinary proceedings has not been as free from blemish as in the licensing area. There has been noted in the text a certain

tendency to substitute considerations of poor reputation, and even conjecture, for proof in disciplinary proceedings. The theoretical availability of judicial review has not in practice always kept the agency in line in the exercise of its discretion. This is particularly likely to be the case where courts defer to a supposed agency expertise in determining what is in the public interest and are prepared to hold that grounds for discipline are not limited to statutory violations. The writer would like to see the grounds for discipline spelled out with more precision, in a manner analogous to recommendation (5) above. These would include conviction of a crime involving moral turpitude; violation of the statute and regulations validly enacted under it; violations of the securities laws of other, similar, jurisdictions; and – perhaps – violation of ethical precepts generally accepted in the industry. Finally, it would appear reasonable to give licensees the protection of a statute of limitations, even if the tolling period were rather a long one in recognition of scarcity of investigative resources and the paramount public interest in the integrity of the marketplace. Furthermore, the statute should spell out both the quantum and the burden of proof in disciplinary proceedings (chapters III.D and IV.G).

(7) The writer would like to see a fining power in the regulatory authority. This would seem the most promising solution to the problem of securities regulators' excessive hesitancy to discipline firms, as opposed to individuals, even in cases where violations appear to be truly those of the firm and not just the result of an aberrational failure of supervision (chapter IV.G).

(8) While the topic of self-regulation in the securities industry is not an immediate concern of this paper, the question of whether membership in a self-regulatory organization is to be made compulsory for securities market licensees will have to be considered. On the basis of the present record, the writer would be opposed to obligatory membership. Certainly imposition of such a requirement could not seriously be entertained in the absence of statutory imposition of duties on the self-regulatory organizations to: (a) accept for membership all applicants that meet statutorily defined standards; (b) enforce standards of ethical conduct against their members, and (c) discipline their members in proceedings that will afford the protections of natural justice to the member and the results of which will be public, at least where a finding of misconduct is made. Assuming, however, that membership in a self-regulatory organization is not to be mandatory, nonmembers should be required to pay as fees to the regulatory

authority any incremental regulatory expenditures that must be made from the public purse as a result of the nonmembership (chapter IV.A).

(9) It would be impossible to spell out in legislation all the standards of conduct that registrants may appropriately be compelled to observe. On the other hand, policy statements are not a satisfactory alternative to binding regulations. Nor does one feel confident that appropriate standards can be developed out of some vague notion of the common law of regulation. It would seem, in short, highly desirable that there should be a securities regulatory authority which itself has a rule-making authority in the area of behavioural standards for licensees. At a minimum, it would appear that licensees themselves would be well served by standards that clarified, to the extent possible, what conduct is permissible and what is not (chapters III.A and IV).

(10) Many of the conflict of interest situations confronting securities market licensees are unavoidable – at least by means that would not require a total restructuring of the securities industry in a manner whose outcome it would be hazardous to predict. In particular this is true of conflicts arising from the commission method of compensation, from the fact that by serving as underwriters and in other capacities the personnel of trading firms may become privy to inside information concerning issuers, and from the general mixing of agency and principal trading functions within a single firm. On the other hand, some conflict situations could be avoided without radical surgery on the industry. Serious thought should be given, in particular, to prohibiting licensed traders from managing pooled funds on a discretionary basis. While some Canadian broker-dealer firms do manage mutual funds and other types of pooled accounts, this activity is not believed to be major for many of them. If a prohibition is going to be instituted, the sooner the better. Discretionary management of pooled funds presents conflict situations arising not only out of the commission method of compensation for executing trades but also out of the possibility that the manager's investment decisions for the fund will be coloured by the manager's own position, and those of its associates, in various securities. Current regulations designed to minimize this latter conflict are not particularly strong. If discretionary management of pooled funds were to become an activity banned for broker-dealer firms, strict logic would dictate that the ban be extended to managing the funds of individuals. The writer would not think, however, that a ban going so far would be

warranted. For one thing, discretionary management of individuals' accounts is a much more traditional activity for broker-dealer firms than management of mutual funds and pension funds. More importantly, unlike the case of pooled funds, it does not appear that there are entities other than broker-dealer firms that could suitably manage the securities accounts of individuals on a discretionary basis. Trust companies, in particular, would not be suitable managers for accounts with speculative investment objectives (chapter IV.F).

(11) Present regulation does not, in the writer's view, impose sufficient obligations upon broker-dealers to make full disclosure of their interests in securities concerning which they render advice. Form hedge clauses are not in all cases sufficient disclosure. Present regulations do not require any disclosure to be made concerning a whole variety of interests and relationships that a broker-dealer or its principals or associated persons may have with an issuer of recommended securities. Ontario's Bill 75 would have equated the disclosure obligations of broker-dealers with those of registered advisers. That approach appears desirable to the writer, considering especially that broker-dealers are more likely to have a variety of positions in the securities they are recommending than are persons or firms who are registered only as advisers (chapter IV.F.3).

(12) The law should not prohibit public ownership of securities firms, although it is entirely appropriate that the officers, directors and major owners of capital of publicly owned firms should require regulatory approval (chapter V).

Conclusion 1482

Chapter I
Introduction

This paper does not purport to answer the question of whether self-regulation in the Canadian scheme of securities regulation has operated in the public interest. Nor does it purport to reach a conclusion that self-regulation is generally preferable to direct government regulation. It is accepted that self-regulation has been and will continue to be an integral part of the Canadian scheme of securities regulation. In order to determine whether the self-regulatory organizations (SROs) have acted in the public interest, a more official process than that involved in writing this paper would be necessary.

In the Canadian scheme of regulation, the manner of regulation of market intermediaries is not an "either-or" proposition, that is, direct government regulation or self-regulation, but is a blend of the two. This paper concentrates on the means for blending the two approaches to securities regulation in Canada and the

In addition to examining published materials concerning the government-SRO relationship, the authors had an opportunity to speak to representatives of the Ontario Securities Commission, the Toronto Stock Exchange, the Montreal Stock Exchange, the Investment Dealers Association of Canada, and other members of the securities industry. Their cooperation and thoughts added much to our understanding of the nature of the relationship between government and SROs. Philip Anisman, director of the securities market study, of which this paper is a part, was helpful in reviewing the manuscript and supplying materials on self-regulation issues.

optimum blend for creating incentives for the SROs to operate in the public interest. The paper also considers the means whereby government, from which the SROs derive their regulatory powers, can be assured that the SROs are acting in the public interest.

This is an aspect of securities regulation worthy of inquiry. The Ontario Royal Commission under Mr. Justice Arthur Kelly which inquired into the Windfall Oils and Mines scandal is the only government inquiry into the functioning of an SRO. The recommendations made in the *Windfall Report* provided the basis for the regulatory framework within which the Toronto Stock Exchange now functions. This framework was established over a decade ago. In the interim, the SROs have continued to thrive in Canada, and it is apparent from recent pronouncements of the Canadian securities administrators that government will continue to rely heavily on the SROs for their contribution to securities regulation in Canada.

In the context of law reform, it is interesting to note that the Ontario Securities Act has undergone substantial revision in the course of a reform process which was recently completed and which extended over a period of almost ten years. However, the Securities Act, 1978, of Ontario, does not significantly alter any of the provisions of the 1966 act affecting SROs. Those familiar with the process of reform in Ontario know that the provisions of the 1978 act dealing with self-regulation did not result from any specific study which concluded that the relationship between government and the SROs was without need of reform. On the contrary, self-regulation is an area of the Ontario act which has not concerned the legislature.

The Commodity Futures Act, 1978, which was also recently enacted by the Ontario legislature, does have a slightly more comprehensive scheme for government supervision of commodities SROs. Part VII of this act imposes general registration requirements upon any person or company seeking to carry on business as a commodity futures exchange in Ontario. The act also spells out the various factors which the Ontario Securities Commission (OSC), the administrator of the act, is required to take into account in determining whether or not to grant registration. Once a commodity futures exchange is registered, it is required to file all of its by-laws, rules, regulations and policies with the commission. The commission is empowered to make any decision on the manner in which the exchange carries on business, etc. The scheme of regulation also provides that any person affected by a decision of a commodity futures exchange may appeal the decision to the commission. The Commodity Futures Act, 1978, represents a modest improvement of its provisions dealing with SROs when com-

pared with the equivalent provisions in the Securities Act, 1978, first, in imposing a general registration requirement upon all SROs, and second, in regularizing the relationship between the SRO and the government supervisor with respect to changes in the SRO constitution. This paper recommends that a similar though more comprehensive code should be included in proposals for a federal securities law.

A geographic limitation of this paper is its concentration on the relationship between government and the SROs in Ontario. This limitation reflects practical considerations. However, it is suggested that the discussion does not suffer materially as a result, for two reasons. First, the Toronto Stock Exchange and the Investment Dealers Association of Canada are representative of the two types of SROs which operate in Canada. Second, the relationships between these two SROs and the OSC are representative of the government-SRO relationships in Canada. It should be noted, however, that the British Columbia Corporate and Financial Services Commission has recently heard a number of appeals from individuals affected by decisions of the Vancouver Stock Exchange and the Vancouver Curb Exchange. These decisions, which are referred to briefly in this paper, are necessary reading for an understanding of the relationship between the British Columbia SROs and the commission. Published material on the relationship between the Quebec Securities Commission and the SROs in Québec is very limited, and therefore has not been relied upon in this paper to any great extent.

Another practical limitation is the fact that the paper does not draw heavily on the experiences of participants in other industries who are attempting to establish a scheme of regulation which includes self-regulation. For example, the accounting profession in the United States is currently attempting to establish a scheme of self-regulation which will be satisfactory to the United States Securities and Exchange Commission. The experience of the U.S. accountants would be useful in any further consideration of the subject of self-regulation in the Canadian securities industry.

This paper provides only a condensed discussion of the SROs and their history. The description of the SROs is intended to provide the reader with sufficient information to understand the issues being discussed. More detailed information is readily available from the SROs and other sources. Also the paper does not discuss in any depth the substance of many of the important issues facing the SROs – such as fixed or negotiated commissions, institutional membership and non-resident membership – but rather focuses on the government-SRO machinery for dealing with these issues.

The discontinuance of operations by some SROs in Canada warrants study as case studies in any further examination of self-regulation in Canada. For example, in the mutual fund industry, until 1976 mutual funds were regulated by the Canadian Mutual Funds Association, which was an SRO recognized in the provincial securities regulations as a regulator of certain aspects of the business of mutual funds. In that year, the CMFA ceased to function and was replaced by the Investment Funds Institute of Canada, which did not assume the regulatory role of the CMFA but which functions as a trade association. Another example is the establishment of the Broker-Dealers' Association of Ontario, and its subsequent decline. While the weakening of these organizations has been alluded to in a number of writings, it has not been studied in depth. The experience of the BDA may be useful in the area of commodities regulation because the BDA was formed with the encouragement of government. The commodities industry is also being encouraged by government to establish its own self-regulatory organization. Another example occurred in British Columbia, where the Broker-Dealers' Association has ceased to function and its role in the over-the-counter market has been assumed since 1974 by the Vancouver Curb Exchange, which was formed by the Vancouver Stock Exchange.

What does this paper provide? It is divided into two parts, the first generally describing the existing position of the SROs in the Canadian scheme of securities regulation and the second discussing a number of the important issues in Canadian securities regulation with significance for the SROs.

Part I, chapter II, provides some basic information on the SROs discussed in the paper and chapter III describes the provisions in the Canadian securities laws recognizing the SROs. Chapter IV provides an historical perspective for this aspect of Canadian securities laws, and chapter V considers the advantages and limitations of self-regulation.

Part II discusses the need for government supervision of securities SROs and identifies a number of issues which must be faced by Canadian SROs. These include extension of a registration system to SROs (other than stock exchanges which are already registered – in a manner of speaking), procedures for government approval of SRO rule changes, government review of SRO decisions, SRO powers to regulate admission to membership, resolving the conflict between self-regulation and competition in the securities industry and the problems of supervising SROs created by the fragmented scheme of securities regulation in Canada.

Part I

Chapter II
Self-Regulatory Organizations in Ontario

Reference has already been made to the reasons for the concentration of this paper on the relationship between government and self-regulatory organizations in Ontario. References will be made throughout the paper to the TSE (the Toronto Stock Exchange) and to the IDA (the Investment Dealers Association of Canada) which represent the two basic types of self-regulatory organizations in Canada. These two types will be discussed in chapter III. In addition, some reference will be made to the BDA (the Broker-Dealers' Association of Ontario), more for historical interest than for present impact on securities legislation in Ontario. Following is a general description of these self-regulatory organizations, as background to a discussion of the relationship of these SROs with government.[1]

A. THE TORONTO STOCK EXCHANGE

The Toronto Stock Exchange is incorporated by statute of the Ontario legislature[2] and is the only stock exchange carrying on business in Ontario and therefore the only exchange recognized by the Ontario Securities Commission.[3] The *TSE Annual Report* for the fiscal year ended March 31, 1977, stated that the TSE had seventy-five member firms and corporations. Although most members are based in Ontario there are members with principal offices in most parts of Canada. Indeed, there are a number of firms which do not carry on any business in Toronto or in Ontario, but maintain a TSE membership in order to take advantage of higher commission splits between members and in order to "locate" themselves so that they may receive more favourable treatment than non-TSE members when the Canada-wide trading system being developed by the TSE is implemented.

In terms of value of shares traded on a stock exchange in 1976, the TSE ranked fifth in North America, with shares valued just in

1 A brief but informative history of these SROs is provided in J. WILLIAMSON, SUPP., ch. X.

2 The Toronto Stock Exchange Act, 1968-69, S.O. 1968-69, c. 132, now the Toronto Stock Exchange Act, R.S.O. 1970, c. 465. The original incorporating statute was S.O. 1878, c. 65.

3 OSC Policy No. 3-17, April 5, 1971, 2 CCH CAN. SEC. L. REP. ¶ 54-911.

excess of $5 billion having been traded through its facilities.[4] Subject to the exercise of the supervisory powers of the OSC discussed in part II of this paper, the TSE has plenary power over the activities of its members, including admission to membership, business carried on by members, capital requirements for continued membership, directors and shareholders of members, affiliated companies, trading procedures, rates of commission and relations with customers. In addition, the TSE specifies the terms upon which shares are admitted to trading on the exchange.[5] The TSE performs a trade association function to a limited degree, the bulk of its budget being applied to the operation of the stock exchange facility.

B. THE INVESTMENT DEALERS ASSOCIATION OF CANADA

The Investment Dealers Association, in contrast with the Toronto Stock Exchange, does not offer a facility, access to which is necessary to carry on an investment banking business. The IDA is an unincorporated association of 85 securities firms located in all provinces of Canada who "handle over 90% of all of the investment business in Canada".[6] Members of the IDA are generally the larger well-recognized firms that perform most of the underwriting and trading of non-speculative securities. This is ensured because one of the criteria for IDA membership is that the applicant must be carrying on a business of "investment character".[7] This phrase is defined[8] so that an applicant (and a member on a continuing basis)[9] must derive at least 60% of his gross profits from his dealings with the public, or at least 60% of his total dollar volume of business from trading "investment securities". Investment securities are limited to government, municipal and corporate debt securities not in default, preferred shares not in arrears of dividends and common shares with a demonstrated earning power.[10]

4 The Montreal Stock Exchange ranked eighth with a volume of approximately $1-1/2 billion. *See* TORONTO STOCK EXCHANGE, ANNUAL REPORT 24 (March 31, 1977).

5 For a general discussion of the secondary market in Canada, *see* D. SHAW & R. ARCHIBALD, 8 THE MANAGEMENT OF CHANGE IN THE CANADIAN SECURITIES INDUSTRY 52 (1977) (The Canadian Securities Market, A Framework and a Plan).

Kniewasser, president of the IDA).

7 IDA by-law 2.2(e), IDA, BLUE BOOK 406 (1977), 1 CCH CAN. SEC. L. REP. ¶ 821, at 758.

8 IDA by-law 1.1(f), *id.* IDA, BLUE BOOK at 404 B, CCH CAN. SEC. L. REP. at 755-56.

9 IDA by-law 6.1, *id.* IDA, BLUE BOOK at 415, CCH CAN. SEC. L. REP. at 763-10.

10 IDA by-law 1.1(g), *id.* IDA, BLUE BOOK at 404B, CCH CAN. SEC. L. REP. at 756.

The IDA applies a greater portion of its budget to trade association functions than the TSE but also regulates the capital and trading practices of its members.[11] A member's capital position is monitored weekly, monthly and yearly in varying degrees and a surprise audit is conducted at least once every fifteen months.

Membership in the IDA, as non-resident securities firms have discovered, is virtually a prerequisite to participation in national underwriting. However, membership in the IDA is not a legal prerequisite to carrying on an underwriting business. The choice of the underwriter is up to the issuer and theoretically the issuer can choose a firm other than an IDA member.[12] The underwriter assembles the banking group and the selling group, subject occasionally to suggestions by the issuer. In fact, if an issuer is anxious for broad distribution of securities, the issuer will choose an IDA member as underwriter and the underwriter will put together banking and selling groups composed of only IDA members. In some respects, the IDA does operate a marketplace like the TSE in that to effect a broad distribution of securities it is essential for members of the IDA to be involved in the distribution.

The IDA is also directly involved in regulation of the market practices associated with the underwriting and distribution of securities,[13] that is, the primary market, and in regulation of the secondary market in corporate and government bonds.[14]

C. THE BROKER-DEALERS' ASSOCIATION OF ONTARIO

The Broker-Dealers' Association of Ontario is also incorporated by statute.[15] Any regulations made by the BDA are subject to the approval of the OSC.[16] The circumstances surrounding the establishment and the decline of the BDA are described[17] in chapter IV.

There have been no applications for membership in the past five years. The twelve continuing members are subject to capital restrictions (which are the same as those imposed by the Ontario Securities Act)[18] established by the association and enforced by

11 IDA by-law 17, *id.* IDA, BLUE BOOK at 439, CCH CAN. SEC. L. REP. at 763-32.
12 The Government of Canada chooses only IDA members to underwrite its issues of debt securities.

regular and surprise audits.[19] The BDA does not offer a trading facility like the TSE or an implicit stamp of approval like the IDA. The only apparent advantage of BDA membership is in the event of a complaint about a member. The OSC normally refers the complaint to the BDA which would conduct the initial investigation. In this respect, the BDA acts as somewhat of a buffer against OSC investigation.

Chapter III
Delegation of Powers to Self-Regulatory Organizations

A. THE MEANING OF "SELF-REGULATORY ORGANIZATION" (SRO)

It is possible for any group of persons or companies with a role in the securities industry – for example, securities salesmen or financial analysts – to establish an association which could have a number of purposes. The association may simply provide a forum for the exchange of information by members. Or, the association may assume the more conventional trade association role, and keep members informed of, and lobby for, changes in the laws affecting the members. The association may apply standards for membership and regulate the conduct of members, using cancellation of membership in the association as the ultimate sanction. If the association is carrying out regulatory functions which are the responsibility of government and government is prepared to recognize this form of regulation, and, indeed, to delegate governmental authority to the association to carry out the regulatory functions, then the association is considered for purposes of this paper a self-regulatory organization – an "SRO".

Recognition of the association by government can come about in two ways. First, the association may operate a facility which is integral to the functioning of the securities markets, such as a stock exchange. A stock exchange assumes the nature of a public utility, which by definition, requires regulation. In the case of a stock exchange, the regulation is normally carried out by its members. Government, however, will want to be satisfied as to the efficacy of the regulation by exchange members to ensure that the utility provided by the exchange is operated in the public interest. Second, the association may not operate a facility, but may feel that it is in a position to effectively regulate certain phases of the activities of its members and therefore will seek government

19 BDA members who are not also TSE members must submit to the secretary of the association all sales literature prior to circulation which acts as a check only against

recognition of its regulatory activities, usually because the association members prefer regulation by their peers. Again, government will be aware that, in the absence of regulation by the association, government will be responsible for regulating the activities of the members, and that to recognize the regulatory activities of the association will amount to a delegation of government power to the association. Delegation of regulatory power can only be made if government is satisfied that the association will exercise its regulatory powers in the public interest.

How are the TSE, IDA and BDA vested with their regulatory powers?

B. LICENSING OF SECURITIES FIRMS

To the extent that trading in securities is to be regulated, the responsibility for such regulation is vested under the present scheme of regulation in Canada, in the government of the province in which the trading takes place. In Ontario, which is a typical province in terms of its scheme of regulation, the government discharges this responsibility through a statutory scheme which, among other things, requires any person wishing to trade in securities to be registered with the Ontario Securities Commission. The registration is granted if the applicant is "suitable" for registration and the proposed registration is not "objectionable".[20]

The commission also has the power to suspend the registration where in the opinion of the commission suspension is in the public interest.[21]

By implementing the registration system government attempts to assure the public of the suitability of all persons and companies carrying on a securities business in each province.

Issuers of securities constitute another major group of participants in the securities industry. The issuers are subject to extensive regulation under the Ontario Securities Act through the requirement for a prospectus on a new issue of securities, through the rules relating to takeover bids and through the provisions of the act requiring financial information on a regular and timely basis – regulatory requirements which are familiar to all Canadian public companies. Issuers of securities differ from registrants in

flamboyance; the BDA check is not a defence in a fitness for registration hearing by the OSC. *See In re* Cumco Corporation Ltd., [1966] OSC Bull. 9 (March).

20 Ontario Securities Act, R.S.O. 1970, c.426, s. 7(1).

21 *Id.* s. 8(1).

that issuers are not generally subject to regulation by SROs whose regulatory powers are exercisable only over their members.[22]

C. DELEGATION OF POWER TO REGULATE NET FREE CAPITAL POSITION OF SRO MEMBERS

Three SROs have been conferred with regulatory power by the act:[23] The Toronto Stock Exchange,[24] the Ontario District of the Investment Dealers Association of Canada and the Broker-Dealers' Association of Ontario. The statutory recognition is provided for in part V of the Ontario Securities Act relating to audits.[25] The act imposes upon every registrant the obligation to keep the books and records necessary for the proper recording of his business transactions and financial affairs and the obligation to file with the OSC annually, and at such other times as the commission may require, a financial statement satisfactory to the commission, and such other information as the commission may require in such form as it may prescribe.[26] There is a broad exception to this requirement for registrants who are subject to audit by the three SROs referred to above. The three SROs are required to cause each member to appoint an auditor from a panel selected by the SRO and the auditor is required to make the examination of the financial affairs of the member prescribed by the SRO and is further required to report to the SRO auditor. The SRO auditor is appointed by the SRO with the approval of the commission.[27] The

22 The exception is the issuer whose securities are listed and posted for trading on a stock exchange. Such an issuer is required to comply with certain provisions in the by-laws of the TSE, for example, the obligation to make a filing statement in the event of a material change in the business of certain issuers. If an issuer does not comply with these by-laws, the TSE has the power to delist the issuer's shares. Issuers are not directly represented on the board of governors of the exchange or on its other regulatory committees. This is also the case for issuers whose securities are listed and posted for trading on the Montreal Stock Exchange and the Vancouver Stock Exchange.

23 The "act" is the Ontario Securities Act, *supra* note 20.

24 The act refers to "every stock exchange in Ontario recognized by the Commission...." As previously stated, the Toronto Stock Exchange is the only stock exchange in Ontario and it is recognized by the commission; Ontario Securities Commission, Policy Statement No. 3-17, *supra* note 3.

25 Ontario Securities Act, ss. 30-33. Ontario Securities Regulations, pt. X, empowers the commission to require reporting of information concerning trading in the over-the-counter market to an agency recognized by the commission. The commission relies on the IDA for supervising the assembling of information on trading in this market and has published a manual for registrants on over-the-counter trading reports.

26 Ontario Securities Act, s. 32.

27 *Id.* s. 30(b). The commission recently gave notice of its approval of a new exchange auditor on certain conditions; *see* OSC Weekly Summary, January 20, 1978; text accompanying note 212 *infra*.

by-laws, rules and/or regulations of the SROs in respect of the practice and procedure of the examination and the actual conduct of the examination must be satisfactory to the commission.[28]

The statutory provisions relating to SRO audits are at first glance merely procedural. However, in practice, they have the effect of conferring upon the SROs the authority for monitoring the conventional index for measuring a registrant's health, that is, its capital position. The stock exchanges and the IDA have made arrangements for dividing this audit jurisdiction in the case of firms that are members of more than one SRO.[29] The requirement that the regulation of the SROs be satisfactory to the commission does give the commission the power to retrieve its delegated responsibility for ensuring the suitability for continued registration of persons and companies carrying on a securities business. (This "threat" to the SROs' regulatory powers is one way - although perhaps not so intended - in which the government assures itself of effective SRO regulation.) In fact, the OSC has drawn upon the expertise of the SROs with respect to audits and has adopted, in substantially the same form, the auditing requirements of the SROs and published them as conditions of registration for every registrant whose financial affairs are not subject to examination by an SRO under section 31 of the act.[30] The SROs therefore have assumed full responsibility for assuring themselves that members maintain adequate capital. There is considerable incentive for each SRO to take a tough position on the maintenance of adequate net free capital because the greater portion of the cost of the failure of a member firm within the audit jurisdiction of the SRO is assumed by members of that SRO. The cost is borne by all registrants by way of their contributions to a national contingency fund. Participation in such a fund is a condition of registration found in subsection 6(3) of the Ontario Securities Regulations. As additional assurance against failure, the SROs

28 Ontario Securities Act, s. 31(2).

29 *See* discussion in ch. XII.B *infra*.

30 Ontario Securities Regulations, s. 6(6). In paragraph 6 of these Conditions of Registration the OSC recognized the Canadian Mutual Funds Association and noted its approval of the procedure for audit surveillance and rules relating to the examination of the financial affairs of its members and exempted mutual fund dealers from the requirements of the conditions so long as they complied with the requirements of the association. However, starting in 1976, the Canadian Mutual Fund Association began to phase out its self-regulatory function and, in particular, it discontinued its responsibility for the auditing of its members. This function is now performed by the securities commission of the relevant province. As part of the process, the association changed its name to the Investment Funds Institute of Canada on June 2, 1976. (A recently published revision of the Conditions of Registration makes no reference to the Canadian Mutual Funds Association or to the Investment Funds Institute.)

have adopted higher requirements for minimum net free capital than those prescribed by the regulations made pursuant to the Ontario Securities Act.

D. REGULATION OF NON-SRO MEMBERS

None of the provinces require as a prerequisite to carrying on a securities business that a person or company be a member of an SRO. In Ontario there are seven categories of dealers,[31] only three of which require membership in an SRO:

(1) a broker, which is a person or company registered exclusively to trade securities as an agent and is a member of the Toronto Stock Exchange;
(2) a broker-dealer, which is a person or company that trades as agent or as principal and is a member of the Broker-Dealers' Association of Ontario;
(3) an investment dealer, which is a person or company that trades as an agent or principal and is a member of the Ontario District of the IDA.

If a firm does not wish to become a member of one of the three SROs, the firm can nevertheless carry on a securities business in the capacity of either an agent or principal by being registered as a securities dealer.[32] As of April 30, 1978, there were seven firms registered only as brokers, ten firms registered only as investment dealers, and twelve firms registered as broker-dealers. The largest category is that of broker-investment dealer, reflecting membership in both the TSE and the IDA. There were forty-six firms registered as broker-investment dealers. There were ten firms registered as securities dealers, and eleven firms registered as both brokers and securities dealers.[33] The latter are members of

31 Ontario Securities Regulations, s. 2(1).

32 *Id.* The other categories of dealers set out in s. 2(1) are: mutual fund dealer, scholarship plan dealer and security issuer. Subsection 2(2) provides that anyone who is an adviser is to be registered as one of investment counsel, portfolio manager, or securities adviser. Anyone registered as a broker-dealer, investment dealer or securities dealer is also deemed to be registered as an underwriter; *id.* s. 2(3).

33 These represent some significant changes. As of June 30, 1976, the numbers were as follows:

Brokers	8
Investment dealers	11
Broker-dealers	12
Broker-investment dealers	52
Securities dealers	9
Broker-securities dealers	13

Information taken from [1976] OSC Bull. 192 (July).

The other registrants as of April 30, 1978 were as follows:

Broker-broker-dealers	1
Scholarship plan dealers	1

the TSE but carry on an underwriting business without membership in the IDA.

Ontario then recognizes that not every registrant will qualify or will want to quality for membership in an SRO. The government of Ontario has therefore had to retain those regulatory powers for non-SRO members which have been delegated or assumed by the SROs. Ontario could, if it felt that self-regulation provided a greater degree of investor protection, require the SROs to regulate non-SRO members, although it has not chosen to do so.

Chapter IV
Evolution of the Scheme of Statutory Recognition of SROs

A. SELF-REGULATION WITHOUT GOVERNMENT SUPERVISION

Ontario SROs enjoyed an era of self-regulation free of government supervision until the enactment of the Security Frauds Prevention Act, 1930.[34] The era began at least as early as 1852 when the Toronto Stock Exchange started business[35] and continued through the introduction of the first Ontario legislation enacted to protect investors. The reason for the lack of government regulation was that early Ontario securities legislation concentrated on the regulation of the primary or "new issue" securities market. For example, the earliest investor legislation in Ontario[36] provided for the statutory liability of a director for untrue statements contained in a prospectus of his company. In the late 1800s and into the 1900s protection of the public was not apparently perceived to require any government regulation of the secondary markets.

The Security Frauds Prevention Act, 1928,[37] provided for some regulation of the secondary market by requiring registra-

35 The Toronto Stock Exchange (TSE) was incorporated by statute in 1878; S.O. 1878, c. 65.

36 Director's Liability Act, 1891, S.O. 1891, c. 34, s. 4. The earliest legislation in Canada directed specifically at investor protection was the Manitoba Sale of Shares Act of 1912 which was later replaced by the Municipal and Public Utility Board Act; S.M. 1926, c. 33.

37 S.O. 1928, c. 34.

tion of brokers and salesmen.[38] At the same time, the disclosure requirements found in the Companies Act[39] were transferred to the Companies Information Act, 1928.[40] The latter act provided for the filing of a prospectus by an issuer, which would also have to be registered as a broker under the Security Frauds Prevention Act, 1928. Although by today's standards these statutes established a relatively primitive approach to government protection of investors, they had a significant impact on the primary market of the day. If the absence of provisions dealing specifically with the regulation of the secondary market suggests that this was not an area of great concern to the legislature in 1928, the degree of regulation was to change within a short time.

In the province of Québec, legislative concern for investors did not materialize until 1924, even though the Montreal Stock Exchange had been incorporated back in 1874.[41] In 1924, "An Act respecting the issue and sale of shares, bonds and other securities"[42] was proclaimed. This was a basic disclosure statute and did not provide for government regulation of the secondary markets.

Meanwhile, British Columbia was following the example of Ontario. In addition to requiring prospectus disclosure, the Companies Act, 1897[43] created statutory liability for statements made by directors in a prospectus. A decade later, the Vancouver Stock Exchange was incorporated by statute.[44]

British Columbia securities legislation did not develop further until the province enacted the uniform Security Frauds Prevention Act, along with Alberta, Manitoba, Nova Scotia, Ontario, Prince Edward Island, Québec and Saskatchewan. It is apparent that until the introduction of the uniform acts, the SROs were not subject to government supervision and therefore enjoyed a period of pure self-regulation.

38 The 1928 act prohibited trading in any security without registration; the terms "trade" or "trading", "security" and "fraud" are defined in s. 2 of the 1928 act.

B. SECURITY FRAUDS PREVENTION ACT, 1930 – DELEGATION OF THE AUDIT FUNCTION

In Ontario, the Security Frauds Prevention Act, 1930,[45] replaced the 1928 statute and is important in a discussion of self-regulation because it was the first statute completely revising Ontario's securities legislation and establishing[46] what continues today to be the basic scheme for SROs assuming responsibility for the manner in which their members' financial affairs are audited.[47] The 1930 legislation required the executive committee of every stock exchange to appoint an auditor for each stock exchange member. The auditor was vested with broad powers and was required to audit the financial statements of stock exchange members allocated to him as of specified dates (brokers not subject to exchange audit were required to file audited financial statements with the Registrar[48]).[49] The auditor could also be authorized by the executive committee to conduct a special audit or, "report upon the whole or any aspect of the business or affairs of any person or company who is or has been a member or in any way represented upon the exchange".[50] The 1930 statute had teeth – the executive committee of the stock exchange could impose any requirements on members relating to any system of bookkeeping or record-keeping,[51] and failure by a member to comply with an exchange requirement constituted an offence and entitled the stock exchange executive committee to suspend the member from the exchange.[52]

The absence of any published Ontario government reports or studies indicates that there was no coherent philosophy of self-

45 S.O. 1930, c. 39. As stated above, most of the provinces adopted the uniform Act in 1930. Alberta enacted the Security Frauds Prevention Act, 1930, S.A. 1930, c. 8; British Columbia, SecurityFrauds Prevention Act, S.B.C. 1930, c. 64; Manitoba, An Act to Amend the Security Frauds Prevention Act, 1929, S.M. 1930, c. 26; Nova Scotia, the Security Frauds Prevention Act, S.N.S. 1930, c. 3; Prince Edward Island, the Security Frauds Prevention Act, 1930, S.P.E.I. 1930, c. 2; Québec, Security Frauds Prevention Act, 1930, S.Q. 1930, c. 88; Saskatchewan, the Security Frauds Prevention Act, 1930, S.S. 1930, c. 74. While the statutes were substantially uniform, there were some notable differences due to the absence of stock exchanges in several of the above-mentioned provinces. Provisions relating to stock exchanges were deleted and alternative means of regulation inserted in their place.

46 The provisions for the audit of brokers were first enacted by the Security Frauds Prevention Act, 1929, S.O. 1929, c. 51, which amended the Security Frauds Prevention Act, 1928. These provisions were reenacted in the 1930 act. *See* ch. III.C *infra*.

47 *See* Ontario Securities Act, ss. 30-33; Ontario Bill 7, ss. 18, 19-21.

48 The registrar was appointed by the Lieutenant Governor in Council.

regulation but rather a pragmatic response to one aspect of the provision of investor protection – assuring some organized control over the manner of reporting and the timing of reports of the financial position of stock exchange members. From this, one may infer that the government considered public confidence in the securities market to be dependent on the financial stability of members and that the best way to monitor members' financial positions was through audits of their financial statements. This approach to regulation probably made good political sense, because the public would be much more sensitive to the failure of a stock exchange member than to a stock market manipulation.

The Security Frauds Prevention Act, 1930, contained further evidence of an increasing awareness by legislators to the importance of the secondary markets. The statute gave to the Lieutenant Governor in Council broad powers to make regulations "for the regulation of listing and trading in securities upon any stock exchange, of the records relating thereto and of the clearing of transactions thereon...".[53] No regulations were ever enacted under this provision. The 1930 act also required that every stock exchange in Ontario keep a record of the trading conducted on the exchange,[54] and further required that it make this information available to the parties involved in a particular trade.

C. CREATION OF THE ONTARIO SECURITIES COMMISSION

A securities commission was unheard of up to 1930 because the regulation of trading in securities was the responsibility of the Attorney-General. It was not until the following year that a government board was set up to regulate the securities industry.[55] The board was to be appointed by the Lieutenant Governor in Council to administer the Security Frauds Prevention Act, 1931, but was not referred to as the Ontario Securities Commission in the legislation until 1933.[56] The power of the Lieutenant Governor in Council to make regulations concerning the listing and trading of securities on any stock exchange created by the 1930 legislation was transferred to this board, subject, however, to the approval of the Lieutenant Governor in Council.[57] This transfer of the power

53 *Id.* s. 31(a).

54 *Id.* s. 16.

55 Security Frauds Prevention Act, 1931, S.O. 1931, c. 48, s. 3. Manitoba was ahead of Ontario, having established a board in 1926 under the Municipal and Public Utility Board Act, S.M. 1926, c. 33.

56 *See* the Statute Law Amendment Act, 1933, S.O. 1933, c. 59, s. 34; Ontario Order-in-Council (65 Ont. Gazette, pt. II, 883) (June 23, 1932); Securities Amendment Act, 1937, S.O. 1937, c. 69, s. 3.

57 Security Frauds Prevention Act, 1931, S.O. 1931, c. 48, s. 3.

to make regulations, although temporary,[58] is probably the closest the Ontario Securities Commission has come to having something equivalent to the rule-making power of the United States Securities and Exchange Commission.[59]

The lack of concern during this period with some of the issues to be discussed in part II of this paper, such as the impact of the stock exchanges on competition and whether the procedures used by the SROs are fair, is apparent. The major impact of securities legislation in this period was to create both civil and criminal liability for false statements in prospectuses. By the 1930 act, however, broad powers were vested in the executive committee of a stock exchange, including suspending a stock exchange member for failing to comply with a stock exchange requirement relating to a member's financial position, but no provision was made for review by a government body of the exercise of these powers by the executive committee. Indeed, the 1930 act gave protection to a stock exchange from actions against any stock exchange, or against any broker or exchange auditor in respect of any act dealing with audits.[60] Certainly the appearance of integrity in the securities markets could be created by the imposition of tough sanctions in the event of false statements. However, as discussed later in this paper, self-regulation has a number of limitations which can result in abuse of the regulatory role. Concern about such abuse was not apparent in the legislation.

D. THE SECURITIES ACT, 1945 – INCREASED SUPERVISION OF THE TORONTO STOCK EXCHANGE

The Ontario scheme of securities legislation was not entirely successful in protecting the investor from fraud and manipulation in the securities markets. By 1945, Ontario had achieved an international reputation as a haven for fraudulent stock promoters[61] and in 1945 the Royal Ontario Mining Commission (the Urquhart Commission) was able to write:

> "The stated purpose of the Ontario Securities Act and its predecessor the Security Frauds Prevention Act of 1928, 1929 and 1930, was to prevent fraud and misrepresentation in the sale of securities to the public. The Acts, with

58 The board did not have this power under the Securities Act, 1945, S.O. 1945, c. 22 (1st Sess.).

59 *See* Securities Exchange Act of 1934, s. 23(a).

61 Bray, *Ontario's Proposed Securities Act: An Overview, Its Purpose and Policy Premises,* [1975] OSC Bull. 235 (October).

their many amendments and regulations, do not appear to have attained the objective set."[62]

The Urquhart Commission did not concern itself with the operation of the stock exchanges, but was more concerned with the powers of the Ontario Securities Commission and the impact that such powers had on prospecting activity in Ontario. Many of the Urquhart Commission recommendations were accepted in the Securities Act, 1945,[63] which was, by today's standards, Ontario's first comprehensive securities legislation. The legislation is also important in the context of this paper in that it marked the first statutory requirement for government supervision of stock exchanges.

The 1945 act required any person wishing to carry on business as a stock exchange to obtain the consent of the Ontario Securities Commission.[64] In addition, every stock exchange member was required to furnish to the exchange auditor a completed statement, presumably relating to the members' financial condition, in the form approved by the commission.[65] In anticipation of the establishment of an association of non-stock exchange brokers, the 1945 legislation provided for the assumption of the audit function by the association from the OSC.[66]

Although regulation of certain aspects of the affairs of their respective members by the stock exchange and a brokers' association was provided for, this provision was not enacted in response to a comprehensive rationale for self-regulation in the securities industry. Rather, it was enacted as one way of limiting government control of the securities industry, a form of control which the Urquhart Commission considered had an adverse effect on mining financing. The OSC did however retain its broad powers to cancel or suspend the registration of any broker or dealer[67] and to approve a prospectus which was required when there was a primary distribution to the public.[68] If the reason for this intended shift of

62 2 REPORT OF THE ROYAL ONTARIO MINING COMMISSION 18 (1944) [1945] (Regulations Governing the Financing of Mining Developments).

64 *Id.* s. 31. In Canada this requirement first appeared in Manitoba in An Act to Amend the Security Frauds Prevention Act, 1929, S.M. 1930, c. 36, and was introduced in Ontario in the form of an Order-in-Council under the Securities Act, 1930; *see* Ontario Order-in-Council (66 Ont. Gazette, pt. II, 1951) (September 21, 1933).

65 S.O. 1945, c. 22 (1st Sess.), s. 35(2).

66 *Id.* s. 42(2).

67 *Id.* s. 10.

68 *Id.* s. 49. The term "prospectus" was not used in the legislation but instead s. 49(1)(a) provides for "a clear and concise statement in the form prescribed by the regulations dated and signed by every person who is, at the time of filing, a director or promoter of the person or company issuing the security or an underwriter or

regulatory power from government to the private sector was to create a looser regulatory environment in order to stimulate mining financing, the shift of power could be interpreted as an unfortunate statement about self-regulation and the perception of self-regulation by the government of the day. It suggests that self-regulation is not as strict as government regulation or, is regulation motivated by self-interest or, at best, is regulation which is more sensitive to the needs of the regulated. There does not appear to have been any public discussion of this shift of power to the SROs other than a not very informative statement by the Attorney-General upon introducing the Broker-Dealers' Association Act.[69]

The Securities Act, 1947,[70] was a consolidation of the various pieces of securities legislation[71] then in force. The power given to the OSC to consent and, by implication, withdraw its consent, to a person or company wishing to carry on business as a stock exchange did not mean increased supervision of the TSE by the OSC.[72] The termination of the business of the TSE for even minor reasons was too severe a sanction and unlikely to be exercised. Confronted with the choice of using the "big stick" or doing nothing, the OSC would generally do nothing.[73] In order for the

---

optionee of the security, containing a full, true and plain disclosure of all material facts...".

69 The Attorney-General, the Hon. Leslie E. Blackwell, on the first reading of the act stated:

> "I might now refer to the other Bill. At the present time there exist two organizations with which the Commission can deal, the first of which is the Stock Exchange which is incorporated under an Act of this Province of long standing. The other is the Investment Dealers Association of Canada, which has an Ontario division. But the greater number of brokers and dealers in mining promotions, by and large, are not members of either of these organizations, although a limited number are, but in the main, they have been a number of individuals. The Commission has been completely without a representative body with which matters could be discussed, and where a certain amount of sound regulation of the members could be procured to the advantage of the public interest. It is not contemplated that any of these organizations should have the control of registration. Under the Act, the road is still clear to any one who wishes to engage in the business, and anyone is eligible for registration without membership in an organization being a condition precedent to so engaging in that business."

LEG. ONT. DEB. 22d leg., 3d Sess. No. 1, at 884 (1947).

70 Securities Act, 1947, S.O. 1947, c. 98.

71 Securities Act, 1945, S.O. 1945, c. 22; Securities Amendment Act, 1946, S.O. 1946, c. 86; Prospecting Syndicate Agreements Act, 1945, S.O. 1945, c. 16.

72 The Toronto Stock Exchange has been the only stock exchange operating in Ontario since the 1934 merger of the old Toronto Stock Exchange with the Standard Stock and Mining Exchange.

73 The SEC faced a similar limitation on its supervision of the U.S. SROs prior to the Securities Reform Act of 1975; *see* REPORT OF THE SUBCOMM. ON SECURITIES OF THE SENATE COMM. ON BANKING, HOUSING AND URBAN AFFAIRS, S. REP. No. 13, 93d Cong., 1st Sess. 188 (1973) [hereinafter SENATE SECURITIES INDUSTRY STUDY].

OSC to effectively supervise the TSE, other sanctions and procedures would have to be spelled out in the legislation.

The commission did have some other powers over the TSE. The prospectus requirements of the Ontario Securities Act did not apply to the securities of mining, industrial and investment companies, which were listed and posted for trading on any recognized stock exchange if such securities were sold through such stock exchange.[74] The OSC assumed that recognition of a stock exchange could only be by the commission. It has been pointed out, however,[75] that it is possible to interpret the recognition requirement so that recognition had nothing to do with the OSC, and that it was a matter of fact in each case whether or not a particular stock exchange was "recognized". If the OSC's interpretation was correct, to terminate recognition of the TSE would have denied to companies listed on the exchange an important advantage of listing and an important means of raising capital from the public. However, the power to recognize a stock exchange did not give the commission any direct supervisory powers over the other activities of the exchange[76] and, like the power to consent to a person or company carrying on business as a stock exchange, really only gave the commission a lever that could be used in negotiations with an exchange seeking recognition.

Other powers of the commission which could be exercised to control the activities of stock exchange members were the power to suspend or cancel the registration of a TSE member as a broker under the Securities Act, the power to investigate the affairs of a TSE member and the power to order a surprise audit.[77] Had the commission wanted to carefully supervise the activities of the exchange, these powers plus the consent and recognition powers would clearly have given the commission a very strong hand in any negotiations with the exchange.[78]

74 Securities Act, 1947, S.O. 1947, c. 98, s. 46(b). The exemption also existed in the Securities Act, 1945, S.O. 1945, c. 22, s. 49(7)(b), but detailed prospectus requirements were not introduced until the 1947 act.

75 Baillie, *The Protection of the Investor in Ontario* (pts. 1-2), 8 CAN. PUB. ADMIN. 172 and 325, 334 n. 369 (1965).

76 *Id.*

77 S.O. 1947, c. 98, ss. 8, 26 and 41 respectively.

78 In addition to these powers vested in the OSC, the cabinet had power to pass regulations concerning the listing and trading of securities, but this power was never exercised; *see* Baillie, *supra* note 75, at 334 n. 369.

E. THE BROKER-DEALERS' ASSOCIATION OF ONTARIO

From 1945 to 1963, few changes were made to Ontario's scheme of securities regulation. From the point of view of self-regulation, perhaps the most interesting event was the formation and legislative authorization in 1948 of the Broker-Dealers' Association of Ontario.[79] The Broker-Dealers' Act, 1947, conferred on the board of governors of the association power to make regulations necessary for the association to function. But the regulations were made expressly subject to the approval of the OSC, which indicated that the legislature was not prepared to permit an SRO to be totally free of government supervision.[80]

At the time of the BDA's creation, there were more than 200 non-stock exchange members "who specialized in the sale of highly speculative mining securities across the continent through the use of direct mailings and the long distance telephone".[81] The BDA was established to regulate registrants who were not members of the stock exchange or the Investment Dealers Association. Its establishment followed completion of a review by the OSC of the fitness for continued registration of every registrant,[82] a review which resulted in the elimination of a substantial number of registrants. Incorporation resulted from warnings of the chairman of the OSC who suggested that the alternative to self-regulation by the broker-dealers was strict bureaucratic control.[83]

By 1948, the OSC had passed on some regulatory authority to the BDA. However, control over the association was reassumed by the commission in 1949 as a result of dissatisfaction with the workings of the association. "Although the association had done some housecleaning, it appeared to be as much interested in promoting legislation to relax controls on securities dealings as in limiting the undesirable activities of its members."[84]

The creation of the BDA should not be construed as an attempt by the government of Ontario to strengthen self-regulation in the securities industry in Ontario, in the same manner as was

79 The Broker-Dealers' Act, 1947, S.O. 1947, c. 8. For a detailed analysis of the sanctioning practices of the association, *see* P. Anisman, Sanctioning Practices of the Broker-Dealers' Association of Ontario: Self-Regulation in Action (1967) (unpublished paper prepared for the Federal Securities Task Force, on file in Corporate Research Branch, Consumer and Corporate Affairs Canada, Ottawa).

the United States Maloney Act of 1937[85] which provided for the registration of national securities associations with the SEC. The creation of the BDA was a pragmatic attempt by the government to provide protection to the investors of the province by means of private regulation, thereby sparing the government direct responsibility for regulation of a sector of the securities community.

F. RECOGNITION OF THE INVESTMENT DEALERS ASSOCIATION

From a self-regulatory point of view, the other interesting event during this era was recognition in Ontario securities legislation of the existence of the Investment Dealers Association of Canada.[86]

The provision for audits of stock exchange members supervised by a stock exchange auditor was extended to the IDA (as well as to the BDA) which was required to appoint a district association auditor responsible for supervising the audit of the affairs of members of the IDA Central District.

The Securities Act, 1947, added to the supervisory powers of the OSC over the SROs.[87] It provided that the by-laws, rules and regulations of every stock exchange, the rules and regulations of the IDA Central District, and the regulations of the BDA in respect of the practice and procedure of the examinations of the financial affairs of members by auditors and the actual conduct of such examinations be satisfactory to the OSC.

There is no publicly recorded evidence of OSC intervention to change the practice and procedure in the supervision of auditing members' affairs by the TSE and IDA. Indeed, it was not until the OSC and the TSE were jolted by the Windfall affair that the OSC made some adjustments to its laissez-faire relationship with the TSE.

G. THE WINDFALL REPORT

Government responsibility for permitting SROs to carry on business and for supervising their operations became an issue of public concern with the appointment under Mr. Justice Arthur Kelly of the Ontario Royal Commission to inquire into trading of shares of Windfall Oils and Mines Limited.[88]

The Royal Commission was appointed as a result of public concern over dramatic fluctuations in the price and volume of

85 The Maloney Act added s. 15A to the Securities Exchange Act of 1934.
86 Securities Act, 1947, S.O. 1947, c. 98, s. 38.
87 *Id.* s. 39(2).
88 The commission published the WINDFALL REPORT (1965).

trading in Windfall shares, a speculative mining and exploration company listed on the TSE. George and Viola MacMillan had purchased large blocks of Windfall shares which permitted them to take control of the company, the shares of which were listed on the TSE. Public interest in the company followed the April 16, 1964, announcement of the huge mineral discovery by Texasgulf in the Timmins area which was followed two days later by the sale to Windfall by Mrs. MacMillan of claims in the vicinity of the Texasgulf discovery. By the middle of June, Windfall had arranged for distribution of its shares on the exchange.

Interest in the Windfall shares intensified when a drilling rig was moved onto the Windfall property. The price of shares rose rapidly because of Windfall's failure to release to the public preliminary findings indicating negative results. The only public statement was a press release stating that Windfall was drilling in the vicinity of the Texasgulf discovery. With the price of the Windfall shares climbing, the MacMillans began selling. The TSE then made a formal demand for more information. After a meeting attended by representatives of the TSE, OSC and Windfall, another press release was issued, but this release merely served to fan buyer interest. Before release of a laboratory analysis of the core samples the stock reached a high of $5.50 per share. The day after the release of the negative report, the opening price plummeted to $0.80 per share.

As disturbing as the above events were for the investing public in Ontario, the conclusion was worse. The MacMillans ended up with profits in excess of $1 million which they did not have to disgorge, apparently due to lack of adequate civil liability remedies. Members of the TSE realized net profits of about $0.5 million in addition to estimated brokerage commissions of $1.2 million. Losses of approximately $1.1 million and $1.3 million were suffered by miscellaneous large traders and small traders respectively. Criminal charges were laid, which resulted in acquittals or minor sentences.

The Windfall affair underlined the inadequacy of the OSC supervision of the TSE, the need for an effective, timely disclosure policy and the inability of the TSE to force disclosure by listed companies. In addition it highlighted the problems of primary distributions through the facilities of the TSE (which were exempt from regulation by the OSC).

The inadequacy of the powers of the Ontario Securities Commission over the TSE was particularly reflected by the OSC, TSE, Windfall meeting referred to above. The OSC called the meeting to determine the reasons for the heavy trading of Windfall shares. At the end of the meeting, a timely disclosure statement was

published which, as noted, did little to still the rumours about Windfall drilling results but served simply to prolong market activity. The exchange apparently felt that once the commission had been drawn into the affair the exchange was absolved from further responsibility. Mr. Justice Kelly disagreed, concluding that the full responsibility for the trading was that of the exchange because of the lack of commission authority to take corrective action.[89] The commission apparently did not construe its power to withdraw its consent to the exchange's carrying on business as a mandate from the legislature to regulate day-to-day trading on the exchange.

Another example of the commission's lack of power over the exchange was demonstrated by the misuse of the exemption from the prospectus requirements of the Ontario act for distributions of shares of listed companies through the facilities of the exchange. Mr. Justice Kelly explained that the exemption from the prospectus requirements amounted to a statutory delegation to the stock exchange of commission responsibility for prospectus disclosure, but that such delegation should only be made on the condition that "the Commission should have the right and responsibility to oversee the performance of the delegated duties".[90]

H. THE KIMBER REPORT

The *Windfall Report* was published in September 1965. Earlier in the same year, the *Kimber Report*[91] had been published, and although the latter report did not study the relationship between the OSC and the TSE in depth, the Kimber Committee did consider the question of primary distributions through the facilities of the TSE, recommending that such distributions be discontinued because of the manipulation of the exchange market which occurred in the course of such distributions.[92]

Probably assuming that Mr. Justice Kelly would study the relationship between the OSC and TSE in depth, the Kimber Committee commented on only one occasion about the OSC-TSE relationship stating: "In our opinion, the policy-making functions of the Commission, especially in the significant areas of primary

distribution and jurisdiction over stock exchanges, should be embodied in published regulations".[93]

I. THE SECURITIES ACT, 1966 – SPECIFIC PROVISIONS FOR OSC SUPERVISION OF THE TSE

The publication of the *Kimber Report* and the *Windfall Report* was quickly followed by the introduction of the Ontario Securities Act, 1966.[94] Although that statute has been identified more for its introduction of requirements on insider trading, financial reporting, proxy solicitation and takeover bids, it also prescribed more carefully the relationship which should exist between the Toronto Stock Exchange and the government of Ontario, through the Ontario Securities Commission. This relationship was given definition by the act in three ways:

1. *OSC Consent to the Exchange Carrying on Business*

The question of whether or not a stock exchange had to be recognized by the OSC to qualify under the Ontario act as a "recognized stock exchange" was answered with the introduction of the prohibition against any person or company carrying on business as a stock exchange in Ontario unless the stock exchange was recognized in writing as such by the commission.[95] The Toronto Stock Exchange is the only stock exchange recognized by the commission.[96]

2. *Distributions through the TSE*

The prospectus exemption for primary distribution of listed securities through the TSE, which had concerned both Mr. Justice Kelly and the Kimber Committee, was continued, though with a significant qualification. A listed company taking advantage of

93 *Id.* ¶ 8.06.

94 S.O. 1966, c. 142. The 1966 act was proclaimed in force on May 1, 1967.

95 *Id.* ss. 139(1), 58(2)(b). The Securities Act, 1947, S.O. 1947, c. 98, had distinguished between "consent" to carry on business and "recognition" for the purpose of exemption from prospectus requirements. The new provision appears to have lumped "recognition" and "consent" together.

96 OSC, Policy No. 3-17, *supra* note 3. In the discussion of the Estimates of the Ontario Ministry of Consumer and Commercial Relations by the Standing Committee on Administration of Justice, James Renwick asked the the OSC chairman Arthur Pattillo, "is the Commission considering revoking the license of the Toronto Stock Exchange to conduct the exchange?" Patillo responded glibly, "No, not at the moment". The minister echoed Pattillo's sentiments, "Hadn't entered our minds". Ont. Leg. Committee on Supply, Proceedings, No. S-26, 5th Sess., 29th Leg. at S848-49 (June 5, 1975).

this means for distributing shares was required to prepare a statement of material facts which had to be acceptable to the stock exchange and the commission. The prospectus exemption was effectively nullified because the standard of disclosure required for a statement of material facts is identical to that required of a prospectus.[97] Distributions of shares through the stock exchange are now rare because of the high standard of care and disclosure, the stricter policies of the commission dealing with financing of mining and oil companies[98] and the general decline in public equity financings.

3. *Government Supervision of the Exchange*

The regulation of distributions through the exchange and the requirement for OSC consent to carry on the business of a stock exchange did not deal directly with the issue of exchange supervision by the Ontario government. Mr. Justice Kelly, however, wished to deal with this issue, stating there must be "a decision of far-reaching consequence as to whether or not security trading on an exchange should be subject to regulation by an external agency and, if so, the extent of that control".[99] To understand the supervisory powers conferred on the OSC by the 1966 act it is useful to review the reasons why Mr. Justice Kelly considered that self-regulation on the Toronto Stock Exchange displayed weakness. He listed these reasons as follows:

> "First, rule-making has not kept pace with the ingenuity of those who wish to take advantage of the deficiencies in the rules. Secondly, there is widespread aberration from strict observance of the spirit of the rules. Thirdly, there is woeful lack of any effective surveillance to ensure the adherence to rule; an explanation frequently offered in justification for departure from the rules is that 'it is customarily done that way'."[100]

Not surprisingly, His Lordship concluded strongly in favour of external supervision of the exchange:

> "Even if the Exchange merits the continuance of its self-governing character by adopting satisfactory rules and showing a disposition to enforce them strictly but

97 *See* Ontario Securities Regulations, s. 53(1) *as amended*, which requires that a statement of material facts provide full, true and plain disclosure of all material facts relating to the security proposed to be issued.

98 *See e.g.* OSC, Policy No. 3-02, April 1, 1976, revised October 1, 1977, 2 CCH CAN. SEC. L. REP. ¶ 54-866 (Financing of Mining and Oil Companies), which, *inter alia*, sets maximum offering prices or price spreads.

99 WINDFALL REPORT at 99.

100 *Id.* at 100.

equitably, it is essential that some supervision be provided over the manner in which the Exchange performs its self-regulatory function. The supervisory body should not be empowered to examine the operations of an exchange member directly, but should in the first instance confine its attention to examining the effectiveness of the Exchange's supervision of the conduct of business by its members. Any direct control over an individual member should be exercised only when, through the examination of the general performance of the Exchange there appears to be good cause to suspect misconduct on the part of the member."[101]

The 1966 act gave the commission statutory power to regulate virtually every aspect of the operations of the TSE, in the following terms:

"The Commission may, where it appears to be in the public interest, make any direction, order, determination or ruling,

"(a) with respect to the manner in which any stock exchange in Ontario carries on business;

"(b) with respect to any by-law, ruling, instruction or regulation of any such stock exchange;

"(c) with respect to trading on or through the facilities of any such stock exchange or with respect to any security listed and posted for trading on any such stock exchange; or

"(d) to ensure that companies whose securities are listed and posted for trading on any such stock exchange comply with this Act and the regulations."[102]

In addition to the 1966 act there are two other statutes which give the OSC supervisory power over the TSE. The Toronto Stock Exchange Act, 1968–69,[103] which replaced the original statute[104] incorporating the exchange, "represented a restatement of the exchange's authority as a self-regulatory body"[105] and reinforced the commission's powers under the Ontario Securities Act by providing in subsection 4(3):

"The Corporation shall operate the exchange in a manner that does not contravene the requirements of The Securities Act, 1966, and the regulations, directions, orders,

101 *Id.* at 101.

102 Securities Act, 1966, S.O. 1966, c. 142, s. 139(2).

determinations or rulings made thereunder, and the Corporation may impose any additional or higher requirement within its jurisdiction."

and in section 112:

"Nothing in this Act shall be construed to derogate from the powers of the Ontario Securities Commission under The Securities Act, 1966, or any other Act."

In considering whether or not the Vancouver Stock Exchange was an SRO or just an operator of a stock exchange, the B.C. Corporate and Financial Services Commission referred[106] to the Toronto Stock Exchange Act to compare it with the Vancouver Stock Exchange Act, noting that the regulatory powers conferred on the TSE by the Ontario statute were much broader than those conferred on the VSE. The deficiencies in the B.C. statute were remedied shortly thereafter.[107]

The other statute is the Securities Amendment Act, 1968–69, which added to the 1966 act a right of appeal to the commission from a decision of the TSE in the following terms:

"Any person or company who feels aggrieved by any direction, order or decision made under any by-law, rule or regulation of a stock exchange in Ontario may apply to the Commission for a hearing and review in the same manner as to the hearing and review of a direction, decision, order or ruling of the Director."[108]

Ontario Bill 7 which introduced the Securities Act, 1978, is the most recent attempt to improve the statutory regulation of the secondary market with the creation of a statutory obligation on "reporting issuers" to make timely disclosure of material facts supported by sanctions for failure to comply. The Securities Act, 1978, is the first major revision of the Securities Act since 1966.[109] It continues, without significant amendment, the major provisions relating to SROs.

J. STATUTORY REVISIONS IN QUÉBEC AND BRITISH COLUMBIA ON GOVERNMENT SUPERVISION OF SROS

The legislative experience in Ontario was generally duplicated in Québec and British Columbia. As discussed above, Québec adopted the uniform Security Frauds Prevention Act, 1930.[110] This act provided for registration of brokers and salesmen, investigation and action by the Attorney-General, audit of brokers by an auditor from a panel selected by a stock exchange, preparation of audited financial statements by brokers who were not members of a stock exchange, regulation of trading by brokers, and the requirement that stock exchanges keep records of stock transactions. From 1930 to 1955, when Québec adopted more modern legislation based on the 1945 Ontario Securities Act, there were six amending statutes which revised and expanded on the topics listed below.

However, unlike the Ontario statute, the Securities Act[111] of 1955 did not give the QSC power over SROs. In fact, it was not until a 1971 amendment[112] to the Securities Act that the legislation provided that "No person or company may operate a stock exchange in the Province of Québec unless such stock exchange is recognized as such in writing by the Québec Securities Commission".[113] The same amending statute gave the commission broad powers to intervene in the affairs of an exchange when it is of the opinion that the public interest so requires. This provision permits the commission to take any decision, make any order, or give any instruction or direction,

> "(a) respecting the manner of operating a stock exchange in the Province of Québec;
> "(b) respecting any regulation, direction, instruction or order of such stock exchange;
> "(c) respecting dealing on the floor or by means of other devices of such stock exchange or respecting any security quoted or agreed to be quoted on such stock exchange;
> "(d) to ascertain that the companies the securities of which are quoted or agreed to be quoted on such stock exchange comply with the Securities Act and the regulations made under such act;
> "(e) respecting reports and information from any stock

113 *Id.* s. 21; now Québec Securities Act, s. 92(1).

> exchange, its members or the firms or companies represented at such stock exchange."[114]

With the exception of clause 92(2)(e), the above provisions are essentially those included in Ontario's Securities Act of 1966.

While the QSC's powers over SROs are still limited to the Montreal Stock Exchange[115] it does have extensive powers over securities firms, similar to those possessed by the OSC. The act prohibits trading in securities without registration,[116] provides that the granting or renewal of registration is to be at the discretion of the director[117] and provides that the commission may at any time, after giving the registrant an opportunity to be heard, suspend, cancel or revoke the registration.[118] In addition, the commission has powers to launch investigations to determine, *inter alia,* if there has been a breach of the securities legislation.[119]

Supervision of SROs in the province of British Columbia began with the requirements for audits of its members by the Vancouver Stock Exchange in the 1930 uniform act.[120] This supervision was extended in 1937[121] with the introduction of several new provisions with respect to stock exchanges. There was a prohibition against carrying on the business of a stock exchange without the consent in writing of the Attorney-General;[122] the Attorney-General and the Superintendent of Brokers were given the power to inspect stock exchanges;[123] and stock exchanges were required to file with the superintendent copies of all by-laws and amendments within seven days of their adoption.[124] However, the superintendent was not given any power to review, reject or approve the by-laws.[125] In sections 20 and 21 the executive committee of the stock exchange was explicitly given self-regulatory duties. It was directed not to allow members to trade in violation of the act, regulations or of its own by-laws. To enforce this directive, stock

125 An amendment to s. 137 of the British Columbia Securities Act (S.B.C. 1975, c. 70, s. 9) provides that "No stock exchange shall enforce any by-law, rule, instruction or regulation unless it has been filed with the Superintendent and approved by him in writing". This provision had not been proclaimed as of June 20, 1978.

exchanges were given the power to suspend or expel any member of the stock exchange "notwithstanding anything contained in the by-laws of a stock exchange".[126]

In 1967, British Columbia adopted a new Securities Act[127] similar to the Ontario Securities Act of 1966.[128] Sections 32 to 35 provided for the assumption of the audit function by three self-regulatory organizations: "Every stock exchange in the Province recognized by the commission, the Pacific District of the Investment Dealers Association and the British Columbia Bond Dealers Association...".[129] The Vancouver Stock Exchange was the only stock exchange recognized by the British Columbia Securities Commission under this section and section 137(1)[130] until the Vancouver Curb Exchange came into existence in 1974[131] to provide a market in over-the-counter issues after the Broker-Dealers' Association of British Columbia ceased to function as of June 1, 1974.[132] In the same year, an amendment to the act established a new commission, the British Columbia Corporate and Financial Services Commission, to replace the B.C. Securities Commission and to function as an independent appellate body for administrative decisions in the entire corporate and financial area. At the same time, the administrative powers of the Superintendent of Brokers were extended to include many of those formerly vested in the B.C. Securities Commission.[133]

Chapter V
A Rationale for Self-Regulation

The evolution of the legislation establishing Ontario's scheme of self-regulation reflects a lack of any purposeful government philosophy about self-regulation. As in the United States,[134] initial attention was focused on the stock exchanges, although this attention really constituted recognition of an existing situation. The rationale for establishment of the Broker-Dealers' Association appears to have been based on a mixture of concerns, for example, that direct government regulation would be too strict, and that

government would be reluctant to incur the expense of expanding its bureaucratic machinery to regulate the 200-odd non-stock exchange, non-IDA brokers. With one exception referred to below, there was no policy foundation for Ontario's scheme. Practicality dictated the scheme, rather than an assessment of the advantages and disadvantages of self-regulation.

Practicality was the primary ground for resorting to self-regulation as a control technique in the enactment of the United States Securities Exchange Act in 1934. The practicality of self-regulation was referred to in hearings before the House of Representatives on the 1934 act, in the following terms:

> "In framing a regulatory measure, the practical problem of administration has always to be faced and when regulation gets beyond a certain point and sheer ineffectiveness of attempting to exercise it directly through government on a wide scale counterbalances the fact that possibly the exchanges might not be as diligent as we would wish them to be about regulating themselves or as diligent as the Government would be if the task were compact enough to fall within the limits of effective governmental performance."[135]

The one exception to the lack of governmental analysis of the theory of self-regulation is the statement made by the Ontario Attorney-General on introducing the Broker-Dealers' Association Act, 1947,[136] when he suggested that the establishment of such a body would raise the standard of transacting business in a way that is difficult to accomplish through the "policing" of the industry by government.[137] The BDA did not prove to be a very convincing example of the objective outlined for the association by the Attorney-General for a number of reasons. Perhaps the most important of these was that the scheme of regulation was imposed upon a group of securities firms which were, at best, mildly enthusiastic about regulation. Another reason would be the lack of careful government supervision in the initial stages of the operation of the association.

Whether or not there exists a conscious government policy on self-regulation, the fact is that our scheme of securities regulation does exist, and to the degree that this scheme includes self-regula-

135 *Hearings on H.R. 7852 and H.R. 8720 before the House Comm. on Interstate and Foreign Commerce*, 73d Cong., 2d Sess. 514 (1934) (Statement by John Dickinson, Assistant Secretary of Commerce and Chairman of the Roper Committee), *quoted in* SPECIAL STUDY, *supra* note 134, at 501. 137 *See* materials in note 69 *supra*.

tion, state powers have been conferred on private organizations. The exercise of such powers clearly can have anti-competitive consequences and can be used to seriously impinge on the rights of individuals. The potential for abuse of these powers makes more important the development of a strong rationale for self-regulation. Following is a summary of some of the advantages and limitations[138] of self-regulation in the securities industry:

A. ADVANTAGES OF SELF-REGULATION

In addition to the practicality of self-regulation referred to above, regulation by one's peers should mean that those persons engaged in developing and enforcing regulations are more expert than a government regulator would be. Government is more remote from the business of the members of the SROs. The SEC *Special Study* comments that

> "persons on the scene and familiar with the intricacies of securities and markets from daily and full-time pursuit of the business can more readily perceive and comprehend some types of problems, and more promptly devise solutions than a governmental agency which, however great its collective knowledge and skill, may be able to concern itself only intermittently with specific problems, may become aware of them only after the event, and often must defer decision and action until thorough investigation or study has been completed.[139]

In addition to the expertise of members and the informality and flexibility of self-regulatory procedures, another suggested advantage is that self-regulation is less costly than direct regulation. Direct regulation would involve an increase in the government bureaucracy and increased expenditure of funds. However, it has been submitted by some that there are in fact no savings flowing from self-regulation. Studies have suggested that the efficient functioning of bureaucracies is determined not by whether they are public or private, but rather by a number of other factors such as size, relationship to the organizations around them, and the definition of their goals or functions.[140] On the question of cost, self-regulation itself requires the expenditure of very sub-

138 There are some limitations of self-regulation in Canada that stem not from self-regulation per se but from the general structure of the government supervisory scheme which has different provinces supervising a single SRO or one province supervising an SRO which impacts on the securities markets in all parts of Canada. These limitations are discussed in ch. XII *infra*.

139 SPECIAL STUDY, *supra* note 134, at 694.

140 *See* P. BLAU AND W. SCOTT, FORMAL ORGANIZATIONS 198 (1962); M. BERNSTEIN, REGULATING BUSINESS BY INDEPENDENT COMMISSION, ch. 3 (1955).

stantial funds which must be borne by the industry, and ultimately by the investing public. Because pay scales may be higher in the private sector than in government, there is an increase in the cost of regulation. In any event, the cost of regulation – private or public – could be allocated by an excise tax.[141]

In the United States, the *Report of the Subcommittee on Securities of the Senate Committee on Banking, Housing and Urban Affairs*[142] states that the most important advantage of self-regulation is its potential for establishing and enforcing what Mr. Justice Douglas referred to as "ethical standards beyond those any law can establish".[143] He stated:

> "Self-regulation...can be pervasive and subtle in its conditioning influence over business practices and business morality. By and large, government can operate satisfactorily only by proscription. That leaves untouched large areas of conduct and activity; some of it susceptible of government regulation but in fact too minute for satisfactory control; some of it lying beyond the periphery of the law in the realm of ethics and morality. Into these larger areas self-government and self-government alone can effectively reach. For these reasons, such regulation is by far the preferable course from all viewpoints."[144]

In Britain, the City Panel on Take-Overs and Mergers is an example of self-regulation without government supervision. Its chairman, Lord Shawcross, has expressed the same thought:

> "What is regarded as good ethical practice has in this field gone far ahead of what Parliament has or indeed ever could lay down. It may indeed be said that as a general proposition that where the aim is to establish high standards of conduct in technical or professional matters, the only way in which the maximum standards, can be obtained is by self-regulation and discipline."[145]

It is not that the Ontario Securities Commission lacks the power to create and impose high standards. Indeed, the commission has used its authority on section 8 fitness for registration

145 CITY PANEL ON TAKE-OVERS AND MERGERS, REPORT ON THE YEAR ENDED MARCH 31, 1974 (1974) (Foreword by Lord Shawcross, chairman). The establishment of the Council for the Securities Industry, of which the City Panel will constitute an arm, is discussed in text accompanying note 159 *infra*.

hearings to enforce obligations on registrants beyond those required by any statute or regulation, and which are more in the realm of ethics. In a recent section 8 hearing, the commission stated:

> "[The registrant] and his counsel both sought to impress on us the scrupulous attention that (he) paid to the legal requirements of The Securities Act, the staff of the commission, and the requirements imposed on his registration. In our opinion, it is not good enough merely to try by means of corporate distinction and geographical walls to urge compliance with the letter of the restrictions and not in the spirit of them....However, we want you to understand, and we want all the Broker-Dealers' Association to understand, that we expect you to operate in the future so that the public has a fair shake for its money."[146]

There are, however, numerous examples of standards for behaviour established by the SROs which are tougher than those imposed by the commission and subsequently adopted by it. For example, the commission recently acknowledged the TSE's know-your-client rules and procedures, which the commission has attached as a condition of registration to all classes of dealer.[147] (The Conditions of Registration generally apply to non-SRO members.) Indeed, the provisions in the OSC Conditions of Registration for Calculation of Minimum Free Capital have been based on the equivalent TSE provisions. Another example of policy development in the private sector, later to be adopted by the public sector, is the evolution of the TSE's timely disclosure policies which preceded the equivalent OSC policies.

An equally if not more important advantage of self-regulation relates to the psychological acceptability to the industry of regulation by one's peers. As Jennings states, no one likes external controls, least of all businessmen. The opportunity to participate in the regulatory process makes it much more palatable.[148] As Mr. Justice Douglas put it, "self-dicipline is always more welcome than discipline imposed from above".[149]

Mr. Justice Kelly in the *Windfall Report*[150] stressed another advantage of regulation by one's peers, namely, the more favourable position of one's peers to detect breaches of SRO regulations. His Lordship stated:

146 *In re* Herbert & Co. Securities Ltd., [1975] OSC Bull. 35, 39-40 (January).
147 *In re* Gordon Robert Fischel, [1978] OSC Bull. 9, 13 (January).
148 Jennings, *supra* note 141, at 678.
149 Address by SEC chairman Douglas, *supra* note 143; also *cited in* Jennings, *supra* note 141.
150 WINDFALL REPORT, *supra* note 88, at 100.

"It is to be expected that the combined wisdom of the members of the exchange would enable them to appreciate the objectives to be sought and the means by which these could be attained. The Exchange is favourably situated to assess the performance if its constituency and to determine the areas which call for the greatest vigilance in its supervision."

The B.C. Superintendent of Brokers has made a point of underlining the "duty incumbent upon members of self-regulatory bodies at all levels within the securities industry to assist in policing the marketplace in the best interest of the public and clients dealing in the marketplace".[151]

B.C. registrants were warned that concealment of knowledge of manipulative schemes is a factor that will be taken into account in determining fitness for continued registration.

With the increasing complexity of securities trading techniques and systems, surveillance by those close to the markets can be more effective.

The intense competition in the brokerage industry creates a considerable incentive for every broker to ensure that his competitors are abiding by the rules. The SRO rules generally restrict action by market intermediaries. In many cases the rules are designed to remove the conflicts of interest that exist between a broker and his client. A simple example is a broker trading against his client. Such trading might be profitable to the broker; the stock exchanges, however, have enacted rules to prevent it. Another example is the employee of an underwriter purchasing securities in a "hot issue" in preference to the wishes of his client. Such purchases are contrary to the IDA rules. Brokers and underwriters who comply with the rules should be quick to ensure that their competitors also comply so that their competitors do not realize an unfair advantage through departures from the rules.

Another incentive for SROs to vigilantly police their members stems from the wishes of the SROs to preserve their existing regulatory powers and, where possible, expand such powers before they are assumed by government. In general, businessmen are not enthusiastic about regulation. However, if there must be some form of regulation in the securities industry, businessmen are very enthusiastic about self-regulation compared with direct government regulation.

The enthusiasm of the industry for self-regulation raises queries about state powers being used for private ends. Nevertheless,

151 Notice published in B.C. Corporate and Financial Services Division Weekly Summary, April 23, 1976, at 2.

industry enthusiasm underlines the belief prevalent in the industry that those who don't play according to the rules can be more readily detected and removed by the industry. Industry members know that unless conduct contrary to SRO rules is effectively policed, sooner or later it will become apparent to outsiders who will incur losses and complain to government about inadequate regulation. Regulatory responsibility is shared between the SRO, as regulator, and the government, as supervisor. Inadequacy of the regulation will generally be the fault of both the SRO and the government and will result in less SRO regulatory power and more government supervision – the situation which the industry continually seeks to avoid. An example of such a series of developments is the Windfall affair, the *Windfall Report* and the government's response to the report.[152]

The SROs are very protective of their status in the securities regulatory system. To preserve this status, the SROs are exceedingly conscious not only of imposing effective regulation, but also of being seen to impose effective regulation. On some occasions one suspects that the SROs are more severe in disciplining particular conduct than the OSC would have been in similar circumstances. Consider some of the limitations of self-regulation.

B. LIMITATIONS OF SELF-REGULATION

The following limitations should be read bearing in mind the effect increased government supervision would have in eliminating or reducing the impact of these limitations on securities regulation.

First, there is a concern that self-regulatory agencies might approach their regulatory duties with something less than enthusiasm.[153] The SEC *Special Study* referred to this concern in the following terms:

> "No business is eager for regulation, for self-evident reasons, and it is only natural to expect less zeal for almost any aspect of the job on the part of a self-regulator than may be true of an outsider whose own business is not involved. The former may be complacent about a matter of public concern where the latter is disturbed; may not see any need for an organizational change or a rule change where the latter does; may interpret a rule more narrowly; may be satisfied with a lesser program of surveillance and detection; may be more lenient in imposing

152 *See* WINDFALL REPORT, pt. I, ch. III.6.
153 SPECIAL STUDY, *supra* note 134, at 501.

> sanctions; may have greater concern with avoiding adverse publicity for a specific violation or an industry group, and so on. To the extent that these are matters of degree the self-regulator, absent governmental oversight, is generally and understandably motivated by self-interest to lean toward the lesser degree."[154]

There is an equal danger of the regulation imposed by self-regulators being overzealous. SROs in their efforts to retain and even increase the scope of their regulatory powers may be inclined, when disciplining a member, to impose a sanction which is not consistent with the seriousness of the offence. The SRO then hopes that its expeditious manner of dealing with the offence will impress government and the public generally and will allay government fears that the SRO is falling down in its regulatory efforts. Whether the danger is one of unenthusiastic regulation, or overzealous regulation, it does underline the need for government supervision to monitor the intensity of the SROs' regulatory efforts.

Second, there is the tendency of an SRO to carry on its business in an anti-competitive or monopolistic manner. The temptation exists for businessmen to use their self-regulatory powers to impair competition in order to advance private economic interest rather than to satisfy regulatory needs.[155] This is a concern reflected in the Stage II amendments to Canada's competition legislation, although this concern does not stem specifically from the operation of the SROs in the securities markets.[156] Related to the competition question is the possibility that if membership in the SRO is not available to all participants in the industry, those who are members may realize a competitive advantage over those who are not.[157]

One has to be impressed with the sense of responsibility with which the officers of the TSE and the IDA approach their SRO regulatory powers. There is little doubt that the SROs are very anxious to preserve their regulatory responsibilities. They know that with government supervisors who are increasingly qualified the preservation of their regulatory responsibilities requires a higher degree of care. The SROs are also very anxious about the effect the Stage II amendments to Canada's competition legislation will have on their self-regulatory powers. They know that the only effective way of avoiding the intervention by administrators of the competition policy is to enact regulations and administer

154 *Id.* at 695.
155 Senate Securities Industry Study, *supra* note 73, at 149.
156 *See* discussion in ch. XI.C *infra.*
157 Canadian Mutual Fund Report at 724-25.

them in a manner consistent with the objectives of achieving an efficiently functioning capital market and with the objectives of Canada's competition laws. Perhaps the best rationale, then, for preserving the Canadian self-regulatory scheme of regulation is that the various incentives which now exist for the SROs to effectively discharge their responsibilities will assure the Canadian investing public of regulation consistent with capital markets operated fairly and efficiently.

Although this paper does not purport to make any systematic assessment of whether or not self-regulation operates in the public interest the conclusion is inevitable that self-regulation is an established and integral part of the Canadian scheme of securities regulation. Indeed, James Baillie, chairman of the OSC, has since his appointment on January 1, 1978, stated the commission's belief in self-regulation and in expanding the role of self-regulation.[158] This paper is concerned with a number of aspects of the relationship between government and the SROs and in part II makes some proposals for improvement.

Part II

Chapter VI
Government Supervision of SROs

The North American style of self-regulation is self-regulation with government supervision. In Britain, self-regulation of the securities markets is "pure" in the sense that there is not even the statutorily created possibility of the U.K. government's intervening in the regulation of the U.K. securities industry by the newly created Council for the Securities Industry. Regulation in the U.K. is voluntary, as is compliance. Indeed, the U.K. government in establishing the Council for the Securities Industry has opted

158 The occasion for Baillie's statement was a letter from the chairman addressed to the subscribers of the Weekly Summary; *see* OSC Weekly Summary, March 23, 1978, at 2A. The expanded role for self-regulation involved a regulation suggested by the commission exempting dealers which concurrently carry on portfolio management activities from obtaining concurrent registration as portfolio managers on the condition that the IDA and the TSE adopt rules governing the conduct by their members of these activities; *see* OSC Weekly Summary, March 16, 1978. Another recent endorsement of self-regulation, not just by the Ontario Securities Commission, but by all the Canadian securities administrators is evidenced in the amendment to National Policy No. 17. The policy now provides that not only violations of securities laws of other jurisdictions are prejudicial to the public interest and may affect the fitness for continued registration of registrants, but also violations of the rules of a recognized self-regulatory organization that are adopted for the protection of investors; National Policy No. 17, May 1978, 2 CCH CAN. SEC. L REP. ¶ 54-854.

against setting up a securities commission to oversee regulation of the securities markets in favour of creating the council which, among other things, will assume the role of the City Take-Over Panel and apply the panel's standards to a wider range of activities in the securities markets.[159]

As will be apparent from the discussion that follows, the U.S. has reinforced the supervisory powers of the SEC over the United States SROs in the Securities Reform Act of 1975. The scheme of regulation in the U.S. has been referred to as "cooperative regulation",[160] rather than self-regulation, in order to denote regulation both by the government and the SROs.

The SEC's *Special Study*[161] describes three reasons why government supervision of SROs is necessary:

A. GOVERNMENT MUST BE ASSURED THAT THE SROS ACTUALLY PERFORM THEIR REGULATORY FUNCTIONS

Because government is ultimately responsible for regulation of the securities markets, government must be assured that the SROs actually assume responsibility for, and effectively discharge, their regulatory functions. If the regulatory functions are not performed by the SROs they will have to be performed by government. If government does not undertake the regulatory functions and the SROs do not perform the functions faithfully and effectively, the result will be an appearance, a mere facade, of protection for the public which will be more dangerous than no protection at all.

B. REGULATION MUST REPLACE IMPAIRMENT OF COMPETITION

Some degree of impairment of competition and public control will result from self-regulation. Supervision is necessary, not only to ensure that such impairment is compensated for by effective regulation, but also to ensure that the kinds and extent of impairment are no greater than required by the exigencies of regulation.

A concern expressed about self-regulation is the lack of enthusiasm of businessmen for regulation. An equally important concern should be for overzealous regulation – regulation not necessary and inconsistent with the objectives of securities legislation. Supervision is necessary to maintain the balance between

159 Bank of England, Press Notice, The Council for the Securities Industry (March 30, 1978).

160 SPECIAL STUDY, *supra* note 134, at 723.

161 *Id.* at 501 ff.

the objectives of securities markets to function both fairly and efficiently.

C. SUPERVISION OF A QUASI-PUBLIC UTILITY IS NECESSARY

The facility operated by a stock exchange is in the nature of a quasi-public utility, and in this capacity requires public oversight for much the same reason that other utilities such as telephone companies do. Supervision by government is necessary to assure that the market is operated in the public interest.

The OSC has three bases for its power to supervise the TSE:

(1) the TSE requires recognition by the OSC before it can carry on business as a stock exchange in Ontario;
(2) the OSC can make any direction, order, determination or ruling on the activities of the TSE;
(3) the OSC hears appeals from decisions of the TSE by any person or company that feels aggrieved by such decision.

These three supervisory powers,[162] the power to register, to make rules for SROs and to review SRO decisions, are now considered in turn – first, how they apply to the TSE, and second, how they can be refined and applied to other SROs.

Chapter VII
A Registration System for SROs

A registration system for SROs should be designed to assure government that an SRO is qualified to exercise regulatory powers that would otherwise have to be exercised by the government. Such a system would apply to SROs in two different ways, depending on the nature of the SRO. If the SRO is an association of securities firms, such as the IDA, which does not operate a facility like a stock exchange, registration would be optional and would be sought by the association if it wanted to assume and apply regulatory powers which would otherwise be applied by government. If the SRO is a stock exchange, registration would be mandatory. The public would be invited to trade securities only on an exchange which the government was satisfied had the resources to operate in the public interest.

Ontario now has, in effect, a system of registration as it applies to stock exchanges in that no person or company can carry on business as a stock exchange in Ontario unless the stock ex-

162 The provisions of the Ontario Securities Act relating to the supervision of the TSE would be carried forward unchanged by Ontario Bill 7.

change is recognized by the commission.[163] The OSC will presumably not recognize a stock exchange unless the OSC is satisfied that the exchange will be operated in the public interest. The *ALI Federal Securities Code* (American Law Institute) would make it unlawful for an exchange or clearing agency to do business unless it was registered, and further provides that an association of brokers and dealers may become a registered securities association.[164] Ontario does not impose any general registration requirement on a securities association, although, as has been described, the Ontario District of the IDA and the BDA, along with the TSE, have been vested with limited regulatory powers under the Ontario Securities Act in respect of the control of the auditing of members' financial affairs. In fact, to the extent of the exercise of these powers, there is a limited system of registration, in that the rules of the Ontario District of the IDA and the BDA (and the TSE) on practices and procedures in examining the financial affairs of their members must be satisfactory to the commission.[165] As has also been previously noted, the TSE and the IDA exercise regulatory powers, beyond those delegated by statute, relating to members' capital position, insurance, and trading practices, with the concurrence of the OSC.

A. APPLICATION FOR "RECOGNITION" UNDER THE ONTARIO SECURITIES ACT

Under the Ontario Securities Act, no procedure has been developed which a stock exchange would have to follow to obtain recognition by the OSC. This is not particularly surprising in view of the fact that the TSE is the only exchange carrying on business in Ontario, and its existence preceded the first requirement in Ontario securities legislation for recognition of a stock exchange.[166] Similarly, there is no formal procedure whereby the TSE, the Ontario District of the IDA or the BDA can satisfy the OSC that their rules and regulations on the practice and procedure in audits of members' financial affairs are satisfactory to the commission.

165 *See* discussion in ch. III.C *supra*.
166 *See* discussion in note 64 *supra*.

B. APPLICATION FOR REGISTRATION UNDER THE ALI FEDERAL SECURITIES CODE

The *ALI Federal Securities Code*[167] prescribes a procedure to be followed by an exchange, securities association or clearing agency seeking registration. The application must contain the rules of the SRO and be accompanied by whatever other information, financial statements or documents the commission specifies by rule.[168] Publication of a notice by the commission that an application has been made is required. Time limits within which the commission must either grant registration or institute a proceeding to determine whether registration should be denied are prescribed. The criteria which must be satisfied in order for an application for registration to be granted are also spelled out, and include the requirement that the applicant have the capacity to comply with and carry out the purposes of the code and to enforce compliance by its members with the rules of the applicant and with the applicable code provisions. In addition, the code spells out a number of substantive requirements relating to the terms of the rules of the applicant. These requirements relate to who can be a member of the SRO (open membership),[169] composition of the SRO board of directors,[170] (for example, issuers and investors must be represented), allocation of fees and charges by the SRO,[171] the substance of the SRO rules[172] (for example, the rules must be designed, *inter alia* to remove impediments to a free and open market and in general to protect investors), discipline,[173] fair procedure with respect to discipline and denial of membership[174] and competition.[175] The rules may not impose any burden on competition not necessary in furtherance of the purposes of the applicant as an SRO under the code.

The requirements in the code substantially repeat the requirements of the 1934 Securities Exchange Act after the 1975 amendments.[176]

Once registered, the code provides for careful supervision by the appropriate government regulator of the SRO. The means for

176 Securities Exchange Act of 1934, s. 6(b). Indeed, Rule 6a-1 under this act prescribes

supervising the SROs are explored later in the paper[177] but include provisions requiring government approval before any SRO rule change takes effect, specifying the procedure to be followed in the event of a disciplinary action and providing for government review of disciplinary proceedings.

Although the Securities Act of Ontario leaves a great deal to inference, the supervisory scheme spelled out in the code is essentially that to which the TSE is now subject. The apparent reason for the government not imposing this scheme on the IDA is that the IDA does not operate a marketplace as does a stock exchange.[178] How valid is this distinction between the IDA and the TSE and how important is it in this context?

C. CRITERION FOR REQUIRING SRO REGISTRATION – IDA REGISTRATION

The simple test for determining whether or not a securities association should be registered with a government-appointed supervisor such as the OSC is whether the association is exercising regulatory powers which would otherwise be exercised by the government.

Reference has already been made[179] to the rather extensive regulations of the IDA and to the fact that IDA membership is virtually a prerequisite to carrying on an underwriting business in Canada. In the latter respect, the IDA is like a stock exchange in that IDA membership opens the doors to participation in particular markets. Discipline by the IDA can therefore have a material effect on a member's earnings. Penalties include a reprimand, a fine not exceeding $15,000, suspension of membership rights and privileges and expulsion from the association.[180] In addition, provision is made for the IDA to publish the penalty – the IDA has a complete by-law on "Publication of Notice of Penalties".[181] There

---

a form to be completed by a stock exchange applying to become registered as a national securities exchange.

177 *See* discussion in ch. VIII *infra*.

178 *See* comment to ALI FEDERAL SECURITIES CODE, Tent. Draft No. 5, s 802(b), which provides that an association of brokers and dealers may become a registered securities association. In the comment, it is explained that s. 802(b) does not parallel s. 802(a)(1) requiring an exchange to be registered, because associations do not operate a marketplace as exchanges do and, therefore, it is not unlawful for an association of brokers and dealers to function without registration. Some do.

179 *See* discussion in ch. II.B *supra*.

180 IDA by-law 19.7, IDA, BLUE BOOK 445 (1977), 1 CCH CAN. SEC. L. REP. ¶ 821, at 763-39.

181 IDA by-law 20, IDA, BLUE BOOK 449 (1976), 1 CCH CAN. SEC. L. REP. at 763-43.

are four degrees of notice provided, depending on the offence, which range from notice to all members[182] to notice to the press.[183]

Fines of this severity are doubtless necessary to ensure compliance with minimum net free capital requirements, but one is also driven to the conclusion that the IDA must offer something that its members consider valuable. It is difficult to believe that the IDA simply offers its members a forum to discuss issues of common interest and the opportunity to participate in the submission of briefs to government. Because of the regulatory role which has been conferred upon and assumed by the IDA, and because of the significance in the underwriting community of IDA membership, the association should be subject to the same standard of supervision as the Toronto Stock Exchange.

The first step to providing for such supervision is to require the IDA to be "recognized" by the appropriate government agency - which means to be registered with such agency. The statute should not simply empower the OSC to register the SRO when the SRO is "suitable" and is "not objectionable" or when registration would be in the public interest. Actual standards to be satisfied by the SRO should be spelled out, as in the *ALI Federal Securities Code*, to guide the SRO and to require the government to publish what it thinks are the appropriate standards for an organization or exchange seeking to exercise government regulatory powers. The Securities Act when amended by Ontario Bill 7 will be more specific in some areas on the grounds for exercise of commission discretion.[184] The precedent has been set.

There are a couple of problems with this proposal. The TSE is located in one place geographically. It is therefore relatively easy under the existing scheme of securities regulation in Canada for securities regulators to agree on the government regulator with jurisdiction to supervise the TSE.[185] (Presumably when fully automated trading is implemented the location of the computer will be determinative of this question.) The IDA carries on its operations in all provinces, and may assume a different degree of responsibility for regulation in each province. The rules of the IDA are uniform, although it functions according to district. If the supervision of the IDA is to be on a provincial basis, then it will be necessary for the association, if it wishes to maintain uniform rules

182 IDA by-law 20.1(a), (b), *id.*

183 IDA by-law 20.4, *id.*

184 *See* the basis for the exercise of the so-called "blue sky" discretion in Ontario Bill 7, s. 60; *compare* Ontario Securities Act, s. 61.

185 This is not of course to be interpreted as saying that supervision by the province is the best supervision. As discussed *infra*, the activities of the TSE obviously have

and regulations, to adopt rules and regulations acceptable to each province. This is now the case for IDA rules and regulations on the practices and procedures in auditing members' financial affairs.

Appeals from decisions of IDA regulatory committees can be heard on a provincial basis. If a member is affected by a disciplinary proceeding taken by the Ontario District Conduct Committee, then that appeal would be heard by the Ontario Securities Commission because the OSC will be responsible for supervising the Ontario district.

It should be added in this context that the IDA would apparently welcome government supervision. The IDA takes the position that it has nothing to hide from the securities commissions and formal supervision by the commissions might assist the IDA in its attempt to obtain an exemption from Canada's competition laws.

Bill C-13 which would amend the Combines Investigation Act,[186] if enacted, could impose severe restrictions on the IDA's ability to regulate its members, because the IDA rules might be construed to be anti-competitive. An exemption from these provisions is made for "regulated conduct"[187] which is conduct subject to regulation by a "regulating agency".[188] If the IDA was required to be registered under the Securities Act and as a result of such registration was subject to supervision of the requisite degree, then the regulation of members' conduct by the IDA would be exempt from the Combines Investigation Act.

On the same theory for requiring registration of the IDA, the BDA should also be registered, although it is now in effect registered with the OSC because all its rules must be approved by the OSC. Registration would also require the OSC to be satisfied that the BDA has the capacity to enforce its rules.

Registration of other securities associations would be optional to the associations and would only be sought if the association sought to exercise regulatory powers which would otherwise be the responsibility of government.

---

implications beyond the borders of Ontario, and perhaps the best supervision would be at the federal level; *see* discussion in ch. XII *infra*.

Chapter VIII
Government Power to Make Rulings Concerning SROs

The power of the Ontario Securities Commission to make any ruling under subsection 140(2) of the Ontario Securities Act on the business of a stock exchange is exercised in two ways.

The TSE submits all by-laws and revisions to by-laws to the OSC for review prior to the by-law or revision becoming effective.[189] The effective date is ordinarily set by the exchange board of governors after the OSC has completed its review and is satisfied with its terms.

On receipt of a by-law, the OSC conducts its review and makes a judgment on whether or not there is sufficient public interest in the by-law to warrant a public hearing. The OSC rarely convenes public hearings into TSE by-laws, but instead may summarily advise the exchange that the commission has no objection or may "negotiate" changes to the by-law to assure itself that the by-law does conform to the commission's view of the public interest.[190]

A. PRIVATE NEGOTIATION OF TSE BY-LAW CHANGES

An example of OSC-TSE negotiation of a by-law may be gleaned from the commission's reasons in the *Bralorne Resources Limited* case.[191] Cornat Industries Limited proposed to acquire 50.5% of the Bralorne shares, all of which were listed on the TSE, MSE and VSE. The proposal involved avoiding the takeover bid requirements in provincial securities legislation by relying on the "exempt offer" exception[192] to the takeover bid rules for offers to purchase shares to be effected through the facilities of a stock exchange (whether or not recognized by the commission). The proposed acquisition was to be made at a time when the OSC and the TSE were attempting to agree on a code of rules for "stock exchange takeover bids". (The VSE and MSE had already settled rules with their respective securities commissions.)[193]

Before the bid was actually made, Bralorne was advised by the OSC that it would not permit the proposed offer to proceed

189 The by-law will generally have been enacted by the TSE board of governors and approved by the exchange members before it is submitted to the commission.

190 For a description of the private consultation which transpired between the NYSE and the SEC to settle NYSE rule changes before the Securities Reform Act of 1975, *see* note, *Informal Bargaining Process: An Analysis of the SEC's Regulation of the New York Stock Exchange*, 80 YALE L.J.. 811 (1970-71).

192 Ontario Securities Act, s. 81(b).

193 Montreal Stock Exchange Rule VIII, 3 CCH CAN. SEC. L. REP. ¶¶ 87-700-87-777 (November 18, 1975) (Stock Exchange Takeover Bids).

through the facilities of the TSE, apparently on the basis that such bids would not be permitted until the code for stock exchange takeover bids was settled. Accordingly, Cornat and Bralorne decided to proceed through the VSE only. Shareholders, including those resident in Ontario, could deposit their shares in response to the bid through the VSE. The OSC issued a cease-trading order against the Bralorne shares. The order was subsequently terminated and in its reasons for lifting the order, the OSC made it clear[194] that such bids would not be permitted in the future, unless the proposal was submitted to the OSC in advance and unless the proposal at least satisfied the TSE draft requirements for stock exchange takeover bids. The commission then explained the status of its discussions with the exchange in the following words, "in the meantime, it is hoped that the uncertainties referred to at the hearing will be removed by an early agreement between the Toronto Stock Exchange and the Ontario Securities Commission".[195]

Because rules had already been adopted by the VSE and MSE, there was considerable pressure at the time of the Cornat bid for the TSE to prescribe rules governing takeover bids effected through its facilities. The uncertainty created by the inability of the OSC and the TSE to agree on a set of rules meant that a number of large transactions were effected through the other exchanges depriving members of the TSE who were not members of the other exchanges of commission revenue. The problem that arose was that any person who owned 20% of the equity shares of a company could not increase his holdings through the TSE without complying with the takeover bid requirements of the Ontario Securities Act. Without the stock exchange exemption, such shareholders could not increase their holdings through stock exchange purchases.

This gave rise to great pressure on the TSE from firms that were not members of the other stock exchanges for the TSE to adopt a code which would make provision for "normal course purchases".[196] The TSE was, of course, at the mercy of the OSC in these circumstances.

This series of events illustrates the sometimes informal nature of the process for OSC approval of a TSE by-law. If a formalized approval process had existed, including requirements for the

194 *In re* Bralorne Resources Limited, *supra* note 191, at 264.

195 *Id.*

196 TSE by-law 23.01(16), 3 CCH CAN. SEC. L. REP. ¶ 90-126 (December 7, 1976). In the period during which these rules were being settled, disciplinary proceedings were taken by the TSE against a firm of which the then chairman of the TSE was a director.

OSC to publish notice of the by-law to afford interested persons an opportunity to comment on the by-law, approve the by-law or convene a public hearing on it – all within specified time limits – it would have meant that any delay experienced by the TSE in implementing its takeover bid rules would have been quantifiable in advance.

B. PUBLIC HEARINGS ON TSE BY-LAW CHANGES

The alternative to private negotiations between the TSE and the OSC to settle a TSE by-law is to convene a public hearing as part of the process for settling the by-law terms. The decision on whether or not there will be a public hearing is made solely by the OSC. A public hearing requires the TSE in a public submission to the OSC to defend the terms of its by-law, and provides members of the public an opportunity to make submissions on the proposed by-law. As noted above, there is no prescribed code of procedure for publication of notice of the hearing and time limits within which the hearing must be held and within which the commission decision must be made. Once the OSC decides to convene a hearing, the Statutory Powers Procedure Act[197] of Ontario applies and it provides that reasonable notice of hearings is to be given to all parties and that the notice is to set out the "time, place and purpose of the hearing".[198] This act also permits notice to be given by public advertisement, or by some other method in the discretion of the tribunal where it is impracticable to give individual notice.[199]

On the first occasion when the OSC decided to convene a public hearing under subsection 140(2)[200] the TSE suggested that "the Commission should act under this section by means of private consultation with the exchange when the exchange was considering important matters of policy rather than by public hearings".[201] It is worthwhile quoting at length the commission's reasons for rejecting this suggestion, because it is the first statement of the OSC's understanding of its responsibilities under subsection 140(2):

> "In the first place, the language of the Act referred to above does not provide that the Commission should consult with and advise the Exchange. Secondly, it is the opinion of the Commission that the course suggested by

199 *Id.* s. 24(1).

200 Then s. 139(2) of the Securities Act, S.O. 1966, c. 142.

201 *In re* the Toronto Stock Exchange and the Proposed Schedule of Commission Rates, [1967] OSC Bull. 15, 16 (June).

the Exchange could involve the Commission in many of the day-to-day details of the administration of the Exchange which the Commission does not consider is its proper function. It is the Commission's view that the Toronto Stock Exchange should continue to administer its affairs in the future as in the past. If, however, any of the actions of the Exchange appear to the Commission to be contrary to the public interest the Commission will ask the Exchange to explain the matter. This action might be taken by the Commission either on its own volition or as a result of representations received by it from members of the public. Such a hearing being ipso facto a matter concerning the public interest should be in public. It seems to the Commission that this procedure is preferable to any exercise by the Commission of its statutory authority in any informal or private manner.

"By the foregoing the Commission does not in any way suggest that there should be any interruption or diminution in the continuous exchange of information and discussion which has taken place in the past between the staffs of the Commission and the Exchange and such close co-operation between these staffs has and will continue to serve a very useful purpose in achieving strong administrative practices and policies."[202]

The occasion for this pronouncement was an amendment to a TSE by-law to increase minimum commission rates. The OSC in effect determined that the question of stock exchange commission rates involved a matter of public policy which should be considered in a public hearing. On the basis of this decision, all proposed amendments to the TSE commission rate by-laws have been the subject of a public hearing before the OSC.[203] In the course of these hearings, the commission has considered not only the reasonableness of proposed commission rate increases and temporary surcharges, but also the general question of whether or not the TSE

202 *Id.* at 16-17.

203 The commission decisions on the TSE commission rate by-laws are reported as follows:
[1973] OSC Bull. 107 (August);
[1974] OSC Bull. 199 (November);
[1975] OSC Bull. 193 (August);
[1975] OSC Bull. 278 (December);
[1976] OSC Bull. 289 (November);
[1976] OSC Bull. 157 (July); *see also the commission decision on the TSE by-law relating to the Conduct of Principal Transactions, in In re* the Toronto Stock Exchange, [1977] OSC Bull. 171 (July).

minimum rate by-law should be repealed and be replaced by fully negotiated rates.[204]

Whereas the commission rate hearings are convened in response to a TSE proposal to amend the relevant by-laws, the OSC can and has used its powers to convene a hearing under subsection 140(2) on its own initiative when broad questions of principle are raised by a TSE by-law. This was explained in the commission's consideration of by-law 24 and ruling 49 of the TSE:[205]

> "These questions involved, we felt, matters of principle that deserved more exhaustive consideration than we should be able to give them if we left them to be decided incidentally as they came up in particular cases. We therefore decided to exercise the power granted to us by subsection 2 of Section 139 and institute, of our motion, a legislative type hearing to consider them."[206]

By-law 24 and ruling 49 were replaced by by-laws 19.01 and 19.09, respectively, when the Toronto Stock Exchange Act[207] became effective on June 18, 1969. By-law 19.09 applies to "non-exempt"[208] listed companies. A non-exempt company must file with the exchange a filing statement of any proposed material change in its business or affairs. If the filing statement is not accepted by the exchange and the material change is proceeded with, the shares of the company will be delisted. This by-law was intended to enable the exchange to control companies whose "assets had been dissipated and stolen through improvident or fraudulent transactions"[209] and remove companies which failed to maintain minimum listing requirements from the exchange list.[210]

A further refinement of the OSC-TSE relationship for approving TSE by-laws was evidenced in the first month of the tenure of the new chairman of the OSC. In its *Weekly Summary*[211] the commission announced it had no objection to TSE By-law No. 169

204 For a commentary on the commission's decision specifically related to this question, *see* Connelly, *Fixed Versus Negotiated Commission Rates on the Toronto Stock Exchange*, 2 CAN BUS. L.J. 244 (1977).

208 TSE by-law 19.09(3), 3 CCH CAN. SEC. L. REP. ¶ 89-798, gives the exchange power to exempt listed companies from by-law 19.09, thus the exempt and non-exempt lists.

209 *In re* by-law 24 and ruling 49 of the Toronto Stock Exchange, *supra* note 205, at 15.

210 In a hearing which preceded the *By-law 24 and Ruling 49* hearing by three months, the OSC had an opportunity to consider by-law 24 on an appeal from a decision of the TSE board of governors in *In re* Win-Eldrich Mines Limited, [1969] OSC Bull. 110 (July). In this case, the commission was also critical of the TSE's methods of proceeding in deciding to suspend trading of listed shares.

211 OSC Weekly Summary, January 20, 1978.

relating to the trading of listed securities in, by, or through a Computer-Assisted Trading System(CATS). This announcement is significant because the OSC does not ordinarily publish in its *Weekly Summary* a notice of a new exchange by-law or that the OSC approves of such a by-law. Giving public notice of OSC approval of an exchange by-law is a possible first step toward more public participation in SRO rule-making and the passage of SRO rules that better reflect the public interest. The publication of the notice in this case, however, did not go quite far enough in that no notice of the by-law was given when it was received by the OSC.

This apparently more public approach to the OSC-TSE relationship is further evidenced by the recent publication by the OSC of a notice[212] of its approval of a new exchange auditor. Approval of the exchange auditor is required by section 30 of the Ontario Securities Act. The commission explained in the notice that the new auditor (as was the case with his predecessor) is an employee of the exchange. The other SROs retain an independent firm of chartered accountants to perform the equivalent functions. The exchange auditor is required to act in accordance with a list of instructions prepared by the exchange. The OSC has required that the instructions not be amended without its consent.

C. APPROVAL OF SRO RULE CHANGES UNDER THE ALI FEDERAL SECURITIES CODE

Under the *ALI Federal Securities Code*, a rule change of an SRO does not take effect unless approved by the commission.[213] A procedure is described in the code which must be followed by the commission before a rule change is approved. The procedure requires the SRO to file copies of the rule change with the commission, the commission to publish a notice of the rule change and to afford interested persons an opportunity to comment on the rule change.[214] Upon expiration of a specified period of time, the commission must either approve the rule change or institute a proceeding to determine whether or not the rule change should be disapproved.[215] The order instituting the proceeding must give notice of the grounds for disapproval, and at the conclusion of the proceeding, the commission must decide whether or not to approve

212 OSC Weekly Summary, February 24, 1978.

215 *Id.* s. 805(b)(4).

the rule change.[216] Provision is also made for a summary procedure[217] for approval of certain types of rule changes, such as changing a fee relating to administration of the SRO. Provision is also made for the commission to make a change in the rules of an SRO on stipulated grounds.[218]

Although the Ontario Securities Commission has never actually made a change in the rules of the TSE, its powers under subsection 140(2) of the Ontario Securities Act are certainly broad enough to enable it to do so. Perhaps the closest situation to the government (not the OSC) enacting a TSE by-law change occurred in connection with the review of the TSE decision rejecting the Baker Weeks of Canada Ltd. application for continued membership after a change of control. The OSC held that the regulations enacted by the Lieutenant Governor in Council on this subject would in effect govern the TSE's policy on the issue.[219]

D. CODIFYING PRACTICE FOR GOVERNMENT APPROVAL OF SRO RULE CHANGES

To impose a similar code of procedure on the TSE, other registered SROs and the government regulator would have the effect of regularizing the undefined relationship which exists between the government regulator and the SROs. As indicated above, the TSE practice[220] since 1967 has been to place all by-laws before the commission so that the commission may, should it so desire, exercise its powers of review pursuant to paragraph 140(2)(b) of the Ontario Securities Act. The IDA similarily keeps the provincial securities commissions constantly aware of its activities and "would not implement any decision or by-law that was opposed by them. Further, we are in constant touch with federal authorities, particularly the Bank of Canada and the Department of Finance....These federal authorities, like the provincial securities commissions, are constantly aware of our activities and we would not implement any decision or by-law that was opposed by them".[221]

The only issue, then, is whether or not the government regulator should be required to publish a notice of a proposed rule change. In fact a proposed rule change receives very broad circulation among the membership of the SRO and, accordingly, it is difficult to imagine the SRO being prejudiced by having the government regulator publish the rule change prior to government approval. After publication, the government regulator would receive comments on the proposed rule change and would have a more accurate idea of the public interest in it. On this basis, the government regulator would be in a position to make a more informed judgment on whether or not the proposed rule change should be the subject of a public hearing.

By regularizing this procedure, the rule changes of the SROs will have increased credibility with members of the investing community, because they will have had an opportunity to make their views known on any issues raised by proposed rule changes.

Chapter IX
Review of SROs' Actions

The Ontario Securities Act now provides that any person or company that feels aggrieved by any decision made under any by-law, rule or regulation of a stock exchange in Ontario may apply to the Ontario Securities Commission for a hearing and review thereof.[222] A hearing and review by the commission of a stock exchange decision is governed by the same procedural requirements as a review by the commission of a decision of the OSC director.[223] Accordingly, in order for the person or company that feels aggrieved to initiate the review proceedings, notice must be given in writing to the commission within thirty days after the mailing of the notice of the stock exchange decision.[224] Upon the hearing of the review, the commission may by order confirm the decision under review, or make such other order as the commission considers proper.[225] The commission is also empowered to grant a stay of the decision under review until disposition of the hearing and review.[226]

224 *Id.* s. 28(1).
225 *Id.* s. 28(2).
226 *Id.* s. 28(3).

A. PRINCIPLES GOVERNING OSC REVIEW OF SRO ACTION

Although the first review of a stock exchange decision occurred shortly after the review power became effective,[227] the commission did not enunciate the principles which it would follow upon review of stock exchange decisions until 1972 in the *Williams* case.[228] Williams appealed a decision of the board of governors of the TSE declaring that he was unfit to be granted the status of an "approved" person under the by-laws of the exchange.[229] Thus Williams raised the issue of the power of the exchange to set standards for the admission of exchange members and employees of exchange members.

At the outset, the commission made it clear that the standards by which it measures applicants for registration may differ from those applied by the exchange and that registration under the Ontario Securities Act would not guarantee that the registrant would be approved as a registered representative employee of an exchange member. The commission then proceeded to state its views on the circumstances in which it would interfere with the exchange's exercise of discretion:

> "Since the Exchange has the power to impose additional or higher requirements in the ordinary case it would not be our intention to substitute our standards for those of the Exchange nor to substitute our discretion for that of the Governors. If their standards were not consistent with our view of the public interest or their discretion were not exercised fairly, such as an absence of evidence upon which their conclusions could be supported, we would not hesitate to intervene."[230]

The views expressed in the *Williams* case were developed further on the occasion of the first appeal by Lafferty, Harwood & Partners Ltd. from a decision by the Toronto Stock Exchange rejecting the Lafferty application for exchange membership.[231] In affirming the exchange's decision, the commission stated:

> "We reaffirm our position in the Williams case again in this case. We do not consider it a proper exercise of our

227 The power was granted in S.O. 1968-69, c. 116, s. 9 and the first decision was the review in *In re* Win-Eldrich Mines Limited, [1969] OSC Bull. 110 (July).

228 *In re* Edward Arthur Paul Williams v. the Toronto Stock Exchange, [1972] OSC Bull. 87 (May). For a pre-1966 example of how the commission dealt with an exchange member which did not meet exchange membership requirements, *see In re* Barrett, Goodfellow & Company Limited [1966] OSC Bull. 9 (July-August).

229 Such status is necessary for an individual to be employed as a "registered representative" or "account executive" by a TSE member.

230 *In re* Edward Arthur Paul Williams v. TSE, *supra* note 228, at 88-89.

231 *In re* Lafferty, Harwood & Partners Ltd., [1973] OSC Bull. 26 (February).

> jurisdiction under subsection 3 of section 140 and under subsection 2 of section 28 to which section 140(3) directs us, to substitute our judgment for that of the Exchange merely because we may disagree with the decision they have come to or because we may have given a different decision. If the Exchange has proceeded on some incorrect principle, or has erred in law, or has overlooked some material evidence, or new and compelling evidence was presented to us that was not presented to the Exchange, then we would deem it proper to interfere with a decision of the Exchange. In the absence of such factors we do not believe it to be a proper exercise of our jurisdiction to so interfere."[232]

The courts had an opportunity to consider the principle enunciated by the commission when, undaunted, Lafferty reapplied to the TSE for membership, was rejected, and applied to the OSC for a review of the exchange decision.[233] The commission again affirmed the exchange decision and Lafferty appealed the commission's decision under subsection 29(1) of the act to the Divisional Court of the Ontario High Court of Justice.[234] Counsel for Lafferty argued that the OSC ought to have held a trial de novo and should not have limited itself in the manner described in the quotation from the commission's reasons above. This contention was rejected by the Divisional Court.[235]

B. REVIEW OF SRO ACTION NOT INITIATED BY SRO MEMBERS

Not all of the reviews by the commission of stock exchange decisions have resulted from a stock exchange ruling applicable to one individual. On one occasion a company (which was not a member of the exchange) feeling it was "aggrieved" by an amendment to the exchange by-laws on commission rates applied to the commission for a review of the by-law in question.[236] The applicant, Fiscal Consultants Limited, could no longer "bunch" orders of its clients over five-day periods in order to obtain lower commission rates. The commission refused to grant the relief requested and the exchange by-law remained intact.

232 *Id.* at 45.

233 *In re* Lafferty, Harwood & Partners Ltd., [1974] OSC Bull. 125 (June).

234 8 O.R. (2d) 604, 607–08 (1975).

235 The Divisional Court's confirmation of the OSC statement of the general principles governing an appeal in cases of this kind was adopted by the B.C. Corporate and Financial Services Commission in *In re* Bali Exploration Ltd., B.C. Corporate and Financial Services Division Weekly Summary, July 30, 1976, at 1.

236 *In re* the Toronto Stock Exchange and Fiscal Consultants Limited, [1974] OSC Bull. 139 (June).

The B.C. Corporate and Financial Services Commission had an opportunity to consider who had status to seek review of an SRO decision in a case where a member of the public sought review of a decision by the VSE not to investigate her complaint against an exchange member.[237] In rejecting the application, the reasons of the commission include a useful discussion of the meaning of "person aggrieved". The B.C. commission has also had an opportunity to hear an appeal by a company whose shares were listed on the Vancouver Curb Exchange from an order by the exchange suspending trading of the shares[238] and an appeal by some shareholders of a company whose shares were listed on the Vancouver Stock Exchange from a decision of the exchange accepting a notice for filing by the company.[239]

C. OSC INTERFERENCE WITH SRO DISCRETION

In only one case has the OSC interfered with the exercise of the exchange's discretion because the exchange standards were not consistent with the commission's view of the public interest – as enunciated by the commission in its reasons in the *Williams* case.[240] The circumstances for this action by the commission arose in connection with the application for continued membership on the exchange of Baker Weeks of Canada Ltd. (hereinafter "Baker Canada"). Prior to the application, Baker Canada was a wholly-owned subsidiary of Baker, Weeks & Co. Inc. of the United States. With the introduction of fully negotiated commission rates in the United States, Baker U.S. became less and less profitable and ultimately its assets, including the shares of Baker Canada, were sold to Reynolds Securities Inc. The sale of assets resulted in a change of control of Baker Canada, which triggered a number of regulatory requirements to be satisfied by the new owners, (1) the consent of the OSC to the material change of control of an Ontario registrant;[241] (2) the approval of each of the TSE, MSE and IDA of the new controlling shareholder; and (3) approval by the Foreign Investment Review Agency.

Baker Canada first sought and obtained the consent of the OSC notwithstanding the opposition of both the TSE and the

241 Ontario Securities Regulations, s. 6d(3).

IDA.[242] The OSC's consent was conditional upon Baker Canada not engaging in any underwriting activity in Canada.

The next step for Baker Canada was to seek the approval of the TSE to the change in shareholders.[243] This involved a two-stage process; first the applicant had to obtain the approval of the TSE board of governors, and second, the approval of the exchange membership as a whole. The board did not approve the change and therefore the application was not submitted to the exchange membership as a whole. Accordingly, Baker Canada sought a review of the board's decision by the commission.[244]

The question of public policy raised by the Baker Canada application for review was the question of whether the exchange could accept or reject membership applications on the basis of the residence of the owners. The commission in effect determined that if the Securities Act or regulations thereunder already dealt with a question of public policy, an SRO no longer has any power to enact regulations dealing with the same issue. In order to reach this conclusion, the commission first had to painstakingly trace the evolution of the regulations under the act dealing with non-resident securities firms. The commission then stated:

> "But as the custodians of a public monopoly granted by the Government of Ontario any power the Exchange might have had to bar non-resident owners disappeared on July 14th, 1971, when the regulations, made by Lieutenant Governor in Council pursuant to the Securities Act were filed. These regulations were exhaustive of the rules to be applied to non-residents in Ontario with respect to non-resident ownership."[245]

Not only was the commission prepared to intervene when it felt that a question of public policy on which the government had already acted was at issue, but the commission also gave definition to the TSE's jurisdiction. It has already been noted that under the Toronto Stock Exchange Act, 1968–69[246] the exchange could impose "any additional or higher requirement within its jurisdiction".[247]

D. REVIEW OF ACTIONS OF SROS OTHER THAN STOCK EXCHANGES

If Baker Canada had been heavily engaged in the underwriting business, no doubt the IDA would have, on the same grounds as the TSE, rejected Baker Canada's application to continue its IDA membership. Baker Canada could not have sought review of this decision by the OSC. Furthermore, the OSC would have lacked the power to make an order requiring the IDA to delete from its by-laws the provisions dealing with non-resident members. If the OSC's decision in the Baker Canada case requiring SROs to refrain from passing regulations dealing with matters of public policy already subject to regulation by the government is to be effective, then the OSC should have the right to order the deletion from the IDA by-laws of a provision in an "occupied field". In this respect, section 805(e) of the *ALI Federal Securities Code*[248] which enables the SEC to make a rule change in the rules of an SRO is a precedent. If the government enacts rules in an area of public policy, an SRO should not have the power to emasculate these rules through its own rules. Control of Baker Canada, now Reynolds Securities (Canada) Ltd., has again changed with the merger in the United States of Reynolds Securities International and Dean Witter Organization Inc., thereby necessitating another set of approvals.[249]

Registration of the IDA with the appropriate government regulator would mean that any person or company that feels aggrieved by a decision made under a rule of the IDA could apply

248 ALI FEDERAL SECURITIES CODE, Tent. Draft No. 5, s. 805(e).

249 The OSC has denied the application for an order permitting the change in ownership of Reynolds Securities (Canada) Ltd.; *In re* Reynolds Securities (Canada) Ltd., [1978] OSC Bull. 101 (March). The commission decided that certain conditions set out in s. 6d(3) were not satisfied; specifically, there was no "material or unique service to Ontario investors" which was "not substantially available to those investors through other registrants". However, the commission felt that it was in the best interests of the public to continue the registration. For this reason, it decided to postpone the procedure for termination of the registration of Reynolds Securities (Canada) Ltd. for a reasonable period of time to allow the registrant time to approach the Ontario cabinet through the Minister for a change in the regulations. The original theory underlying the requirement for approval of changes in control was to prohibit non-residents from obtaining "backdoor" registrations. This theory is not applicable when the change in control results, not from the intention of an acquirer to obtain a Canadian registration, but simply from the continuing rationalization of the U.S. securities industry.

The MSE rejected the application by Reynolds Canada for approval of the change of shareholders from Reynolds Securities Inc. to Dean Witter Reynolds Inc. However, the QSC ordered the MSE to approve the change of control on the basis that the application satisfied all exchange requirements for membership in the absence of specific regulations with respect to non-resident members; 9 QSC Bull. No. 9 (Decision No. 5460, March 7, 1978). In its reasons on this appeal the QSC also rejected the rather novel argument of the exchange that a decision of its members was not

to the regulator for review of the decision. The right of appeal from the IDA makes sense for many of the reasons that registration of the IDA as an SRO makes sense. A person or company that is denied membership in the IDA should have the right to have the IDA decision reviewed, if, for example, the person or company feels that the IDA proceeded on an incorrect principle or has overlooked material evidence. Similarly, because the IDA is involved in market regulation, if a person or company feels aggrieved by a rule change of the IDA that does affect the market, then again, it is not difficult to justify such a person or company having a right to seek a review of the rule change. With respect to the BDA, it is interesting that the OSC has veto power over any by-laws or regulations of the BDA, but has no jurisdiction to review any ruling by the BDA board of governors.[250]

E. REVIEW PROVISIONS IN ALI FEDERAL SECURITIES CODE

The provisions for review of SRO actions in the *ALI Federal Securities Code* are spelled out in much greater detail than the equivalent provisions in the Ontario Securities Act. First, the SRO is required to file a notice of its action in certain circumstances: if the SRO makes an adverse determination on the application for membership, imposes a disciplinary sanction on a member, or prohibits or limits any person in respect of access to services offered by the SRO or a member.[251] The SRO action is subject to review by the appropriate regulatory agency, either on its own motion or on an application by an aggrieved person. The code then spells out the principles to guide the regulatory agency in reviewing the decision. If the decision under review is a denial of membership, the agency must find that specific grounds for the SRO action exist, that the SRO action accords with the rules of the SRO and that those rules are and were applied in a manner consistent with the purposes of the code. If this is the finding, then the proceeding is dismissed. If the agency does not make this finding, or if it finds that the action taken imposes a burden on competition not necessary or appropriate in furtherance of the purposes of the code, the agency must set aside the order and require the SRO to admit the applicant to membership.[252] In respect of disciplinary

a decision of the exchange and therefore was not subject to review by the commission; *id.*

250 The OSC had assumed it had this power over the BDA until 1956 when the Ontario Court of Appeal held otherwise; *Re* Larrimore Securities, [1956] O.W.N. 501 (C.A.).

251 ALI FEDERAL SECURITIES CODE, Tent. Draft No. 5, s. 810(a); based on Securities Exchange Act, s. 19(d)(1).

252 ALI FEDERAL SECURITIES CODE , Tent. Draft No. 5, ss. 810(d)(1)(A), (B).

proceedings the code provides that if the appropriate regulatory agency finds that a sanction imposes a burden on competition not necessary or appropriate in furtherance of the purposes of those provisions, then the agency may cancel, reduce or require the remission of the sanction.[253]

The bases for the review spelled out in the code are in some respects similar to the principles enunciated by the OSC.[254] However, with the increasing emphasis which will have to be placed on the implications for competition of SRO actions, the reviewing agency should be specifically required to direct itself to this question on every review of an SRO's action. It should state specifically that such action does not exceed the requirements of a competitive securities market and what is necessary for the protection of the investor.

Chapter X
Membership in SROs

> "Inherent in self-regulation is the 'private' formulation of restrictive standards of business conduct and their enforcement by exclusionary and other 'anti-competitive' practices."[255]

A. APPLICATION FOR MEMBERSHIP ON THE TSE

The grounds for describing a stock exchange as a "private club" have all but disappeared with increased government supervision and increased publicity of stock exchange affairs. However, it is still possible for the membership of the TSE to "blackball" an applicant from membership. An application for membership on the TSE is first referred to the board of governors and "the candidate will be admitted only if approved first by the board and then by the members on a ballot...".[256] The TSE by-laws provide for a minimum number of votes to be cast on the question, a minimum number of such votes to be in favour of the admission and a limitation on the number of votes against admission.[257]

253 *Id.*, s. 810(d)(3).

254 *See* discussion in text accompanying notes 230, 232 *supra*.

255 SPECIAL STUDY, *supra* note 134, at 149.

256 TSE by-law 3.14, 3 CCH CAN. SEC. L. REP. ¶ 89-215.

257 *Id.* subsection (3) of by-law 3.14 provides:

> "The candidate shall be admitted if: (a) the number of votes cast on the question is at least 50% of the total number of votes that could be cast thereon by all members then entitled to vote thereon, and (b) at least 2/3 of the votes cast thereon are in favour of admission of the candidate, and (c) the number of votes against admission of the candidate is less than 20%

There is little doubt about the statutory power of the TSE to regulate admission to membership. The TSE's act of incorporation provides[258] that the by-laws of the TSE may provide for and regulate the admission of members, including the requiring of approval by the directors or members or both, at meetings or individually, and the manner in which such approval is to be given. The OSC has affirmed that the TSE has the power to refuse membership to an applicant for membership on the exchange.[259]

B. THE LAFFERTY AND BAKER CANADA TSE MEMBERSHIP APPLICATIONS

Neither the Lafferty Harwood nor the Baker Canada TSE membership application was referred to the membership for a vote. Both were denied by the TSE board of governors. However, the denial of the Lafferty Harwood and Baker Canada applications were based on two different policies. In *Lafferty, Harwood & Partners Ltd.* the board of governors determined that the Lafferty firm was not fit for membership based on evidence of past conduct of *Lafferty.* The OSC confirmed the judgment of the TSE board that the conduct indicated a lack of judgment and responsibility on the part of the applicant.[260] On the second *Lafferty* application, the decision of the TSE board of governors was again confirmed on the basis of the applicant's present attitude toward his past conduct (and not for the conduct itself).[261] The *Baker Weeks of Canada Ltd.* case[262] did not involve an application for membership but approval of a change of control,[263] which is treated like a membership application under the TSE by-laws. As was noted in the commission decision, there was no suggestion that Reynolds Securities Inc., the new owner of Baker Canada,

---

of the total number of votes that could be cast on the question by all members then entitled to vote thereon."

The by-laws of the Montreal Stock Exchange also provide for consideration of an application for membership by the Governing Committee of the exchange. If a majority of the Governing Committee approves the membership application it is submitted to the members and "the applicant shall be declared elected if at least the majority of the members have voted and at least two-thirds of the ballots have been cast in favour of the admission of the applicant"; MSE by-law No. III, art. 3108, 3110, 3111, 3 CCH CAN. failed to meet any of the tests relating to honesty, reputation in the business community, ability, experience, competence and financial resources[264] as was the case with the Lafferty application. The board of governors of the TSE based its decision on the public policy question already referred to,[265] that is, that non-resident controlled firms which were members of the SROs at the date of the *Moore Committee Report*[266] would be granted "grandfather status" provided that upon a change of control the grandfather status could be withdrawn. It was on this basis that the TSE board of governors denied continued membership to Baker Canada. As was discussed in chapter IX, the OSC determined that if the government has enacted regulations on important questions of public policy, including restrictions on non-resident ownership, then the power of the exchange to enact regulations dealing with such questions is removed. The commission did concede that in the absence of government action an SRO such as the exchange might have the power to deal with questions of public policy such as non-resident ownership.

C. PRIVATE BALLOTS ON MEMBERSHIP APPLICATIONS

The Baker Canada decision afforded the OSC an opportunity to comment on the private ballot procedure used by the exchange membership in determining the admissibility of an applicant for membership or for approval of new shareholders of an applicant which has undergone a change of control. The TSE argued that even if the board of governors did not have the power to deny the Baker Canada application for membership, the board of governors should be permitted to refer the question to the TSE members for a vote. The commission replied:

> "Moreover, as we have concluded, there is no jurisdiction in the Exchange to deal with any question involving non-resident ownership, it would clearly be an abuse to permit a vote when the only matter in issue must be that of non-resident ownership. A negative vote of the member might be perceived as a vote designed on the one hand to support the decision of the Board, and on the other to further reduce non-resident competition. No matter how erroneous this perception might be there is no effective

264 *In re* Baker Weeks of Canada Ltd. and the TSE, *supra* note 262, at 47-48.

266 REPORT OF THE COMMITTEE TO STUDY THE REQUIREMENTS AND SOURCES OF CAPITAL AND THE IMPLICATION OF NON-RESIDENT CAPITAL FOR THE CANADIAN SECURITIES INDUSTRY (May 1970). This committee was established jointly by the IDA, TSE, VSE and Canadian Stock Exchange with Trevor F. Moore as chairman.

> way of examining the reasons of the individual member for its vote and, therefore, lodging an effective appeal from such a decision."[267]

The commission effectively points up the problems with the secret ballot. A vote against an application for membership could be based on any number of motivations, for example, a question of public policy upon which the SRO has no power, or a concern about competition from the applicant for membership. In addition, there is the problem that if the vote is unfavourable the applicant has no reasons that can be examined to determine whether OSC review of the decision is worthwhile. The applicant is effectively denied the statutory right of review.

The IDA by-laws on membership do not provide for a secret ballot by members on an application for membership.[268] An application must first be approved by the applicable District Council, then the National Committee of the IDA, which, in its discretion, decides on all applications. All members are given notice of an application for membership and have the opportunity to object to the admission of the applicant. However, whether it is the District Council or the National Committee which ultimately refuses an application, there will be reasons available to the applicant and he can decide whether or not a government review of the SRO decision would be worthwhile.

D. REMOVAL OF THE "BLACKBALL" VOTE

Recommending the removal of the "blackball" vote from SROs on applications for membership is not a very radical suggestion. As noted above, recent applications for membership on the TSE were not denied as a result of a secret ballot vote, but for reasons spelled out in writing by the board of governors of the exchange. The secret ballot is not consistent with the public utility nature of the stock exchanges and with the increasing concern, evidenced in the proposed amendments to the Combines Investigation Act, that private powers may be used to limit competition.

SROs should not be permitted to include in the criteria for membership "questions of public policy" - which have already been taken into account in the registration requirements - as outlined in the OSC's decision on the review of the TSE decision on Baker Canada. What constitutes a "question of public policy" would be determined by the appropriate government regulator. This determination would be made upon an application by an SRO

267 *In re* Baker Weeks of Canada Ltd. and the TSE, *supra* note 262, at 51-52.
268 IDA by-law No. 2, IDA BLUE BOOK 406 (1976), 1 CCH CAN SEC. L. REP. ¶ 821.

for registration as an SRO or upon the submission for government approval of an SRO rule change.

The *ALI Federal Securities Code* requires that the rules of an applicant for registration as an SRO, in the case of an exchange or association of securities firms, provide that any registered broker-dealer may become a member of the SRO.[269] The code further provides that a national securities exchange or registered securities association may deny membership to a person who does not meet the standards of financial responsibility or operational capability prescribed by the SRO rules, or deny membership to a natural person from becoming an associate[270] of an SRO member if the person does not meet the standards of training, experience and competence prescribed by the SRO rules or has engaged, and there is a reasonable likelihood that he will again engage, in acts or practices inconsistent with just and equitable principles of trade.[271]

It is submitted that similar restrictions upon SRO bases for admitting and denying membership should be included in the securities laws of Canada.

Chapter XI
Self-Regulation and Competition Policy

In a submission to the United States Secretary of the Treasury, J. Lorie states:

> "The general objective of public policy is to have markets that operate fairly and efficiently. Fairness and efficiency lead to confidence on the part of the investing public that returns will be reasonably related to risks, that the institutions through which they deal have financial integrity, and that the individual investor is not at a serious disadvantage compared with the institutional investor. The principal and best method of ensuring this result is well known: competition."[272]

Historically, Canadian legislators and administrators of securities regulations have concentrated on the fairness of the operation of our securities markets. Legislation and administration directly intended to enhance the level of competition in the markets have taken a secondary position to investor protection. However, sensitivity to competitive conditions is increasing. Concern

about the level of competition in the Canadian securities markets has been stimulated by the 1975 amendments to the Securities Exchange Act in the U.S. which, for example, required negotiated commission rates.[273] In addition, Canada's own competition legislation has been revised and further revisions are proposed. This reform process has been directed toward the extension of competition laws to service industries.

A. STAGE I AMENDMENTS TO THE COMBINES INVESTIGATION ACT

The Stage I amendments to the Combines Investigation Act[274] include an exemption from certain offences in relation to competition, for agreements or arrangements between or among persons where such an agreement or arrangement has a reasonable relationship to the underwriting of a specific security.[275] The IDA had argued in favour of such an exemption on the basis that it would be coextensive with the regulatory and supervisory authority of the provincial securities commissions.[276] The securities industry is using essentially the same argument in its attempt to limit the application of the Stage II amendments to the Combines Investigation Act in Bill C-13.[277]

B. U.S. EXPERIENCE

The issue of the applicability of the antitrust laws to self-regulatory action in the securities industry was faced, not by a legislative body, but by a court in the United States in 1963 in *Silver v. New York Stock Exchange.*[278] Silver's securities firms were not members of the exchange, but instead had wire connections with some firms which were members. The members applied for approval as required by the rules of the exchange. "Temporary approval" was granted, but several months later the exchange ordered its members to discontinue the wire connections with Silver's firm without giving Silver a hearing or reasons for its decision. Silver commenced an action against the exchange and its members alleging, *inter alia,* breach of the Sherman Act. The

278 373 U.S. 341 (1963).

exchange pleaded that the Securities Exchange Act of 1934 required it to regulate its members and therefore provided it with immunity from antitrust suit and effectively repealed the antitrust laws. The court held that the concerted action of the exchange and its members was a group boycott and therefore a per se violation of the Sherman Act absent justification derived from the policy of another statute. The problem that arose was one of reconciling "pursuit of the antitrust aim of eliminating restraints on competition with the effective operation of a public policy contemplating that securities exchanges will engage in self-regulation which may well have anti-competitive effects in general and in specific applications".[279] After reviewing the history of self-regulation the court held that since the Securities Exchange Act contains no express exemption from antitrust law, "[r]epeal is to be regarded as implied only if necessary to make the Securities Exchange Act work, and even then only to the minimum extent necessary. This is the guiding principle to reconciliation of the two statutory schemes".[280] The court then went on to conclude that the act did not afford justification for anti-competitive collective action taken without according fair procedure. In other words, there could be no justification where the exchange exceeded the scope of its authority under the act.

This case left open several of the key questions in the application of antitrust law to self-regulatory action because, first, the Securities and Exchange Commission did not have the power to review the action of the exchange in the *Silver* situation,[281] and second, this was a procedural attack on exchange rules as opposed to one questioning the merits or substance of the rule. The court made it clear that "Should review of exchange self-regulation be provided through a vehicle other than antitrust laws, a different case as to antitrust exemption would be presented".[282]

The cases which followed *Silver* failed to provide a satisfactory answer to the unresolved questions. *Kaplan v. Lehman Brothers*[283] was a derivative action on behalf of mutual funds claiming that fixed commission rates constituted a violation of antitrust law. The U.S. District Court of Illinois gave summary judgment for the defendants holding that it was clearly implied in the Securities Exchange Act that stock exchanges had the power to fix minimum

commission rates. It pointed out that the Securities and Exchange Commission had the power to review the rate structure and that any appeal as to the unreasonableness of the rates should be made to the commission.

In *Thill Securities Corporation v. New York Stock Exchange*,[284] non-members of the exchange brought a suit complaining that a rule prohibiting members from sharing commissions with non-members violated antitrust laws. A divided U.S. Court of Appeals remanded the case to the District Court after deciding that the rule was not exempt from attack under antitrust law merely because the rule was subject to SEC review. The exchange had the onus of proving that the rule was necessary for it to discharge its responsibilities under the Securities Exchange Act. The majority was split on the question of whether the SEC had primary jurisdiction to consider anti-competitive aspects of exchange rules or whether the matter should go directly to the courts. This issue appeared to have been decided in favour of granting primary jurisdiction to the regulatory agency in *Ricci v. Chicago Mercantile Exchange*.[285] However, in 1976, the United States Supreme Court clarified its decision in *Ricci* as well as the general question of immunity.

In *Gordon v. New York Stock Exchange*[286] the plaintiff sued on behalf of himself and other small investors claiming that fixed commission rates for transactions under $500,000 violated antitrust law. After a lengthy review of the history of commission rates, and a description of the supervision provided by the SEC and the Congress, the court reaffirmed its decision in *Silver*. It then went on to hold "that these requirements for implied repeal are clearly satisfied here. To permit operation of the antitrust laws with respect to commission rates, as urged by petitioner Gordon and the United States as *amicus curiae*, would unduly interfere, in our view, with the operation of the Securities Exchange Act".[287] The factors which influenced this result were (1) the statutory authorization for regulation by the SEC; (2) the long history of oversight by the SEC and, in particular, the recent moves toward more competitive rates; and (3) continued congressional approval of the SEC's authority over the commission rate system. Finally, the court decided that the question of whether there is repeal of antitrust law is one for the courts, but that the courts may defer to the regulatory agency where the issue is whether the activities violate the Securities Exchange Act or rules. There would be no

deference where the "conduct charged was clearly encompassed by the legislation or rules and where there was no factual dispute".[288]

In proposing the Stage II amendments[288a] the Government of Canada is asking Parliament, in effect, to spell out the criteria which must be satisfied before there is an exemption, whether or not "implicit", under the competition legislation.

C. STAGE II AMENDMENTS TO THE COMBINES INVESTIGATION ACT

Bill C-13 provides an exemption for "regulated conduct" from certain offences in relation to competition, including conspiracy to unduly restrain competition, bid-rigging, monopolization, price discrimination, unfair allowances and price maintenance.[289] "Regulated conduct" is defined in the bill,[290] and it is interesting to review this definition, not only because of its significance in the application of the bill to the securities industry, but also because of the response of the securities industry to the definition. The response is revealing of the industry's relationship to the provincial securities commissions.

> " 'Regulated conduct' means conduct in respect of which the following conditions are met:
> "(a)the conduct has been expressly required or authorized by a regulating agency[291] that...is not appointed or elected by the persons, or by classes or representatives of the persons, whose conduct is subject to be regulated by such agency...and
> "(b)the regulating agency is expressly empowered, by or pursuant to an Act of Parliament or of the legislature of a province, to regulate the conduct in the manner in which it is being regulated and has expressly directed its attention to the regulation of the conduct...."[292]

288 *Id.* at 688.

288a Bill C-42, 30th Parl. 2d Sess. (first reading March 16, 1977), An Act to Amend the Combines Investigation Act and to Amend the Bank Act and Other Acts in Relation to or in Consequence Thereof, and its subsequent replacement, Bill C-13, 30th Parl., 3d Sess. (1977), have proposed numerous amendments to the Combines Investigation Act. One amendment would have changed the name of the act to the Competition Act.

289 Bill C-13, 30th Parl., 3d Sess., s. 4.5 (1977).

290 *Id.* s. 4.5(2).

291 *Id.* The term is defined in s. 4.5(2).

292 Section 4.5 of the proposed Competition Act as it would have been amended by Bill C-13, 30th Parl., 3d Sess. (1977). The TSE noted in its submission on Bill C-42, 30th Parl., 2d Sess. (1977), that the standards in s. 4.5 are substantially more onerous than those imposed under the present law which is summarized by Chief Justice McRuer in R. v. Canadian Breweries Limited, [1960] O.R. 601, 629 (H.C.). Bill C-42, which preceded Bill C-13, contained a third condition for "regulated conduct", that

A provincial securities commission would be considered a "regulating agency" as defined in the bill.

The TSE in its submission on Bill C-42,[293] the predecessor of Bill C-13, applied the "regulated conduct" criteria to the process of fixing commission rates and to other exchange-regulated activities to point out the stringency of the "regulated conduct" exemption. The conduct of the TSE in respect of commission rates involves the exchange applying to the OSC for approval of a specified schedule of rates. On this basis, the TSE concluded that its conduct in this respect is "expressly authorized".

However, on the second part of the "regulated conduct" definition, the TSE did not believe "that it could accurately be said that the commission is expressly empowered to regulate the setting of commission rates",[294] notwithstanding the broad supervisory powers of the commission over the exchange contained in subsection 140(2) of the Ontario Securities Act. In addition, the commission's consideration of the TSE's application for approval of its schedules of commission rates means that the OSC "has expressly directed its attention to the regulation of the conduct".

As stated above,[295] Bill C-42 contained a requirement that the proposed Competition Act seriously interfere with the attainment of the primary regulatory objectives of the relevant act before the conduct was considered "regulated conduct". This requirement was dropped when Bill C-13 was introduced. The TSE had complained that this criterion was imprecise and it was not certain how a court would conclude in these circumstances. The TSE's concerns did not fall on deaf ears.

Consider the application of the "regulated conduct" criteria to other aspects of stock exchange conduct. As noted earlier, the OSC does not normally conduct a public hearing into a proposed stock exchange by-law, and therefore, there may not be any express authorization by the OSC of the by-law. In the absence of this express authorization, such a by-law may not be considered "regulated conduct". As noted above, although the OSC has broad supervisory powers over the exchange, it is not expressly empowered to regulate the various aspects of the conduct of the exchange members which are the subject of exchange by-laws. In the ab-

---

in the application of which under the proposed Competition Act to the conduct, in the specific circumstances of the case, would seriously interfere with the attainment of the primary regulatory objectives of the act empowering the regulatory agency; see Bill C-42, clause 5.

293 The Toronto Stock Exchange, Submission with Respect to Bill C-42, An Act to Amend the Combines Investigation Act 12 (September 19, 1977).

294 *Id.* at 13.

295 *See* note 292 *supra.*

sence of the publication by the OSC of a statement indicating its approval of an exchange by-law, such as the statement approving the exchange by-law implementing the Computer-Assisted Trading System,[296] there will not be any evidence available to the TSE that the commission has expressly directed its attention to the exchange by-law.[297]

The TSE concluded in its brief:

"With regard to the operation of the Exchange, we submit that the results arrived at by the application of section 4.5 of the Bill to the self-regulatory function performed by it and its members under the supervision of the Ontario Securities Commission, the Securities Act and the Government of Ontario are not in the public interest".[298]

The exchange supported a recommendation by the IDA which would involve an amendment to the Combines Investigation Act giving "specific recognition of the distinctive position of the securities industry through an exemption similar to the underwriting exemption in section 4.1".[299]

The conduct of IDA members as regulated by the IDA would not be "regulated conduct" under the bill because of the absence of any requirement in the Ontario Securities Act for recognition of the IDA and for approval by the provincial securities commissions of IDA conduct.[300] The IDA recognizes that its rules could be considered to have an "undue" impact on competition within the meaning of section 32 of the Combines Investigation Act as it would be amended by Bill C-13 and the association is concerned that it is open to attack, "an attack that might be launched despite the fact that the activities are conducted openly and with the approval of both provincial and federal regulatory authori-

296 *See* text accompanying note 211 *supra*.

297 The exchange in its submission on Bill C-42 provided an example of how the third criterion contained in that bill (and not carried forward in Bill C-13) for "regulated conduct" could effectively nullify the exchange's self-regulatory functions. If an applicant for membership in the exchange is rejected because he fails to meet the capital requirements imposed by the exchange, the applicant may argue that the requirements are anti-competitive in nature and are not so necessary that rendering them ineffective would interfere with the primary regulatory objectives of the Securities Act. The exchange considers that requirements such as the capital requirements are "necessary and appropriate to the administration of its self-regulatory function". However, it pointed out that under Bill C-42 it is open to a court to determine that such is not the case.

298 TSE submission, *supra* note 293, at 22.

300 One exception relates to audit standards discussed in text accompanying note 24 *supra*.

ties".[301] The IDA concludes: "While it seems unlikely that a criminal prosecution would succeed, it is unfair to this Association for us to face any exposure as a consequence of open adherence to rules that are designed for investor protection and that enchance the effective operations of our capital markets."[302]

D. INCREASED AWARENESS BY GOVERNMENT SUPERVISORS OF COMPETITION POLICY

Parliament will have to decide whether (1) the standards of self-regulation imposed by the stock exchanges and the IDA on their respective memberships and (2) the supervision of the stock exchanges and the IDA by the provincial securities commissions are sufficiently sensitive to competitive conditions in the securities markets.[303] A scheme of securities legislation in place in Ontario has developed because of the emphasis on investor protection. Investor protection has been sought through the imposition of disclosure requirements and licensing requirements, and by legislating against insider trading. Investor protection therefore has meant, historically, protection against a lack of information, unscrupulous and undercapitalized securities firms and inequality of information – not protection against the costs of anti-competitive conduct.[304]

The only examples of the OSC expressly directing itself to the state of competition in the marketplace appear in its consideration of stock exchange commission rates and particularly in its 1976 decision on whether or not commission rates should be unfixed. Indeed, the majority opinion concluded:

> "After considering all of the facts relating to competitive forces now in effect and appreciating that hard evidence in support of either fixed or negotiated commissions is limited, the majority of us have concluded that it would not be in the public interest at this time to direct the

301 IDA brief, *supra* note 221, at 5.

302 *Id.*

303 8 D. Shaw & R. Archibald, *supra* note 5, at 107-08, describes the concern expressed in some quarters that the major underwriters act in a non-competitive manner in their banking group relationships, choosing syndicate members based on historical relationships rather than capability.

304 *See* Saari, *The Efficient Capital Market Hypothesis, Economic Theory and the Regulation of the Securities Industry*, 29 Stan. L. Rev. 1031, 1069 (1977). Saari states:

> "The SEC has typically reacted to assertions that it is failing to achieve its goals by recommending more and better disclosure, or by calling for stricter enforcement of insider trading laws. Belief in the virtues of disclosure and in the evils of insider trading has become so strong that the SEC has not considered seriously the true effects of its regulation on the investors who it is charged with protecting;" *id.*

immediate introduction of negotiated rates in whole or in part."[305]

The two commissioners who dissented and favoured negotiated rates concluded:

> "Real competition through the price mechanism will encourage the responsiveness to new conditions, the healthy rationalization and the spirit of innovation that should characterize the Canadian securities industry if it is to meet the needs of the capital market in the years ahead."[306]

Competition and regulation are not antithetical: both are an attempt to maximize efficiency by eliminating monopoly profit through inducing competitors to provide services at a minimum cost, through preventing undue discrimination in pricing and, in general, encouraging business to be responsive to consumer preferences. Indeed, both antitrust enforcement and regulation from this point of view have the same goals.[307]

The securities industry is thus faced with the dilemma of all regulated industries: regulation can be constructive in developing the credibility of the marketplace, thereby enhancing efficiency, while regulation can, at the same time, be destructive because compliance with rules can inhibit efficiency. The analysis of the implications on the marketplace of revisions to our securities laws has been limited and usually only carried out in response to a reaction from the private sector. The consequences of a fraud are relatively easy to identify in economic terms and to explain in legal terms and therefore provide an easy basis for preventive legislation. The consequences of new legislation for the marketplace are prospective and difficult to measure, and are therefore not often analyzed in depth prior to enactment.

The provincial securities commissions have not dealt forcefully with the issue of competition and indeed have received little encouragement from the legislatures to do so. Competition and the resultant increase in efficiency must become a major consideration in reviewing the activities of the various SROs. It has been noted that such a concern does not run contrary to desires to protect the investor and that regulation generally has the same goal in that it attempts to reinforce competition. Full competition in the securities industry is not possible.[308] The difficulty is that

305 *In re* the Securities Act and part XV of the by-laws of the Toronto Stock Exchange, [1976] OSC Bull. 289, 302 (November).

308 *Id.*

competition and efficiency have so often been neglected in favour of the goal of investor protection. Perhaps this has not been such an unfortunate situation. In order for our securities markets to efficiently allocate resources, integrity must be a primary and competition a secondary concern. Considerations of competition generally have been sacrificed when the two values conflicted. The integrity of our markets has not been seriously questioned in the last ten years, and thus it is timely for our regulators to be more sensitive to the establishment of a highly competitive open environment for trading securities.

The U.S. Securities Reform Act of 1975 was primarily motivated by the desire to increase the level of competition in the securities markets. The *ALI Federal Securities Code* would require the appropriate government regulator to consider the implications of the conduct of SROs for the level of competition. In order for an SRO to become registered under the code, its rules must satisfy a number of requirements including that they do "not impose any burden on competition that is not necessary or appropriate in furtherance of the purposes that the applicant is intended to further as a self-regulatory organization under this Code".[309] One of the criteria which must be applied by the appropriate government regulator in reviewing the action of an SRO is whether or not the disciplinary action "imposes a burden on competition not necessary or appropriate in furtherance of" the purposes of the code,[310] and if the government regulator finds inappropriate or unnecessary actions, it is required to nullify the action. Under the *ALI Federal Securities Code,* the commission has the power to make rules and orders to implement specific provisions of the code.

> "In exercising its rule-making authority, the Commission shall consider, among other matters, the impact that the rule change would have on competition. It may not adopt a rule change that would impose a burden on competition not necessary or appropriate in furtherance of the purposes of this Code and it shall include in the statement of basis and purpose incorporated in every rule change the reasons for its determination that any burden on competition imposed by the rule change is necessary or appropriate in furtherance of those purposes."[311]

If the Canadian securities industry is to achieve the exemption it has requested from the federal competition legislation[312] then it must be in a position to demonstrate to Parliament that its

regulators are sensitive to the considerations of competition and that their rules will not be enacted if they restrain competition in a manner not necessary for the purposes of the scheme of securities regulation. The regulators in the best position to make this determination are the self-regulators and the government supervisors rather than a commission or body appointed under the proposed Competition Act. The self-regulators and government supervisors have the proximity to the securities markets which is necessary to make the delicate judgment of whether regulations unduly restrain competition. Upon review of the rules of an SRO, registration of an SRO, application for approval of a rule change of an SRO and review of an action taken by an SRO, the government regulator should be specifically required by statute to consider whether or not the SRO action restrains competition in a manner inconsistent with the purposes of the scheme of securities regulation. The government regulator's decision must also be made in the course of a procedure which provides for public notice of the SRO rule and the opportunity for public comment on the rule.

Chapter XII
Division of Regulatory Powers in Canada's Scheme of Securities Regulation

Operation of the SROs in a manner that is responsive to the public interest depends in some measure on adequate government supervision. Under the existing scheme of securities regulation, government supervision is carried out largely by the provinces. Therefore, the Toronto Stock Exchange is supervised by the Ontario Securities Commission, the Montreal Stock Exchange by the Quebec Securities Commission, the Vancouver Stock Exchange and Vancouver Curb Exchange by the British Columbia Corporate and Financial Services Commission, and so on. The IDA is not formally supervised by the provincial securities commissions, except to the extent that each IDA district has been vested with powers to regulate the auditing practices and procedures of members' financial affairs. Rules relating to such powers must be satisfactory to the provincial securities commission for the province in which members of a particular IDA district are registered. The IDA, to some degree, is supervised by the federal government in the sense previously discussed, in that the IDA submits to the Department of Finance rule changes which may interest the department. An example would be a rule change relating to mar-

gin requirements.[313] There are some problems and some advantages built into this fragmented regulatory structure.

A. DIVISION OF REGULATORY POWERS AMONG THE PROVINCES

Operations of an SRO may have implications which transcend the boundaries of the province which is responsible for supervising the SRO. The best example of such a circumstance is the process for establishing commission rates in Canada. The supervisory power in respect of commission rates has been exercised only by the province of Ontario. The process has been relatively simple, involving an application by the TSE to the OSC for approval of a minimum rate structure. Recognizing in the absence of adoption of a materially lower rate schedule or of negotiated rates that the TSE really determines the commission rates for Canada, the QSC and the B.C. commission have not second-guessed the Ontario process.[314] The TSE has afforded the other stock exchanges an opportunity to participate in the preparation of the rate structure submitted to the OSC. For example, the rate structure proposed by the TSE in 1973 was a "new national commission scale" because it was approved by each of the Toronto, Montreal, Canadian (as it then was) and Vancouver stock exchanges before it was proposed to the OSC. Amendments to this national commission scale have since been made, but always with the participation of the other exchanges.

Because the OSC is the government supervisory body for the TSE, it performs the responsibilities, in many ways, of a national securities commission. Because of the concentration on the TSE of share trading in Canada the TSE is in a position to dictate commission rates, and, accordingly, the rate structure proposed to the OSC sets the standards for the industry. The OSC has assumed this role reasonably comfortably, noting that "We have been as sensitive to the national interest as our duty to the Ontario public permits. The evidence before us suggests that the changes which

313 In BANK OF CANADA, ANNUAL REPORT FOR THE 1956 FISCAL YEAR 34 (1957), reference was made to an example of federal supervision of the SROs. The report states that "the general margin requirement according to the Rules of Stock Exchanges in Canada is 50%. The Bank of Canada has no power to impose or alter margin requirements. The Bank did, however, have a discussion with members of the governing bodies of the Montreal, Canadian and Toronto Stock Exchanges, in the course of which general agreement was expressed that it would be undesirable for the volume of credit used in stock market trading to increase any further under present conditions. A circular to this effect was issued by these three Exchanges to their members." *Id.* at 34.

314 The QSC and the BCSC could not directly question the TSE commission rates but could only do so when adopted by the Montreal Stock Exchange or the Vancouver Stock Exchange, as the case may be.

were made in the original proposals were not the result of regional differences peculiar to any province".[315] This passage does, however, point up the conundrum for the OSC establishing a national commission structure. Is the Ontario public interest consistent with the national interest?

The amendments to the MSE by-laws on commission rates are submitted to the QSC for approval and the QSC has, to date, agreed with the Ontario determination.[316]

The impact of the OSC's determinations on TSE commission rates was again noted in the OSC decision on whether or not the TSE should be required to discontinue minimum rates.[317] The OSC received submissions from the MSE[318] and VSE and from the Director of Investigation and Research under the Combines Investigation Act, Consumer and Corporate Affairs Canada.[319]

The problem in having one province consider the reasonableness of a national rate structure is apparent. Will a provincial commission be able to elicit submissions representing regional interests, and indeed is a provincial commission equipped to make determinations with respect to such interests? Interest in the Canadian rate structure is not confined to the regions of Canada, but also exists internationally, and the question must be asked whether or not a provincial commission is the appropriate body for assessing the international implications of such a decision.

An illustration of what is possible can be based on the unfinished debate over whether or not commission rates should be fixed or negotiated. The OSC, for the time being, has determined that fixed rates of commission are in the public interest. Coincidentally,

315 *In re* Proposed Amendments to Part 15 of the By-laws of the Toronto Stock Exchange, [1973] OSC Bull. 107, 126 (August).

316 The Quebec Securities Commission first considered Montreal Stock Exchange commission rates in 1973; *see* 4 QSC Bull. No. 31 (Decision No. 3635, July 25, 1973). At that time the QSC noted that s. 32 of the Quebec Securities Act gave it the power to review commission rates but stated that the public interest did not then require its intervention. Rather than making a decision on the rates it preferred to comment on the data presented and to point out the need for more thorough studies. It also raised the possibility of negotiated rates. *See also* 5 QSC Bull. No. 32 (Decision No. 4338, August 13, 1974); 8 QSC Bull. No. 13 (April 26, 1977). In the most recent consideration the QSC announced that it intends to recommend to the Québec government the adoption of legislation establishing the principle of competition in the determination of commission rates, *i.e.* negotiated rates. *See* text accompanying note 320 *infra*.

317 *In re* Part 15 of the By-laws of the Toronto Stock Exchange, [1976] OSC Bull. 289 (November).

318 *Id.* at 295. The MSE Director of Development had prepared a study; *see* P. Lortie, The Case for Fixed Commission Rates in Canada (1975).

319 Director of Investigation and Research, Combines Investigation Act, Consumer and Corporate Affairs Canada, Ottawa, Submission to the Ontario Securities Commission Regarding Fixed Commission Rates on the Toronto Stock Exchange (July 19, 1976).

by letter dated April 18, 1977, the chairman of the Quebec Securities Commission wrote to the Montreal Stock Exchange and "announced that the Commission intends to recommend to the Québec Government the adoption of legislation establishing the principle of competition in the determination of commission rates on the Montreal Stock Exchange. Such legislation will be based on the principle that competition is the best determinant of prices".[320]

The Canadian securities industry has been the beneficiary of cooperation among stock exchanges. However, if the provincial supervisory bodies for the stock exchanges require exchanges to assume conflicting positions on matters such as commission rates, the fragmentation of the securities industry may be heightened.

Another example of division of policy at the supervisory level is on the policy question of non-resident investment in the securities industry. The province of Ontario is the only Canadian jurisdiction which has enacted regulations specifically on non-resident securities firms.[321] Because of Ontario's policy, non-resident firms have been denied access to Canada's major financial centre. The implications of Ontario's actions are clear in that Ontario is defining a national policy for non-resident securities firms. A non-resident firm considering expanding into Canada thinks first of the Ontario prohibition which it would consider as characterizing Canada's national policy and only as a second alternative looks at the more open policies of some of the other provinces.

The Shaw-Archibald recommendation on regulation of foreign market intermediaries is that they be permitted to operate in Canada to the extent of transacting in foreign securities with Canadians.[322] In order for such a recommendation to be adopted, cooperation by Canadian stock exchanges is necessary. Such cooperation may be forthcoming, but uniformity is unlikely in the absence of government intervention. Government intervention

320 8 QSC Bull. No. 13 (April 26, 1976). The translation of chairman Lacoste's letter continues:

> "This recommendation is a result of several studies on the question. The Commission followed closely the adoption of such a policy by the Securities and Exchange Commission in the United States, as well as its effect, and undertook quantitative studies on the impact of such a measure on member-brokers of the Montreal Stock Exchange. The Commission also considered the impact of such a change on the efficiency of our market. The decision of the Ontario Securities Commission was also considered as well as representations made before the Ontario Securities Commission during last summer's hearing on this question." *Id.*

321 The OSC is currently studying the policy underlying the Ontario regulations and may recommend the enactment of regulations which would permit non-registered, non-resident securities firms to trade foreign securities with Ontario residents and to underwrite securities of Canadian companies for foreign sales; *see* OSC Weekly Summary, February 10, 1978.

322 8 D. SHAW & R. ARCHIBALD, *supra* note 5, at 96.

may similarly not be coordinated from province to province. Again, as is the case with commission rates, if one exchange "breaks rank" the market system is faced with an unresolved issue. Possibly different rules on different exchanges could be in the national interest, but there is no supervisory body in place now that has the scope to deal with national interests. Certainly the federal government would be somewhat limited in its dealings with foreign governments on the issue of non-resident participation in the Canadian securities markets when these rules are set by provincial securities commissions, or by SROs over which the federal government has no supervisory authority.

B. COOPERATION AMONG SROS

There are a number of examples of cooperation among the SROs, particularly the stock exchanges, and a number of examples of competition among the stock exchanges which, in the end, have probably benefitted the Canadian investing public. Cooperation is evidenced, for example, in the sharing of the audit responsibility among the stock exchanges and the IDA. There is a considerable incentive for the SRO with audit responsibility to discharge this responsibility carefully, because any failure of a member for which it has audit responsibility may cost members of the SRO a greater amount than if the SRO did not have audit responsibility. As noted above, the SROs have also cooperated in the preparation of a national commission rate structure which they have considered to be in the public interest. Other matters of broad public policy have also been the subject of study on a cooperative basis by the SROs, for example, diversification of business by securities firms.

Competition among the stock exchanges has sometimes resulted in benefits to the investing public. For example, there was the joint effort of the TSE and the MSE to establish one clearing operation for options on Canadian stock. However, the joint effort broke down over the incompatibility of computer operations at the two exchanges and the splitting of the options list. When both the Toronto and Montreal exchanges applied to the OSC for approval to establish separate options corporations, the OSC granted such approval on the condition that a joint facility be created within a year. The competition between the exchanges may have resulted in an options clearing unit available to the investing public at an earlier date than would otherwise have been possible, but it doubtless also represented unnecessary costs as a result of the duplication. Another example of both competition and cooperation relates to the imposition and recently proposed removal by both the MSE and the TSE of the restrictions on arbitrage and "freighting"

between exchanges. The TSE anti-freighting rule was adopted in the 1960s in retaliation against a somewhat laxer requirement by the QSC that trades ordered by Québec residents must be shown on the floor of the MSE before being attempted elsewhere.[323] This regulation of the QSC was abolished in September 1977.[324] On this basis, the TSE has proposed dropping its "anti-freighting" rule, which formally prohibited brokers buying or selling stocks for their own account and liquidating the position on another Canadian exchange.

A law requiring SROs to share regulatory responsibility is not feasible on a provincial basis. The *ALI Federal Securities Code*, on the other hand, proposes that the Securities and Exchange Commission have the power by rule to allocate among the SROs the authority to adopt rules with respect to matters over which the SROs share authority, and with respect to a person who is a member of more than one SRO, in order to relieve any SRO of certain regulatory responsibilities and, similarly, relieve such person of the duty to comply with the rules of the SRO to the extent that the SRO is relieved of responsibility.

The SROs as a group are not enthusiastic about further government regulation of any sort. Accordingly, they have an incentive to cooperate in the public interest in sharing responsibilities and adopting policies in order not to encourage the creation of a federal supervisory power which would be able to require and enforce cooperation among the SROs. However, this incentive may not always be adequate to ensure SRO cooperation in the national interest.

Chapter XIII
Conclusion

Self-regulation in the Canadian securities industry is vital to the overall scheme of securities regulation. Most market intermediaries seldom deal directly with government on regulatory matters. The business they can conduct and the manner in which it is conducted is regulated by the SROs of which they are members. The SROs are conscious of and anxious to protect their regulatory role. The alternative to self-regulation is increased government regulation. Without doubt, SRO members prefer regulation by their peers.

Notwithstanding this vital role, the public does not know a great deal about the internal operations of the SROs and the

323 The Globe and Mail (Toronto), February 3, 1978, at B2.
324 8 QSC Bull. No. 35 (Decision No. 5316 September 6, 1977).

functioning of the SRO-government relationship. What regulatory functions does government assume the SROs are performing? The securities statutes certainly disguise the extent of the regulatory responsibilities of the SROs. Where does the standard of SRO regulation fit in relation to the standard of government regulation of non-SRO members? Are the SRO standards for monitoring the conduct of their members adequate? Does government perform "surprise audits" of SRO operations? Or should it be the other way around? Is there duplication of government regulation and SRO regulation? What really happens when the TSE proposes a by-law change to the OSC? Would the IDA really welcome a requirement for registration of its various districts in all of the provinces in which it functions? How do the stock exchanges agree to a uniform commission rate schedule? Do we have adequate regulatory machinery if the MSE opts for negotiated commission rates or admits non-resident members?

This paper suggests a number of additions to the securities laws in Canada which provide for the supervision of SROs in order to define more carefully the responsibilities of government in conferring regulatory powers on the SROs and the responsibilities of the SROs in exercising these regulatory powers, and also to provide the public with more information about the functioning of the SROs. With more information, we will be able to better examine the issue of whether the SROs do operate in the public interest.

This of course is the question which is basic to the continuation of the SROs in the Canadian scheme of regulation. There is an obvious assumption underlying our scheme of regulation that self-regulation is in the public interest. No government in Canada has ever articulated the rationale for this assumption. Self-regulation has "just happened". The recent pronouncements by Canadian securities administrators in favour of self-regulation are rather stark. It is incumbent on the administrators to articulate this rationale and tell the Canadian public how the SROs function within this rationale. The suggestions in this paper may to some limited degree assist the administrators in this task. However, only the administrators have the daily and direct contact with the SROs to assess their performance.

There are other issues facing the Canadian securities industry that will test the SRO-government relationship and, in particular, government supervision of SROs. More and more the secondary markets will operate across provincial boundaries. Our scheme of securities regulation is however based on provincial securities statutes and administration. The administrators in the past have been innovative in providing for regulation of issues of securities with implications which go beyond provincial boundaries, and

their ability to innovate will be necessary to continue to effectively supervise the SROs. The alternative is, of course, one national administrator responsible for supervising the SROs. The allocation of regulatory responsibility, and therefore the efficacy of the supervision, will be important to the quality of self-regulation in the future.

Chapter I
An Overview of the Securities Industry in Canada and the United States

A. THE SECURITIES INDUSTRY

"The pursuit of the economic development of a society tends to be gravely impeded by a scarcity of resources. It thus becomes imperative to create an active financial market which eases the investors' access to the pool of available capital in their society. One of the important elements of this financial market is the securities industry.

"The financial market comprises, besides the mass of individual investors, two main types of well defined economic organisms: the financial institutions properly so called on the one hand and the securities firms on the other. The financial institutions (banks, trust companies, pension funds, insurance companies, etc.) act mainly as financial middlemen between borrowers and lenders. Their main function consists in raising funds from the public through the issue of debt securities and making these funds available to third parties in the form of investments (personal, collateral, mortgage and industrial loans, bonds, etc....).

> "On the other hand, the securities firms' role is to ensure the marketing, distribution and trading of the various securities being traded on the financial market. In order to do so, they must bring together those who seek and those who have funds. The liquidity of a security is thus directly linked to the dealer's ability to dispose of such securities in the primary market and maintain their marketability in the secondary market where trading by institutional and individual investors takes place."[1]

The securities industry has been broadly defined as meaning "those financial intermediaries required to obtain registration in some principal capacity under the Securities Act".[2]

Under the Ontario Securities Act there are three main classes of activity which require registration. These are "advisers", "dealers" and "underwriters".[3] "Advisers" and "dealers" are further classified in the regulations to the act according to differences in function and membership in recognized self-regulatory bodies. These definitions indicate both the various classes of persons that constitute the securities industry and the difficulty of using one title to describe all classes.

An "adviser" is defined as one who engages in or holds himself out as in the business of advising others on the desirability of investing in or buying or selling securities.[4] An "adviser" may be either an "investment counsel" or "securities adviser". An "investment counsel" is defined as advising others on the advisability of investing in specific securities or giving continuous advice on the investment of funds on the basis of individual client needs.[5] A "securities adviser" is defined as one who advises either directly or

1 DEPT. OF FINANCIAL INSTITUTIONS, COMPANIES AND CO-OPERATIVES, STUDY ON THE SECURITIES INDUSTRY IN QUEBEC: FINAL REPORT 27, 28 (1972) [hereinafter cited as BOUCHARD REPORT]; W. MARTIN JR., THE SECURITIES MARKETS: A REPORT WITH RECOMMENDATIONS 4 (Bd. of Governors of NYSE 1971) states:

> "The public interest dictates that the primary purpose of a securities market is to raise capital to finance the economy. Without continuous capital formation, our economy could not grow or prosper. It could not provide job opportunities for our growing labour force. It could not sustain a rising standard of living. It could not generate economic opportunities so vital to the health of our free economic system. It could not assist government in its programs to lessen social problems such as poverty, pollution and crime..."

2 ONTARIO MINISTRY OF CONSUMER AND COMMERCIAL RELATIONS, REPORT OF THE SECURITIES INDUSTRY OWNERSHIP COMMITTEE OF THE ONTARIO SECURITIES COMMISSION 35 (1972) [hereinafter cited as ONTARIO OWNERSHIP REPORT].

3 *See* Ontario Securities Act, s. 1(1) (definitions of "adviser", "dealer" and "underwriters").

4 *Id.* s. 1(1).

5 Ontario Securities Regulations, s. 2(2) (1).

through publication or writings on the advisability of investing in specific securities.[6]

A "dealer" is described in the Ontario Securities Act as one who trades in securities in the capacity of principal or agent.[7] This is a very wide term which is further classified in the regulations to the act into one or more of the following groups:

"(a) 'broker', a member of the Toronto Stock Exchange who trades exclusively as an agent;

"(b) 'broker-dealer', a member of the Broker-Dealers' Association of Ontario who may trade as an agent or principal and who automatically receives registration as an underwriter;

"(c) 'investment dealer', a member of the Investment Dealers Association of Canada, who may also trade as an agent or principal and who automatically receives registration as an underwriter;

"(d) 'mutual fund dealer', registered exclusively to trade in securities of mutual funds; members of the Canadian Mutual Fund Association have modified conditions attached to their registration;

"(e) 'scholarship plan dealer', registered to trade exclusively in the securities of a scholarship or educational plan or trust;

"(f) 'securities dealer', trades either as principal or agent and is automatically registered as an underwriter but is not a member of one of the recognized self-regulatory bodies; and

"(g) 'securities issuer', registered to trade exclusively in securities of his or its own issue."[8]

An "underwriter" under the Ontario act is one who, if he is not registered under any other capacity, may only distribute to the public through other classes of registrant.[9] Broker-dealers, investment dealers and securities dealers, each of whom is registered to trade as principal or agent, are deemed to be granted registration as underwriters. This permits them, and the issuer with whom they are dealing, to enjoy the exemption contained in section 19(1)6 and section 58(1)(c) of the Securities Act.

In this paper, unless the contrary is indicated, "securities dealer" is used to describe all persons in the securities industry that deal in securities as principal, agent or adviser.

It is, however, important at the outset to distinguish the

6 *Id.* s. 2(2) (2).
7 Ontario Securities Act, s. 1(5).
8 Ontario Securities Regulations, s. 2(1).
9 *Id.* s. 2.

function and operation of brokerage firms and investment dealers. The stockbroker, or as he is more often known, a broker, and the investment dealer or dealer play very different roles.

> "Stockbrokers act essentially as agents or mandataries in their transactions and must comply with their clients' wishes. The clients place their orders for securities (buy or sell) with their stockbroker who executes them on the floor of the exchanges. It might be noted that the investor's decision may be influenced by the stockbroker's recommendations due to the latter's great experience and knowledge; however, in the final analysis, the decision is the investor's."[10]

Meyer describes the role of a broker as follows:

> "The broker, in executing his customer's order for the purchase or sale of securities or commodities, acts as the customer's agent. The broker does not himself sell to or buy from the customer, but represents the customer in making a contract of purchase or sale with a third party."[11]

and

> "In the execution of an order for the purchase or sale of securities or commodities, the relationship between the broker and the customer is that of agent and principal. The contract of purchase or sale is between the customer and a third party, the broker acting as the customer's agent in making the contract. The broker does not himself sell to or buy from his customer, and therefore in making the purchase or sale is not himself the seller or buyer.[12]
>
> "There are two ways for one to purchase stocks or bonds through a broker. The customer may give the broker the full amount of the requisite purchase price or he may make a margin arrangement with the broker: the usual margin required being 10%[13] of the purchase price. In such a transaction the customer pays the broker this margin; and it is then the duty of the broker to buy the stock himself advancing the remainder of the necessary amount. In either case the broker assumes a fiduciary relation towards his customer. In actual practice the bro-

12 *Id.* at 249.

13 In the 65 years since the article from which this quotation is taken was written, the usual margin has increased from 10% to 50%.

> ker does not advance out of his own pocket the money necessary to buy the stock. On the contrary, he hypothecates the purchased stock to a bank for the necessary amount. Hence, in every margin transaction there are three parties, the customer, the broker and the broker's bank."[14]

The broker, being an agent, is paid a commission for his services.

The investment dealer, on the other hand, acts on his own behalf in market transactions. He builds up an inventory of securities for resale to interested purchasers.[15] The true investment dealer buys as a principal, often through underwriting, and sells for his own account.[16].

Generally, the larger securities firms combine the functions of stockbrokers and investment dealers. There are only a few securities firms in Canada which act exclusively as investment dealers. As an agent, a securities firm may purchase or sell for the customer's account. As a principal it may purchase for its own account from and sell to a member of the public or another dealer. The former function is often regarded as the "broker" function and the latter as its "dealer" function.[17]

While the brokerage function constitutes the major function of a broker-dealer or securities firm such firms provide many other services related to a traditional role of corporate financial advisers. A securities firm, for example, may offer a market service to its clients and information on request. It may offer investment advice to clients on a regular basis, issue market commentaries and recommendations. Some firms provide portfolio management services as investment counsel. Other firms manage pooled accounts known as "in house" mutual funds which through a prospectus are qualified for sale to the public. Other so-called convenience accounts such as margin accounts, custody for clients' securities and collection of interest and dividends may be provided. In addition, corporate clients may be advised, on a fee basis, on a wide range of business problems including mergers, acquisitions, corporate reorganizations and even economic forecasting and future expansion.[18]

> "The key factors which distinguish the securities industry from other industries are its custodial responsibility for customers' funds and securities and the unique role

18 *Id.* at 45.

the industry must play in the formation and maintenance of the capital needs of governments and corporations."[19]

B. THE OPERATION OF A BROKERAGE FIRM

"The present securities markets require that the broker be able to locate and deliver free credits and free securities immediately upon the direction of his customer. To do this the broker must identify the specific transaction which was performed on behalf of those customers and which resulted in the credits and securities due the customer. This will permit the broker to determine that he has an obligation to perform the customers' instruction. The broker must then locate the cash or securities necessary to comply with the instruction and dispose of them as the customer directs."[20]

If a broker's business is confined to institutional clients or only to a few clients who are members of the public, all of these acts can be performed by him. A separate depository could be used for each client's securities. This, however, would be all but impossible for a large firm.

In practice, brokers use a system of bulk segregation. Individual transactions that result in a securities or cash position for a customer can always be identified, thereby permitting the broker to ascertain his obligations to his customers. However the actual proceeds of a transaction or the securities involved in respect of a customer cannot be specifically identified after completion of the transaction and its recording in the books of the firm. Both the cash and securities involved are regarded as fungible. The broker uses the cash and securities to meet the obligations incurred for all his customers. The cash becomes a part of the firm's "float" and the securities go into the bulk segregation provided by the "one box system".[21]

The customers' free credit balances held by a broker have traditionally been used in the conduct of a broker's business.

"A free credit balance is an amount of cash owed by a broker-dealer to a customer which is not subject to any unfulfilled commitments of the customer to the broker-

19 Notice of Revisions to Proposed Rule 15c3-1 and Notice of Proposal to Adopt an Alternative Net Capital Requirement for Certain Broker-Dealers, SEC, Securities Exchange Act of 1934 Release No. 11094, November 11, 1974, [1974-1975 Transfer Binder] CCH FED. SEC. L. REP. ¶80,006.

20 Shields & Co., Re: Protection of Customers' Securities and Free Credit Balances in the Possession of Brokers, June 21, 1971, at 11 (memorandum by NYSE member).

21 *Id.* at 12.

> dealer, and which the customer has an unrestricted and immediate right to withdraw on demand. A free credit balance is usually created in one of three ways: (a) by the deposit of cash by the customer with the broker-dealer in anticipation of placing an order to buy securities; (b) by the broker-dealer selling securities for the customer and holding the proceeds of the sale pending reinvestment or other instructions; or (c) by the broker-dealer receiving and holding for the customer interest or dividends received on securities owned by him."[22]

A study made by one brokerage firm indicated that about 70% of the individual balances were for less than $100 and in that group the average balance was $16. Sixteen percent did not exceed $500 with the average balance in that group being $230. The study indicated that credit balances for the most part are transitory and represent a "float". One-third of all balances had a life of only one day to a maximum of three weeks. An additional 25% had been on the books for less than sixty days. [23]

Free credit balances, while in a constant state of change are, in aggregate, important to the securities industry. They are, in fact, the source of millions of dollars of interest-free capital used by the industry to finance loans to other customers. The report of member firms of the Toronto Stock Exchange as at the close of business on December 31, 1974, indicated that customers' free credit balances totalled $85,672,000. For the industry in Canada at any one time, free credit balances would be in excess of $120 million to $150 million.[24]

Historically, the securities industry, particularly that segment doing a major share of retail business and directly serving the public, has been financed by the unrestricted use of such customers' funds.[25]

A broker, by custom of the industry, is permitted to use free credit balances if:

22 SECURITIES INDUSTRY STUDY, REPORT OF THE SUBCOMMITTEE ON COMMERCE AND FINANCE OF THE HOUSE COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE 38 (Subcomm. Print 1972) [hereinafter cited as SECURITIES INDUSTRY STUDY REPORT].

23 Letter from Merrill Lynch, Pierce, Fenner & Smith to J.R. Kimber, president, Toronto Stock Exchange (September 20, 1968).

24 For member organizations of the New York Stock Exchange carrying public customers' accounts, free credit balances at 1970 year-end amounted to $2.0 billion compared to total capital (including subordinated liabilities) of $3.1 billion. During the first nine months of 1971, free credit balances of these member firms ranged at month-ends between $2.1 and $2.8 billion; SECURITIES INDUSTRY STUDY REPORT, *supra* note 22, at 38. On November 1, 1968, Shearson, Hamill & Co., Inc., held $41,419,965 in free credit balances, representing 18% of the firm's total liabilities; The New York Times, December 14, 1968, at 59.

25 SECURITIES INDUSTRY STUDY REPORT, *supra* note 22, at 38.

(1) the contractual arrangement between the customer and broker expressly authorizes such use;
(2) the course of dealing between the customer and the broker is such that a court would imply a term in the contract authorizing such use; or
(3) the custom established in the trading of securities in a particular community authorizes such a use and is one which the courts will deem to govern the contractual relationship between the broker and his customer.[26]

"Representatives of the securities industry have stated frequently that, if customers' funds were no longer available as working capital, replacing these funds would result in loss of income to the broker-dealer and this probably would result in higher costs to individual customers."[27]

Brokers contend that they do not have the same fiduciary relationship with their customers as do, for example, solicitors, insurance and real estate agents, trustees and others with their customers, clients or *cestui que trust*. This, they say, is the reason for the custom of the trade permitting the non-segregation of free credit balances and therefore their use as a source of working capital.[28]

Brokers as a rule act as agents for undisclosed principals. As a result, when a broker completes a trade on the floor of an exchange he assumes a liability of his own. The broker must settle the transaction with the broker with whom he trades whether or not his customer defaults.

The liability of a broker can extend over some considerable time. Rules of exchange trading provide for settlement three or four days later. In many cases, the liability remains for much longer by reason of delays in effecting the delivery of securities through registrations, transfer and other requirements.

The clearing of business each day, which is done by offsetting or netting out securities and money, results in materially reducing the total dollars and securities needed for settlement. However, as a result of this process, settlement is usually made with a broker other than the broker with whom the trade was made. The major consequences of this is that all members of an exchange become collectively responsible for every member meeting his clearing commitments each day.

A different system of trading developed in Europe. Member-

26 Letter from A.J. MacIntosh, Q.C., to J.R. Kimber, president, Toronto Stock Exchange (September 18, 1968).

28 Toronto Stock Exchange, The Reason for the Custom of the Trade (1968) (memorandum).

ship in European exchanges is exclusively in the hands of banks and trading approaches a basis of immediate cash or unquestioned ability to pay and immediate delivery. The European exchanges do not, however, have the same high volume of trading, members of the public are not large participants and the exchanges do not have the same high degree of liquidity as do the exchanges in the United States and Canada.[29]

C. CLEARANCE AND SETTLEMENT: PROCESSING OF CERTIFICATES

Clearance and settlement are the processes involved in the completion of either a purchase or sale of securities between broker-dealers. Clearance is the process of comparing the details of the transaction to ensure that there is agreement. This involves, for example, the details of the number of shares traded and the price. Settlement is the completion of the transaction in which the securities are delivered from one broker-dealer to the other in exchange for payment.[30]

The clearance and settlement process involves the processing of stock certificates whereby the certificiates of a vendor are converted into certificates in the name of the purchaser or several purchasers in exchange for the agreed consideration. Traditionally this has been a manual process that was both lengthy and complex. The United States *Securities Industry Study Report* in 1972 by the House Subcommittee on Commerce and Finance listed the major steps involved in the manual process of clearance used as late as the 1960s, in a typical transaction executed through a broker-dealer that was a member of an exchange, as follows:

> "1. The customer placed his buy order with a registered representative, usually at the branch office of a brokerage firm.
>
> "2. The registered representative wrote up the order which was then telephoned or teletyped to the brokerage firm's central office for relay to a broker on the floor of the exchange for execution.
>
> "3. The floor broker took the order to the post – a designated location on the exchange floor where the stock is traded. He checked the market with the specialist handling the particular stock and made a bid to buy the securities either from the specialist or from another broker at the post who was attempting to sell the stock.
>
> "4. He and the seller then quickly negotiated a price. (In

29 *Id.*

30 *Id.* at 59.

some cases, the specialist may have offered his own stock to assure an orderly market.) ([*Note:*] If the buyer limited his order to a price below the current market, the floor broker then would give the order to the specialist to enter in his book for execution, should the market decline to the specified price.)

"5. Each broker marked the price and the other broker's symbol on his ticket and returned the ticket to his booth on the floor. The price was then telephoned or teletyped back to the brokerage house for customer notification.

"6. A reporter on the exchange floor recorded the trade and relayed the price to an exchange clerk who keyed it into the tickertape system.

"7. The executed order, as annotated by the floor broker, was hand carried to the brokerage house where cards were punched to be used to prepare customers' billings.

"8. These cards (the counterparts of which were prepared by the selling broker) were submitted to the clearing-house daily for comparison and netting of the day's trades in each security. Also, allocations were made which showed to whom the selling brokers must deliver and, conversely, from whom the buying brokers would receive securities. This is called the daily balance order system.

"9. The seller's brokerage firm obtained the securities from the seller and delivered them to the clearinghouse. The securities were designated for specific brokers (under the netting process, not necessarily the brokers on the other side of the trade) and were accompanied by a list showing the money due for each delivery.

"10. The clearinghouse sorted each firm's securities receipts for the day and placed them in messenger boxes for delivery to the appropriate brokerage firm. The money value of deliveries was credited to the delivering broker and debited against the receiving broker. The dollar difference between credits and debits was settled daily between the brokerage firms through the clearinghouse.

"11. Upon receipt of these securities by the buying brokerage firm, they were generally sent to the transfer agent who canceled them and issued new certificates in the broker's name (commonly known as 'street name') if they were to be held by the brokerage firm or in the customer's name if they were to be delivered to him. The transfer agent then forwarded the new certificates to the registrar for registration.

"12. The registrar checked the new certificates for validity (*i.e.*, to make certain that the stock was not restricted and that the total number of shares outstanding did not exceed the amount authorized) and registered the certificates on the corporate records. The registrar then returned the certificates to the transfer agent who in turn delivered them to the brokerage house. Ownership was now properly recorded so that dividends, proxy statements, quarterly reports and other such materials would be sent to the registered owner. Where securities were registered in street name, dividends and share-holder information were sent to the brokerage firm, which credited the owner's account with the dividends and forwarded information to the beneficial owner.

"13. Upon receipt of the new certificates from the transfer agent, the brokerage firm verified them against the transfer instructions. They were then either sent out to the customer (if in the customer's name) or were held by the brokerage firm.

"In executing and processing a single transaction, a typical brokerage firm used approximately 33 different documents, 18 for each trade and 15 for summary records of the transaction. One error may have doubled the number of documents required when corrections were made. In the case of one large brokerage firm, 210 pieces of paper were prepared and moved in consummating a transaction from the time an order was entered until the final disposition of the stock certification. ([*Note:*] See Hearings [Senate Securities Industry Study Hearings], p. 1597, testimony of Robert R. Maller.)

"Indeed, as has been pointed out by one study:

"A middle-aged investor who dealt with the same brokerage firm during the past 25 years might have observed that, as volume mounted, striking transformations occurred in the physical appearance of the office, the character of the personnel, and the speed with which he was able to obtain information. The board room that he visited to check the current status of the market was more comfortable and the visual displays more complete and easier to see....The investor now could obtain a wide range of current statistics on price, volume, dividends, and earnings, by simply pressing the appropriate keys of an electronic machine. All in all, he would be very pleased, not only with the conveniences afforded him, but because these very same innovations indicated the firm's ability

to keep pace with the changing times....But had he asked for a description of the path his order took, from the time he submitted it until he finally received a stock certificate, his registered representative might have presented a flow diagram yellowed with age. In other words, from a systems viewpoint, there was little change. ([*Note*:] Hearings, Appendix BB, p. 2187, from the report of Lybrand, Ross Bros. & Montgomery, at p. 22.)

"Until very recently, relatively little attention in the industry was given to standardizing the documents which accompany stock certificates during their processing. Noncertificate paper represents a significant part of the total paperwork load in processing a single transaction. According to testimony before the Senate Securities Subcommittee in September, 1971:

"[T]he stock certificate is just one of many kinds of paper that contribute to the total log jam. There is a multitude of other documents, and each of them, under current systems, varies in data content and format. These documents are produced, transmitted and processed by a myriad of diverse procedures by and for a variety of loosely coordinated entities. ([*Note*:] 2 Securities Industry Study, Hearings before the Subcommittee on Securities of the Senate Committee on Banking, Housing and Urban Affairs, 92d Cong., 1st Sess. ["Senate Securities Industry Study Hearings"], p. 65, 1971. See also Hearings, p. 1359, for a discussion of the problems associated with the lack of standardization of documents.)

"Reference was made above to the daily balance order method of clearing and settling transactions. This system has traditionally been used by the Stock Clearing Corporation of the New York Stock Exchange. Another method currently gaining wide acceptance is that of 'continuous net settlement' (CNS), used by the clearing corporations operated by the Pacific Coast Stock Exchange and the Midwest Stock Exchange and being increasingly used by the National Clearing Corporation in connection with over-the-counter transactions. ([*Note*:] As of June 5, 1972, all of National Clearing Corporation, 250 New York clearing members had been converted to CNS for over-the-counter transactions. Clearing had been extended on a pilot basis to Boston and Philadelphia and, by year-end, according to the NASD, over 40% of its members' OTC activity should be on CNS.) The following is a brief description of how each system operates:

"Under the 'daily balance order' method, the clearing corporation nets out on settlement date each day's purchases and sales submitted by firms which are clearing members. This process produces a daily net balance of shares to be delivered or received, depending upon whether a firm on that day was a net seller or a net buyer of a particular security. As the brokerage firms deliver or receive their designated balances of securities through the clearing corporation, the money balances, which have been similarly netted, are also settled. When a firm cannot deliver its stock, this creates a 'fail'.

"Under the 'continuous net settlement' system, the clearing corporation acts as an intermediary rather than a keeper of accounts between different firms. The brokerage firm settles with the clearing corporation which, in effect, stands on one side or the other of every transaction. Thus, the firm becomes either a debtor or creditor of the clearing corporation. This system provides for more effective control over 'fails' because the clearing corporation is on the opposite side of every transaction. In the event of a firm's failure to deliver stock on the settlement date, an appropriate entry is made in the firm's account with the clearing corporation which reflects the market value of the stock on the day the firm failed to deliver. As long as the 'fail' is outstanding, it is marked to the market daily. Thus, when the contract is ultimately settled, the moneys receivable by the broker reflect the current market, not the original contract price. No other system for fails control eliminates market risk as does the CNS system. ([*Note*:] See Hearings, p. 1367, statement of David H. Morgan.)"

In order to cut down on the paper work involved in the clearance and settlement process there has been a growing use of depositories. Typical of these is the depository operated by the Stock Clearing Corporation of the New York Stock Exchange in conjunction with its daily balance order clearance and settlement system. Studies are under way to expand the use of depositories into a Comprehensive Securities Depository System (CSDS) which will serve all brokers, banks and institutions in the United States as the Central Certificate Service (CCS), the depository operated by the NYSE serves its member firms. It is expected that a central depository system will soon be introduced into Canada.

Under the CCS system firms transmit most of their proprietory securities to the central depository. This would include all fully paid and excess margin securities as well as margined but

unhypothecated securities. The securities are then registered in the name of the depository. These certificates are then converted into certificates of larger denominations and except for a small working supply are deposited in the banks of the depository.[31]

Margin accounts are affected by a bookkeeping entry which transfers the securities to the account of the pledgee bank.

Subsequent transactions are cleared through the depository's computer and appropriate adjustments are made in the accounts of members. Unless there is a specific request there is no physical delivery of securities.

Under a depository system there is only bulk segregation of securities. Segregation is by record only as the securities are held by the depository. Free credit balances are unaffected as they are not included in the system.

D. SOME DIFFERENCES IN THE CANADIAN SYSTEM OF PROCESSING CERTIFICATES

The preceding description of the processing of certificates applies to the U.S. system and, while substantially the same, the Canadian system does differ in a number of respects. Although a number of U.S. firms failed during the 1960s through loss of control of their operations it does not appear that any Canadian firm failed for this reason.

Canadian stock exchanges, brokers and transfer agents appear to have better operation systems for the settlement of transactions. Good delivery, for example, in the United States has been by way of one hundred share certificates while in Canada it has always been by way of so-called "jumbo" certificates.[32] This, by itself, has resulted in much less paper to control. Canadian exchanges also use a three-part trade ticket which results in "locked in" settlement information with no D.K.s.[33] In the United States, D.K. rates range from 3% to 10% of transactions.[34]

Another major difference between the U.S. and Canadian systems is that in Canada almost all public securities business is done through exchange members. In the United States there is a substantial volume of business done through over-the-counter

31 STOCK CLEARING CORPORATION, OUTLINE OF MAJOR OPERATIONAL FUNCTIONS OF CENTRAL METHOD FOR HANDLING SECURITIES (1967).

32 A "jumbo" certificate is a certificate for a large denomination.

33 A "D.K." is the abbreviation for "Don't Know". It is an expression used in the brokerage business to indicate that a certain transaction which another brokerage concern is attempting to confirm or compare is unknown to them. When mutual understanding is reached, the transaction is properly compared or cancelled.

34 H. Cleland & D. Gardner, memorandum to R. Tassé, Assistant Deputy Minister, Consumer and Corporate Affairs Canada, April 14, 1972, at 2.

firms that are not regulated to the same extent as firms which are members of an exchange. In Canada some 90% to 95% of equity trading is in listed issues. In the United States over-the-counter trading is equal to or greater than exchange trading.[35]

A major difference between the U.S. and Canadian systems is size. It is important to take this into consideration when comparing procedures. Many procedural problems in the processing of certificates directly relate to the size of the systems. The Canadian system is very much weaker than the U.S. system. In the United States there are six to ten times as many transactions per day as in Canada with a dollar value thirty or forty times greater. While the population of the United States is about ten times that of Canada, the U.S. securities market in terms of size and volume of activity is approximately twenty to thirty times larger than the Canadian market. Merrill Lynch has a capital of some $500 million, which is more than double that of the entire Canadian industry. Merrill Lynch processes as many transactions per day as all Canadian broker-dealers put together.[36]

It is also significant that the capital of Canadian brokerage firms is almost all "cash" capital. This is very different to the securities positions pledged as capital in the United States. The effect is that in Canada, brokerage house principals have a greater personal responsibility for a firm's capital than do their U.S. counterparts. Moreover, Canadian margin requirements are, as a rule, more conservative on debt instruments and the same or more liberal on equities.[37]

E. THE LEGAL RELATIONSHIP BETWEEN A BROKER AND HIS CUSTOMERS

The Canadian securities industry is very closely patterned on that of the United States but is much smaller. As a result there have been comparatively few failures of Canadian broker-dealers, particularly in recent years. The Canadian courts have accordingly not had a great number of cases relating to the insolvency of broker-dealers. As a result, U.S. authorities are frequently referred to in Canadian cases and in this paper.

Mr. Justice Anglin, later Chief Justice of Canada, made reference many years ago to the need to look to and rely upon U.S. authorities:

"It is common knowledge that the business of stockbro-

36 H. Cleland & D. Gardner, *supra* note 34, at 2; *Cleland;* MERRILL LYNCH, PIERCE, FENNER & SMITH, ANNUAL REPORT 1 (1974); Black, *Stockbrokerage Bankruptcies: Implementing CCS,* 54 CORNELL L. REV. 750, 752, n. 13 (1969).

37 H. Cleland & D. Gardner, *supra* note 34, at 2, 3.

kers in this country is conducted in a manner more closely resembling that which prevails in the United States, and particularly in the State of New York, than that which obtains in England. Many customs and usages of English brokers are unknown in Canada; and many practices prevalent in our markets, which have come to us from the United States, would not be recognized on the London Stock Exchange. For this reason, and also because of the dearth of English Authority (*see* R. 70 of the London Stock Exchange, Stutfield 3rd ed., p. 45). I have drawn for authorities, perhaps more freely than is usual in our courts, upon American Sources."[38]

In *In re Stobie-Forlong-Mathews, Ltd.*, Dysart, J., observed that:

"In general there is a sharp line of cleavage – the British cases on stock transactions follow the general principles of the law of trust; the United States decisions follow new principles, based on fictions designed to work out rateable treatment for all creditors."[39]

In the Manitoba Court of Appeal, Fullerton, J.A., referred to the fact that it was impossible to find English authority for the reason that the customs and usages of stockbrokers there are very different from most in vogue in this country. In coming to his decision he discussed at length and followed a line of cases of the Supreme Court of the United States saying:

"I can see no reason why the above principles (as referred to in the Supreme Court of the United States cases) should not be applicable here."[40]

As it is desirable that there should be as much uniformity in the law as possible and, with the great similarity between our two systems, it would be natural to expect Canadian courts to continue to rely on U.S. cases.

The legal relationship between a broker and his customer is in part based on custom.[41] In *Solloway v. Blumberger* Mr. Justice Rinfret said:

"This was an agreement for dealing in stocks on the Vancouver Stock Exchange. In the absence of evidence to the contrary, the respondent, who gave authority to the appellants to do business for him on the Exchange, should be deemed to have contracted subject to the rules and

41 Richardson v. Shaw, 209 U.S. 365 (1908); Solloway v. Blumberger, [1933] S.C.R. 163.

> customs of the Exchange; and the nature of the powers and duties of the brokers would be determined by the usage and course of dealing in transactions of this character between broker and customer in Vancouver."[42]

A custom or rule of an exchange can alter a duty which the law would ordinarily impose. In general, any contractual relationship between a broker and a customer is ordinarily governed by well established usages in effect in the brokerage community or on the exchange where the transaction is completed. Thus, in *Forget v. Baxter*,[43] the customer took the position that a broker had no right to sell shares acquired for the customer when the customer failed to pay the balance of his account because the broker was a pledgee who could only sell by following the procedure prescribed by the Civil Code. Sir Henry Strong, who wrote the opinion of the Judicial Committee of the Privy Council, held that:

> "[W]hen one employs a broker to do business on a Stock Exchange he should, in the absence of anything to show the contrary, be taken to employ the broker on the terms of the stock exchange."[43a]

However, a custom of a stock exchange, even though well understood, cannot prevail against the express terms of the actual contract between broker and customer.[44] As a rule, brokers who are members of regular exchanges and who purchase securities for margin, collateral or partial payment require their customers to sign agreements which permit the broker to rehypothecate the securities for any purpose in miscellaneous loans for any amount.

Depending, however, on the circumstances of a customer's dealing with a broker,

> "In any given situation there may be customers who have deposited securities with the broker for safekeeping or on an order to sell; others who have given the broker cash with which to buy certain securities, paying for them in full, which order may or may not have been executed. Then too there are always margin customers who have deposited their own stocks as security for their trading accounts, and some for whom the broker has bought securities on margin, which he is carrying for them subject to their indebtedness to him on account of the purchase. Between these different groups who have claims

43 [1900] A.C. 467 (P.C.).

43a *Id.* at 478.

44 Cartwright & Creckmore Ltd. v. MacInnes, [1931] S.C.R. 425, [1931] 3 D.L.R. 693, *aff'g*, [1931] 1 W.W.R. 81, [1931] 1 D.L.R. 572 (B.C.C.A.); N. Elevator Co. v. Lake Huron Mfg. & Milling Co., 13 D.L.R. 349 (C.A. 1907).

on bankruptcy the legal relationship of the broker varies; so that he is at once a creditor, bailee, agent, trustee and pledgee. As to the safekeeping securities he is bailee, trustee; in executing orders for purchase or sale he acts as agent, while in advancing the credit with which to buy on margin he becomes a creditor who holds on pledge the securities bought. When money is put up by a customer to buy particular stocks, the broker has been held a trustee under the duty of carrying out his instructions.

"On the occurrence of [a] bankruptcy the state of the bankrupt's accounts theoretically may include any one or more of the following situations:

"1. The broker has in his possession the particular certificates deposited or bought in execution of the customer's order.

"2. The broker has specifically earmarked certificates for all customers; though not those originally deposited or bought for them.

"3. There are in the box stocks and bonds of the kind claimed, not earmarked, but sufficient to satisfy all demands.

"4. The broker has pledged to his bankers or correspondents (a) the securities of margin customers, which may or may not be enough alone to satisfy the pledgee's lien, or (b) fully paid for securities. The property pledged may have been rightfully pledged either by consent expressed or implied from the custom of the trade; wrongfully pledged or wrongfully pledged in part, as in the case of margin stocks pledged for more than the debt of the customer.

"5. There are bank accounts which in addition to the broker's own general funds include (a) purchase money for unexecuted orders, traceable into the particular fund, or (b) proceeds of converted securities traced therein."[45]

In an Ontario case, Ferguson, J.A., quoted *inter alia* from Jones on pledges and Dos Passos on stockbrokers:

"Jones on *Pledges*, 2nd ed., para 496: The broker acts in a threefold relation: first in purchasing the stock he is an agent; then, in advancing money for the purchase, he becomes a creditor; and, finally, in holding the stock to secure the advances made, he becomes a pledgee of it. It does not matter that the actual possession of the stock

45 Note, *The Bankrupt Stockbroker: Section 60(e) of the Chandler Act*, 39 COLUM. L. REV. 485 (1939).

> was never in the customer. The form of a delivery of the stock to the customer, and a redelivery by him to the broker, would have constituted a strict, formal pledge. But this delivery and redelivery would leave the parties in precisely the same situation they are in when, waiving this formality, the broker retains the certificates as security for the advance. The contract is in spirit and effect, if not technically and in form, a contract of pledge, and is governed by the law of pledges.
>
> "Dos Passos on *Stockbrokers*, 2nd ed., p. 205 and 804: We have already seen what the relation is where a stockbroker contracts to buy stocks for a client on a margin for speculation, and advances all or the greater portion of the purchase-money, and that, after such purchase, the broker immediately acquires a lien upon the stocks, for the balance of the purchase-money in excess of the margins received, which he has advanced to pay for the stocks, and becomes in relation thereto, a pledgee, with the full powers and responsibilities of that position...where the broker advances the money to pay for the stock which he is employed to purchase, he stands in the position of pledgee of the stock so purchased, and may hold the same until his advances are paid, as we have seen in another connection."

Ferguson, J.A., went on to say that:

> "A careful perusal and consideration of the reasons for judgment in *Ames v. Conmee*, 10 O.L.R. 159, affirmed 12 O.L.R. 435.which was reversed (*subnom. Conmee v. Securities Holding Co.*), 38 S.C.R. 601, and in *Clarke v. Baillie*, 19 O.L.R. 545, affirmed 20 O.L.R. 611, which was affirmed 45 S.C.R. 50, leads me to the conclusion that the law of this Province in respect of the relationships arising out of a transaction in stocks on margin, such as is stated by the learned Judge appealed from, is accurately and concisely stated in the quotations I have made from...Jones on *Pledges*, and Dos Passos on *Stockbrokers*...."[46]

The general rule is that if a broker is given money to buy a particular stock, he becomes a trustee as to both stock and money. If he sells a particular stock belonging to a client, he becomes a fiduciary as to such stock and its proceeds. But as to money deposited on "margin" to cover the fluctuation of the market, and

46 Re Stout and City of Toronto, 60 O.L.R. 313, [1927] 2 D.L.R. 1100 (C.A.). The quotation from L. JONES, LAW OF PLEDGES (2d ed. 1901) was also approved in Richardson v. Shaw, *supra* note 41; and *see* Re Bryant Isard & Co., 3 C.B.R. 49, 22 O.W.N. 537 (S.C. 1922), *aff'd*, 4 C.B.R. 537, 23 O.W.N. 113 (C.A. 1922).

where settlements are had by the balances struck, he is merely a debtor to his client.[47]

The general nature of margin transactions in stocks is well understood. The typical contract between a broker and margin customers has been described as follows:

"The broker undertakes and agrees:

"1. at once to buy for the customer the stocks indicated;

"2. to advance all the money required for the purchase beyond the ten percent furnished by the customer;

"3. to carry or hold such stocks for the benefit of the customer so long as the margin of ten percent[48] is kept good, or until notice is given by either party that the transaction must be closed. An appreciation in the value of the stocks is the gain of the customer and not of the broker;

"4. at all times to have in his name and under his control ready for delivery the shares purchased, or an equal amount of other shares of the same stock;

"5. to deliver such shares to the customer when required by him, upon the receipt of the advances and commissions accruing to the broker; or,

"6. to sell such shares, upon the order of the customer, upon payment of the like sums to him, and account to the customer for the proceeds of such sale.

"Under this contract the customer undertakes:

"1. to pay a margin of ten percent [49] on the current market value of the shares;

"2. to keep good such margin according to the fluctuations of the market;

"3. to take the shares so purchased on his order whenever required by the broker, and to pay the difference between the percentage advanced by him and the amount paid therefor by the broker.

"The position of the broker is twofold. Upon the order of the customer he purchases shares of stocks desired by him. This is a clear act of agency. To complete the purchase he advances from his own funds, for the benefit of the purchaser, ninety percent of the purchase money. Quite as clearly he does not in this act as an agcnt, but assumes a new position. He also holds or carries the stock for the benefit of the purchaser until a sale is made by the

47 J. Dos Passos, Law of Stockbrokers and Stock Exchanges 199, 200 (2d ed. 1905); McBurney v. Martin, 29 N.Y. Super. Ct. Rep. (6 Robt.) 502 (1866).

48 The usual margin today is 50%.

49 McBurney v. Martin, *supra* note 47.

order of the purchaser or upon his own action. In thus holding or carrying he stands also upon a different ground from that of a broker or agent whose office is simply to buy and sell. To advance money for the purchase and to hold and carry stocks is not the act of the broker as such. In so doing he enters upon a new duty, obtains other rights, and is subject to additional responsibilities....In my judgment the contract between the parties to this action was in spirit and effect, if not technically and in form, a contract of pledge."[50]

Chapter II
Failures of Broker-Dealer Firms

"[A]ny reasonable man ought to know that a broker's office is no place to leave money or securities for safekeeping."[51]

By reason of the similarity of the securities industry of Canada and the United States there is frequent reference in this chapter to the U.S. experience. Where a distinction can be made between the experience or the organization of the industry in the two countries this has been done. As the law discussed in this chapter is confined to common law and equitable principles unaltered by statute, there are many references to U.S. authorities. There are only a very few instances in which Canadian courts have not followed the general principles in this field of law as developed in the U.S. courts.

A. SOME CAUSES FOR FAILURES

The peculiar nature of the securities industry creates unusual hazards that can very quickly put a broker-dealer in a position where he is unable to meet his obligations as they become due. Large amounts of negotiable property are entrusted to broker-dealers. In addition, there are usually large cash accounts carried arising out of the proceeds of sales, dividends paid on shares held in street name and deposits for future purchases. Fraud and misappropriation by employees and officers are constant dangers to the investing public. There is also the danger of incompetent broker-dealers or the overly risky business practices of other

50 Markham v. Jaudon, 41 N.Y. 235, 239 (1869), *applied in* Richardson v. Shaw, 209 U.S. 365, 375 (1907).

broker-dealers either in the selection of customers or by speculative ventures.[52]

If public confidence is to be maintained in the securities market it is important to prevent, or at least minimize, the number of failures of broker-dealer firms and to protect the *bona fide* investor from loss. A necessary first step is to analyze previous failures and to ascertain their causes. As the number of Canadian failures has not been great, exclusively Canadian statistics are not sufficiently representative to permit a meaningful analysis. The U.S. experience has been much greater. But while the analysis of the failures of broker-dealers in the United States is helpful for Canadian purposes, it must be recognized that the U.S. and Canadian securities markets are not always comparable. A major and significant difference, for example, is their size.

The failures of securities dealers during the 1960s in the United States resulted to a considerable extent from the inability of brokers to meet their obligations during periods when the market was suffering unusual increases in volume accompanied by wide price fluctuations.

> "The large increases in volume impaired the operational fitness of many firms while radical price fluctuations impaired their ability to meet financial obligations. As a result they became unable to satisfy their daily commitments to customers and to other brokers for both cash and securities. Changes in market condition will specifically affect the ability of a broker to function, as follows:
>
> "(a) Volume fluctuations – a change in volume will require the broker to handle a larger number of orders, record larger bookkeeping and physical handling burdens. As the bookkeeping burdens increase, the time consumed in directing the movement of securities increases; and as the volume of deliveries increases the physical movement is slowed even more.
>
> "(b) Price fluctuations – a failure of the broker to satisfy his operational commitments places each uncompleted transaction at the risk of the market. In a stable market this is inconsequential, but in a fluctuating market this impairs the financial stability of the broker. As the operational capacity of the firm declines and the market level moves away from the unfulfilled commitments, the bro-

52 Note, *Protection of the Accounts of Stockbrokerage Customers*, 77 HARV. L. REV. 1290 (1964).

> ker is exposed to increasing financial losses on transactions which it is physically unable to consummate."[53]

The very nature of a securities firm and the changing conditions to which it is subject cause it to have many risk factors. In the United States, where securities firms are permitted to issue securities generally to the public, the most recent registration statements by securities firms have described these risk factors in detail. The registration statement, for example, filed by Bache & Co. Inc. contains the following statement:

> "As indicated in this prospectus, the company and the securities industry are subject to a number of inherent risks. Factors affecting the securities industry as a whole include such uncertainties as the state of world affairs and the national economy, governmental and other regulatory policies and trading volume and price levels in securities and commodities markets.
>
> "Volume of trading and price levels in the securities and commodities markets fluctuate widely. Any significant reduction in trading volume on the exchanges of which the company is a member or in the over-the-counter market could result in lower brokerage commission revenues. Significantly increased volume, on the other hand, could result in increased operational problems such as increased failures to deliver and receive, errors in servicing customer accounts and in processing transactions and increased clerical and supervisory salaries and related costs. Price fluctuations could result in losses in the company's securities inventories and investment accounts.
>
> "The securities industry is governed by regulatory bodies which are charged with protecting the interests of the company's customers in many instances rather than its shareholders. Bache's business is subject to immediate curtailment and even termination of its memberships on securities and commodities exchanges or its broker-dealer registration should be revoked or lesser sanctions imposed.
>
> "Recent and proposed changes in regulations governing the securities industry may have an adverse effect on the Company."

The United States *Study of Unsafe and Unsound Practices of*

53 Shields & Company, Re: Protection of Customers' Securities and Free Credit Balances in the Possession of Brokers, June 21, 1971, at 13, 14 (memorandum).

Brokers and Dealers criticized the following practices which it found to be unsound:

> "1. Inadequacy and impermanence of capital; in some cases the injudicious employment of capital that did not exist.
>
> "2. Over-emphasis on sales and trading activities at the expense of operational resources.
>
> "3. There was an absence of control of securities traffic to provide assurance of prompt delivery of securities and remittance of payments. The result was a virtual breakdown in the control over the possession, custody, location and delivery of securities, and in the payment of money obligations to customers, exposing customers to risk of loss. The industry, and to an extent the self-regulatory bodies themselves, had not implemented or planned broad-based solutions to the settlement process and the related flow of paper.
>
> "4. Inability of self-regulatory organizations to respond to the crisis with meaningful corrective measures. The absence of an effective early warning system caused belated action when the full impact of the crisis was finally ascertained.
>
> "5. Lack of experience of principal members of many, principally small, concerns, pointing up problems in entrance requirements to the industries."[54]

The paper handling breakdown which resulted in a breakdown of the operations systems and procedures for handling the paper work in some U.S. brokerage firms was a principal cause of several bankruptcies in the 1960s. The volume of securities transactions in the United States from 1965 to 1968 had multiplied dramatically. In 1964 the average daily volume of the New York Stock Exchange was 4.9 million shares. This had increased to 7.5 million shares by 1966 and to 10.1 million in 1967. On twenty-nine days in 1971 the number of shares traded on the New York Stock Exchange exceeded 20 million. In 1972 the average daily volume reached 16.5 million shares.[55]

This dramatic increase in the volume of shares traded made it almost impossible for most brokerage houses to keep up with the paperwork demands of their business. As a result of the paperwork deluge or back office crisis, papers including share certificates, confirmations and ledger accounts became misplaced or misfiled. In such circumstances, instructions could be more easily misread

54 *See* SEC, 38TH ANNUAL REPORT 4 (1972).

55 NYSE, 1973 FACT BOOK, 6, 72 (1974).

and wrong stock or wrong size deliveries made. Very great costs were incurred by firms as the result of large amounts of securities being delivered in, while deliveries out against payment were slowed down by the paperwork crisis.

In such situations, employees in a brokerage house that was having difficulties could also more easily misappropriate large amounts of monies and securities through alterations of records that could not be reconstructed or sufficiently documented to permit the firm to make a claim on its insurance. This happened to several firms in the United States and was the direct cause of their subsequent failure.[56]

There appears to have been no Canadian failures directly attributable to the paper handling breakdown. This may be because the volume of trading by Canadian houses did not compare with comparable U.S. houses and in some respects Canadian stock exchanges, brokers and transfer agents had better operation systems for the settlement of transactions.[57]

A substantial change in the prices of securities can seriously hurt a broker and in extreme cases cause bankruptcy when the securities

(1) are held in inventory;
(2) are ordered by a customer who cannot or refuses to pay for them on delivery; or
(3) are held by a customer on margin.[58]

The bankruptcy of a broker-dealer through the bad investment of the broker's own funds, while possible, is not common:

> "Generally, brokers have internal rules for their traders regarding concentration of firm positions. They are looking for profitable trades – any decline in value of inventory is like a loss of earnings. Brokers are very sensitive to such losses. Another significant feature of inventory accounts is that open purchases and sales for inventory accounts become clear liabilities of the firm as soon as the position is taken. They are obvious both to internal financial control personnel and to regulatory body examiners. In Canada, exchange and IDA margin requirements are applied to house positions without relief. These requirements form a more than adequate cushion against possi-

57 H. Cleland & D. Gardner, *supra* note 34, at 7, 8.

58 I am obliged to Messrs. Cleland and Gardner for this analysis of the changes in security prices as a cause of bankruptcy; *see id.* at 4.

> ble losses – except perhaps in investments in short-term debt instruments where margin rates are very low."[59]

The margin customer has traditionally been considered as posing a greater danger to a broker than a cash customer. This usually is not the case, however, as the broker has more control over the margin account than he has over the cash account customer.

A "cash account" is settled, as a rule, in full on the value date, which is three business days after the trade. Exchange rules require it to be settled in ten days, very often "delivering against payment" (DAP), frequently to a bank where settlement will be made as required. While in theory the broker has control over a cash account, in that credit managers will sell out suspicious accounts and stocks on the third day after trade where payment is not made, it is difficult, particularly if the broker is not in a position to make delivery.[60]

There are two kinds of "no-pay" cash accounts that may hurt a broker. The first is the account of the usually honest customer who has overreached his resources and is not able to pay for a stock that did not perform as expected.[61] The second is the account of the dishonest customer who has set up the broker for a no-pay situation.

In the usual case of the no-pay account where the customer is unable to pay by reason of having overreached his resources, the losses of the broker who must take over the account are not so large as to cause the broker to fail. As a rule the losses can be absorbed out of the capital of the firm which in the case of delinquent accounts is continually being put aside to meet margin and capital requirements.

> "Probably, the most dangerous position for a broker's solvency is created by a deceptively arranged cash account – DAP to a bank. Accounts which are engineered to go bad usually start by the completion of several legitimate trades in legitimate stocks. Gradually, the account gets involved in a 'speculative' stock, several deliveries are completed to the bank and paid for. Then one day

59 *Id.* at 5.

60 H. Cleland & D. Gardner, *id.* point out that:
"It should be made clear that an under-margined margin account and a cash account are very similar so far as the broker is concerned for capital requirement purposes - the obligations rest with the customer but the broker is *responsible* for securing any shortages. In effect, exchange rules require brokers to set aside sufficient capital to take over under-margined and upaid-for cash accounts as if they were inventory accounts after they have been negligent for an unreasonable time (value date for under-margined accounts; 3, 8 or 21 days in the case of cash accounts depending on circumstances)."

61 *Id.* at 6.

> when there is a big delivery to be made the bank has no instructions, the client cannot be found and suddenly there is no bid: the broker is 'hung'. This is something like what happened in the *Malone Lynch* case."[62]

A broker may suffer a loss that will affect his capital position arising out of a holding in a customer's margin account. But for this to occur three things must happen.

(1) In the first place, the value of the security must fall by an amount which will entirely wipe out the customer's equity. In practice, having regard to the rules of the exchange, this means a fall of more than 50% for an equity.
(2) In addition, the fall in price must be such as to wipe out the equity value of all the other securities held by that customer in his account.
(3) The customer must also have refused to honour his obligation to the broker to repay the loan.[63]

Above all else, before a broker can suffer a loss from a holding in a customer's margin account there must be a degree of negligence on the part of the broker in not selling out the account before, or as the stock fell, to have permitted a substantial part of a loan against a single security, and to have done business or continued to do business with a person who does not or is not able to honour his obligation.

> "In view of the fact that brokers are required to have substantial net liquid assets in addition to exchange seats and other fixed assets which are not counted in capital requirements and that no broker is obligated to take an order for a customer, the confluence of circumstances necessary to bring about a bankruptcy through margin account trading is rare indeed."[64]

Any bad account whether arising out of a cash or margin account ends up the same as inventory positions – that is, to be supported by the broker's capital. In both cases the loss for the broker is created by the very large change in the price of the security. The broker is, however, most vulnerable not in a margin account but in a cash account that provides for delivery upon payment.

As a rule, failures result not so much from trading losses as from manipulation of assets.

Whatever a dishonest customer can do with a cash account can be done by the principals of the firm. Indeed, they are in a better

62 *Id.* at 6, 7, *citing* Re Malone Lynch Securities Ltd., 17 C.B.R. (N.S.) 105 (S.C. Ont. 1972).

63 H. Cleland & D. Gardner, *supra* note 34, at 4.

64 *Id.*

position to defraud a firm, as the internal control decisions are often the responsibility of the owners.

The 1972 *Securities Industry Study Report* said:

> "[U]ntil such time as the stock certificate is eliminated as evidence of ownership, theft will continue to present a serious operational and financial problem to the securities industry. Testimony has indicated that at least one brokerage firm ultimately failed principally as a result of financial losses sustained from a theft of $1.8 million worth of securities. One witness testified that an estimated $1.2 billion in negotiable stolen securities are a source of extreme concern to the securities industry. A more recent estimate places the value of stolen and missing securities at a figure of as high as $10 billion."[65]

One final cause of brokerage bankruptcies that might be mentioned is the domino effect caused by the sudden failure of a broker who has been acting as an agent for other broker-dealers. It could also happen where customers or inventory accounts were trading commercial paper or bonds and the issuer failed to honour the obligation on maturity.[66]

In the United States, The Securities Investor Protection Corporation, which will be discussed in detail later in this paper, attempted to ascertain the causes of failures of sixty-four securities firms liquidated by it and found that:

> "Inadequate, inaccurate or non-existent books and records must be mentioned as one of the most significant conditions encountered in almost all of these cases. In a number of instances records have been falsified and customers' accounts manipulated by the principals. This failure of record keeping has led in some cases to a loss of control of the business....
>
> "In many cases, the operating management did not have the qualifications or experience needed to operate a general securities business. Principals did not possess the

65 Securities Industry Study Report, *supra* note 22, at 75. The figure of $10 billion for stolen or missing securities must be higher. The National Crime Information Center computer operated by the FBI already lists $11 billion of stolen, counterfeit or missing securities. Since it is certain that some lost or stolen securities are not listed on the computer, it is clear that the true figure must be higher. A witness before the U.S. Senate Permanent Subcommittee on Investigations testifed that the dollar value of lost or stolen government and corporate securities could be as high as $50 billion but other witnesses doubted whether the figure would be anywhere near that high.

66 H. Cleland & D. Gardner, *supra* note 34, at 7. Section 16.15 of the Toronto Stock Exchange By-Laws, 3 CCH Can. Sec. L. Rep. ¶¶89-635-89-645c, provides that the margin may be as little as 1/4% on prime commercial paper of less than 16 days maturity.

knowledge of complicated trading procedures or basic concepts of good management and control over securities operations. Many were ignorant of brokerage accounting and regulatory rules and regulations.

"Lack of adequate capital has been mentioned by the trustees as a major factor in firm failures....This condition may result from a number of reasons ranging from too small a capital base to such matters as temporary illiquidity, over-commitment in a particular security or venture, inability to absorb an adverse market movement, too rapid expansion or improper controls. There was over reliance on subordinated capital in a number of instances. In others, the subordination was improperly executed or fraudulently induced....

"Of the firms in liquidation, 49 had been in business five years or less and 19 under two years. Expressed on a percentage basis 77% of the firms in liquidation were in business five years or less and 30% two years or less.

"Mismanagement likewise has been stated frequently as a major factor. This may stem from a lack of knowledge and experience in the business, emphasis on sales to the exclusion of other aspects of the business, ineptitude, failure of records or controls or other matters such as, for example, conduct reflecting on the integrity of the principals or their key employees.

"The matter of fraud and manipulation which has surfaced in a number of cases must be recognized as a major factor in these failures. Customer securities and funds were fraudulently used in the business including improper use of discretionary accounts. There were several market makers and underwriters of low grade, highly speculative issues where prices were inflated and customer accounts manipulated to maintain these prices. Heavy concentrations in a few speculative issues and imprudent trading activities contributed to other failures....

"Reasons for failures of sixty-four firms are:

Reasons	*Number of firms*
Poor books and records	44
Misconduct	26
High operating costs – poor controls	21
Mismanagement	28
Lack of knowledge of the securities business	18
Adverse market conditions	10
Dealing in highly speculative issues	29"[67]

Any review or examination of the failure of broker-dealer firms should not be concluded without observing that there are certain events or conditions which, contrary to wide belief, do not cause the bankruptcies of securities dealers in Canada.

In the first place, while a principal of a securities firm may defraud the firm, the theft, forgery or defalcation by an employee of a firm will not usually result in bankruptcy because brokers are required to carry insurance against this risk. This, of course, assumes that the alterations of records can be sufficiently reconstructed and losses documented to permit the firm to make a claim, which is not always the case.

Secondly, contrary to the experience of securities firms in the United States and the bankruptcy experience of Canadian marketing or manufacturing businesses, no Canadian securities firm has failed by reason of non-expansion or from loss of control of operating expenses.

Finally, no Canadian firm has collapsed only because of a demand for payment by a trade creditor or bank which has been "going along with management" in trying to get the firm back on a profitable basis. This is almost impossible by reason of the margin and capital requirements.[68]

B. WHAT CAN HAPPEN ON THE VERGE OF THE FAILURE OF A BROKER-DEALER FIRM

It is not unusual in a bankruptcy for very large losses to be incurred during the last few weeks prior to the bankruptcy. As credit is cut off from the debtor or greatly reduced, the assets that might otherwise be available to the creditors are consumed by the debtor in a last desperate effort to stave off bankruptcy. As bankruptcy appears to be all but inevitable, very often there is a strong temptation on the part of debtors to hide assets. This activity could take the form of fraudulent and surreptitious transfer of assets to persons not at arm's length. It could also amount to out-and-out theft. The temptation to convert assets to one's own use is often felt by the employees of the debtor who see the business failing before their eyes, accompanied by the fact that during the last few weeks there is often not the same supervision and control by management over the operations of the business.

The securities industry is a complex operation that is in deli-

---

67 SECURITIES INVESTOR PROTECTION CORPORATION (SIPC), 2ND ANNUAL REPORT 24, 25 (1972).

68 H. Cleland & D. Gardner, *supra* note 34, at 3.

cate balance. When adversity strikes, whether it affects the entire industry or any individual unit of it, extremely difficult legal problems are encountered. The complexity of these problems is such that normal legal remedies are difficult and expensive to enforce. Losses can be very great and safeguards designed to protect customers are often ineffective or insufficient.

The nature of the securities industry, which places large amounts of negotiable securities in the hands of securities dealers, makes fraud and manipulation easier. The complexity of the records resulting from the normal volume of individual transactions often makes it difficult to detect fraud or to identify the persons responsible for it.

Both employees and principals of firms in a shaky position can be expected to make a special effort to register and deliver out securities to customers. Families and friends may come first. In addition, employees and principals may move their accounts to other firms to escape the expected collapse.

As the collapse becomes imminent and there is no longer sufficient time to deliver securities to customers, there is a temptation to "straighten out" the records of the firm in favour of principals, employees and favoured customers so that their positions are assured and it is easier for them to trace securities. Securities can be segregated and other securities identified as belonging to particular customers. This can be done quickly and without witnesses in the last few hours before a receiver or bankruptcy trustee takes possession of the firm. In theory, such registrations and deliveries might be attacked as preferential or as fraudulent conveyances, but it is unlikely that they would be discovered as it would be all but impossible to reconstruct the books and records and identify what in fact had been done.

> "It is well to remember that large and highly portable values are involved. These values are controlled by easily alterable records. A bankruptcy is a situation of desperation for those who see their hard-earned assets in jeopardy. It would be naïve to expect associates of a brokerage house to fold their hands when they are the people in a position to have a substantial impact on their own personal outcome. The point we are stressing is that a brokerage bankruptcy arising from a back office paper-processing breakdown is not like bankruptcies in other types of business and the protections given to creditors in other bankruptcies through tracing and preference control are not likely to be effective in brokerage practice."[69]

69 *Id.* at 8.

C. THE OBLIGATIONS OF A BROKER TO HIS CUSTOMERS UPON THE FAILURE OF THE BROKER

Before considering the remedies available to a customer of a defaulting broker-dealer it is useful to first consider the obligations of the broker-dealer to his customers at the point of time of his failure.

> "He should have on hand, or in pledge with the banks, enough securities of the kind ordered by his margin customers to meet their contracts with him. He should likewise have on hand, set apart from his own assets and free from lien, all monies furnished him with which to buy securities outright, all securities so acquired for customers who have paid in full and all securities which his customers have left with him, for safekeeping or otherwise, upon which he has made no advances."[70]

The problem is that for many reasons the broker-dealer very often will have neither the cash nor the securities on hand that he should have. In this event, the customer will usually have a cause of action against the broker-dealer.

Where a customer has paid the broker-dealer in full for the purchase of securities and the securities are not on hand the customer may maintain an action for money had and received to his use.[71] The customer, in addition, may file a proof of claim in the bankruptcy of the broker-dealer for the money paid to him and where the customer is already indebted to the broker-dealer he may offset his indebtedness to the estate of the broker-dealer against the conversion of his money.[72]

Where a broker-dealer, who in fact has purchased securities ordered and paid for, subsequently sells the securities without the authority of the customer, the customer has a valid claim for the conversion of the securities against the estate of the broker-

70 Glenn, *supra* note 14, at 425.

71 8 HALSBURY'S LAWS OF ENGLAND (3d) ¶409 states:

"The precise nature of the action of money had and received has long been a matter of discussion. One approach is to regard the defendant as liable because he has been unjustly benefited. Another is to regard him as liable on an implied promise to pay. A third school of thought considers that the matter is still open and that the true nature of the action has yet to be established. Finally, it has been suggested that although the basis of the action is an implied promise to repay, such a promise will be implied only where an element of unjust enrichment exists."

See also Royal Securities Corp. Ltd. v. Montreal Trust Co., [1967] 1 O.R. 137 (H.C.) (*per* Gale C.J.H.C.).

72 Glenn, *supra* note 14, at 427.

dealer. The customer may also file a proof of claim for the value of the converted securities.[73]

In the cases above mentioned, all that the customer is required to prove to make a *prima facie* case of nonapplication of his money is to show that, at the time of the failure of the broker-dealer, the securities he should have purchased on the order of the customer were not on hand either in the office of the broker-dealer or in any of the banks with which he did business. In the case of the margin customer, a proof of claim may be filed for the difference between the value of the securities the broker should have on hand as of the date of the failure less the amount that would as of that date be due to the broker-dealer by the customer.[74]

In a bad insolvency, a customer would receive only a few cents on the dollar in respect of any claim proved in the bankruptcy. Consequently, customers are always more interested in attempting to trace their money or securities. If, however, they cannot trace their securities they would be relegated to their rights as general creditors;[75] only then would they file a claim.

D. TRACING

Prior to the case of *Re Hallett's Estate*,[76] where a trustee failed to observe the terms of the trust in respect to specific property, a court of equity would either appoint a new trustee or give the property to the *cestui*. If, however, the trust property consisted of money or the trustee by his own wrongdoing had converted it into money, then the court took the position that money had no earmark and was incapable of identification. Accordingly, if a trustee, before his bankruptcy, had converted trust property into money and mingled the proceeds with his own or with the money of others it was difficult for an *cestui* to successfully assert a claim against the fund.[77] At common law, tracing was treated in a strictly materialistic way.

> "It (the Common Law) could only appreciate what might almost be called the 'physical' identity of one thing with another. It could treat a person's money as identifiable so long as it had not become mixed with other money. It could treat as identifiable with the money other kinds of property acquired by means of it, provided that there was

77 Glenn, *supra* note 14, at 429.

> no admixture of other money. It is noticeable that in this latter case the common law did not base itself on any known theory of tracing such as that adopted in equity. It proceeded on the basis that the unauthorized act of purchasing was one capable of ratification by the owner of the money."[78]

In the case of *Re Hallett's Estate* Sir George Jessel, M.R., reviewed all the authorities in respect of tracing trust property mixed with other property. His Lordship said:

> "Supposing the trust money was 1,000 sovereigns, and the trustee put them into a bag, and by mistake, or accident, or otherwise, dropped a sovereign of his own into the bag[79].... I do not like to call it a charge of 1,000 sovereigns on the 1,001 sovereigns, but that is the effect of it. I have no doubt of it. It would make no difference if, instead of one sovereign, it was another 1,000 sovereigns; but if instead of putting it into his bag, or after putting it into his bag, he carried the bag to his bankers, what then? According to law, the bankers are his debtors for the total amount; but if you lend the trust money to a third person, you can follow it. If in the case supposed the trustee had lent the £1,000 to a man without security, you could follow the debt, and take it from the debtor.... If, instead of lending the whole amount in one sum simply, he had added a sovereign, or had added £500 of his own to the £1,000, the only difference is this, that instead of taking the bond...the *cestuis que trust* would have a charge for the amount of the trust money on the bond."[79a]

Since *In Re Hallett's Estate* the law has been:

> "If a trustee mixes trust property with his own private property, whether in his banking account or elsewhere, then, if there is ultimately specific property whether in the shape of a credit balance in that banking account or otherwise, to which the trust money can be traced, the *cestui qui trust* has, as against the trustee and his un-

79 In Diplock v. Wintle, [1948] Ch. at 521, [1948] 2 All E.R. at 347, Lord Greene, M.R., said it was "tempting to use the illustration of sovereigns in a bag" but pointed out that "such an illustration has little or no likeness to possible facts in present-day conditions".

79a Re Hallett's Estate, *supra* note 76, at 711.

> secured creditors or trustee in bankruptcy, a charge on that specific property for the trust money."[80]

Or, as the Supreme Court of the United States explained *In Re Hallett's Estate*:

> "If money held by a person in a fiduciary character though not as trustee has been paid by him to his account at his bankers, the person for whom he held the money can follow it and has a charge on the balance in the bankers' hands, although it was mixed with his own monies...."[81]

In Re Hallett's Estate also held, overruling the existing law, that where a trustee wrongfully or otherwise comingles his own money with monies of his *cestui qui trust* in one account and then makes withdrawals from the mass so constituted, the trustee is presumed to make payments for his own purposes out of his own money and not out of the trust money.

In *Sinclair v. Brougham*[82] Lord Chancellor Haldane called attention to the fact that at common law the right to follow money was not confined to cases where there was a fiduciary relationship, although the existence of that relationship was the ground upon which the right to follow was often based. The question at common law was, had the property passed, and if it had not and no relation of debtor and creditor had intervened, the money could be followed and recovered notwithstanding its normal character as currency, provided it could be earmarked or traced into assets acquired with it. The Lord Chancellor also pointed out that equity exercising a concurrent jurisdiction based upon trust gave a further remedy where the money could not be specifically identified. The Lord Chancellor said:

> "But while the common law gave the remedy I have stated, it gave no remedy when the money had been paid by the wrongdoer into his account with his banker, who simply owed him a debt, so that no money was or could be, in the contemplation of a court of law, earmarked. Here equity, which had so far exercised a concurrent jurisdiction based upon trust, gave a further remedy. The Court of Chancery could and would declare, even as against the general creditors of the wrongdoer, that there was what it called a charge on the banker's debt to the person whose money had been paid into the latter's bank account in favour of the person whose money it really was. And, as

80 33 HALSBURY'S LAWS OF ENGLAND (3d), at 330, 331.

81 National Bank v. Insurance Co., 104 U.S. 54, 68 (1881).

82 [1914] A.C. 398 (H.L.).

Jessel, M.R., pointed out in *Hallett's Case*, 13 Ch. D 696, 49 L.J. Ch. 415, this equity was not confined to cases of trust in the strict sense, but applied at all events to every case where there was a fiduciary relationship. It was, as I think, merely an additional right, which could be enforced by the Court of Chancery in the exercise of its auxiliary jurisdiction, wherever money was held to belong in equity to the plaintiff. If so, subject to certain qualifications which I shall presently make, I see no reason why the remedy explained by Jessel, M.R., in *Hallett's Case, supra*, of declaring a charge on the investment in a debt due from bankers on balance, or on any mass of money or securities with which the plaintiff's money had been mixed, should not apply in the case of a transaction that is *ultra vires*. The property was never converted into a debt, in equity at all events, and there has been throughout a resulting trust, not of an active character, but sufficient, in my opinion, to bring the transaction within the general principle."[83]

It is a basic concept in the law of bankruptcy that, in general, a trustee has no better title to property coming into his hands or disposed of by the bankrupt before his bankruptcy than the bankrupt. This concept is particularly important in the bankruptcy of broker-dealers.[84] Accordingly, while

"A broker may not be strictly a pledgee, as understood at common law, he is essentially a pledgee and not the owner of the stock, and turning it over upon demand to the customer does not create the relation of a preferred creditor within the meaning of the bankrupt law."[85]

So also where money is handed to a broker for the purpose of purchasing securities and he invests it in unauthorized securities and then becomes bankrupt, the securities purchased belong to the principal and not to the broker's trustee in bankruptcy, for a broker is a constructive trustee for his principal. Lord Ellenborough said:

"The property of a principal entrusted by him to his factor for any special purpose belongs to the principal, notwithstanding any change which that property may

Tatman, 198 U.S. 91 (1900); *In re* Nakashidze, [1948] O.R. 254, 29 C.B.R. 35, [1948] 2 D.L.R. 522 (S.C.); the trustee takes the property of the bankrupt merely as a successor in interest of the bankrupt not as an innocent purchaser for value without notice but as the debtor had it at the time of the bankruptcy subject to all valid claims, liens and equities.

85 Richardson v. Shaw, 209 U.S. 365, 380 (1907).

> have undergone in point of form, so long as such property is capable of being identified, and distinguished from all other property."[86]

Tracing is further discussed in chapter II. G, "Priorities in Securities".

E. SECURITIES ARE FUNGIBLE

Securities are treated as fungible goods. This is the "grain in the bin" concept. James A. McLaughlin in testifying before the House Committee on the Judiciary in respect to section 60(e) of the Bankruptcy Act of the United States said:

> "Under the prevailing rule, stocks are treated as fungible goods, having no earmark which distinguishes one share from another, but is [sic] like a grain of uniform quality in an elevator, one bushel being of the same kind and value as another."[87]

In *Caswell v. Putnam*[88] which was quoted with approval in *Richardson v. Shaw*[89] the court said:

> "One share of stock is not different in kind or value from every other share of the same issue and company. They are unlike distinct articles of personal property which differ in kind and value, such as a horse, wagon or harness. The stock has no earmark which distinguishes one share from another, so as to give it any additional value or importance; like grain of a uniform quality, one bushel is of the same kind and value as another."[90]

The court in *Richardson v. Shaw* in respect of the same matter went on to say that:

> "A certificate of the same number of shares, although printed upon different paper and bearing a different number, represents precisely the same kind and value of property as does another certificate for a like number of shares of stock in the same corporation. It is a misconception of the nature of the certificate to say that a return of a different certificate or the right to substitute one cer-

86 Taylor v. Plumer, 3 M. & S. 562, 573, 105 E.R. 721, 725 (K.B.); *see also Ex parte* Cooke, 4 ch. D. 123 (C.A. 1876) which held that apart from the question of trust, the position of a broker is not that of a banker, but of an agent into whose hands money is put to be applied in a particular way and that money paid can therefore be followed by the customer.

90 120 N.Y. 153, 157 (1890).

> tificate for another is a material change in the property right held by the broker for the customer."[91]

Mr. Justice Holmes in *Richardson v. Shaw* stated:

> "[I]t is possible to say that after a purchase of stock is announced to a customer he becomes an equitable tenant in common of all the stock of that kind in the broker's hands, that the broker's powers of disposition, extensive as they are, are subject to the duty to keep stock enough on hand to satisfy his customer's claims and that the nature of the stock identifies the fund as fully as a grain elevator identifies the grain for which receipts are out."[92]

Thus, as in other cases of tenancy in common of fungible goods, or goods treated as fungible where the mass is not sufficient to satisfy all who are entitled to share in it, each owner can only have a proportionate interest in the mass.[93]

An alternative theory for the proposition that securities are fungible is the so-called "presumption" theory. This was described by the Supreme Court of the United States in *Gorman v. Littlefield*:

> "The ground upon which the Circuit Court of Appeals decided the case seems to have been that the certificates were not sufficiently identified, but, as we have said, they were on hand to an amount claimed by the appellant and more, and were not claimed by any other customer. We think that there should be no presumption that the stock was stolen or embezzled with intent to deprive the rightful owner of it, and when the unclaimed shares are found in the possession of the bankrupt it is only fair to accept the general presumption in favor of fair dealing and to decide, in the absence of countervailing proof, that the broker out of his funds has supplied the deficiency for the benefit of his customer, which he had a perfect right to do."[94]

The presumption theory has been criticized in that it is generally not supported by the facts. Mr. Justice Pitney of the Supreme Court of the United States said in a dissenting opinion:

> "It is one thing to infer an intent to make restitution to a customer when the acts have been done that are necessary to effect restitution; it is an entirely different mat-

ter to infer an intent to make restitution when no restitution has in fact been made. The presumption of an intent to restore fractional interests in this case must rest on the merest fiction; and such a fiction ought not to be indulged in cases of this character, where it will inevitably result in creating a series of arbitrary preferences, contrary to the equity of the Bankruptcy Act."[95]

F. THE NEW YORK AND MASSACHUSETTS RULES

The 1938 amendments to the Bankruptcy Act of the United States introduced provisions specifically dealing with proceedings involving stockbrokers and the rights of customers of a bankrupt broker. The amendments were designed to bring uniformity to the confusing system of administration of bankrupt estates under different and often conflicting state rules. Under the prior law customers were ranked into a number of classes depending on the circumstances of their dealings with the bankrupt. Two rules evolved. The majority view was the so-called "New York" rule while the minority view was known as the "Massachusetts" rule.[96]

The New York rule, which is the rule recognized by Canadian courts, treated the broker-dealer as the agent for his customers in purchasing and selling securities. The customer was regarded as the owner of the shares if he could identify them irrespective of whether the shares had been delivered for safekeeping and segregated, or delivered to the broker-dealer as margin or purchased by the broker-dealer for the customer's account and held in pledge.[97]

A broker under the New York rule was permitted to pledge in a common loan the stock purchased by him on margin in order to raise the money for the purchase of them. Thus the stock purchased for customer A and the securities purchased for customers B, C and D could be pledged in the common loan. The broker thereby was given the fullest use of all such securities in order to raise the purchase money on them, subject, however, to the final rule that the broker would be liable for conversion if he was unable to tender to his customer, when required, not necessarily the identical securities originally purchased, but similar shares of the same stock.[98]

The customer had to trace his securities to reclaim them. That is, he had to find them among those in the possession of the

broker-dealer or of the person to whom the broker-dealer had rehypothecated them. It was not necessary, however, to specifically identify particular share certificates or specific securities if share certificates or securities of the same kind were found in the possession of the broker-dealer or his pledgee. A margin customer could claim his securities which were subject to a pledge for the unpaid balance by doing no more than showing that he was entitled to shares of the same issue as those found in the bankrupt's custody. Securities were treated as fungible.[99] If, however, the broker-dealer did not have the same or similar securities, the customer's claim failed and he too became a general creditor.

The minority Massachusetts rule following the English law held that the relation between the broker-dealer and his customer as to the security purchased is that of creditor and debtor. It regarded the broker-dealer in margin transactions as the owner of the security purchased on margin and his title to the security in general passed to the trustee. The broker was regarded as an independent middleman and the view of a margin transaction was a partially performed contract, under which upon payment of the balance of the price the broker-dealer would deliver the shares. In essence it was regarded as a conditional sale. In bankruptcy the margin customer was treated as a creditor with a contract claim.[100].

The Massachusetts rule in part is based on the law relating to "contango" transactions which are common on the London Stock Exchange. In its more usual sense "contango" means continuation or carrying-over, which is in form and in law a sale and repurchase, or a purchase and resale, as the case may be. It is a new contract and not merely getting further time for the performance of the old contract. [101]

> "When a client directs a broker to buy stock for which the client is not himself finding the money to pay at the time, the money is provided by the broker, and he borrows the money for the purpose. This is done sometimes, no doubt, by a pure and simple loan; but in a very large majority of cases...the thing is done by the broker finding the money on 'contango', and then what happens is this: he is treated, not as the mortgagee or pledgee of the shares for the money which he advances, but he becomes by contract the purchaser of the shares, out-and-out, and they

> become his own property. The shares are not yet transferred to him – he does not acquire any legal interest in them; but, as between the client on whose account he has bought them on the one hand, and himself on the other when he finds the money on 'contango' he becomes the absolute owner of the property, subject, however, to a contract made at the same time, or part of the same contract, that he is to resell to the client a like amount, not the same identical shares, but a like amount of similar shares, usually on the next account day, although a later day may be fixed by arrangement, at a price larger than that for which he gave his client credit on the first occasion; because the enhanced price is to cover interest upon the money in the meantime."[102]

The results under both the New York and Massachusetts rules, but particularly the New York rule, were widely criticized. The rules were regarded as "complicated, impracticable and usually inequitable"[102a] and turned upon "refinements utterly unintelligible to the businessman" and involved "elements of chance more appropriate to a beano party than to the administration of justice".[103]

G. PRIORITIES IN SECURITIES

In 1938, the Chandler Act[104] added section 60(e) to the United States Bankruptcy Act which provided for a statutory scheme of distribution of the estate of a bankrupt stockbroker. Prior to that time distribution was governed by federal equity jurisprudence. Priorities depended upon the status of the customers' property under state law. Four classes of claimants to property in the possession of stockbrokers were recognized prior to the Chandler Act. These were:

> "1. Those who could reclaim specific assets in the possession of the stockbroker;
>
> "2. Claimants who were customers and who had claims to securities that survived a wrongful hypothecation and liquidation of the broker's pledge. These claimants were known as class A claimants;
>
> "3. Claimants who were customers and who had claims to securities that survived an authorized hypothecation and

liquidation of the broker's pledge. These were known as class B claimants;
"4. General creditors."[105]

1. *Canadian Position*

The pre-Chandler Act order of priority in the United States is the order of priority which currently prevails in Canada. The Canadian courts, however, have hesitated in making a distinction between cases of wrongful and lawful pledging. With this exception the pre-Chandler Act and the present Canadian order of priority on distribution is as follows:

a. *First Priority*

The first priority in distribution is the class of claimants who can trace and identify specific assets owned by them in the possession of the broker-dealer, as for example certificates that were "in the box" at the time of his failure and which can be identified by their number. However, effect is given to this class of claims only if they are paid up or on the payment of the balance due.[106] "If the owner can identify his security and pay up his indebtedness to the broker, he is entitled to the return of his security; it is his property."[107]

In certain cases, cash may be reclaimed - as, for example, where it has been deposited for purchase or where it arises from sales and the funds can be traced into a specific account.[108]

Where securities cannot be traced by certificate number but are found in quantities sufficient to satisfy the demands of all claimants, each claimant is entitled to recover in full if the securities are found "in the box".[109]

When no claims are made to the specific securities held by the trustee and the quantities are insufficient to satisfy the demands of all the claimants in full, all of the claimants long of that particu-

(trustee handed over the returned securities identified by customers and there was enough left to satisfy the claims of one who could not identify any).

lar security hold as tenants in common in respect of the mass of certificates of that security.[110]

If a customer finds securities which he can identify in the possession of the pledgee of the broker, they can be reclaimed in full, subject to the "burden of the loan" and also to rights of a superior class, if such class existed.[111]

The doctrine of "sharing the burden of the loan" or the doctrine of "contribution" has been stated thus: "where securities belonging to different customers are pledged by the broker, and some are sold by the pledgee in order to satisfy his claim, whereas others which are not needed for that purpose are not sold, the owners of the securities which are not sold must contribute *pro rata* to the loss of those whose securities have been sold."[112] The rule does not rest on contract, or on any principle of joint action or original relationship between the parties whose securities will be pledged but on principles of fundamental justice and equity and the maxim that "equality is equity".

"Sharing the burden of the loan" only applies as a rule when the pledgee sells the securities after bankruptcy. If the liquidation is before bankruptcy and the proceeds of the securities have in any way been applied to the use of the insolvent broker, the customer is not entitled to contribution from others whose securities remain.

> "The reason for this is that he has been unable to trace his securities and therefore no matter how great a wrong has been committed against him, cannot reclaim. That is one of the hazards assumed by a customer in entrusting securities to his broker."[113]

However, the fact that securities are liquidated prior to bankruptcy does not affect the operation of the doctrine if the customer can identify the proceeds of his securities as part of the fund held by the pledgee.

Where a broker has pledged securities belonging both to him and to customers, the securities belonging to the broker must be

113 C. Meyer, *supra* note 11, at 634.

applied to the pledge before the securities of the customer can be called upon to contribute.[114]

b. *Second Priority*

The second order of priority which was recognized by the U.S. courts prior to the Chandler Act in 1938 is the class of claimants whose securities were wrongfully hypothecated by the broker. Such customers take before and, if necessary, to the exclusion of those customers whose shares were used lawfully. The underlying principle for this priority is that when a customer gives a broker authority to do what he has done, he stands in an inferior position to a customer who did not voluntarily subject himself to the same risk.[115] This priority has been explained on the basis that:

> "[S]uperior rights should be granted to claimants whose securities have been wrongfully hypothecated by the bankrupts over those whose securities have been rightfully pledged....
>
> "When a broker pledges as collateral to his loan at a bank securities left with him for safe-keeping or for sale, he is a wrongdoer from the outset, and while the bank may have the right to hold the securities, the claim of the owner, upon the satisfaction of the bank's demand, is of the highest equity. On the other hand, when a broker, acting under the authority conferred upon him by a customer, hypothecates his securities, the latter may, upon the adjustment of his account with the broker and the termination of the bank's demand, reclaim his securities; but, as he has no ground for complaining that his securities were pledged, his rights are clearly inferior to the owner whose securities were wrongfully hypothecated."[116]

The courts in Canada have not distinguished between different degrees of wrongdoing in the wrongful pledge of securities of several customers. This, no doubt, arises from the fact that equities cannot always be measured by a hard and fast rule.[117]

c. *Third Priority*

The third priority in distribution is the class of claimants who

116 *In re* Ennis, 187 F. 720, 722 (2d Cir. 1911).

117 *In re* Bryant, Isard & Co., 7 C.B.R. 44, 49 (Ont. C.A. 1925).

expressly or impliedly gave the broker authority to rehypothecate their securities but for the amount of their indebtedness only, and whose securities were rehypothecated by the broker for a greater amount. They participate only after the claims of creditors with a superior position, such as those who did not voluntarily subject themselves to the same risk, have been satisfied in full. Their rights are those of owners whatever may be their obligations to the trustee or to other owners.[118]

d. *Fourth Priority*

The fourth and last priority in distribution are the general creditors who in the failure of a broker-dealer are usually customers whose securities do not happen to survive the wreck. It can be argued that the fund available to distribute among the general creditors may be increased by unclaimed customers' securities.

> "If customers who have certain rights of ownership in securities which survive or can be traced do not assert their rights, their shares it is submitted should fall into the general pot, rather than go to other customers whom luck has already favoured."[119]

An Ontario case supported this suggestion. Armour, J., in an *obiter dictum* said:

> "the fund may be sufficient or more than sufficient to meet all such equitable claims. In that happy event, the claims are all satisfied in full and the remainder of the fund, if any, goes to swell the general assets of the estate."[120]

This doctrine is based on the position that traders on margin reclaiming their securities can obtain no greater benefit than they would receive if *all* such traders had filed similar reclamation claims.[121] The United States Second Circuit Court of Appeals said:

> "But their shares must be ascertained by including in the calculation the shares of all long customers in the same position, whether they made claim for their shares in the stocks on hand or not. That the shares of those who claim should be increased by the circumstance that other long customers made no claim would be inequitable. What would otherwise have gone to those customers should go to the general creditors."[122]

122 *In re* Pierson, 238 F. 142 (2d Cir. 1916).

One commentator observed that the court did not explain why it is that any other course would be "inequitable". He points out that the generally accepted theory of the legal relation between a stockbroker and margin trader is that the securities are regarded to be the property of the trader with a right in the broker to pledge them as security for the advance he has made for their purchase. Accordingly, it would seem that the trustee in bankruptcy could have no interest in the pledged property since it is not property of the broker.[123]

2. *Criticism of the System*

The system of priorities and the protection afforded to customers prior to the Chandler Act amendments to the Bankruptcy Act of 1938 were widely criticized.

Judge Learned Hand in referring to the system once said:

> "Nobody recognizes more acutely than I do the artificiality of all this reasoning...."[124]

In another case decided the same year, Judge Rose was moved to express his scepticism over the value of the complicated equities traced in stockbrokerage bankruptcies.

> "The practical importance of having a fixed and uniform rule in these cases is great.... But is there not more of theory than substance in the assumption that the unclaimed property must be treated as if it had been the bankrupt's at bankruptcy merely because another customer in like class with petitioner does not, after bankruptcy, claim what such other was entitled to? There would seem nothing to recommend except a certain formal logic which it has or seems to have.... *In the long run, would not as high a degree of equity be worked out, if all the customers of the bankrupt brokers shared equally in their assets, and that, too, with infinitely less of trouble, delay and expense?*"[125]

Perhaps the frustration over the existing system was best summed up by James A. McLaughlin, whose remarks were quoted in part previously:

> "The existing law turns upon refinements utterly unintelligible to the businessman and involves elements of

chance more appropriate to a beano party than to the administration of justice."[126]

Chapter III
Protection of Customers' Funds and Securities in the United States

Prior to the Chandler Act, the legal remedies available to customers of a broker-dealer that had failed were at best cumbersome and expensive and at worst inequitable and capricious.

The law in respect to bankrupt stockholders was formulated primarily in cases involving the rights of margin customers. In the United States where most of this law developed, the rights of customers varied from state to state with the federal bankruptcy court applying the law of the jurisdiction in which the transaction at issue took place. As has been seen, a number of inequities developed. To a great extent the system provided for both lucky and unlucky claimants and it was often difficult to decide whether any particular claimant was a member of one class or another.[127]

This chapter will describe the changes to the legal system and the devices developed in the United States over the past forty years for the protection of customers and the integrity of U.S. capital markets.

A. SECTION 60(e) OF THE UNITED STATES BANKRUPTCY ACT

Section 60(e) which deals exclusively with broker bankruptcies was added to the Bankruptcy Act by the Chandler Act of 1938[128] as a result of the general dissatisfaction with the treatment of the customers of bankrupt brokerage houses.

According to J. MacLachlan:

"Section 60(e) adopts the theory that all the customers of a broker who permit him to have wide powers over their securities are subjecting themselves to the common risk of his failure. He should not be permitted to favor some over others when he and they contemplate the imminence of his failure. Furthermore, upon bankruptcy the available assets should be distributed by applying equitable principles upon a broader base than that recognized under the pre-existing bankruptcy law."[128a]

126 McLaughlin, *supra* note 51, at 397.

127 NATIONAL BANKRUPTCY CONFERENCE, REPORT OF THE COMMITTEE ON STOCKBROKER BANKRUPTCIES (1971).

128 Pub. L. No. 696, 52 Stat. 840-940 (1938).

128a J. MACLACHLAN, BANKRUPTCY 323 (1956).

The primary objective of the draftsmen of section 60(e) was to eliminate, as far as possible, the old classifications of stockbrokerage customers with the artificial distinctions that had arisen and to bring bankruptcy practice in respect to stockbrokers more in line with other fields such as voidable preferences.[129]

The general policy of section 60(e) is that customers who are the owners of specifically identified property (the "cash customers") are entitled to preferred treatment while the margin customers who permit the broker to have wide powers over their securities should be subject to the risk of the broker's failure but with some priority over general creditors.[130] Accordingly, three classes of claims were established: (1) "cash *customers*" who are able to identify "specifically" their securities; (2) all other *customers*, and (3) general *creditors*.

As the primary purpose of section 60(e) was to eliminate as far as possible the old classifications of margin customers the draftsmen concentrated mainly upon the rights of such customers and apparently gave no deep consideration to the rights of customers who did not enter into margin transactions.[131]

The first level of priority established by section 60(e) is "cash customers" who have paid in full for securities that are specifically identifiable. These customers are permitted to reclaim such identifiable securities and thereby gain priority over other customers, presumably on the theory that they are believed to be still owners of the specific property. Securities are regarded to be not specifically identified unless they remained in their identifiable form in the broker's possession until the date of the bankruptcy, or unless such securities or any substitutes therefor or the proceeds thereof were more than four months before bankruptcy or at a time while the stockbroker was solvent, allocated to or physically set aside for such customer, and remained so allocated or set aside at the date of bankruptcy.[132]

Thus, in order that securities be specifically identified, one of three alternatives must be met:

(1) the securities must have remained in their identical form in the broker's possession until the date of bankruptcy; or
(2) the securities or any substitutes therefor or the proceeds thereof must have been allocated to and physically set aside for the customer more than four months before bankruptcy and remained so allocated or set aside at the date of bankruptcy; or

129 Note, *supra* note 52, at 1300.

131 Gilchrist, *supra* note 115.
132 Chandler Act of 1938, Pub. L. No. 696, s. 60(e)(4).

(3) the securities or any substitutes therefor or the proceeds thereof must have been allocated to or physically set aside for the customer while the broker was solvent and remained so allocated or set aside at the date of bankruptcy.[133]

The express intent of the draftsmen was that unless the certificate was "specifically allocated or physically set aside, it must be thrown into the fund for distribution to all customers of the single class".[134]

The second level of priority for claimants to the assets of a bankrupt broker as established by section 60(e) consists of all other customers as a group, except those cash customers who are able to specifically identify their property in the manner specified by subsection 4 of section 60(e). Such creditors as a group have priority over other creditors of the bankrupt broker in a "single and separate fund" created by pooling all property acquired or held from or for customers except property that can be specifically identified as belonging to "cash customers".[135]

With respect to margin customers the old New York rule based upon ownership was rejected by the draftsmen of section 60(e) and the Massachusetts rule which treated the relationship between a stockbroker and his customer as that of debtor and creditor was adopted instead.

The third level of priority consists of general creditors who share in the assets of the bankrupt broker after the customers have been satisfied.

In practice, unforeseen inequities developed as the industry introduced new methods of allocating and segregating customers' securities.

The Securities and Exchange Commission's *Report of Special Study of Securities Markets*[136] in 1963 expressed doubt as to the ability of a cash customer to obtain preferential treatment under section 60(e) by reclaiming securities which have been put in bulk segregation where the brokers' records are the only means of identifying a customer's interest in the mass.[137] It also discussed various difficulties which arise under section 60(e) and made the following recommendations for changes in section 60(e):

"6. Problems arising from broker-dealer insolvency:

"It seems evident that section 60(e) is a significant im-

137 *See also* Black, *supra* note 36, at 757.

provement over the law as it formerly existed. Even so, it presents problems both of interpretation and of correlation with the financial responsibility rules.

"*Two main problems of interpretation exist. The first is the question whether the term 'stockbroker', which is not defined in the Bankruptcy Act, means only those who buy and sell securities for their customers on an agency basis or also includes 'dealers'. In Gordon v. Spaldin,* 268 F.2d 327, 330–331 (5th Cir. 1959), the court said: 'The history as well as the text of said S60, sub. e(1) indicates clearly that it was intended to apply only to those who hold securities on margin and otherwise, not as owners, but as agents for their customers.'

"Thus, the test which the court established is the capacity in which the 'stockbroker' has come into possession of a customer's assets; *i.e.*, whether as a principal (dealer) or as agent (broker). It is apparent that this narrow definition could lead to strange results: If a 'stockbroker' purchased securities for a customer as agent, was paid, and held the securities in safekeeping, the customer might be able to reclaim them. If, however, the same securities were sold to the customer in a principal transaction, Section 60(e) might not apply and the customer, even though he had paid for securities, would either have to find his identical certificates in order to reclaim them or become a general creditor. Clarification would obviously be desirable.

"The second involves the ambiguous definition of the term 'customer'. A person who deposits cash with a broker-dealer against a purchase of securities that does not occur before bankruptcy might not qualify as a 'customer' so as to qualify for the second level of priority.

"Even assuming that the foregoing problems are resolved, questions of correlation with the financial responsibility rules would still exist. Segregation of securities, implementing the 'reasonable relationship' rules, may permit many customers specifically to identify their securities and thus to reclaim them in the first level of priority. There may be considerable problems, however, where securities are held in bulk segregation. For securities to be 'identified specifically' one of two tests must be met: The securities must remain in their 'identical form' in the 'stockbroker's' possession until the date of bankruptcy; or the securities or substitutes therefor or proceeds thereof must have been allocated to or set aside for the customer, more than 4 months prior to bankruptcy or

while the 'stockbroker' was solvent, and must have remained so allocated or set aside until bankruptcy. Sec. 60(e)(4).

"The normal manner of operating the bulk segregation system unfortunately makes it impossible for securities to remain in their 'identical form'. Securities are removed from, or placed in, segregation as the day's transactions require, and securities certificates in segregation are regarded as fungible. It may be impossible for any one customer to say that certificates set aside for him remained in their identical form to the date of bankruptcy. Thus, a customer would not be entitled, as a cash customer, to reclaim securities held in bulk segregation, unless those securities were allocated to him more than 4 months prior to bankruptcy or while the broker-dealer was solvent. If the customer could not meet his requirement he would be entitled to share only in the 'single and separate' fund, at the second level of priority.

"A similar problem exists with respect to customers' free credit balances. Even if segregation of such balances were required, it seems clear that the ordinary practices of the securities industry would render it virtually impossible for a given customer to 'identify specifically' a deposit of cash as his own. If a customer delivers a check to a 'stockbroker' it could be said to be in its 'identical form' if it remained uncashed at bankruptcy. Once it is deposited, however, it loses its 'specific identity' and the customer is at best only a 'customer' within the meaning of Section 60(e). Thus, the only means by which a customer having free credit balances could receive protection as a 'cash customer' in accordance with Section 60(e) would be for the free credit balances to be allocated to, or physically set aside for, the customer in a special account, more than 4 months prior to bankruptcy or while the broker-dealer was solvent.

"Finally, Section 60(e) does not apply to receiverships. An insolvent broker-dealer can be placed in the hands of a receiver and be liquidated without ever going into bankruptcy at all. When liquidation is accomplished in this manner it appears that the old Massachusetts and New York doctrines may still have vitality and the capriciousness of result which Section 60(e) was designed to eliminate may prevail.

"A recent application of the New York doctrine occurred in *East v. Crowdus*, 302 F.2d 645 (8th Cir. 1962), in which

the petitioners argued that they had the right to reclaim certain shares of stock held in street name by a broker-dealer who was in receivership. The evidence showed that the claimants had ordered and paid for certain shares, that like shares had been purchased for the account of the broker-dealer, and that they were never specifically allocated to or set aside for the claimants. The claimants, relying upon the New York pledgor-pledgee doctrine, argued that they had traced the securities sufficiently to reclaim them by establishing that like securities to those they had purchased were on hand in an amount sufficient to meet their claim; in short, that securities of like kind are fungible when not specifically identified. The court supported their contention and permitted reclamation.

"Although it would appear from the facts of this particular case that the claimants would have been entitled to the shares even if Section 60(e) applied, slight variations in the facts could have caused the claimants to be reduced to 'customers' at the second level of priority. This indicates the difficulty of developing a system which assures a fair result to all claimants against the assets of a broker-dealer. Nonetheless, if a broker-dealer properly segregated the securities of his customers, it is believed that there would be far less danger under Section 60(e) that results of allocation of the broker-dealer's assets upon bankruptcy would be unfair, than if the Massachusetts and New York doctrines continued to have force.

"*Thus, there are broker-dealer bankruptcy problems still to be resolved.* Amendment of Section 60(e) to assure that 'stockbrokers' include dealers having public customers, and to assure that those who transmit cash to broker-dealers for stock purchases are included in the definition of 'customers' is indicated. The difficulty caused by bulk segregation could be resolved either by requiring specific identification, *i.e.*, abandoning the bulk segregation system or by amending Section 60(e) to include the bulk system among the types of 'specific identification'. As between the two possibilities, the latter would seem preferable. Bulk segregation is the only practicable system for many firms with large holdings of customers' securities and, in the event that a centralized handling system is instituted, all securities of customers in the system probably would be held in that manner or a similar one.

"5. SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

"Many broker-dealers perform banking and custodial functions in the course of which they have custody of, and use, customers' assets of enormous value. The degree of dominion and control over customers' cash and securities may vary considerably depending upon the type of account which the customer has with the broker-dealer and with the amount, if any, owed by the customer to the broker-dealer. While many firms give regular notice to customers as to the status of their accounts, it would appear that there are many others which do not do so.

"Customers' free credit balances are among the foregoing assets and may form a substantial part of the working capital of many broker-dealers. They are rarely segregated from broker-dealers' own funds. On the basis of prior loss experience, there does not appear to be a need to require complete segregation at this time. It would seem, however, that broker-dealers may reasonably be required to maintain an adequate liquid reserve against free credit balances, much as banks are required to maintain such a reserve against deposits. Furthermore, broker-dealers should be required to inform customers at regular intervals as to the status of their accounts.

"Customers' margin and fully paid securities likewise are held in large volume by broker-dealers. Under the rules of the Commission, in some States and certain exchanges, broker-dealers are restricted both in the use which may be made of those securities and in the manner in which they may be held. The rules presently existing are salutary to the extent of their coverage; the rules of the Commission and of some of the self-regulatory organizations should be extended, however, so that they provide the fuller protection now existing under the rules of certain exchanges with respect to segregation and hypothecation and lending of customers' securities.

"The net capital ratio rules of the Commission and certain exchanges have been a valuable protection for investors in preventing insolvency of broker-dealers. The current rigid 'haircut' provisions of these rules, however, do not distinguish among broker-dealers performing different functions in the securities markets (except that exchange specialists and other members having no public business are not subject to such provisions), nor do they take account of changing circumstances in the markets. One result is that broker-dealers, including those making

> primary markets, may not be adequately restricted in accumulating inventories of over-the-counter securities during periods of price rises, but may be compelled to reduce inventories rapidly during periods of falling prices, contrary to market needs.
>
> "Section 60(e) of the Bankruptcy Act is a notable advance in the administration of broker-dealer bankruptcies. Nevertheless, there are within it certain ambiguities which should be resolved; furthermore, it is believed that customers whose securities or free credit balances are appropriately segregated should be entitled to greater protection than they are now accorded by Section 60(e)."[137a]

The *Special Study* concludes and recommends:

> "5. Section 60(e) of the Bankruptcy Act should be amended to provide (a) that customers' securities that have been appropriately segregated within 4 days after receipt so that their ownership can be ascertained, whether or not specifically identified (*e.g.*, the bulk segregation system), and customers' free credit balances if similarly segregated, will be considered to be 'identified specifically' within the meaning of Section 60(e)(4) notwithstanding that such segregation may have occurred less than 4 months prior to bankruptcy or during insolvency; (b) that the term 'stockbroker' clearly include 'dealers' as well as 'brokers'; and (c) that the term 'customers' include persons depositing cash for the purchase of securities. In addition, the Bankruptcy Act should be amended to empower the Commission to petition that an insolvent broker-dealer be adjudicated a bankrupt, so as to assure equitable treatment of claimants under Section 60(e)."[138]

After almost a decade of studies, both in and out of Congress, a new Bankruptcy Bill, H.R. 8200, was approved by the House on February 1, 1978. Senate action is expected later in the year.[139]

Many of the technical deficiencies of, and the problems which arose under, section 60(e) have been remedied by the new bill.

"Stockbroker" is defined by the bill to mean a "person with respect to which there is a customer (as defined by the bill) engaged in the business of effecting transactions in securities: (a) for the account of others; or (b) with members of the general public

137a SECURITIES AND EXCHANGE COMMISSION, *supra* note 136, at 412-16.

138 *Id.*

139 The bill was signed by the President on November 16, 1978.

from or for such person's own account". This definition makes it clear that "stockbroker" includes both a broker and a dealer.

The scheme for the administration of stockbroker liquidations under H.R. 8200 is to create two classes of customers' property found in the possession of the bankrupt stockbroker.

The one class of property is "customer name security". These are securities held for the account of a customer on the date of the filing of the bankruptcy petition of the stockbroker which are registered in the customer's name on such date or in the process of being so registered under instructions from the debtor and are not in a form transferable by delivery on such date.[139a] The trustee is required to deliver such securities to the customer upon payment of any amount owed by the customer to the stockbroker.[140]

The other class of property is "customer property", being cash, securities or other property, and proceeds of such cash, securities or property held by or for the account of the debtor from or for the securities account of a customer, but not including a customer name security delivered to or reclaimed by a customer or property to the extent that a customer does not have a claim against the debtor based on such property (for example, office furniture, computer, etc.).[141] The trustee is required to distribute "customer property" rateably to customers on the basis and to the extent of such customer's allowed net equity claims.[142] To the extent that there is a surplus, it is distributed to the general creditors.[143] To the extent that there is a deficiency, the unpaid customers may claim as unsecured creditors against the general estate of the stockbroker.[144]

Any cash or securities remaining after the liquidation of a security interest created under a security agreement made by the debtor is required to be apportioned between the general estate of the stockbroker and "customer property" in the proportion that the general property of the stockbroker and the cash or securities of customers were subject to such security interest.[145]

B. VOLUNTARY TRUST FUNDS OF UNITED STATES EXCHANGES

While many broker-dealer firms had failed in the aftermath of the 1929 crash, in the years following the enactment of the Securities Exchange Act of 1934 broker-dealer insolvencies were almost unknown in the United States. Before 1960 there had been only three insolvencies involving members and these had all occurred in 1938. There was a public confidence in the major exchanges. The New York Stock Exchange actively encouraged the widely held view that membership in the NYSE is synonymous with solid financial status.

DuPont, Homsey & Co. was the first member of the NYSE to fail after 1960. The NYSE contributed $797,000 to its receiver. The payment was made to create the belief that the NYSE would stand by an insolvent member's customers and secure them from losses caused by the insolvency.[146] It was argued that by indemnifying stockbrokerage customers the NYSE "sought to preserve the image of financial integrity its members had commanded in the eyes of the public".[147] It was said "no customer of a member organization of the New York Stock Exchange in more than 30 years has sustained a loss of securities or funds as the result of the failure of a NYSE member firm".[148]

The failure of DuPont, Homsey & Co. was caused in part by one of the partners absconding with assets of the firm. The NYSE in order to prevent similar failures demanded that fidelity bond requirements be raised to prevent losses due to defalcations by brokerage firm partners.[149] The NYSE took out a fidelity bond to protect customers against fraud by member firms.[150] After all that it did to protect the customers of DuPont, Homsey & Co. the NYSE went out of the way to say that its actions were not to be taken as a "precedent binding the exchange to a similar course of action in the future".[151]

The spectacular failure in 1963 of Ira Haupt & Co. was triggered when one of its customers was unable to meet margin calls on commodities contracts. It was in fact one of the principal

casualties which arose out of The Great Salad Oil Swindle. The NYSE again moved to protect the customers from losses.[152] When disaster struck the Haupt firm, almost all of the firm's cash had been wiped out by losses in the futures markets and it was left with enormous debts. It owed in all to United States and British banks more than $37 million that it could not pay.[153]

Stock exchange officials on learning the extent of the probable losses feared with good reason that if the exchange did not help Haupt there would be widespread loss of confidence in the integrity of brokerage firms. Some 20,700 customers of Haupt had left securities worth more than $450 million in the safekeeping of the firm. Almost $90 million of these securities had been purchased on margin and these had been pledged to banks for loans. Customers, in addition, had left $5.5 million in cash on deposit with the firm. The Haupt firm had been suspended from the exchange. It was only the second time in the NYSE's 171-year history that a member firm had been suspended, and as a result customers were not able to withdraw their securities or money while the firm was under suspension.[154]

The NYSE feared that if the Haupt firm was to be made bankrupt it could be years before the customers recovered their securities and money. Undoubtedly, the customers would suffer losses too if the firm was liquidated through bankruptcy. It was considered that such a situation could not be permitted as it would be the most damaging blow to Wall Street since the crash of the stock market in 1929.

The exchange and the major banks that were creditors of Haupt were convinced that the public interest demanded that Haupt not be forced into bankruptcy. The board of directors of the NYSE devised a liquidation plan for Haupt in which the exchange would provide up to $12 million to pay Haupt's debts to customers which was to be repaid by increasing member firms' dues by 50% for the next three years and the banks would defer up to $24 million of the loans owed to them. The chief examiner of the exchange acted as "liquidator" of Haupt and supervised payments to customers. The partners of Haupt accepted the plan and the claims of customers were quickly settled. The plan was also well received by the other members of the exchange. In devising the plan to protect the Haupt customers from losses which in fact were beyond the control of the exchange, arising as they did from the commodities business of the firm, the exchange was concerned not

153 N. Miller, The Great Salad Oil Swindle (1965).
154 *Id.*

only about the customers but about the image of the exchange and the brokerage business in general.[155]

In 1964 the NYSE moved to put its rescue operations on a permanent basis by establishing a Special Trust Fund. It consisted of $10 million in cash backed up by a $15 million line of bank credit.[156] The Special Trust Fund was created notwithstanding the earlier disclaimer of the NYSE that its bailing-out operation in respect of DuPont, Homsey & Co. was not to be taken as "a precedent binding the exchange to a similar course of action in the future".[157]

The purpose of the Special Trust Fund as stated in its constitution is for "providing direct or indirect assistance to customers of a member...threatened with loss of their money or securities because such member...is insolvent or is in such financial condition that he or it may be unable without assistance to meet his or its obligations to such customers". It went on to disclaim any responsibility to the public by stating "no customer of any such member...and no other person shall in any event have any claim or right of action at law or in equity...against the Exchange, the Trustees of the Special Trust Fund, or any other person, or against the Fund, as a result of any action taken or the failure to act by the Trustees in the exercise of their discretion".[158]

By 1968 all of the major stock exchanges in the United States had established voluntary trust funds by making assessments upon their members. The various funds were small, however, when compared with the volume of trading done by members of the individual exchanges, the value of customers' assets held by members, the size of the net losses arising out of the increasing number of failures of member firms and the amounts earned by member firms from the free credit balances of customers left in their brokers' hands.[159]

157 *See* note 151 *supra*.

158 H. Baruch, *supra* note 156, at 214.

159 The American Stock Exchange fund was $2.6 million with standby credit of $7.4 million. The Midwest Stock Exchange fund was $515,000. The Philadelphia & Baltimore-Washington Exchange fund was $325,000. *See Hearings on H.R. 13308 before the Subcommittee on Commerce and Finance of the House Committee on Interstate and Foreign Commerce,* 91st Cong., 2d Sess., 152 (1970). Robert W. Haack, a former president of the NYSE, once said: "the self-regulators who have been so frequently decried and deplored have, by using their own hard-earned money, kept probably 600,000 to 700,000 accounts out of a bankruptcy court"; H. Baruch, *supra* note 136, at 32-33, retorted by saying that:

> "[i]ncluding the $30 million commitments made to Merrill Lynch in connection with its takeover of Goodbody, all monies ever expended do not exceed $150 million while member firms of the NYSE alone can be fairly charged with earning a net profit of over $230 million on customers' free credit balances in the year 1969."

After the creation of the NYSE Special Trust Fund, no NYSE firm had to be liquidated in the next few years. The first failure thereafter was that of Pickard & Co. The exchange voluntarily responded in coming to its assistance, and to the assistance of some nine other firms which failed shortly afterwards. In 1970, however, the NYSE initially failed to come to the rescue of three member firms and was severely criticized in financial and business circles.[160] It was apparent towards the end of 1970 that the Special Trust Fund of the NYSE was depleted to the point of veritable exhaustion.[161] To shore up the fund, an extra $30 million from the Building Fund of the NYSE was added to the "Special Trust Account".[162]

By April 1970 just over one-half of the NYSE Special Trust Fund had been committed to assist the liquidation of five firms. A special committee of the NYSE was established to "determine the appropriate size of the fund and ways to enlarge it".[163] By July 22, 1971, the NYSE Special Trust Fund had advanced or committed $30 million to assist Merrill Lynch in its absorption of Goodbody & Co.

By 1970 in the United States it was evident that the voluntary trust funds were a "stop-gap" creation at the most. There was increasing public apprehension that the member firms of the various exchanges did not have the ability to meet new losses. A part of this general uneasiness was directly attributable to the exchanges. The exchanges took the position that notwithstanding that they created the funds and publicized the fact to promote investor confidence they had no legal obligation to member firms to pay anything.[164]

The precarious position of customers was underlined by the fact that apart from the voluntary trust funds there was noprotection available to customers of brokers who became bankrupt such as was available to depositors of banks and other groups. Moreover, there was no protection available for customers of broker-dealers who were not members of the exchanges or for customers of commodity brokers.

C. THE SECURITIES INVESTOR PROTECTION ACT OF 1970

Congressional action was demanded when the number of failures of both large and small brokers and the dollar losses increased with the apparent vacillation of the NYSE to come to the rescue of member or former member firms. It was not, however, a new demand, for as early as 1957 Congresswoman Edna F. Kelly of New York had introduced a bill that would have required all brokers to carry insurance on customers' funds entrusted to them.

In June 1969 Senator Edmund Muskie of Maine introduced a bill modeled after the legislation that produced the Federal Deposit Insurance Corporation (FDIC) which provided protection for brokerage customers through the creation of a Federal broker-dealer insurance corporation. In the hearings on the bill there was little disagreement over the fact that the most satisfactory solution to protect the investor was a comprehensive insurance scheme. Disagreement for the most part centred on whether the administration of such a scheme should be in the hands of the industry or of the government.

Senator Muskie in his bill had proposed that the board of directors of the corporation consist of the commissioners of the Securities and Exchange Commission and thus be free of industry control. The exchanges at first had simply opposed the bill. This resulted in a strong public criticism. In April 1970 the chairman of the SEC said he was concerned with "the financial problems of the industry and the losses sustained in 1969 and the first quarter of 1970". The exchanges in a joint industry task force drafted an alternative proposal for an insurance scheme by way of self-regulation. The scheme provided for a corporation that would have twelve directors with only two public seats and with no offer of any regulatory authority to the SEC. Spokesmen for the industry argued that "such an administrative mechanism would be preferable to the creation of another layer of governmental regulation which would be unwieldy as well as unnecessary".[165]

Congress had however become impatient with the industry in its failure to show a sense of urgency in responding to the demonstrable need for some better system to protect investors. In the hearings of the Senate Subcommittee on Securities Senator Muskie indicated this impatience when he replied to a witness from the industry: "The industry had ten months last year to meet those ifs that you just posed in your answer. It was only two days before the

165 *Hearings on S. 2348 before the Subcommittee on Securities of the Senate Committee on Banking and Currency, supra* note 148, at 29 (statement of Donald T. Regan).

hearing today that the industry finally organized itself to put together a program. Is that a confidence-instilling reaction?"[166] Shortly afterwards the Securities Investor Protection Act (SIPA) was enacted and effectively brought to an end self-regulation in this area.

The exchanges, particularly the NYSE, had urged when it was apparent that SIPA would be enacted that the new legislation be made retroactive. In the case of the NYSE this would have relieved it from coming to the aid of the customers of three former member firms that had recently failed. It was the vacillation of the NYSE, and the citing by it of the voluntary nature of its "special trust" fund as one of the reasons for its reluctance to act, that had largely convinced Congress of the necessity of the legislation. Congress, however, lacked precise information on the condition of the industry and was concerned with the impact that the new legislation would have on the Treasury. It accordingly refused to make it retroactive. Congress regarded the losses that had already been experienced as the responsibility of the industry and, in effect, demanded from the industry, as the price for the legislation, that the industry accept responsibility for the losses of customers suffered before the act's enactment.[167]

Indicative of its concern with the industry, Congress added a provision to SIPA that did not appear in either the House or Senate bills. It required the SEC to make a study of unsafe and unsound practices of broker-dealers, to report within twelve months the steps being taken to eliminate them and to recommend any additional legislation needed to do so.[168]

> The legislative history of the SIPA describes its purpose: "The serious and persistent financial problems besetting the securities industry in recent months have led to the voluntary liquidations, mergers, receiverships or, less frequently, bankruptcies of a substantial number of brokerage houses. Such failures may lead to loss of customers' funds and securities with an inevitable weakening of confidence in the U.S. Securities Markets. Such lessened confidence has an effect on the entire economy – whatever other steps must be taken to improve these conditions, one objective of the bill, as reported, is to provide investors protection against losses caused by the

168 Securities Investor Protection Act, 1970, s. 11(h), 15 U.S.C. s. 78 aacc., Pub. L. No. 91-598, 84 Stat. 1636-1757 (1970) [hereinafter cited as SIPA].

> insolvency of their broker-dealer. The need is similar, in many respects, to that which prompted the establishment of the Federal Deposit Insurance Corporation and the Federal Savings and Loan Insurance Corporation."[169]

On December 30, 1970, The Securities Investor Protection Act, 1970,[170] became law when President Richard Nixon signed the bill. He said it was "a vitally important advance in the consumer protection field".[171]

The most important feature of SIPA was to establish the Securities Investor Protection Corporation (SIPC):

> "to protect individual investors from financial hardship; to insulate the economy from the disruption which can follow the failure of major financial institutions; and to achieve a general upgrading of financial responsibility requirements of brokers and dealers to eliminate, to the maximum extent possible, the risks that lead to customer loss."[172]

The SIPC is a private "nonprofit corporation". It is not designed to be an agency or establishment of the United States government but rather to be a membership corporation consistent with the self-regulatory nature of the securities industry. While in theory SIPC is an independent corporate entity, in practice the corporation is completely subordinated to the discretionary power of the Securities and Exchange Commission.[173]

> "The SIPC's role is primarily one of consultation and cooperation with the self-regulatory organizations which remain subject to the federal security terms and the rules of the SEC. By mandating membership in the SIPC for certain members of the securities industry and by granting the SIPC general assessment authority over the members in order to establish a SIPC fund, Congress accomplished its intentions that the cost of providing protection to customers under SIPC was to be borne by the securities industry itself."[174]

The members of SIPC are all persons registered as brokers or

dealers under section 15(b) of the Securities Exchange Act of 1934 and all persons who are members of a national securities exchange other than persons whose business as a broker or dealer consists exclusively of (i) the distribution of shares of registered open-end investment companies or unit investment trusts, (ii) the sale of variable annuities, (iii) the business of insurance or (iv) the business of rendering investment advisory services to one or more registered investment companies or insurance company separate accounts.[175]

In order to finance the insurance program contemplated by the act, SIPC is required to establish a fund consisting of cash, amounts invested in United States government or agency securities and confirmed lines of credit.[176] Assessments in favour of the fund are required to be made against all members based upon the members' gross revenues derived from their securities business.[177] The fund was required to total at least $75 million within 120 days after the enactment of SIPA.[178] It is to eventually reach $150 million "or such other amount as the Commission (SEC) may determine in the public interest".[178a] If there should be heavy claims made against the fund, the SEC, on behalf of SIPC, may borrow up to one billion dollars from the United States Treasury and arrange for a repayment plan subject to SEC approval.[179]

The scheme of the act provides for a liquidation procedure which is closely modeled on section 60(e) of the United States Bankruptcy Act. Indeed, the liquidation procedures of the two acts are very similar except in respect of the rehabilitation of a debtor. SIPA specifically prohibits the formulation of a plan of reorganization[180] and by inference prohibits an assisted "wind down period" so that the liquidation of the broker-dealer could be more manageable.[181] The liquidating trustee, however, does have the power to operate the business of the debtor in order to complete its open contractual commitments.[182]

SIPA stands alone. It neither amends the Securities Exchange Act of 1934 nor does it amend the Bankruptcy Act. The SEC in commenting upon the proposed SIPA said:

"In summary, the bill does not in any way amend the

Bankruptcy Act, as such, but rather provides a specialized liquidation procedure for securities firms in financial difficulties which is designed to accomplish the purposes of the bill in a prompt and fair way, including utilization of any funds advanced by the corporation. In so doing, the bill draws heavily upon the provisions of the bankruptcy laws, many of which are incorporated by reference, but modifies the procedures to the extent determined necessary to accomplish the special purpose of the bill."[183]

The Senate report on SIPA made reference to the existing shortcomings in the Bankruptcy Act:

"Certain shortcomings in Section 60e of the Bankruptcy Act which relate to stockbrokers' bankruptcies have become apparent and SIPA is intended to remedy these shortcomings."[184]

While it is strictly correct to say that SIPA does not, in fact, repeal section 60(e) of the Bankruptcy Act, it has the effect of largely repealing it, as an application for a liquidation under SIPA may be filed notwithstanding the pendency in the same or in any other court of any bankruptcy proceeding[185] and the court is required to stay any pending bankruptcy proceeding.[186]

SIPA makes no provision for the general creditors of the broker-dealer, as opposed to its customers, other than to provide that customers who do not have their claims satisfied in full from the single and separate fund (the concept of which is found in section 60(e)(2) of the Bankruptcy Act and which is continued in SIPA) may share in the general estate of the broker-dealer with the general creditors.[187] The general creditors and customers whose claims are not satisfied in the SIPA proceedings (SIPA does not provide for a discharge of claims not satisfied) who look to the general estate of the broker-dealer to satisfy their claims can, however, only commence or continue proceedings after the SIPC trustee has completed his liquidation proceedings.

Proceedings under SIPA are triggered by the SEC. The SEC, if it is aware of facts which lead it to believe that any member broker or dealer is in or is approaching financial difficulty, is required to immediately so notify SIPC. Similarly, when any of the

183 *Hearings on S. 2348, S. 3988 & S. 3989 before the Subcommittee on Securities of the Senate Committee on Banking and Currency, supra* note 148, at 260-62 (memorandum of the SEC regarding possible amendment of the Bankruptcy Act); SEC v. Wick, 360 F. Supp. 312 (N.D. Ill. 1972).

184 S. Report No. 218, 91st Cong., 2d Sess. (1970).

185 SIPA, s. 5(a)(3)(B).

186 SIPA, s. 5(b)(2).

187 SIPA, s. 6(c)(2)(B).

self-regulatory organizations become aware that a SIPC member is "in or is approaching financial difficulty" it must so notify the SEC.[188]

If the SIPC determines that any member has failed or is in danger of failing to meet its obligations to customers and that any one or more prescribed "danger signals" exist, the SIPC may apply to the court for a decree adjudicating that customers of such member are in need of the protection provided by SIPA. The danger signals are that the member:

"(i) is insolvent within the meaning of section 1(19) of the Bankruptcy Act, or is unable to meet its obligations as they mature, or

"(ii) has committed an act of bankruptcy within the meaning of section 3 of the Bankruptcy Act, or

"(iii) is the subject of any proceeding pending in any court or before any agency of the United States or any State in which a receiver, trustee or liquidator for such member has been appointed, or

"(iv) is not in compliance with applicable requirements under the 1934 (The SEC) Act or rules or regulations of the Commission (SEC) or any self-regulatory organization with respect to financial responsibility or hypothecation of customers' securities, or

"(v) is unable to make such computations as may be necessary to establish compliance with such financial responsibility or hypothecation rules or regulations."[189]

If the court makes an adjudication that customers of a member are in need of the protection provided by SIPA, the court is required to appoint a trustee for the liquidation of the business of that member and an attorney for such trustee as SIPC shall specify.[190]

Once a SIPC trustee is appointed in a SIPC action the procedure that follows is described by the act as a "liquidation proceeding".[191] The purposes of the proceeding are (1) to operate the business of the debtor in order to complete open contractual commitments, (2) to return specifically identifiable property (both cash and securities), distributing the "single and separate fund" to be constituted similar to that required by section 60(e) of the Bankruptcy Act and paying to customers monies advanced by

188 SIPA, s. 5(a)(1).
189 SIPA, s. 5(b)(1)(A).
190 SIPA, s. 5(b)(3).
191 SIPA, s. 6(a).

SIPC, (3) to enforce SIPC's rights of subrogation, and (4) to liquidate the business of the debtor.[192]

In order to accomplish these purposes, a SIPC trustee is given the same power and title over the SIPC member and its property, including the right to set aside preferences as a trustee in bankruptcy. The trustee is also subject to the same duties as a trustee in bankruptcy. He need not, however, reduce into money securities held by a member but not identified as belonging to specific customers.[193] The trustee with the approval of the SIPC may hire and pay all administrative personnel he deems necessary for the purposes of the proceedings.[194]

It is not completely clear what property comes under the jurisdiction of a SIPA trustee. It has been suggested, for example, that as one of the stated purposes of SIPA is "to liquidate the business of the debtor" the personal assets of a debtor who operates a brokerage house as a sole proprietor do not pass to the SIPA trustee and are not included in the liquidation process. It would seem, however, in such a situation that as solvency is predicated upon a debtor's total estate the total estate should be used to meet business debts. It would follow as a corollary that the debtor's personal creditors would be entitled to participate in the distribution of the debtor's general estate subject to the rules of marshalling assets.

A major innovation of SIPA to which reference has already been made is the provision for the completion of open contractual commitments. Section 6(d) provides:

> "The trustee shall complete those contractual commitments of the debtor relating to transactions in securities which were made in the ordinary course of the debtor's business and which were outstanding on the filing date,
> "(1) in which a customer had an interest, except those commitments the completion of which the Commission (SEC) shall have determined by rule or regulation not to be in the public interest, or
> "(2) in which a customer did not have an interest, to the extent that the Commission (SEC) shall by rule or regulation have determined the completion of such commitments to be in the public interest."

The rule established by the commission respecting the completion of open contractual commitments establishes detailed procedures for their completion.

192 *Id.*
193 SIPA, s. 6(b)(2).
194 SIPA, s. 6(b)(3)(A).

"Generally, it permits the completion of fails to receive and fails to deliver between the debtor and another broker-dealer which were made in the ordinary course of the debtor's business and which were outstanding on the filing date. Such open contractual commitments must have arisen from a 'current' transaction, as defined in the rule, in which the other dealer was acting as agent for a customer (or in certain defined principal transactions), and must be bought in, sold out, or closed by delivery of funds and securities promptly in accordance with the provisions of the rule."[195]

The completion of open contractual commitments essentially involves a question of the adequacy of working capital. If and to the extent the debtor's funds are insufficient to complete transactions SIPC may advance to the trustee such monies as may be required to complete them.[196] When the "single and separate fund" is distributed, SIPC is entitled to be repaid in priority to all other claims payable from such fund, the amount of all advances made to permit the completion of open contractual commitments.[197]

While the duty imposed upon the trustee to complete open contractual commitments has the effect of winding down an estate in an orderly manner, it also "means that the brokers with which the bankrupt firm has dealt will probably get paid in full for all cash and securities due them, except where both firms were acting for their own account and not as brokers for their customers".[198]

In order to provide for the prompt payment and satisfaction of net equities of customers of a broker-dealer who has failed, SIPC is also required to advance necessary monies to the liquidating trustee of the broker-dealer from the SIPC fund. There is an overall limit of $50,000 per customer account for a claim for securities and cash left on deposit with a firm. However, where any part of a customer's claim is for cash, as distinct from securities, the amount advanced for the cash part of the claim may not exceed $20,000. Customers who hold accounts in separate capacities are deemed to be a different customer in each capacity. There are certain other limitations on the amounts that may be advanced which primarily prevent advances to be made to a claimant who has an interest in the business of the broker-dealer firm.

SIPC in addition to its right to make advances to complete open contractual commitments and to provide for the prompt

195 SIPA, s. 6(d); SIPC, 3D ANNUAL REPORT 22 (1973).

196 SIPA, s. 6(f)(2); H.R. REP. No. 1613, 91st Cong., 2d Sess. 9 (1970).

197 SIPA, s. 6(c)(2)(B).

198 H. BARUCH, *supra* note 156.

payment and satisfaction of net equities of customers also may make advances to pay administrative expenses of the trustee and may make funds available to pay customer claims within the limits imposed by SIPA. This is designed to ensure the prompt payment and satisfaction of the net equities of customers.

No advance may be made by SIPC to the trustee to satisfy any claims of any customer who is a general partner, officer, or director of the debtor, the beneficial owner of 5% or more of any class of stock, or limited partner with a participation of 5% or more in net assets or net profits of the debtor. No advance may be made by SIPC to the trustee to satisfy the claims of any broker or dealer or bank unless the claims arise out of transactions for customers of the broker or dealer or bank, in which event each customer is deemed a separate customer of the debtor.[199]

The actual liquidation of a debtor's business is not dissimilar to a liquidation under section 60(e) of the Bankruptcy Act. In general the provisions of the Bankruptcy Act apply except where they are inconsistent with SIPA and except also that, in no event, may a plan of reorganization be formulated.

The SIPA, for example, as does section 60(e) of the Bankruptcy Act, divides claimants against the broker-dealer into three classes: (1) cash customers, (2) all other customers and (3) general creditors. The definition of a "customer" is expanded by SIPA. It recognizes that a debtor is not necessarily only a stockbroker but may have been a dealer, *i.e.*, he acted as a principal and that the term "customer" includes a person who had deposited cash with the debtor for the purchase of securities. However, it expressly excludes any person to the extent that such person has a claim for property which by contract, agreement or understanding, or by operation of law is part of the capital of the debtor or is subordinated to the claims of creditors of the debtor.[200]

SIPA also expands the definition of "cash customer" in section 60(e) of the Bankruptcy Act (a customer who is entitled to immediate possession of securities without the payment of any sum to the debtor) to include one who is entitled to the immediate possession of "cash" as well as of securities. The same person may be a "cash customer" as to certain securities or cash and not a "cash customer" with reference to other securities or cash.[201] Guidelines set by SIPA to determine whether property was allocated to or specifically set aside for customers recognize that brokers or dealers keep property in street name and utilize bookkeeping segregation and

199 SIPC, 3D ANNUAL REPORT 22 (1973); SIPA, s. 6(f)(1)(C)(D).

200 SIPA, s 6(c)(2)(A)(ii).

201 SIPA, s. 6(c)(2)(C).

that securities may be held in a central or similar depository in bulk segregation.[202]

SIPA, like section 60(e) of the Bankruptcy Act, provides that all customers other than cash customers constitute a single and separate class of creditors entitled to share rateably in the single and separate fund on the basis of their net equities and subject to certain priorities. If the "single and separate fund" is insufficient to pay the cash customers in full, they are entitled to share in the debtor's general estate with his general creditors.

While SIPA contemplated that trustees could make payments to customers in the interests of speedy settlements whether or not they have filed a formal proof, the:

> "SIPC has taken the position that advances should not be made until the trustee and the SIPC are satisfied that claims are *bona fide* and accurate. Experience to date has warned of the need to be watchful for fraudulent claims or at least erroneous ones. The state of the books and records frequently is such that it is possible for claims to be misstated under circumstances making difficult detection and prevention of overpayments or improper payments."[203]

This cautious approach has lead to some criticism of SIPC. The delay in payments has not helped to increase the confidence of investors in the industry which was one of the principal reasons for the enactment of SIPA. The SIPC liquidation that has been completed in the shortest period of time involved a firm where a total of six claims were received. It took twenty-two months to complete the liquidation.[204]

The SIPC has however accomplished a good deal. At the end of 1977, which was the seventh anniversary of the enactment of SIPA, 128 firms had been placed in liquidation under the act.[205] Of this number the liquidation of all but five have been completed or substantially completed – that is, all claims except problem claims have been satisfied. The value of cash and securities distributed for accounts of customers to December 31, 1977, is approximately $279 million. In 1977 seven firms were placed in SIPC liquidation. This compares with four in 1976, eight in 1975, fifteen in 1974 and forty in the high year, 1972.[206]

204 Duff, *supra* note 181, at 990. The firm referred to was that of Lang-Lasser & Co. of Beverly Hills, California. The trustee was appointed on September 14, 1971. The liquidation was closed on July 16, 1973.
205 SIPC, 7TH ANNUAL REPORT 4 (1977).
206 *Id.* at 5.

There has been some general criticism of the drafting of SIPA. Difficulties often arise in its practical application. The court, for example, in *SEC v. Aberdeen Securities Inc.*, observed:

> "The intent of Congress to protect customers of financially distressed security dealers is clear, but the specifics of precise resolution of individual situations are clouded by the provisions of a statute which range far from the clarity of the blue sky one might expect in this area of the law."[207]

As a result of general criticism of the legislation and a desire to remedy the shortcomings of the act, a special task force was created by SIPC in 1973 to consider ways and means, including legislative proposals, to improve the program of customer protection under SIPA. In announcing the composition of the task force the chairman of SIPC said:

> "The Securities Investor Protection Act of 1970 was an innovative and exemplary piece of remedial legislation, evolved principally through the cooperative efforts of the Congress, the Securities and Exchange Commission, and the securities industry itself. In general it has worked well, and thousands upon thousands of securities investors have been greatly benefitted. However, as with any new legislation, only experience can demonstrate its precise efficacy and suggest areas of possible improvement. Now that SIPC has had experience in the liquidation of 94 firms over a three-year period it is appropriate for it to join with other interested and knowledgeable parties in a common effort to improve this program of customer protection."[208]

SIPC was not unaware of the practical problems involved. The first large broker-dealer liquidated by SIPC was Weiss Securities, Inc., a member of the NYSE with some 32,000 active customers. As Weiss had maintained an apparently accurate system of computerized customer account records, the trustee was able to begin settling customer claims immediately upon his appointment. Within three months the trustee had processed and approved for payment some 92% of the customer claims filed. Notwithstanding, some 5% of the customers filed objections with the court to the trustees' proposed distribution. Approximately 10% of the customers corresponded with the trustee concerning settlement of their claims. The principal complaints were the sale by banks of the

207 SEC v. Aberdeen Securities, Inc., 480 F.2d 1121 (3d Cir. 1973); on the confusion that exists in the jurisdiction of a SIPA Court, *see* Karmel & Weissman, *Taking Stock of the Court's Jurisdiction in a SIPA Liquidation*, 41 BROOKLYN L. REV. 1 (1974).

208 SIPC, 3D ANNUAL REPORT 5 (1973).

hypothecated margin securities of customers and the disruption which the customer experienced in the normal flow of dividends and other distributions. From the Weiss experience it became even more apparent that the liquidation procedures prescribed by SIPA are in some respects inefficient, expensive, inflexible and not necessarily the speediest methods possible.[209]

The task force made its report in July of 1974. Broadly, the report recommended that SIPC's role should remain that of a liquidator and not a regulator, that broker-dealers in financial difficulty should continue to be liquidated rather than rehabilitated, that procedures for satisfying customers' claims be speeded up and that increased investor protection be made available.

Perhaps the single most important specific change recommended by the task force is for customers to receive the contents of their accounts just as they were when the broker-dealer went out of business. The recommendation was that:

> "[A] customer should receive securities to the maximum extent possible in satisfaction of a claim for securities. Customers whose claims fall within the limits of protection provided by the act should receive their accounts as they stood on the filing date. In furtherance of this end, the trustee should be authorized to use customer-related assets or SIPC funds to:
>
> "(a) Purchase securities in the open market or complete open contracts, as desired by the trustee, to obtain securities needed to restore customers' accounts.
>
> "(b) Pay or guarantee bank loans and thereby reclaim hypothecated securities."[209a]

The second part of this recommendation relating to margin customers has the effect of putting the margin customer in the same position as cash customers, reversing the effect of section 60(e) and SIPA in which margin customers have a priority following cash customers.

The task force was of the opinion that the margin customer should not bear any greater proportion of the loss occasioned by the failure of a broker-dealer than a cash customer. The objective of the task force was to structure a SIPC liquidation in such a way that there are only two classes of claimants, customers and general creditors apart from subordinate lenders and equity holders. The concept of "a single and separate fund" would be eliminated and

209 SIPC, REPORT OF THE SPECIAL TASK FORCE TO CONSIDER POSSIBLE AMENDMENTS TO SIPA (1974), *reprinted in Hearings on H.R. 8064 before the Subcomm. on Consumer Protection and Finance of the House Comm. on Interstate and Foreign Commerce*, 94th Cong., 1st Sess. 59, 60-61 (1975).

209a *Id.* at 63.

all property which can be identified to customers as a whole would be distributed rateably.

In the interest of speeding up the satisfaction of customers' claims it was recommended that a SIPC trustee be authorized to transfer accounts in bulk to another broker-dealer without the consent of the customer and to indemnify the receiving broker-dealer against loss within certain limits. This would give the customer quick access to his account. He would not however be obligated to leave the account with the new firm. It is recognized that the bulk transfer of accounts is only feasible when the firm that failed has accurate and complete customer records and the trustee is able to find another firm willing to take on the accounts. It was the opinion of the task force that the prompt transfer of accounts coupled with appropriately limited indemnification will prove to be the most practical procedure in terms of satisfaction of customers' claims.

Where bulk transfer is not practical, customers who have debt balances in their accounts would be permitted to pay them and receive securities to which they are entitled.

The task force considered the specific application of their recommendations to the allocation of property to customers. It was the opinion of the task force that the following plan of allocation comports with, and carries out the intent of its recommendations in this regard.

> "(1) Monies in customer segregated bank accounts should be allocated *pro rata* to customers with free credit balances.
>
> "(2) Securities in the possession or control of the debtor should be allocated *pro rata* to customers, issue by issue on the basis of each customer's ownership interest in each issue, without distinguishing between cash and margin customers. Securities registered in the names of individual customers, however, should be returned to customers entitled thereto, as is currently done.
>
> "(3) Each customer's claim for cash and/or securities remaining unsatisfied after application of (1) and (2) above would be valued, using filing date prices. The resultant dollar values would be aggregated to determine the total dollar value of remaining unsatisfied claims.
>
> "(4) The expenditure required to restore each account to its filing date status would be determined by adding to unsatisfied cash claims the amount of funds necessary to purchase in the open market the shortfall in securities claimed by customers beyond those recoverable from bank loan.

"(5) The resources available to the trustee, before consideration of any SIPC advances for the purposes of restoring accounts, would be determined. Such resources would primarily consist of customers' debit balances, the market value on the filing date of customer short security positions and the market value on the filing date of securities on hand which relate to open contracts such as customer-related fails to deliver, stock borrowed, COD contracts, and securities due to CNS systems, which are not to be completed and which were not allocated as possession or control securities.

"(6) If the aggregate dollar value of the resources available to the trustee in (5) above equals or exceeds the aggregate dollar value of the claims in (4) above, each customer's account would be restored to its filing date status without the use of SIPC funds, other than for any net losses due to market fluctuations which would be borne by SIPC.

"(7) To the extent that the resources available are less than the funds needed to restore the accounts to their filing date status, such shortfall will be allocated to customers based upon the proportion that each customer's claim in (3) above bears to the total dollar value of all remaining claims in (3) above.

"(8) Any customer whose *pro rata* share of the shortfall is within the limits of protection provided by the act will have his account restored to its filing date status. For those customers whose *pro rata* share of the shortfall exceeds the SIPC limits, the trustee will determine at his discretion which securities are not to be returned.

"(Note: Each customer's *pro rata* share of the shortfall would first be applied against his unsatisfied claim for securities, if he has claims for both securities and cash.)

"It is important to understand that the steps outlined do not result in any distribution to customers. Rather they constitute a method of ascertaining the aggregate shortfall in customer property and the resources needed to reconstitute customers' accounts. The procedure involves first equitably allocating available or obtainable customer property then computing and allocating rateably the aggregate shortfall in property needed to reconstitute customer accounts. In every instance where a customer's *pro rata* share of the shortfall is less than the protection

> provided by SIPC, the customer would receive his account intact."[209b]

Another recommendation of the task force was that the trustee should have broader authority to operate the business of the debtor:

> "1. For a limited period of time in order to preserve the saleability of certain assets of the debtor, such as branch offices;
>
> "2. To arrange interim financing to facilitate the transfer of accounts from a debtor to a transferee or purchaser of assets; and
>
> "3. To margin and maintain accounts in accordance with prescribed standards."[209c]

On the assumption "that a court will stay banks from liquidating securities held as collateral and that a trustee will be able to hold the debtor's sales and back office personnel together for a short period of time while he determines the aggregate shortage of customer property and negotiates with potential purchasers of the debtor's assets or other transferees".[209d]

The report gave consideration to requiring the trustee to complete all open contractual commitments as if in the ordinary course of business.

> "After deliberation, the task force concluded that this was not a viable alternative. There are situations where completion is not desirable, such as where no orderly market exists. This frequency occurs where the debtor is the principal market-maker for the issue in question. For the trustee to complete all transactions promptly would entail a significant administrative burden during the critical first days of a liquidation; to delay completion would subject SIPC to prolonged market risk. Also, complex problems would have to be resolved concerning the status of clearing corporations and concerning institutions which deal on a COD basis. Finally, completion of all open contractual commitments without regard to whether a customer had an interest in the transactions would result in direct protection of broker-dealers with SIPC funds in some situations. The legislative history of the 1970 act indicates that Congress did not favor extending SIPC protection in such situations, and the task force did

209b *Id.* at 68.
209c *Id.* at 69.
209d *Id.*

not find compelling reasons to suggest modification of that position."[209e]

The report also called for the increase of the present limits of protection to $125,000 per customer, with a $50,000 maximum for cash claims from the present limits of $50,000 and $20,000, respectively.

One significant omission from the report is that it did not propose extending protection to commodity traders. The reason would appear to be that the great majority of broker-dealers do not handle futures trading and the Commodity Futures Trading Commission is working on a plan of its own.[210]

Legislation to amend the SIPA, based on the report, but which would increase the present limits of protection only to $100,000 per customer with a $46,000 maximum for cash claims, was passed by the House on November 1, 1977. Senate hearings are expected by the fall of 1978.

D. PROTECTION OF CUSTOMERS THROUGH LIABILITY INSURANCE

Some broker-dealers in the United States have provided protection to customers through liability insurance additional to that provided by SIPC.

In October 1973 Merrill Lynch, Pierce, Fenner & Smith announced that it would provide up to $250,000 worth of surety insurance on the securities it holds for each customer. This is protection in addition to the $50,000 maximum per customer provided by SIPC. Since then about thirty other firms have introduced similar insurance programs.

Recently, the NYSE spent some time in an effort to develop a plan for excess customer-insurance protection for brokers. This was prompted by the fact that there had been some brokers that had apparently been turned down by insurers at a time when others had obtained supplementary insurance in substantial

209e *Id.* at 71.

210 Section 417 of the Commodity Futures Trading Commission Act of 1974, Pub. L. No. 93-463 (1974) directs the commission to consider "the need for legislation insuring owners of commodity futures accounts and persons handling or clearing trades in such accounts against loss by reason of the insolvency or financial failure of a futures commission merchant carrying such accounts". In the 37-year period from 1938 to 1974, there were 44 insolvencies of commission merchants dealing in regulated commodities resulting in $1,260,396 of customer funds being jeopardized. Inflated to 1974 dollars, this figure becomes $2,282,614. During the same period there were 13 insolvencies of merchants dealing with non-regulated commodities resulting in approximately $2,925,949 of customer funds being jeopardized which inflates to $3,724,413 in 1974 dollars; J. HELMUTH, REPORT TO CONGRESS CONCERNING COMMODITY FUTURES ACCOUNT INSURANCE (November 1, 1976) (reporting that there was no need for commodity account insurance).

amounts. In November of 1974 the NYSE chairman reported that "the insurance program kind of died of its own weight". He cited member firm resistance to the added cost of increased protection. He also gave as another reason for the lack of strong member firm interest the contemplated increase in SIPC protection from $50,000 to $100,000. The Midwest Stock Exchange and the NASD have also shown some interest in developing a group approach to insurance.[211]

The Securities Industry Association likewise attempted to develop a comprehensive plan of excess customer insurance, which would be available to members on a voluntary basis if there was enough interest. The association believed that excess coverage to about $300,000 could be obtained at an annual premium substantially lower than the $25,000 often mentioned as a minimum. Initially, some broker-dealers believed that firms with coverage might obtain a "competitive edge" in the industry. It seems not to have happened, which is a reason for the less than enthusiastic interest in excess coverage.[212]

The Securities Industry Association recently abandoned its study to provide excess SIPC insurance coverage. After several surveys it was found that there was not sufficient interest among its membership. The prospects for additional SIPC coverage to a maximum of $100,000, to be provided in legislation expected to be considered by Congress shortly, was the principal reason for the marked reduction in interest in excess coverage.[213]

E. REGULATION OF SECURITIES MARKETS IN THE UNITED STATES

Prior to the enactment of the Securities Exchange Act of 1934, stock exchanges, unless incorporated under certain state laws, were "subject to regulation by no governmental authority and...exercised unrestricted dominion over the activities of their members".[214] Exchanges were usually voluntary unincorporated associations, which were regarded both by the exchanges and the courts as private business clubs with the right to establish their own rules for admission, expulsion and discipline without judicial interference. The courts considered that the rules of an exchange as contained in its constitution and by-laws constituted a "contract by which each member had consented to be bound, and which measured his duties, rights and privileges".[215]

For many years the exchanges of the United States exercised virtually unrestricted control over their members and successfully resisted almost all attempts to place them under state or federal regulation. In 1932, a Senate investigation found that the exchanges had done little to upgrade their standards, and reforms had occurred only "during periods of popular agitation or when legislative action was threatened".[216] The investigating committee summarized its findings as follows:

> "[First] the view that internal regulation obviated the need for governmental control was unsound for several reasons. In the first place, the interests of exchanges and their members frequently conflicted with the public interest. Thus, it was amply demonstrated...that some of the methods employed by the stock-exchange members to stimulate active trading were technically in conformity with stock-exchange rules and yet worked incalculable harm to the public. Second, the securities exchanges have broadened the scope of their activities to the point where they are no longer isolated institutions but have become so important an element in the credit structure that their regulation, to be effective, must be integrated with the protection of our entire financial system. Third, stock-exchange authorities have taken the position that they would regulate only their own members and that they had no power to prevent abuses by operators who were not members of the exchanges, but who used their facilities to impose upon the public. Fourth, the attitude of exchange authorities toward the nature and scope of the regulation required was sharply at variance with the modern conception of the extent to which the public welfare must be guarded in financial matters."[217]

By reason of the "evils and abuses which flourished on the exchanges and their disastrous effects upon the entire nation ... Federal regulation was necessary and desirable", in the opinion of the Senate committee. It was no longer appropriate, it felt, to regard stock exchanges as "private clubs to be conducted only in accordance with the interests of their members".

> "[They were in fact] public institutions which the public is invited to use for the purchase and sale of securities listed therein....The great exchanges of this country upon which millions of dollars of securities are sold are

217 *Id.* at 138.

> affected with a public interest in the same degree as any other great utility."[218]

As a result of the Senate report and public agitation, the Securities Exchange Act of 1934 was enacted. Representative Sam Rayburn who was actively involved in the passage of the legislation said:

> "As a complex society so diffuses and differentiates the financial interests of the ordinary citizen that he has to trust others and cannot personally watch the managers of all his interests as one horse trader watches another, it becomes a condition of the very stability of the society that its rules of law and business practice recognize and protect the ordinary citizen's dependent position."[219]

President Franklin D. Roosevelt, in a special presidential message in respect of the legislation, said:

> "Outside the field of legitimate investment naked speculation has been made far too alluring and far too easy for those who could, and those who could not, afford to gamble."[220]

The Securities Exchange Act gave the Securities and Exchange Commission (SEC) a broad rule-making authority over the activities of investors and exchange members. Thus, the commission had direct regulatory power over all exchange members insofar as they engage in "excessive trading". Since 1938 it has had authority to regulate financial responsibility standards for all broker-dealers. The Securities Reform Act of 1975 extended its authority by giving the commission the power to abrogate, add to or delete from, rules of any of the self-regulatory bodies. The commission also has authority to define and prohibit "manipulative and deceptive devices". Notwithstanding these broad powers of regulation, the exchanges were left with a wide measure of initiative and responsibility. The SEC has, however, a powerful "reserved control...if the exchanges do not meet their responsibilities".[221] The rationale of the act was that government regulation be used only to supplement and supervise what in the first instance was self-regulation of the exchanges. The final House committee report said:

> "Although a wide measure of initiative and responsibility is left with the exchanges, reserved control is in the Commission if the exchanges do not meet their responsi-

bility. It is hoped that the effect of the bill will be to give to the well-managed exchanges that power necessary to enable them to effect themselves needed reforms and that the occasion for direct action by the Commission will not arise."[221a]

In 1938 Congress amended the Securities Exchange Act of 1934 by adding section 15A, which provided for the formation of one or more national securities associations to police the over-the-counter markets. It set detailed standards which any such association would have to meet and the substantial duties it would have to perform in order to exercise the statutory powers. Pursuant to these provisions, the National Association of Securities Dealers (NASD) was formed and registered in 1939.

The degree of regulatory authority of the SEC used to be significantly greater over NASD than the exchanges. Inversely, the right of self-regulation was greater for the exchanges than NASD. This was changed by the Securities Reform Act of 1975 establishing a new coordinated pattern of registration and regulation for national securities exchanges and securities associations.

A brief statement of the concept of cooperative regulation was contained in a 1964 address by commissioner (later chairman of the SEC) Manuel F. Cohen.

"*First:* Congress vested the Commission with primary responsibility for effectuating the purposes of the law. This requires the Commission to act directly in many areas. But unlike other federal regulatory agencies, the Commission discharges only a portion of this responsibility directly.

"*Second:* A major part of this responsibility is delegated to the self-regulatory agencies. They are to enforce compliance by their members not only with legal standards but with ethical concepts as well. They are authorized to fix standards and control practices of their members, within such concepts as the 'promotion of just and equitable principles of trade' which obviously allow a wide range of activity. In some respects these powers are broader than the Commission's authority.

"*Third:* To discharge these responsibilities, the self-regulatory agencies are vested with governmental powers which are to be exercised in the public interest and for the protection of investors. This is perhaps the key difference between a self-regulatory body and a trade association,

221a *Id.*

which is not the recipient of delegated government powers.

"*Fourth:* To aid in assuring that they perform effectively in the public interest and that they do not misuse their powers the Commission has certain oversight responsibilities. The Commission is empowered to act on its own, directly or through authority with respect to the rules of the self-regulators, when the latter do not or cannot act.

"These are the essential ingredients. Merely listing them demonstrates the cooperative character of the system."[222]

Periodic financial and operational reports must be filed by all registered broker-dealers. As a result of the 1971 *Study of Unsafe and Unsound Practices of Brokers and Dealers*, an office of Broker-Dealer and Investment Adviser Examinations was created with the SEC. The office is designed to develop and administer a program for more frequent and intensive inspection of broker-dealers and through the improved oversight of and coordination with the inspections given by the self-regulatory agencies as well as to strengthen the investment adviser inspection program.

The back office and operations crisis of 1967–1970 prompted the SEC to introduce a wide range of rule changes designed to correct the practices that led to the crisis and in general to protect the customer of a broker-dealer before bankruptcy. The SIPA specifically authorized the commission to prescribe rules and regulations necessary or appropriate in the public interest or for the protection of investors to provide safeguards with respect to the financial responsibility and related practices of all brokers and dealers, whether trading on an exchange or in the over-the-counter market, including, but not limited to, the acceptance of custody and use of customers' securities and the carrying and use of customers' deposits or credit balances.[223]

The most important rules designed to control the financial responsibility of broker-dealers are those that govern their net capital rates. Net capital rules have been described as one of the most important weapons in the commission's arsenal to protect investors.[224] In addition to the rules promulgated by the SEC,[225] rules have also been made by several state securities commissioners, the NYSE and other self-regulatory agencies. The ratio of

223 SIPA, s. 7(3).

224 Blaise D'Antoni & Assocs. v. SEC, 289 F.2d 276, 277 (5th Cir. 1961), *cert. denied* 368 U.S. 899 (1961) (*per* Wisdom, J.).

225 Rule 15c3-1, 17 C.F.R. s. 240.15c3-1 (1977).

aggregate indebtedness to net capital currently established by the SEC and all state securities commissioners having net capital rules is 20:1, except for Ohio and the NYSE, where a net capital ratio of 15:1 is required. The SEC is considering reducing the ratio to 15:1.[226] The SEC has reduced the maximum net capital ratio for new broker-dealers for the first year of their operations to 8:1. At the same time, the SEC rule was amended to increase the minimum net capital required by most broker-dealers from $5,000 to $25,000.

In order to speed up the warning that a broker-dealer may be in financial difficulty, the SEC recently promulgated rules intended to provide it and the various self-regulatory organizations with an adequate and timely flow of information on the financial and operational condition of broker-dealers. The rule has four major provisions: (1) immediate telegraphic notice by a broker-dealer to the SEC and any self-regulatory organization of which it is a member followed by a financial report within twenty-four hours when its net capital falls below the level required by any capital rule to which it is subject; (2) the filing by a broker-dealer of special monthly reports until its capital position shows improvement for three successive months when its aggregate indebtedness exceeds 1,200% of its net capital or its total net capital or less than 120% of the minimum net capital required of it by any capital rule to which it is subject; (3) immediate telegraphic notice by a broker-dealer to the appropriate regulatory authorities followed by a written report within forty-eight hours when a broker-dealer's books and records are not current; and (4) notification to the SEC by a self-regulatory organization when it learns that a member has failed to give notice or file any report required by the rule.[227]

A financial responsibility rule (15c3-3) promulgated by the SEC became effective as of January 15, 1973. It is entitled "Customer Protection – Reserves and Custody of Securities". It represents the first comprehensive step by the SEC to regulate the safekeeping of customers' funds and securities in the possession of brokers or dealers. The rule imposes varying requirments on broker-dealers to better safeguard customer property. It deals with the obligation of a broker-dealer to maintain physical possession or control over securities left with it by a customer and to have basic reserves against customer cash, and cash realized through utilization of customers' securities. The rule "addresses itself to three

226 SEC, Securities Exchange Act of 1934 Release No. 10,525, November 29, 1973, [1973 Transfer Binder] CCH FED. SEC. L. REP. ¶79,566.

227 Rule 17a-11, 17 C.F.R. s. 240.17a-11 (1977); *see* SEC, 38TH ANNUAL REPORT 59, 60 (1972); Guttman, *supra* note 146, at 894.

primary areas of customer protection: (1) the obligation of a broker-dealer to promptly take possession or control of all fully-paid securities and excess margin securities carried for the account of customers; (2) a formula for a cash reserve for all customer funds not used in customer-related transaction; and (3) separation of the brokerage operations of a firm from its other activities".[228] The restrictions on the use of customers' funds and securities and the requirement that securities be promptly brought under physical possession or control are designed to protect customers' assets on liquidation. The rule was also intended to restrict unwarranted or over-expansion of a broker-dealer's business, as it would prohibit the utilization of customers' funds and customer-derived funds in areas of the firm's business such as underwriting trading and overhead.[229]

In order to provide better physical control over securities the SEC adopted Rule 17a-13 ("Box Count" rule), which requires broker-dealers to make a quarterly physical examination and count of firm and customers' securities held, and to verify securities subject to firm control or direction but not in the firm's physical possession. During the 1967–1970 period the relevant rules relating to the movement and location of securities provided for only a once-a-year check as part of the audit required by a broker-dealer in its annual report of financial condition.

All regulations are primarily directed toward the protection of customers' funds and securities. If the regulations are observed the operation of a securities firm is not risky. When failures have occurred there generally has been some wrongdoing on the part of principals or employees of the firm or neglect in the observation of the regulations promulgated by the SEC or of the exchanges or NASD. In such cases, or where a firm is facing failure for any reason, the exchanges and NASD have developed practices designed to salvage the firms in the interests of protecting customers. Only in the last resort in such cases is it expected that customers would be obliged to look to SIPC for protection.

The recent failure of Weiss Securities, Inc., is a case in point. In April 1973 several principals of Weiss informed the NYSE of which it was a member firm that the firm "may have" been "understating its profit and loss report to the exchange by several million dollars". The exchange immediately launched an intensive investigation of Weiss' problems and attempted to aid it in improving its capital position so that the firm would survive and customer safety would be assured.

228 SEC, 38TH ANNUAL REPORT 59 (1972).
229 *Id.*

As a result of the investigation and study made by the exchange a merger of Weiss with a stronger firm was suggested. Weiss accepted this suggestion and in turn proposed to the exchange that, pending negotiations and consummation of the merger, it transfer some of its larger margin accounts to the other firm in order to effect an automatic and immediate improvement of its debt-capital ratio. This suggestion was approved by the exchange as a time-tested technique of restoring stability to financially troubled firms. Weiss then unilaterally selected and transferred to the other firm those accounts with the largest debit balances.

The director of the SEC's Division of Market Regulation in commenting on the operation said:

> "It is an accepted practice when a broker-dealer is approaching financial difficulty for...self-regulatory organizations, including the NYSE, to undertake various measures in an effort to place the broker-dealer in a stronger financial posture and to thereby limit overall customer exposure. Such efforts frequently result in the merger, rehabilitation or, if necessary, self-liquidation of the broker-dealer without loss to customers and without the delay and inconvenience which may attend a forced liquidation under the SIPC Act. One step often taken to improve a broker-dealer's financial posture is to reduce the firm's liabilities, and accordingly, reduce the amount of capital required to support these liabilities....
>
> "One possible avenue for reducing a firm's net capital ratio is to reduce the amount of bank borrowings collateralized by customers' margin securities thus reducing aggregate indebtedness which in turn effects a lower net capital ratio.
>
> "In order to reduce bank borrowings collateralized by customers' margin securities, customers' accounts with debit balances are delivered to other broker-dealers who are willing to assume responsibility for such accounts....
>
> "While these efforts to unwind the affairs of Weiss without resort to a SIPC liquidation were unsuccessful, such efforts in other instances appear to have been successful in avoiding forced liquidations of broker-dealers and the disruption inherent in such liquidation proceedings."[230]

There is no doubt however that customers' funds and securities are much better protected in the United States by the major changes since the crisis of 1967–1970. The SEC in a recent report summa-

230 Rich v. New York Stock Exchange Inc., 379 F. Supp. 1122 (S.D.N.Y. 1974).

rized the advances in the provision of stricter standards and procedures and the improved surveillance program:

> "While the changes in the securities industry since 1967 culminated with the adoption of Rule 15c3-3, it is important to emphasize other major advances of the past several years which the Commission believes provide a basis for the belief that the operational failures which result from increased trading volume and inadequate systems for the control and delivery of securities should not recur. Also, the Commission believes that the ultimate objective of improving business practices in the securities industry to serve and protect investors is approaching realization.
>
> "Such recent advances include:
>
> "1. The development and almost universal acceptance of the continuous net settlement system ("CNS") for the completion of securities transactions coupled with the use of securities depositories and other processing facilities and the progress toward realization of a nationwide clearance and depository system.
>
> "The improvement of these systems not only reduces exposure to operational problems and exposure to theft inherent in the physical handling and processing of securities, but also protects the broker-dealer community from loss to it or its customers occasioned by the failure of any given broker-dealer. Transactions completed through such systems are marked to the market on a daily basis minimizing the risk to the system and its members who are required to maintain substantial clearing fund deposits with such systems not only as collateral for their own obligations but also to provide additional protection to such systems which should be used only to satisfy losses incurred by the default of other members.
>
> "2. The development of more comprehensive recordkeeping and control requirements including the quarterly count and verification of securities positions and expanded requirements of independent public accountants to (1) review the procedures for compliance with Rule 15c3-3 and margin requirements of the Federal Reserve System; and (2) comment upon any material inadequacies in systems of accounting control and procedures for safeguarding securities.
>
> "3. The implementation by the Commission and the self-regulators of more vigorous buy-in requirements respecting incompleted transactions with both broker-dealers and their customers.

"4. The development by the Commission and the self-regulatory organizations of comprehensive examination and surveillance programs which have been of significant importance in the timely detection of operational and financial difficulties experienced by broker-dealers. Of equal importance is the concern and premium that broker-dealers themselves now place on the effective management and control of their securities processing and other operational areas.

"5. The development of the Joint Regulatory Report and the steps taken by the Commission to develop a FOCUS Report which will ultimately provide for more effective analysis of the financial and operational condition of broker-dealers.

"6. The development by the Commission and the self-regulators of substantially more effective requirements for retaining both equity and subordinated capital which has eliminated impermanent capital and the probability of a recurrence of a dangerous flight of capital from the securities industry at times when permanent capital is most necessary."[231]

The Securities Reform Act of 1975 made important amendments to preserve and reinforce the concept of industry self-regulation with oversight of the SEC. Standards were set to assure that self-regulatory organizations follow effective and fair procedures and to design rules, *inter alia*, to prevent fraudulent and manipulative acts and procedures, to promote just and equitable principles of trade and to protect investors and the public interest. The SEC is given the power to take action against an exchange or an association upon a finding that the organization has failed to enforce its own rules or Securities Exchange Act provisions, or rules or regulations thereunder.

Chapter IV
Commodity Futures Options and Commodity Options[231a]

The struggle for investor protection can be regarded as being only one aspect of the consumer revolution.[232] The general public and government for many years have expressed concern about the

231 SEC, Securities Exchange Act of 1934 Release No. 11094, November 11, 1974 [1974-1975 Transfer Binder] CCH FED. SEC. L. REP. ¶80,006.

231a I gratefully acknowledge the valuable assistance of Peter Bacsalmasi, a graduate student in business administration at York University, in the preparation of this chapter.

232 H. BARUCH, *supra* note 156, at 298.

investor in securities. There has not been anywhere near the same concern demonstrated in respect of the special interests of consumers and indeed the government itself in the operation of commodity exchanges.

A. COMMODITY FUTURES TRADING

Sometimes governments have justified regulating the sale of securities on the ground that shareholders, estimated to number in the neighbourhood of thirty million in the United States, are the largest single consumer group in the country. What is often overlooked is that every citizen is affected by commodity exchanges in that they establish prices of commodities that affect not only producers, merchandisers and processors but also inventory values, domestic consumer prices, world commodity prices and government fiscal policy.[233]

In 1972, The Conference Board, an independent, nonprofit business research organization, reported that despite the obscurity and lack of public awareness of trading activities of commodity exchanges, the dollar value of futures trading in the United States was more than half that of the U.S. security exchanges.[234]

In Canada, most trading in commodities centres around the western grain and gold markets. The Winnipeg Commodity Exchange, founded in 1887 and until 1972 known as the Winnipeg Grain Exchange, limited its futures trading for many years to the five grain products not controlled by the Canadian Wheat Board, namely, rapeseed, flax, rye, oats and barley. Since 1969, the exchange has been branching into other commodities, setting up markets in beef, potatoes and gold. This expansionary policy will continue, said the president of the exchange:

> "We are interested in trading any commodity for which there would be a viable market. At the moment we are studying the possibility of adding markets for rapeseed oil and rapeseed meal and we are also looking into silver and lumber....The exchange recorded 14,500 gold trades in the first fourteen months of the market's operation to the end of December 1973. This year we expect between 60,000 and 70,000 trades."[235]

The following is a list of the different commodities that are at present actively traded on North American markets:

Grain: wheat, corn, oats, barley, sorghums, milo, flax, rye.

233 Vogelson, *Tightened Regulation for Commodity Exchanges*, 55 A.B.A. J. 858 (1969).

234 B. Berlin, Corporate Use of Commodity Futures (Conference Board Report 1972).

235 The Globe and Mail (Toronto), Tuesday, May 14, 1974 (interview with Ronald S. Ennis, president, Winnipeg Commodity Exchange).

Oilseeds: soybeans, rapeseed, flaxseed, cottonseed.
Fats and oils: soybean oil, cottonseed oil, peanut oil.
Livestock feeds: cattle, hogs, broilers, pork bellies, skinned hams, fresh eggs, frozen eggs, boneless beef, turkeys.
Fibres: cotton, wool, wool tops.
Foods: potatoes, apples, orange juice, butter, sugar, coffee, cocoa, tomato paste.
Forest products: plywood, lumber, rubber.[236]
Metals: platinum, copper, tin, mercury, gold, silver, lead.
Other: propane, foreign currency, U.S. silver coins.

Commodities must meet certain requirments or criteria and have special characteristics before they can be listed or feasibly traded on the futures markets. These are:

(1) Units must be homogeneous; *i.e.*, that traders be able to buy or sell according to established grades and descriptions. Each item must be able to be graded or classified whereby every unit of one commodity may be regarded commercially as the equivalent of a certain number of units of the other (*i.e.*, they must be fungible).
(2) Supply and demand must be large, whereby no one financial body might gain control over an item and obstruct the mechanics of the free market. Furthermore, supply and demand must be uncertain and subject to fluctuations from time to time. Otherwise, commodities with definite markets and sources of supply have no need of the organized market machinery.
(3) The commodity must be relatively durable. Contracts may call for delivery many months in the future.[237]

Transactions in commodities can involve either futures contracts or spot (cash) transactions. A futures contract is an agreement executed on a commodity exchange to buy or sell a definite quantity of a specified commodity of a certain grade in the future. Only 1% or 2% of futures contracts ever reach maturity.[238] They are usually settled by an offsetting futures contract, either before or during the delivery month specified in the contract. This is known as a "round-term".[239] A spot (cash) transaction involves delivery of the commodity purchased and accordingly does not

236 The governors of the Commodity Exchange Inc. of New York recently approved preliminary plans for the reactivation of trading in rubber futures contracts; The Globe and Mail (Toronto), August 31, 1974, at B4.

interest commodity investors as they are not interested in making or accepting delivery of a commodity.

The majority of trading activities are carried on by agricultural and industrial producers and manufacturers who must carry large physical quantities of commodities in inventory and are subject to the risk of price fluctuations. The futures market affords these users a means of price protection by enabling them to hedge the physical quantities of commodities in inventory in either their raw or finished state.[240]

> "There are basically two types of hedging operations. A company with a large inventory on hand can protect itself against a loss on the value of its cash stocks by *selling* an equal amount of the commodity in the futures market. This is called 'selling short'. If the value of the cash commodity drops before it is sold, the company would take a loss on its cash transaction. But the value of the futures contracts the company sold would probably decline by an equal amount. The company then buys enough futures contracts to liquidate its position and thereby achieves a profit on its futures transaction. The profit will approximately offset the loss the company suffered on the decline in value of its cash commodity.
>
> "The second type of hedge involves an opposite manoeuvre. When a company has orders to deliver actual commodities over several months in excess of its stocks, it will *buy* futures contracts in amounts equal to its commitments. This is called 'going long' in the futures market. If the cash price goes up, the futures contracts probably will increase in value by a similar amount. So although the company must buy its actual commodities at a price higher than it estimated when it accepted the orders, it can sell its futures contracts at a profit which will offset its higher costs or the company could take delivery of the futures contracts as they came due to fulfil its order commitments.
>
> "In both these examples of basic hedging manoeuvres, it was assumed that a company's purchases of futures contracts offset the losses it would have incurred by adverse price changes in the cash market. The reverse frequently happens, of course, and cash prices move in a direction that would have been favourable to the company. In such cases, the profit in the cash market is wiped out by a loss on the opposite position the company has assumed in the

240 *Id.* at 106.

> futures markets. The companies maintain it makes little difference to them which way the prices move. Their only purpose in entering the futures market is to avoid losses and they consider their trading successful if they merely break even".[241]

One successful commodity speculator described commodity futures and the use of commodity future trading as:

> "There are two groups who trade in futures: those who produce and use the commodities and who are future trading to avoid risks; and speculators who seek the risks because of the great rewards possible. Originally commodity future trading served two purposes:
>
> "1. To enable producers of commodities to be certain of receiving a fair price for their commodity. For example, if a planter is producing sugar there are many months between the time of planting and the time that actual physical delivery of the sugar can be made. If during this interval the wholesale price of sugar were to fall from say 4¢ a pound down to 2¢, the planter might discover that all his labour produced no profit. On the other hand, sugar might have climbed to 6¢, but planters cannot afford to gamble with their crops, and so they seek some way to ensure a fair profit for themselves. They accomplish this by selling their crop, or at least a portion of it, through a future trade. Thus if the sugar were trading at 4¢ a pound for immediate delivery, there should be little difficulty in selling futures on sugar at 4¢ a pound (possibly a little more or less; this will be explained later) for delivery six months hence. In this way the planter has ensured a successful sale of his crop at a good price.
>
> "2. To enable users of commodities to be certain of obtaining supplies of their needed commodities at a reasonable price. For example, a manufacturer of candy bars must contract in advance to deliver the candy to his wholesalers. If while his contract is still in force he finds that the price of sugar has considerably increased, he may be put in the difficult position of having to produce his candy and sell it at a loss. It is not possible for him to store his sugar supplies very far in advance because of the costs and capital involved, so he protects himself by purchasing a sugar future at 4¢ a pound. Regardless of any price

241 N. Miller, *supra* note 153, at 65, 66; ONTARIO MINISTRY OF CONSUMER AND COMMERCIAL RELATIONS, REPORT OF THE INTERMINISTERIAL COMMITTEE ON COMMODITY FUTURES TRADING 21 (1975) [hereinafter cited as COMMODITY FUTURES REPORT].

> fluctuations, the manufacturer is now sure that he can manufacture and sell his candy bars at a profit.
>
> "Who runs the risks that these producers and consumers are seeking to avoid? Unfortunately the times when producers wish to sell futures rarely coincide with those when consumers wish to buy, and so a third party is welcomed to commodity trading – the speculator. Because producers and consumers *must* buy and sell at certain times (or *hedge*, which is the technical term) there are tremendous profit opportunities for the speculator who can buy or sell when and if he chooses.
>
> "Because the speculator has become essential to the smooth running of the futures markets, a huge industry has developed to service and inform him. Numerous firms specialize in handling speculators' accounts and in rushing information about commodities to them. Newspapers carry crop and weather reports, and even the United States government cooperates by simultaneously releasing crop forecasts to all interested parties. Because weather changes or large sales or purchases can rapidly affect commodity prices, the brokerage firm with whom each speculator deals will send him a daily letter, reporting all such changes and giving that firm's opinion as to future changes. Thus it is very easy for the speculator to keep well informed about the current national and world factors which may affect any commodity in which he is interested. In fact it is not uncommon for a speculator in a certain commodity to be far better informed about that commodity's current and prospective market than are the actual producers of the commodity. Certainly it is easier for a sugar speculator in New York City who is reading Merrill Lynch's daily sugar bulletin to be more up-to-date on the world sugar situation than can be any sugar beet grower in Louisiana or Haïti."[242]

Commodity speculators try to buy when they feel the price is too low and sell when the price is thought too high. Their success is most often determined by their ability to play a "hunch". If their hunch is wrong, they may be called upon to replace their margin deposit the next day due to a downward price fluctuation which had wiped out the previous day's deposit.

242 M. SHULMAN, ANYONE CAN MAKE A MILLION 182-84 (1966); COMMODITY FUTURES REPORT, *supra* note 241, at 21-24.

B. COMMODITY FUTURES OPTIONS

The commodity futures contract discussed in the previous section is a contract for the purchase and sale of a specified quantity and quality of a commodity deliverable at a specified future time. Related to commodity futures contracts are commodity futures options (put and call transactions). A commodity futures option is an option to purchase from (*i.e.*, "calling" for) or sell to (*i.e.*, "putting" to) the grantor of the option an underlying commodity futures contract at a fixed price within a certain period. In consideration for this right the option grantor collects a premium which represents the full extent of the purchaser's financial commitment up to the time the option is exercised or expires. The premium is usually between 5% and 15% of the market value of the futures contract at the time the option is granted.[243]

The purchaser of a "call" realizes a profit if the price of the underlying futures contract rises. The purchaser of a "put" realizes a profit if the price of the underlying futures contract falls.

Some hedgers find commodity futures options more attractive than commodity futures contracts because of the absence of margin calls during the life of the option and the uncertainty of their requirments for the particular commodity. An option grantor who produces, deals in or uses a commodity can reduce fluctuations in income and at the same time generate premium income.

Opponents of commodity futures options argue that because of the hedging activities option grantors may undertake to meet their obligations, price movements on the commodity futures markets become exaggerated. Other critics suggest that commodity futures options reduce the liquidity of markets in commodity futures contracts by taking business away.[244]

Trading in commodity futures options is prohibited in the United States in respect to commodities regulated under the Commodity Exchange Act prior to the amendments contained in the Commodity Futures Trading Commission Act of 1974. Trading in options on commodities brought under the Commodity Exchange Act for the first time by the latter act will be permitted if not contrary to the regulations established by the newly established Commodity Futures Trading Commission.

C. SPECULATORS

Apart from those who engage in the futures market for price protection there is a good deal of trading carried on by speculators. This is not unwelcome by the exchanges.

243 *Id.* at 32.
244 *Id.* at 38.

The speculator is attracted to the commodities markets by the opportunity for profit. The futures market speculators do not own or deal in the physical commodities in which they trade. The speculators hope to realize or profit by assuming the risks of price fluctuations. A commodity speculator buys futures contracts when he thinks prices are too low and sells futures contracts when he thinks prices are too high.[245]

The president of the Winnipeg Commodity Exchange recently commented that farmers fear speculators – people who trade in commodities for a profit with no thought of taking delivery. He was of the opinion, however, that the presence of speculators helps to maintain adequate price levels. "If speculators were not in the market, we could have some pretty drastic price fluctuations at certain times of the year. Farmers are too busy in spring to make deliveries so commodity exporters are not buying. So the speculator is always in the market and this helps to stabilize supply and demand."[246]

Futures contracts are always purchased on margin. Margin requirements for trading on securities exchanges range between 50% to 100% of stock value and usually 65% or more. Margin requirements for commodities are 10% to 20% and in some cases as low as 5%. A 5% rise in the futures price of a commodity can mean a 100% profit for the speculator just as a 5% drop means a 100% loss.[247]

A speculator can however be locked into his position and cannot liquidate his position. He may have to continue to accept losses even after his original stake is wiped out. This results from the exchanges setting prices that a particular futures contract can move up or down in a day in order to prevent extreme price fluctuations. In July 1973, for example, soybean prices on the Chicago Board of Trade increased several times, on twelve successive days. In the face of the strong upward price pressure there were no sellers and trading came to a virtual standstill.[248]

The speculators are considered by the futures trading industry to be an integral part of the futures market. The additional volume of trading generated by the speculators reduces the price disturbance which can result from placement of hedges for any

248 *Id.*

large quantities of a commodity and improves the possibilities of effecting a transaction for a hedge order limited to a specific price.[249]

At one time it was doubted in England whether a sale of unspecified goods for future delivery was valid if the seller neither owned such goods at the time of contracting nor had any means of fulfilling the contract except by purchase from a third party.[250] It was ultimately held that a future sale was not invalid merely because the seller did not own the goods and could only satisfy his obligation to sell by purchase from a third party.[251]

A fine line divides speculation from gambling. Certainly a contract for the future sale and purchase of commodities would not on its face be a wager. The real test of the validity of a futures contract that is generally accepted was established by the Court of Common Pleas in 1852. It is the test of "intent of the parties to deliver".[252]

This test was later restated by Mr. Justice Mathews of the United States Supreme Court:

> "...a contract for the sale of goods to be delivered at a future day...valid when the parties really intend and agree that the goods are to be delivered by the seller and the price to be paid by the buyer; and, if under sale of such a contract, the real intent be merely to speculate in the rise and fall of prices, and the goods are not to be delivered, but one party is to pay to the other the difference between the contract price and the market price of the goods at the date fixed for executing the contract, then the whole transaction constitutes nothing more than a wager, and is null and void."[253]

The Criminal Code (section 341) now provides:

> "(1) Every one is guilty of an indictable offence and is liable to imprisonment for five years who, with intent to make gain of profit by the rise or fall in price of the stock of an incorporated or unincorporated company or undertaking, whether in or out of Canada, or of any goods, wares or merchandise,
>
> "(a) makes or signs, or authorizes to be made or signed,

251 Hibblewhite v. M'Morine, 5 M. & W. 462, 15 E.R. 195 (Ex. 1839).

252 Grizewood v. Blane, 11 C.B. 526, 138 E.R. 578 (C.P. 1852).

253 Irwin v. Miller, 110 U.S. 499 (1884).

> any contract or agreement, oral or written, purporting to be for the purchase or sale of shares of stock or goods, wares or merchandise, without the *bona fide* intention of acquiring the shares, goods, wares or merchandise or of selling them, as the case may be; or
> "(b) makes or signs, or authorizes to be made or signed, any contract or agreement, oral or written, purporting to be for the sale or purchase of shares of stock or goods, wares or merchandise in respect of which no delivery of the thing sold or purchased is made or received, and without the *bona fide* intention of making or receiving delivery thereof, as the case may be;
> "but this section does not apply where a broker, on behalf of a purchaser, receives delivery, notwithstanding that the broker retains or pledges what is delivered as security for the advance of the purchase money or any part thereof.
> "(2) Where, in proceedings under this section, it is established that the accused made or signed a contract or agreement for the sale or purchase of shares of stock or goods, wares or merchandise, or acted, aided or abetted in the making or signing thereof, the burden of proof of a *bona fide* intention to acquire or to sell the shares, goods, wares or merchandise or to deliver or to receive delivery thereof, as the case may be, lies upon the accused."

A contract however is not a gaming contract unless both parties to it intend to gamble.[254] If one party is honestly intending to carry out his contract to the letter and has no knowledge that the other party is engaged in a purely speculative transaction without the intention to either take or give delivery of what is bought or sold, the contract is not unlawful and may be enforced against the person who seeks to escape liability by setting up his own violations of the law.[255]

In *Beamish v. Richardson*[256] some members of the Supreme Court of Canada held that because the customers' intention in a commodity transaction was to speculate in futures merely, with no expectation either for delivery or taking delivery in kind of any commodity, the transaction fell under the ban of what is now section 341 of the Criminal Code. In *Maloof v. Bickell & Co.*[257] which came before the Court five years later Duff, J., however explained:

"*Beamish v. Richardson*, nevertheless, is not a decision

254 Brosseau v. Angevin, 27 Que. C.S. 510 (Ct. of Review 1905).

255 Woodward v. Koeford, [1921] 3 W.W.R. 232, 37 C.C.C. 329 (Man. C.A.).

256 49 S.C.R. 595 (1914).

257 59 S.C.R. 429 (1919).

> upon any point as to the application of that section (*i.e.*, present s. 341). My brother Iddington and my brother Brodeur based their judgment, it is true, upon the view just explained of the effect of the code, but my brother Anglin, though expressing an inclination of opinion in the same direction, explicitly stated that he did not rest his judgment upon that ground, while the remaining members of the court (the Chief Justice and myself) took the opposite view."[258]

In *Maloof v. Bickell & Co.* the majority of the Court agreed that the facts of the transaction which was the subject of the case could not be distinguished from *Beamish v. Richardson* but that the transaction was not within the prohibition of the code. Duff, J., in his reasons said:

> "The purchases authorized by the appellant's orders were to be purchases in the corn pit of the Chicago Board of Trade and in the usual course of business, that is to say, by agents in Chicago; with the consequence that in the absence of agreement to the contrary, the agents would contract as principals and not as representatives, in other words, the purchases and sales would be purchases and sales enforced only by the agent."[259]

Anglin, J., as in the *Beamish* case five years before was still expressing an inclination of opinion in the same direction:

> "While I do not rest my judgment on the grounds of illegality, because in the view I take of the other question it becomes unnecessary that I should do so, I am inclined to think the evidence discloses that neither the plaintiffs nor the defendants at any time contemplated that delivery of the grain sold should be made or taken under the agreements purporting to be contracts for the sale of such grain which the defendant authorized and the plaintiffs made. The intent always was to meet the obligation to deliver by an offset of a contract to purchase a like quantity of grain to adjust the differences between the selling and the buying prices and by thus dealing in such differences to make gain or profit by an anticipated fall in the price of the merchandise. Such transactions are within the literal terms of section 231 of the Criminal Code, and, I believe, are also within the mischief against which it was directed. The difference in morals between thus dealing in differences and speculative transactions

258 *Id.* at 436.
259 *Id.* at 435.

> in which there is an actual purchase accompanied by present or future receipt and a subsequent sale accompanied by delivery, the intent being to make profit by the rise in price of the commodity so dealt in, may not be very clear; but Parliament in its wisdom has deemed it proper to make this distinction, with the result that a transaction of the former class is, while one of the latter is not, *malum prohibitum*.
>
> "For these reasons I would allow this appeal and would dismiss the plaintiffs' action."[260]

Prudential Exchange Co. v. Edwards[261] is the last of the three Supreme Court of Canada decisions in civil actions which have canvassed the applicability of section 341 to commodity futures contracts executed on commodity exchanges. In the *Prudential Exchange* case, Duff, J., while discussing the machinery of the exchange in setting off contractual obligations said:

> "Nor do I think the statute applies, to put the case in its simplest form where the transaction contemplates delivery and payment and the enforceability of the obligations to deliver and pay, merely because one of the parties intends to make use of the machinery of an exchange in such a way as to discharge his obligation to deliver by the acquisition of a converse obligation to deliver to him and the setting off of these obligations one against the other; provided always that the converse obligation is equally real and equally enforceable in point of law."[262]

In the same judgment, Davis, J., said:

> "In one sense it is true, in most marginal trading on a stock market, that the customer does not expect to be called upon to make physical delivery of share certificates representing the shares that he has sold or to take physical delivery and make payment in full for the shares which he has bought. When a marginal trader sells either short or long he probably seldom visualizes the obligation to take or to give delivery – he is so hopeful of a rising or a falling market in the particular stock or commodity in which he is trading that he expects within a short time to be able to close his account and take out a money profit. But the legal obligation is always there and he knows perfectly well that it is there. If a customer who deals on a recognized stock exchange could, every time he loses

260 *Id.* at 519, 520.
261 [1939] S.C.R. 135.
262 *Id.* at 142.

> heavily by the stock going the opposite way from that which he expected, turn 'round and say that he never intended to have any real transactions in the stock or commodities but was merely gambling in breach of the Criminal Code, it would be quite impossible to carry on the business of a well-regulated public stock exchange which renders its own peculiar public service. Here, the respondent admits that he wanted real sales to be made and real purchases to be made for him on the Winnipeg Grain Exchange for future delivery. I cannot see that he can escape from the payment of his losses."[263]

One commentator on section 341 is of the opinion:

> "[W]ith respect to the trade in commodity futures contracts on commodity exchanges, the Supreme Court of Canada has interpreted the requirement of section 341 that contracts for commodities be made with the *bona fide* intention to make or receive delivery to mean that contracts for commodities are to encompass real, legally binding obligations for the making or receiving of delivery. Therefore the accused will apparently discharge the onus of proof under 341 (2) by demonstrating that he has entered into a contract with real, binding obligations to make or receive delivery without necessarily making or receiving delivery. Of course, evidence that actual delivery has been effected will always discharge the burden of proof."[264]

It is apparently the view of the Ontario Securities Commission that section 341 of the code does not prohibit speculators in futures where there is no intention to deliver or take delivery. Certainly this is only the case where there is an intervention in the transaction of agents who contract as principals on behalf of the purchaser or vendor rather than representatives. Whether there are other exceptions it is difficult to say.

It is submitted that Parliament should amend section 341 to make it clear whether or not it applies to speculation in commodities and futures. Certainly there appears to be some confusion in thinking on the part of Parliament and others on the nature of commodity speculation. Commodity speculation does not, for example, cause shortages in a commodity. It is not a case where there is any hoarding or removal of commodities from the market, and

263 *Id.* at 154.

264 *Commodity Futures Contracts and the Significance of the "Bucketing" Provision in Relation to Trade in Commodities*, in COMMODITY FUTURES REPORT, *supra* note 241, at 14 (commentary by Edward Then, Ministry of the Attorney-General of Ontario, discussing s. 341 of the Criminal Code).

the speculator does give some protection to the commodity producer who does not wish to gamble on the sale of an entire crop at an unknown price sometime in the future.

D. REGULATION IN THE UNITED STATES

In the United States, commodity markets have been regulated since 1921.[265] The Futures Trading Act of 1921[266] was a response to the demand for regulation growing out of the high agricultural prices following the first world war. The Grain Futures Act of 1922[267] was essentially the same legislation enacted pursuant to the criminal jurisdiction of Congress purporting to prevent interference with interstate commerce when the Futures Trading Act of 1921 was declared unconstitutional. The Commodity Exchange Act of 1936[268] amended and enlarged the Grain Futures Act.

The Commodity Exchange Authority (CEA) was established under the Commodity Exchange Act. The CEA was responsible for the supervision and regulation of trading of agricultural commodities in interstate commerce and contracts for future delivery. Many important commodities such as aluminum, apples, cocoa, coffee, foreign currency, lumber, silver, sugar and tin which were traded in U.S. commodity exchanges were not regulated.

Largely as a result of the De Angelis Salad Oil Swindle[269] the act was substantially amended in 1968.[270] The Senate report on the amendments pointed out the unique lack of regulation. The report referred to the fact that futures trading in the principal agricultural commodities is at a record level and that the effects of trading are significant factors in the domestic and world economies. Members, brokers and dealers on the national securities exchanges are held to strict financial limitations and their solvency has been considered essential to protect the public interest. But, unlike brokers on the securities markets, commodity consumer merchants have not been required by public policy to meet any financial requirements whatsoever.[271] Among the amendments to the act were imposition of minimum financial requirements, provi-

265 Measures to check speculation in commodity prices date back to at least 301 A.D. when the Edict of Diocletian set a maximum price for provisions and maximum wages. Its effects were ruinous to agriculture and to markets.

271 S. REP. No. 947, 90th Cong., 2d Sess. (1968).

sions for cease and desist orders coupled with additional power to deal with price manipulation.

The Commodity Futures Trading Commission (CFTC) Act[272] of 1974 made substantial amendments to the Commodity Exchange Act which extended coverage to include all goods, articles and all services, rights and interests in which contracts for future delivery are currently being dealt with, or may be dealt with in the future. Transactions in respect of certain commodities such as foreign currency which are regulated by other agencies are exempted from regulation under the Commodity Futures Trading Commission which replaced the CEA.

The CFTC act specifically directed the commission to consider "...the need for legislation insuring owners of commodity futures accounts against loss by reason of the insolvency or financial failure of a futures commission merchant carrying such accounts".[273] The commission made a study and in its report to Congress stated that the need for insurance protection is low because (a) the level of public confidence in the safety of funds appears to be relatively high, and (b) the benefit-cost ratios demonstrate that insurance protection would not be cost effective. It felt that there was no need for additional legislation.[274]

E. REGULATION IN CANADA

As a result of the *Report of the Royal Grain Inquiry Commission of 1938*, the federal Grain Futures Act of 1939[275] was passed. The act, which was designed to regulate futures trading in wheat, oats, barley, rye, flaxseed and corn, was proclaimed but not implemented.

In 1943, by Order in Council, futures trading in wheat was suspended. The Canadian Wheat Board was constituted the sole interprovincial and international marketing agency for western Canadian wheat. The Wheat Board's power was extended in 1948 to oats and barley. In 1974 the federal government removed from the control of the Wheat Board the purchase and sale of wheat, oats and barley for domestic animal feed use.

The Ontario Securities Commission has taken the position that "regulation(s) designed to apply to capital markets...(were) not designed to regulate contracts which had as their goal facilitating trading in actual commodities".[276] An Ontario Interminis-

terial Committee on Commodity Futures Trading recommended legislation to regulate trading in commodity futures contracts.[277] A bill for an Act to Regulate Trading in Commodity Futures Contracts was introduced in the Ontario legislature in 1977. The bill died on the order paper and no further legislative action has been taken.[278]

Apart from the criminal law provisions relating to gaming in stocks and merchandise and enforcing rules of fair play in commodity trading[279] the Canadian and U.S. governments also regulate the commodity markets in the form of international agreements, domestic farm policies and charitable ventures, whereby a commodity's demand, supply and price are most often influenced. A scramble for government contracts often leads to price cutting between competitors that would ultimately benefit the consumer either at home or abroad. Agreements between nations regarding trading limits of one item or another often prevents the producers from glutting the market due to an inaccurate calculation of demand. Unfortunately, governments have been noted to "over pay", especially in cases of foreign aid, for sometimes inferior products from dealers searching for high profits.

The sale of commodities, particularly agricultural commodities, is also greatly controlled in both Canada and the United States by marketing boards.

The industry of options on commodity futures contracts in Canada may be regulated by securities laws, the creation of a Commodity Exchange Authority or a similar agency or through the Criminal Code. The choice among the alternative means of regulation should depend on which route best protects the investing public. But the propriety of bringing some regulation to the industry cannot be doubted.[280] The three principal areas in which regulation is needed in respect of trading in commodity futures contracts and other contracts based on the present or future price of commodities are (a) the marketplace, (b) the participants, and (c) the contracts.

At present in Canada the commodity market is almost completely free of controls and regulations. Unskilled and dishonest dealers who are not members of an exchange or regulatory association may sell commodities without having any capital of their own.[281] Recently, Morton S. Shulman, a member of the Ontario

legislature, complained in the House that in Ontario there were "no regulations, no rules, no financing required, no inspectors, no government supervision in the commodities field".[282]

If any Canadian insurance or similar program to SIPC in respect of securities dealers is established, consideration should be given to having it apply to commodity dealers. SIPC does not apply to funds in commodity accounts, which is difficult for the investing public in the United States to understand. Investors know that very often securities and commodity futures may be purchased from the same broker-dealer. It should not be overlooked that the bankruptcy of Ira Haupt & Co. was precipitated by reason of the substantial losses on the commodity side of the firm's business arising out of The Great Salad Oil Swindle.

Not only may consumers and the public in general be hurt by an unregulated commodity exchange: when a broker-dealer defaults, customers are subject to the same problems as when a commodity futures broker fails. The relationship of a commodity broker to his customer is analogous to that of a broker-dealer and his customer. The same general law in respect to the failure of a commodity broker applies in Canada as did the law in the United States before the enactment of section 60(e) of the Bankruptcy Act. Thus, a grain broker holds the commodity accounts he has in pledge for his marginal customers. Tracing and all related doctrines as developed in stockbroker cases involving the failures of broker-dealers would accordingly apply.[283] The same case for simplifying the expensive and time-consuming administration of broker-dealer failures which often result in unfair or arbitrary results can be made for commodity brokers.

Chapter V
Protection of Customers' Funds and Securities in Canada

A. THE INSTITUTIONAL AND REGULATORY FRAMEWORK OF THE SECURITIES INDUSTRY IN CANADA

In most provinces there is a two-tier regulatory structure. It consists of a provincial securities commission at the top and be-

---

Ont. Cty. Ct. Conviction registered September 10, 1974). The defendant, who was convicted of defrauding the public of some $185,000, was a former registrant under the Ontario Securities Act. The Toronto Stock Exchange had ordered that he never again should be permitted to have any position of any nature in any member firm. Vance had purported to be effecting transactions on his client's behalf when, in fact, he was not placing any orders with any member of a commodity exchange.

282 The Globe and Mail (Toronto), March 21, 1975, at 2; The Toronto Star, March 21, 1975, at A-6.

283 *In re* Rosenbaum Grain Corp., 112 F.2d 315 (7th Cir. 1940).

neath it the various self-regulatory agencies such as stock exchanges, Investment Dealers Association of Canada, broker- dealer associations and the Canadian Mutual Funds Association.

There are two broad, sometimes conflicting objectives of national policy in the regulation of the securities industry:

(1) the first is to maintain, facilitate and improve the performance of the capital market in the interests of economic development, efficiency and stability;

(2) the second is to ensure adequate protection of those who invest in the securities of public companies and in the securities markets.[284]

A principal and stated purpose of the Ontario Securities Act and the earlier Security Frauds Prevention Acts of 1928, 1929 and 1930 is to prevent fraud and misrepresentation in the sale of securities to the public.

Once a person is elected a member of an exchange he becomes subject to the regulations and requirments of the exchange. Such matters as trading practices, credit policies, procedures for dealing with the public and business ethics are regulated. Control over the financial standing of exchange members is through regulations relating to minimum capital, margin requirements and call loans, coupled with monthly reports and spot investigations of a member's accounts and records by exchange examiners. Shareholders and directors of a member firm are required to give claims of public clients of the firm an overriding priority over those of shareholder clients of the firm if the firm should fail.

Regulations of broker-dealer associations provide for admission-to-membership requirments, conduct, financial responsibility and annual, regular and spot audits.

The Investment Dealers Association of Canada traces its history back to the formation of the Bond Dealers Section of the Toronto Board of Trade in 1914. It does not have the same direct regulatory authority of the securities industry as do the exchanges. Its authority is primarily exerted in the areas of standards imposed on members and education.

The annual audit, spot checks and the requirement that all members carry insurance to cover losses of securities by theft, fire, forgery or unexplained disappearance are among the most important conditions imposed on members of the Investment Dealers Association of Canada.

284 Parliament of the Commonwealth of Australia, 1 Report on Australian Securities Markets and Their Regulation 15, 16 (Australia 1974).

During the early 1960s, the securities industry in Canada was criticized for inadequate standards of self-regulation and the failure of securities commissions to actively supervise the self-regulatory associations. It must be said, however, and it is to the credit of the industry in Canada, that no securities firm failed through a loss of control in its operations when so many failed in the United States for this reason. The principal cause of most failures of securities firms in Canada has been, and is likely to continue to be, mismanagement, fraud and other misconduct. It is difficult to prevent failures and to protect the *bona fide* investor from loss. Failures and losses, however, can be kept to a minimum by vigilant supervision, promotion of good business practices and insistence on a high level of integrity in all members of the industry.

B. CANADIAN CONTINGENCY AND SPECIAL TRUST FUNDS[285]

Although the history of the Canadian securities industry since the second world war has been relatively free of failures involving loss to the public there have been a number of failures during the past twenty-five years. These include C.A. Macdonald & Co. Ltd.; Stanbury Investments Limited; Ord, Wallington & Co. Limited; Waite, Reid and Company Limited; Malone Lynch Securities Limited; Andrews & Belanger Limited; Chartrand, Quinn & Senecal Limitée; Blanchard, O'Connor & Co. Ltd., and L.J. Forget & Company Ltd.

In 1955, as a result of the failure of a member firm of the Toronto Stock Exchange, a group of other members volunteered to cover the public's loss in the amount of about $125,000. In 1956 the exchange established a reserve called a Special Contingency Reserve with undefined purposes. In 1961 public losses of some $180,000 resulting from a second failure and all the costs of administration amounting to about $142,000 were paid out of this Special Contingency Reserve.

The Toronto Stock Exchange rebuilt the Special Contingency Reserve to $275,000 after it had been reduced by the payments made from it during the early sixties. While reluctant to write a

285 I am grateful to D.I. Richardson of The Clarkson Company Ltd. who read an early draft of this section and made several helpful suggestions which have been incorporated into this paper.

"blank cheque" the board of governors recognized a responsibility to the investing public and initiated discussions with other exchanges and the Investment Dealers Association of Canada with a view to creating a national contingency fund. The discussions coincided with and undoubtedly received some impetus from the creation by the New York Stock Exchange in 1964 of its Special Trust Fund to provide "direct or indirect assistance to customers of a member...threatened with loss of their money or securities because such member...is insolvent or is in such financial condition that he or it may be unable without assistance to meet his or its obligations to such customers".

An important reason for the pressure to create a national contingency fund was the fact that an exchange member was often a member of more than one exchange and very often a member of the Investment Dealers Association of Canada. It was not practical and certainly not desirable for the Toronto Stock Exchange to cover only the losses of customers who might, for example, be residents of Ontario. At the same time it would be only equitable for the members of an exchange, which by reason of its insufficient supervision resulted in the failure of a member firm, to share in the satisfaction of public losses with the members of other exchanges of which the firm that failed was also a member.

Another reason for creating a national contingency fund was the feeling that the government might regard the protection of public customers as the price of continued independence for the industry in the light of protection given to customers of other financial institutions such as banks and trust companies.

The negotiations within the industry successfully resulted in the formation of a National Contingency Fund in 1968. An agreement and declaration of trust was entered into by the Montreal Stock Exchange, the Canadian Stock Exchange, the Toronto Stock Exchange, the Vancouver Stock Exchange and the Investment Dealers Association. The agreement stated that the participating institutions considered it advisable that in appropriate circumstances financial assistance should be available to clients of their members who suffered financial loss due to the failure of a member to meet any of its obligations as they fall due. The fund which was initially in the amount of $1,500,000 was established by contributions as follows:

The Montreal Stock Exchange and the Canadian Stock Exchange, jointly	$300,000
The Toronto Stock Exchange	500,000
The Vancouver Stock Exchange	200,000
Investment Dealers Association	500,000

The fund currently stands slightly in excess of $1,500,000. The

difference between the present balance and the initial contributions represents the net effect of operating expenses and interest earned.

There is no liability accepted by the exchanges or the Association for clients' losses. However, the governors of the fund are entitled to make discretionary payments to assist clients of members who have suffered financial loss due to the failure of a member of one or more of the participating institutions to meet any of its obligations as they fall due. In general, when payments are made from the fund, the participating institution of the defaulting member is required to reimburse the fund to 75% of the total amount paid out of the fund up to a maximum amount equal to the amount of the initial contribution of the institution. All of the other participating institutions are required to repay the remaining 25% of the payment out *pro rata,* in accordance with the respective amounts of the initial contributions of capital made to the fund by each participating institution.

The fund has been involved to date in the insolvencies of Malone Lynch Securities Limited, Andrews & Belanger Limited, Chartrand, Quinn & Senecal Limitée and Blanchard O'Connor & Co. Ltd. These have all been insolvencies of stockbrokers. The fund, in addition, was involved in an advisory capacity in the Massey Lavoie insolvency.

The fund has operated in a number of ways. It has paid directly the losses of public customers and taken an assignment of their claims which it thereafter asserted against the estate of the defaulting member. In other cases it has loaned funds to trustees to assist in the orderly liquidation of an estate and in one case guaranteed the loans of a bank thereby permitting the release of pledged securities.

In Malone Lynch the bulk of the claims were acquired by the National Contingency Fund either prior to the first dividend which was paid three months after the bankruptcy or after the first dividend and prior to the second dividend.

To date the fund paid and took assignments of the following claims totalling $4,400,000:

Claims purchased before 1st dividend	$ 890,000
Claims purchased after 1st dividend and before 2nd dividend	3,430,000
Claims purchased subsequent to 2nd dividend	80,000

In Andrews & Belanger the advances were all made in late 1971 or early 1972. In Chartrand, Quinn, it is believed the advances were made mostly in 1974.

In all these cases the National Contingency Fund took assignments of the customers' claims.

The fund would prefer to help a failing broker wind down its business rather than to satisfy the claims of public customers after a massive liquidation of a broker-dealer's business that would usually occur in a bankruptcy. Assisting a broker to wind down its business permits the greatest benefit from the limited resources available. Where it is not possible to prevent a bankruptcy the fund can best be used to guarantee bank loans to facilitate delivery of customers' accounts against payment instead of liquidation of margin account security positions.

Perhaps the most significant aspect of the National Contingency Fund is the important role it plays in coordinating the self-regulatory aspects of the securities industry in Canada. The fund employs a chartered accountant on a full-time basis as a National Examiner. His role is to establish uniform standards and to coordinate the activities of the various examiner groups of the several regulatory bodies in the industry.

In 1974 the Quebec Securities Commission required that non-member brokers coming under its direct jurisdiction participate in a fund to be established for the protection of customers of brokers who incur a financial responsibility towards them. The fund is known as the Contingency Group Fund. Each of such brokers is required to deposit $10,000 in a designated trust company that has been constituted the administrator of the fund. Provision is made for further deposits.

Discretionary payments may be made by the administrators from the fund. Participating brokers in general are then required to repay to the fund on a *pro rata* basis the amount of such payments. The maximum payment that may be made from the fund is $5,000 to any one customer for direct out-of-pocket loss. The maximum aggregate amount of claims that may be paid in respect of the default of any one participant in the fund is not to exceed $10,000, multiplied by the number of participants in the fund not in default at the time of the first default of the particular participant. A default is defined as the failure of a participant to meet any liability or obligation to a *bona fide* customer when due or a conversion of funds or securities of such a customer while in the hands or under the control of such participant.

There is in Montréal a $100,000 Brokers' Clearing Fund designed to smooth losses.

The industry also has in Ontario a fund comparable to the Contingency Group Fund of the Quebec Securities Commission.

By regulation under the British Columbia Securities Act, broker-dealers are required, as a condition of obtaining a licence,

to contribute to a trust fund for the purpose of satisfying certain claims against broker-dealers who might become bankrupt or insolvent. A broker-dealer may be excused from joining the plan if he establishes that he has joined some other plan similar to the one established by the regulation – such as the National Contingency Fund. This regulation has been held to be *intra vires* the powers of the British Columbia legislature.[286]

The National Contingency Fund and funds such as the Contingency Group Fund represent an encouraging affirmation on the part of the participating institutions and brokers that they are prepared to accept a degree of responsibility for the financial loss of public customers of member firms or participants who fail to meet their obligations as they become due. Payments are however discretionary in respect of all funds and there are still many broker-dealers, commodity dealers and others in the securities industry who are not covered by either fund.

New policies in respect of the funds are being formed on an *ad hoc* basis with the result that one can never be certain of the policy of the funds in any particular circumstance. There has, for example, been no failure yet of a member actively involved in commodities or futures contracts, and it is uncertain how the National Contingency Fund would regard the claims of customers who suffered losses arising out of such activities. As previously mentioned, it should not be forgotten that the failure of Ira Haupt & Co. in 1963 was precipitated by the great losses it suffered on the commodity side of its business.

Whether the funds are sufficient to provide reasonable protection to the members of failing firms is difficult to say. To a great extent it depends on the manner in which the fund is used. Although the amounts involved in the failures of Canadian broker-dealers have been very much less than those of defaulting firms in the United States, fortunately there has not been a very large failure by U.S. standards. The possibility, however, should not be ignored. Some idea of the dimensions of the failures of Canadian broker-dealers may be had by comparing the claims filed in three of the recent failures (see tables 1–3).

C. THE CANADIAN BANKRUPTCY ACT

The present Canadian Bankruptcy Act does not contain any special provisions concerning the bankruptcy of securities dealers, notwithstanding that such bankruptcies have regularly proved to be especially difficult to administer. As a rule their administration

	1,965,000

Note 2

There was no information available on the number of proved as opposed to possible claims.

Note 3

According to a progress report as at August 31, 1974, the following dividends had been paid:

Preferred creditors	$ 30,000
Unsecured creditors	2,840,000
	2,870,000

Dividends paid:

December 15, 1971	35%
March 15, 1972	15
February 1973	5
November 15, 1974	5
	60

is time-consuming, expensive and often marked by complex legal and administrative problems. Frequently, greater losses are suffered by customers after bankruptcy than before by reason of the long delays in tracing securities and processing claims. The priority of any particular customer is usually determined by pure chance, depending on such things as the manner in which the broker segregated the customer's securities, the status of the corporate securities register, the whim of a pledgee in selecting the securities to sell to retire his loan and the degree of broker misconduct.

The *Report of the Canadian Study Committee on Bankruptcy and Insolvency* recommended that a special uniform procedure be devised to handle and settle all claims by the customers of bankrupt stockbrokers following generally the model of section 60(e) of the United States Bankruptcy Act.[287] Further study revealed that while section 60(e) was a decided improvement on the common law and equitable rules still prevailing in Canada, it nevertheless resulted in a myriad of legal complications, substantial administrative delays and demonstrable inequities among customers and other creditors of a bankrupt stockbroker.

A wide range of possible alternative models was considered:

(1) Ordinary commercial bankruptcy, subject to identification and tracing rules, that is, the present common law.

(2) Customer preference over trade creditors but no limit on the securities identification and tracing rules.

(3) Customer preference over trade creditors with constraints on the identification and tracing rules, limiting those remedies to the recovery of money or securities a claimant can "...specifically identify as allocated to a customer", which is in essence the U.S. model as set out in the Chandler Act of 1938 (now section 60(e) of the Bankruptcy Act of the United States.)

(4) Customer preference over trade creditors to the extent of cash and securities held by the stockbroker, and customers and trade creditors sharing the other assets rateably.

(5) No customer preference and, instead, all assets placed in a common fund that customers and trade creditors share rateably.

The fifth model is the most attractive from an administrative point of view as it is certain, arbitrary and efficient. It was rejected because where there were substantial trade creditors of the bankrupt stockbroker it could be very unfair to the customers of the

287 REPORT OF THE STUDY COMMITTEE ON BANKRUPTCY AND INSOLVENCY LEGISLATION (Canada 1970).

stockbroker who do not regard themselves as ordinary creditors but as passive depositors of a financial intermediary.

The legislative model that was used by the draftsmen of Bill C-60 for a new Bankruptcy Act was the fourth model above. The proposed system worked as follows:

(1) Two asset pools are created. All monies and securities of customers are placed in the one asset pool and all other assets are placed in the other asset pool.
(2) Customers claim rateably against the first pool.
(3) Customers whose claims are not satisfied in full share rateably with trade creditors against the second asset pool.
(4) Remaining assets are distributed to deferred creditors, related customers and deferred customers in that order.

The system proposed by Bill C-60 largely abolished the present system that permitted "lucky" and "unlucky" customers and distinguished between "good" and "bad" customers. The system went a long way to simplify legal conflicts and to expedite administration.

Bill C-60 was criticized by the securities industry which argued that customers would be reluctant to leave either money or securities in the possession or control of a securities firm if they knew that they would not be entitled to claim specifically identifiable property if the firm became bankrupt.[288] It was also said that the scheme while efficient was excessively arbitrary. A customer, who had specifically instructed his broker to segregate his assets and the broker failed to do so, would nevertheless be required to make a rateable claim against the customer pool with customers who had made no attempt to have the broker segregate their assets.

Persuaded by this criticism, the existence of the contingency and special trust funds and the closer surveillance of security firms by the security commissions and self-regulatory organizations, the government amended the C-60 model. The new model now contained in Bill S-11[289] is similar to section 60(e) of the present Bankruptcy Act of the United States. It, however, has tighter definitions of "specifically identifiable property" so as to minimize the problems of interpretation which has caused so much difficulty in the practical application of section 60(e).

The principal difference of the Bill S-11 model from the Bill C-60 model is that in the former, where the claims of customers of a bankrupt securities firm are not paid in full by the estate or an

288 *But* "[any] reasonable man ought to know that a broker's office is no place to leave money or securities for safekeeping"; McLaughlin, *supra* note 51, at 398 (*quoting* Garrard Glenn).

289 First reading was Tuesday, March 21, 1978.

"insurer", customers are entitled to recover their specifically identifiable property. But where the customers' claims are paid in full, the Bill C-60 model is used. Separate pools of customer assets and creditor assets are created, and non-arm's length customers ("related customers") and persons who caused or contributed materially to the bankruptcy of the securities firm ("deferred creditors") are distinguished, with related customers relegated to a second priority and the deferred customers to a last priority.

> "In brief summary, the proposed model operates as follows: A 'self-regulatory' organization or a creditor may initiate bankruptcy proceedings in respect of a securities firm. In any event, a petitioner must give pre-notice of the proceedings to each relevant securities commission. The general rules concerning the vesting of the bankrupt's property in the trustee (which exclude a customer's specifically identifiable property), the broad powers of the trustee to continue the bankrupt firm's business, and the fraudulent transfer and fraudulent preference rules apply to the bankruptcy of a securities firm.
>
> "More specifically, the trustee is empowered to elect, within 30 days of the date of bankruptcy, to satisfy all or part of any claim of a customer against the estate by delivering to the customer securities of the same class to which he was entitled on the date of bankruptcy, irrespective of any change in value of the securities after that date. In other words, the trustee has discretion to keep the customer at risk during that 30-day period. If during that 30-day period the trustee is able to pay all customers' claims, either because the bankrupt firm owns sufficient money and securities or because an 'insurer' undertakes to furnish sufficient money or securities to the estate, the issue of identifying or tracing a customer's 'specifically identifiable property' becomes completely irrelevant. And because an insurer is not specifically subrogated to the rights of the customers, the insurer is not entitled to claim specifically identifiable property in order to establish its priority over related customers, secured creditors, ordinary unsecured creditors, deferred creditors and deferred customers. The insurer only acquires the priority rank of customers when claiming the aggregate amount it paid to the estate. This model therefore continues some of the undesirable characteristics of the U.S. Chandler Act of 1938, but nevertheless, where an insurer steps in, it resolves the central problem: it obviates customer reliance on the identification and tracing concepts and thus

reduces the customers' recovery costs and even more important, eliminates recovery on the basis of chance.

"Where, however, an insurer does not step in to cover customer losses, each customer is entitled to claim his specifically identifiable property, compelling the trustee to scrutinize with great care each bank account, each cheque, and each security certificate, and relegating the customer to a claim that is based more on luck than on prudence or law.

"In either case, after returning any specifically identifiable property or delivering any securities to a customer in payment of the customer's claim, the trustee is required to divide the remaining assets of the broker into two funds: (1) a 'general fund' made up of all property of the securities firm as of the date of bankruptcy; and (2) a 'customers' fund' made up of all money and securities held for customers other than any customer's specifically identifiable property. In the course of processing proofs of claim against an estate, in addition to distinguishing among secured creditors, preferred creditors, ordinary unsecured creditors and deferred creditors, the trustee must also distinguish among arm's length customers, 'related customers' who are associates or affiliates of the bankrupt firm, and 'deferred customers' who caused or materially contributed to the bankruptcy of the firm.

"Generally, out of the customers' fund the trustee pays the claims of arm's length customers (or of an insurer) and related customers. And out of the general fund the trustee pays the costs of administration, the claims of preferred customers, any remaining claims of arm's length customers (or of an insurer) rateably with the claims of ordinary unsecured creditors, any claims of related customers, the claims of deferred creditors and, finally, the claims of deferred customers.

"Although not mentioned the Bill presumes that the appropriate securities commission and self-regulatory organizations ('SRO') will cooperate fully with the trustee in bankruptcy to enable him to administer the estate of a securities firm with the least possible amount of regulatory delay. Indeed, in the typical case of a security firm insolvency, it is probably that an SRO will initiate the bankruptcy proceeding, the contingency fund ('insurer') will act at once to satisfy the claims of arm's length customers, and then the contingency fund will press the trustee for recovery from the estate, thus ensuring ex-

pert intervention to press customer claims and to maintain oversight of the trustee's administration of the estate. In such a case the contingency fund is declared to be a creditor of the estate to the extent it furnished money or securities to satisfy customers' claims and entitled to vote accordingly. Thus it is only where an insurer does not intervene to pay customers' claims in full that customers have claims as creditors. Where an insurer does intervene, the customers are treated essentially as passive depositors, much like depositors of a bank who are protected by deposit insurance."[290]

Chapter VI
Conclusion and Recommendations

(1) The two broad, sometimes conflicting objectives of national policy on capital markets are well stated in the recent *Australian Report on Securities Markets and Their Regulations:*
"i. The first [objective] is to maintain, facilitate and improve the performance of the capital market in the interests of economic development, efficiency and stability.
"ii. The second is to ensure adequate protection of those who invest in the securities of public companies in the securities market."[291]

(2) The interests of stock exchanges, broker-dealer associations and their members can conflict with the public interest.

(3) The public has a legitimate interest in the operation of stock exchanges, broker-dealer and investment dealers associations. These institutions are among the financial institutions of the country and are comparable to banks, trust companies, loan companies, insurance companies, credit unions and similar institutions. As such they should, in the public interest, be subject to regulation, as is any other financial institution.

(4) The right of stock exchanges and broker-dealer associations to self-regulation should be subject to an overriding right in some public body, such as a securities commission, to supplement and supervise their actions and conduct. This right should be asserted aggressively to provide where necessary meaningful corrective measures having "due regard to the public interest, the protection of investors, the need to assure

290 CONSUMER AND CORPORATE AFFAIRS CANADA, BACKGROUND PAPERS FOR THE BANKRUPTCY AND INSOLVENCY BILL (Ottawa 1978).

291 1 REPORT ON SECURITIES MARKETS AND THEIR REGULATION, *supra* note 284, at 15, 16.

fair dealing in securities, the maintenance of fair, honest, and orderly markets and the need to provide and foster competition in our capital markets".[292] As a minimum this implies that securities commissions should have the human and financial resources to effectively assume this responsibility.

(5) The National Contingency Fund established by the exchanges and the Investment Dealers Association represents a major contribution to investor confidence in the Canadian securities industry. There cannot however be complete investor confidence in the industry when there is no legal liability by the industry to compensate a client of a defaulting member. At present, an investor can never be sure whether he will be compensated in whole or in part in the event the broker-dealer with whom he does business should fail.

(6) The securities industry should undertake to protect and compensate all arm's length and *bona fide* customers up to a maximum amount from losses incurred through the financial failure of a member and demonstrate that it has the capacity to underwrite this reponsibility. In the alternative, some scheme of deposit insurance should be established for the securities industry similar to that provided by the Canadian Deposit Insurance Corporation. The creation of a corporation similar to the Securities Investor Protection Corporation of the United States is not recommended.

(7) The trading in commodities should be subject to greater regulation. Consideration should be given to the enactment of a Commodity Exchange Act. There should be provision for the registration or certification of commodity exchanges and for the registration of commission agents and the regulation of the manner and means by which commodities may be traded on the exchanges.

(8) Section 341 of the Criminal Code was primarily enacted to prohibit "bucket shops" where bets are made against the rise or fall of stocks or commodities and where the pretended transactions or purchase or sale are fictitious. Speculators, however, fulfil a useful function to ensure a smooth-running market, and it is widely accepted that by reason of the restricted interpretation placed upon section 341 by the courts the section does not prohibit speculation in futures or commodities where there is no intention to deliver or take delivery. Section 341 of the Criminal Code should be amended to

292 *National Market Board; Hearings on H.R. 4457 before the Subcomm. on Consumer Protection and Finance of the House Comm. on Interstate and Foreign Commerce*, 94th Cong., 1st Sess. 67 (1975) (statement of James J. Needham).

permit trading in futures and commodities without the necessity to have a *bona fide* intention to make or receive delivery.

(9) The principal cause in Canada for the failure of a broker-dealer is the fraud or dishonesty of customers and both the principals and employees of a firm. This primarily takes the form of theft of securities or funds, or fraudulent stock promotion or manipulation.

(10) Until the stock certificate is eliminated as evidence of ownership, theft will continue to be a serious hazard in the securities industry. All reasonable measures should be taken to minimize this risk. Such measures could involve improved operations systems to reduce the number of hands securities must pass through, stricter regulations in the safekeeping of customers' securities, and the creation of a theft detection system by developing a data bank for lost or stolen securities which would provide instant access to the numbers of all stolen or missing securities.[293]

(11) Customers' funds as well as securities may also be stolen. To minimize this, stricter regulations may be necessary on the use of customers' funds not used in customer-related transactions.

(12) Underlying all fraudulent activity in the securities industry is the growing involvement of organized crime figures in commercial fraud. Many of the top organized criminals have shifted their operations from risky crimes with severe penalties such as trafficking in heroin to stock frauds where the profits can be equally as high or often higher. Moreover, the risks of prosecution and severe punishment are much lower. Investigations are complex, expensive and time-consuming. One recent investigation of a stock fraud by the RCMP took more than three years to complete at a cost of $1 million. It involved thirty-six companies and required outside auditors to examine the books of the companies seized in raids that required one hundred men to make.[294] In the long run the capital markets and those who invest in securities and commodities will be exposed to greater losses through stock frauds than from any other source. The best protection is prevention. The investigative staffs of securities commissions

293 This last suggestion was made in the SECURITIES INDUSTRY STUDY REPORT, *supra* note 22, at 75.

294 The Globe and Mail (Toronto), April 2, 1975, at 3, reporting on an interview with Superintendent Henry Jensen, head of the RCMP Commercial Crime Branch. In the interview, he stated that the RCMP alone investigated $203 million worth of losses suffered by Canadians in 1973; "I couldn't give a good realistic estimate of the total loss by fraud - only a rough estimate. I'd say between $1 [billion] and $2 billion"; *id.*

should be expanded, as should the fraud squads and commercial crime branches of the various police forces in the country. As stock frauds can involve a planned bankruptcy, the Bankruptcy Branch of Consumer and Corporate Affairs Canada may also be involved to a much greater extent than in the past in the investigation of commercial fraud. With so many agencies that can and should be involved, and with the constitutional division of powers in respect to crime prevention and law enforcement in Canada, it is increasingly important to closely coordinate the work of all agencies.

(13) The proposed new system for the administration of a bankruptcy of a broker or securities dealer enormously simplifies and expedites the administration. The following amendments to Bill S-11 might be considered:

(a) The trustee shall be specifically authorized to purchase securities in the open market or complete open contracts, as desired by the trustee, to obtain securities needed to restore customers' accounts.

(b) The trustee shall be specifically authorized to sell or otherwise transfer customer accounts to another broker-dealer without the consent of customers.[295]

295 All of these suggestions except the first are among the recommendations in SIPC, *supra* note 209.

Conclusions 1713

Abstract

I. Introduction

The purposes of this paper are generally to review a number of basic assumptions about the Canadian securities market and, more specifically, to explain the concept of economic regulation and its application to securities markets, analyze alternative regulatory mechanisms and propose the means the federal government can employ to regulate the Canadian securities market if it decides that it should regulate that market.

II. Nature of Economic Regulation

In a contemporary mixed economy there is an inevitable mix of the institutions of both command and market economies to achieve the three basic functions of government: to allocate resources among alternative uses, adjust the distribution of income and wealth among individuals, and stabilize the operation of the overall economy to achieve a high level of resource use with a minimum of inflation. To reconcile command institutions – partic-

John L. Howard is Assistant Deputy Minister, Corporate Affairs, Consumer and Corporate Affairs Canada. The opinions in this paper are those of the author and do not necessarily reflect the policy of the Government of Canada or of the department.

The author assumes responsibility for the contents of this paper but acknowledges the great assistance of those persons who made comments on an earlier draft, in particular, Philip Anisman, James C. Baillie, Warren Grover, and J. Peter Williamson.

ularly planning – with market institutions, the mixed economies have developed a hybrid institution called economic regulation to constrain the market activities of enterprises by equalizing market power, institutionalizing responsibility within the enterprise, or directing the structure and operation of a particular market through an external agency with power to control entry, conduct and prices in that market.

Regulation through an external agency to plan and direct the structure and operation of a particular industry is applied in two common cases: first, where there is a natural monopoly as in the infrastructure industries – energy, transportation and communications; second, where the government has artificially created a monopoly or cartel structure to achieve stability or security for specific actors in a market (for example, an agricultural marketing board to protect producers or a securities commission to protect investors), long-term political goals that are consciously given priority over the goal of ideal market efficiency.

III. Economic Function of Securities Markets

The regulation of capital markets to ensure investor security from fraud is a typical example of a government legitimated cartel structure, but the regulation of securities markets has one unique characteristic: much of the regulatory power is delegated to private sector agencies that exercise this power under the surveillance of the securities commissions. Within the overall capital market complex, however, the securities market – made up of stock exchanges, clearinghouses, brokers, transfer agents and depositories – is one more financial intermediary. Its distinguishing characteristic is that it permits the investor to participate directly in the ownership and control of enterprises on such conditions that the investor bears directly the risk of loss on any security he buys.

The flow of funds calculations in the national accounts of Canada for 1974 disclosed that the capital markets allocated some $7 billion out of an approximate total of $36 billion of savings that were employed by business firms in the economic system. Although the securities market allocated a relatively small amount of these total savings, the securities market is a valuable institution not only because of the still very large absolute value of the transactions executed in that market but also because of the catalytic effect of an issue of securities, which frequently enables a corporation to obtain credit from other sources simply because it has been closely and objectively scrutinized by underwriters, investment advisers and investors. But perhaps even more important are general public benefits that are extraneous to the goals of

the securities market actors: securities markets induce investment in productive enterprise; they empower investors to participate in the ownership and control of firms; and they tend to decrease the need for and so reduce the undesirable effects of extensive foreign direct investment.

IV. Development of Securities Market Regulation

Securities market regulation did not develop from preconceived premises but grew out of a number of separate policy initiatives set out in corporation laws and securities laws. Although the rhetoric to justify securities market regulation varies from one jurisdiction to another, depending on the prevalent political doctrine and economic dogma, there is an implied consensus that a securities market should be cartelized – at least in part – to ensure investor confidence and, as a corollary, should be subjected to close government surveillance, employing techniques analogous to those applied to regulate the public utilities or, in other words, the natural monopolies.

Recent developments in the securities market, particularly the immense growth of the financial intermediaries such as banks, pension funds and mutual funds and the implementation of computer-communications technology, have compelled reconsideration of the cartel-like structure and operations of the market and of the institutions designed to regulate that market. Current proposals – all of which assume a central information system – can be distinguished as four models: (1) a continuation of the present quasi-cartel structure with only service competition, managed by a private sector agency under the surveillance of a securities commission; (2) a straightforward cartel system with only service competition, regulated as a public utility by a securities commission having full powers over entry, conduct and prices; (3) a qualified cartel system, managed in respect of entry and conduct by a private sector agency under the surveillance of a securities commission but subject to negotiated commission rates; and (4) management of the central information system by government as a public utility but with no constraints on market entry or prices and only those conduct constraints required to ensure full and fair disclosure and to prohibit fraud with a view to achieving full price and service competition.

V. Regulatory Mechanisms

Unless the fourth market structure referred to in the foregoing paragraph is adopted, regulators of capital markets will tend to exploit all three regulatory techniques – balancing power to preclude monopoly control, institutionalizing responsibility with-

in firms, and regulating the market through an external agency. The first technique – balancing power–will continue to concern mainly the distribution of capital market functions among competing intermediaries and the reconciliation of securities law with competition law. The second technique – institutionalizing responsibility – will largely concern the reconciliation of securities law with corporation law, including the imposition of personal liability on directors and officers of securities market actors. But the emphasis will continue to be placed on the third technique, that is, the regulation of entry, structure, conduct and prices in the securities market through an external government agency or a self-regulatory agency subject to close government surveillance.

Although there is currently a great deal of criticism of the regulatory commission as an institution, it is probable that legislatures, for political reasons, will continue to invoke the regulatory commission – that is, a commission set up outside the conventional government departments – to resolve problems that are too complex to be resolved through ordinary bureaucratic administrators who apply relatively static statutory rules and standards. Following are the general characteristics of and the advantages frequently attributed to the regulatory commission.

(1) The independent regulatory commission is a minigovernment, which is empowered to exercise legislative, judicial and administrative powers with a view to planning the structure and operations of an industry or a market.

(2) As a general rule, a commission must have a relatively broad delegation of power under its enabling act if it is to be able to regulate imaginatively and effectively. Delegation under broad "public interest" standards is in effect authority to develop and enunciate policy as distinct from applying value-free rules and standards to specific cases. It is in this sense that each regulatory commission is in politics.

(3) For the same reason – the absence of value-free rules and standards – judicial review of the decisions of a regulatory commission is not a satisfactory means to control commission decisions, except to constrain a commission from acting outside the limits of its jurisdiction, acting arbitrarily, or following unfair procedures. A court should adjudge only the legality of a commission's decision, not the correctness of the policy decision made.

(4) Rather than focus on delegation standards or judicial review, it is more appropriate, particularly in the Canadian context where scant attention is accorded separation of powers mythology, to structure a commission in a way that achieves a workable balance between the commission's relative indepen-

dence and its responsiveness to the executive as well as its accountability, through a minister, to the legislature.

(5) Assuming regulation is politically necessary, the legislators and the regulators should be constantly aware when undertaking to regulate an industry or a market that to displace market competition – and particularly price competition – is to bureaucratize the industry or market. To do so is to abandon the price mechanism as a means of determining value and measuring performance and to substitute other performance measures. Wherever possible, therefore, regulation should be limited to conduct rules and standards and should only be extended to govern entry and prices – the strategic elements of a competitive market – when no other solution is politically acceptable.

(6) In summary, in addition to the general economic criticism that regulation is a poor substitute for a competitive market, regulation through a regulatory commission is frequently attacked on three fronts. First, the exercise of broad discretion within the context of a public interest standard may empower a commission to dilute the force or even subvert the original policy of the law, unless the standard is further refined or the agency subjected to continual policy oversight by the executive. Second, again because of the broad discretion exercised by a typical commission, it may act unlawfully, unfairly or arbitrarily unless it is subjected to judicial review. Third, because of its relative independence, a commission may become ineffective or even become a captive of the regulated industry, unless its planning is closely coordinated with the overall plans of the executive to ensure that the commission's goals and priorities are consistent with the government's goals and priorities.

(7) The regulatory commission is widely acknowledged to have a number of specific advantages over the conventional department structures that outweigh its disadvantages.

(a) It permits flexible and expert administration where bureaucratic administration of rules and standards as interpreted by the courts would not work. A commission can take on a novel and complex task, explore and analyze an industry, apply its expertise to refine very broad statutory policy through adjudication and regulation-making, and maintain continuous oversight of the regulated market or industry to determine the effectiveness of that policy.

(b) It permits the resolution of conflicts among rival interest groups, if not free from politics, at least free from the immediate pressure of short-term, partisan politics, permitting it to

avoid expedients and so develop policies that will have considerable continuity. A commission can, particularly when adjudicating a specific case, retain enough independence from the executive to decide the case impartially.
(c) Presumably it can, as a collegiate body, render better judgments and permit broader representation in the regulation-making process than can an agency with a single head.
(d) It enables interested persons better to aim their criticisms and to recommend policy changes to government because the establishment of a commission tends to focus program responsibility. A commission can also serve to balance conflicting interests by considering the interests of groups that are not well represented because the benefits of regulation are widely diffused among the public whereas the costs are concentrated and borne, for example, by a small group of producers.
(e) It can offer a number of administrative advantages, particularly freedom from the constraint of the bureaucratic rigidities of government personnel and financial management rules and from the requirement of queuing up to receive general services such as legal, data processing and public relations services. A commission can achieve better program performance through term employees or contracts. This also precludes the growth of tenured employees and so facilitates winding-up when a limited program goal has been achieved.
(f) It facilitates regional representation and also the coordination of programs that cut across the traditional jurisdiction of several departments.
(g) It is a versatile institution to coordinate intergovernmental programs, which is an especially important characteristic of a commission in a federal system.

VI. Institutions of Federal-Provincial Cooperation

In theory there are three approaches to the development of a system of securities market regulation. The first is a unitary system where the federal government occupies the field and displaces provincial laws. The second is a dual or two-tier system, where the federal parliament and provincial legislatures enact separate laws applying to different subjects or applying different but complementary standards to the same subjects. The third is an integrated system that permits Parliament and the legislatures to delegate administrative power to administer separate federal and provincial laws to one regulatory commission.

In view of the historic development of securities regulation in Canada and the realities of provincial powers, only a dual or an integrated system is likely to be adopted in Canada. A dual system,

such as that in the United States, has the advantage that it permits coexistence of discrete federal and state systems with a minimum of political conflict. The major disadvantage of a dual system is that it institutionalizes multiple statute systems, making practical administration and compliance with the law both complex and costly. In addition to uniform administration, an integrated system has the advantage that it will tend over time to develop uniform laws.

Because of the large number of variables involved, a great many regulatory models can be constructed, depending upon the system of regulation, the system of administration and the several alternative ways of dividing jurisdiction over securities market functions. Table 5 summarizes the dimensions of each model; table 6 illustrates a broad spectrum of possible models.

VII. Alternative Models - Securities Regulation

Models 4, 6, 10 and 13 are the models in table 6 that best reflect the range of alternatives and probably are most acceptable from a political point of view.

(1) Model 4 is a dual system with both federal and provincial securities commissions administering separate statutes and in which a provincial commission would deal only with intraprovincial trading and the federal commission with all other trading.
(2) Model 6 reflects a unitary system in the sense that there would be only one administrator of the securities law in each province, because the federal government would delegate exclusive powers to each provincial securities commission.
(3) Model 10 is a dual system, which presupposes separate federal and provincial securities commissions administering separate federal and provincial statutes, paralleling the U.S. system.
(4) Model 13 is an integrated system, based on the idea of delegation of powers from the federal Parliament and the provincial legislatures to one securities commission. This model does not require uniform laws, but because of the single commission it would tend strongly to the development of such laws and to the development of one disclosure system supported by a common data base.

VIII. Conclusions

Of these three models, model 13, although it engenders formidable political problems, is technically the most desirable. It continues reasonable provincial autonomy, permitting each province to establish for intraprovincial transactions its own substantive standards applicable to market entry and its own additional dis-

closure requirements. It will, because of the centralized policy making structure, tend strongly to the development of uniform laws and procedures. It also has the advantage that it permits the use of experienced personnel to administer the various laws through completely decentralized administrative offices. And finally, it reconciles central policy making with decentralized administration through a mechanism that, because it contemplates separate federal and provincial laws, is flexible in the sense that it can be responsive to local needs and yet be effective to achieve Canada-wide goals.

Chapter I
Introduction

In the introduction to its *Securities Industry Study* the House Subcommittee on Commerce and Finance characterizes the securities market as the "backbone of our economic system".[1] Even if one discounts this description as the hyperbole of technical experts who tend to see their field of expertise at the centre of the universe, it does reflect a broad consensus among the many vocal critics of the securities industry that the securities market is a cornerstone of a market economy serving to match the multitude of different liquidity preferences of savers and users of capital and allocate capital among those enterprises, particularly new enterprises, that can make most profitable use of it.

Notwithstanding the apparent consensus about the essential nature of the securities market, there has been for two generations an almost continuous controversy in the United States, the United Kingdom, Canada and other countries about how the market should be structured, how it should operate, and who should regulate it.[2] Indeed, during the last fifteen years econo-

mists and lawyers have relentlessly probed, dissected, analyzed and criticized the purposes, structure, functions and performance of the securities market. They have questioned not only technical issues such as allocational and operational efficiency but also fundamental issues that had long been accepted as articles of faith – for example, fixed commission rates, private sector control over exchange membership, and confinement of government regulation essentially to the market actors' conduct, particularly by preventing market manipulation and other fraudulent activities.

The securities industry at first reacted strongly to deny many of the charges laid by its critics, pointing out that even if the securities market does not achieve the economist's conceptual model of a perfect market, it works well to allocate capital among business enterprises at relatively low cost. But during the past decade extraneous events overtook the securities industry. Tax laws were changed in a way that rendered high-risk investments less attractive to individual investors. Institutional investors expanded very rapidly, causing many individual investors to abandon the securities markets because they felt they had less information and therefore could not compete with the large intermediaries such as pension funds, mutual funds and trust companies. The institutional investors, seeking cheaper brokerage rates, developed techniques either to avoid fixed commission rates or to trade outside of the formal stock exchange markets. And finally, computer-communications technology developed to the point where it became not only cheaper but obviously essential to automate brokerage office accounting, trading information, clearing, settlement and, to a limited extent, even trading functions.

These extraneous pressures, particularly the brokerage office management problems in the United States and the increasing balkanization of the securities market into a number of regional and specialized markets, compelled the securities industry itself to

re-examine first principles. This was to determine whether the securities market should have a different character and, accordingly, whether it should be regulated as an essentially free market, a special kind of cartel, or a closely regulated information network characterized as a public utility that would permit the operation of a relatively free market with respect to entry and conduct. After years of acrimonious debate the United States Congress decided somewhat ambiguously to adopt the latter policy,[3] that is, a comprehensively regulated but relatively open, nation-wide market where price competion will prevail and where all qualified actors will have access to all pertinent information with a view to achieving best execution of their securities trades.

Although it has only been on the fringe of the United States controversy, Canada cannot ignore the fundamental changes taking place in the United States because the North American capital markets are closely integrated. Some changes – particularly negotiated commission rates and improved information systems – have immediate impact in Canada, as evidenced by the debates here concerning fixed commission rates and computerized trading systems. The purposes of this paper, therefore, are generally to review a number of basic assumptions about the Canadian securities market and, more specifically, to explain the concept of economic regulation and its application to securities markets, analyze alternative regulatory mechanisms, and propose some of the alternative means the federal government may employ if it decides that it should regulate the Canadian securities market.

Chapter II
Nature of Economic Regulation

In the literature of economics, political science and law there is no concept more nebulous than government regulation, which is invoked to achieve many purposes ranging from authoritarian control to mere persuasion both at the macro and micro levels of the economy, employs many instruments (both direct and indirect) and, to complicate matters further, is too often seen, analyzed and criticized as a one-dimensional institution. For these reasons it is inadequate simply to define "regulation". Instead I shall try to explain briefly the overall context within which the term is used (except those cases in respect of which the term is not appropriate) and so focus on the aspect of "regulation" that is the central concern of this paper.

3 *See* SECURITIES REFORM ACT OF 1975, H.R. REP. NO. 94-123, 94th Cong., 1st Sess. (1975).

Although an almost infinite variation of themes is possible, if we categorize each in accordance with the coordinating mechanisms it uses to link the activities of all subunits, there are only three basic economic systems: first, a traditional system where all functions and roles are largely predetermined as in a feudal society; second, a market or, in other words, a price system; and third, a command system based on a planning process.[4] In a traditional feudal system the function of each unit was related to specified lands and the role of each individual actor was largely determined by his social status. The fundamental institution was a tacit or even express agreement between each individual and his superior in the feudal hierarchy that set out the reciprocal obligations of each to the other. The feudal system was stable but essentially static and therefore unable, like the dinosaur, to adapt even to glacial changes in society. Government intervention did exist in the feudal system, particularly in connection with the transfer of titles of nobility, the transfer and use of land, and the prices for goods and services,[5] but since even secular change was rare government intervention was infrequent and, because all units were bound tightly together in the system, it was generally seen as natural and unobtrusive.

In contrast, a market system is predicated on the idea of dynamic equilibrium, a system in which each unit is relatively free to decide what, how and when it will produce and consume and to make such decisions with reference to prices that respond generally to the supply and demand for goods and services. How well these conditions are fulfilled depends upon a number of factors – the relative size and power of the different market actors, the free flow of information, and the degree of government intervention, which can include even government ownership if it does not displace the actual operation of the market as a price setting mechanism.

A command system, although it can be dynamic in the sense that it adjusts readily to a changing environment, deliberately eliminates the market as a price setting mechanism and substitutes, instead, a governmental planning mechanism that determines objectives, priorities, input allocations, input costs, output

4 G. Grossman, Economic Systems 18–20 (1974). *See also* H. Jacoby, The Bureaucratization of the World (1973).

5 Two notable interventions were the Statute of Labourers, 1351, 31 Edw. 3, St. 1, c. 6, which was enacted in response to the intense labour shortage created by the great plague of 1348–49 to fix wages and prices and to make it an offence for an unemployed, able-bodied man to refuse a job offered to him; and the Statute of Artificers, 1563, 5 Eliz., c. 4, which was enacted, in contrast, in response to a population boom, and which among other things introduced a work-sharing program; *see* E. Morgan, American Slavery, American Freedom 62–68 (1975).

prices, and ultimate end uses. As a substitute for the price mechanism and the resultant determination of profits to gauge the success of an enterprise, the planning authority sets out a number of alternative performance measures. For the invisible hand of the market system the command system substitutes express controls over the operations - or at least over the objectives - of each subunit in the economy in accordance with an overall economic plan, which may be established centrally by a state agency or through a system of cartels that are coordinated or even directed by a state agency.[6]

There is no such thing as a pure traditional, market or command economy, for each modern economy, usually referred to as a mixed economy, exploits some of the coordinating techniques that characterize each system in order to carry out the three basic economic functions of government: (1) to allocate resources (especially the basic factors - capital, labor, natural resources) among alternative uses; (2) to adjust the distribution of income and wealth among individuals; and (3) to stabilize the overall economy with a view to achieving a high level of resource use with a minimum of inflation.[7] The outstanding characteristic of the traditional system is a set of relatively static controls relating to personal status, land use and the fixing of prices of goods and services. The signal characteristic of the command system is a set of quite dynamic controls relating to objectives, input allocations and end uses. The outstanding characteristic of the market system is the allocation of resources in accordance with price bids made by relatively free subsystem units, subject only to a limited number of controls and a broad spectrum of constraints that serve to miti-

6 The obvious example of the centrally planned economy is the system of the Soviet Union, described in detail in R. CAMPBELL, SOVIET ECONOMIC POWER (2d ed. 1966). There are many versions of attempts at decentralized planning through cartels under varying degrees of government supervision. The U.S. experience during the New Deal era is summarized in M. FAINSOD, L. GORDON & J. PALAMOUNTAIN, GOVERNMENT AND THE AMERICAN ECONOMY 525-69 (3d ed. 1959) [hereinafter cited as M. FAINSOD]; and in C. WILCOX, PUBLIC POLICIES TOWARD BUSINESS 762-66 (4th ed. 1971). Vestiges of these cartels continue to exist in certain sectors of the agricultural industry, *e.g.* through milk or egg marketing boards.

For an interesting comment on regulation in a planned economy, *see* Kurczewski & Frieske, *Some Problems in the Legal Regulation of Economic Institutions*, 11 L. & SOC. REV. 489 (1977).

FRIEDMANN, THE STATE AND RULE OF LAW IN A MIXED ECONOMY 3 (1971), where the author uses four similar but different functional categories - provider, regulator, entrepreneur and umpire. *See also* Lowi, *Four Systems of Policy, Politics and Choice*, [1972] PUB. AD. REV. 299, where the author speaks of four categories of policies that determine the form of government action - distributive, constituent, regulatory

gate blind market forces, to fill in gaps where markets do not work effectively, or to make markets work better.

In sum, both traditional and command economies are essentially distinguished by express, detailed controls, whereas the market economy is distinguished by relatively free decision making by subsystem units in a context where absolute controls are applied only in exceptional cases and where regulatory instruments are employed generally to make markets work better and more equitably. In this paper, therefore, "control" means state power to decide resource allocation, production and consumption issues in a manner that displaces the market as an institution. In contrast, "regulation" includes all of the techniques employed in a market economy to mitigate market forces through transfer payments, adjustment payments and stabilization instruments; to restrain market forces through constraints on competition; to reconcile monopoly or cartel activities with an overall market system, particularly so-called natural monopolies; and to make markets work better by equalizing the respective powers of market actors, institutionalizing responsibility for good market conduct in each actor, or setting up an external agency with power to adjust market structures and operations.[8]

But for the purposes of this analysis even this definition of regulation is too broad, encompassing as it does a very broad range of government activities to manage a market economy, therefore the meaning must be further refined, first by distinguishing between mechanisms used at the macro as distinct from the microlevel, and second by distinguishing among direct and indirect mechanisms used at the microlevel.

Macroeconomics, which deals with national income analysis[9] – aggregate flows such as gross national product, national income, aggregate investment and total consumption, as well as relationships among these aggregates and means to adjust them – involves mainly instruments that have direct impact on aggregate demand, particularly taxes, money supply, credit constraints, and government spending, including spending in the form of transfer payments to equalize imbalances among regions, economic sectors and households. Direct intervention at the macrolevel is not pertinent to this paper, which assumes that the proposed techniques of

---

and redistributive policies, *cited in* Doern, *The Concept of Regulation and Regulatory Reform*, in CANADIAN PUBLIC POLICY 8 (G. Doern & V. Wilson eds. 1974).

8 Kaysen, *The Corporation: How Much Power? What Scope?*, in THE CORPORATION IN MODERN SOCIETY 85, 103 (E. Mason ed. 1966).

9 *See* C. SCHULTZE, NATIONAL INCOME ANALYSIS 11 (3d ed. 1971).

More specifically, macropolicies regulate aggregate demand with a view to

regulation at the microlevel are consistent with the overall macroeconomic policy context, therefore macrolevel techniques of intervention will not be considered further.

At the microlevel, where we are concerned with determining how the market or price system allocates and distributes particular goods and services among subsystem units (*i.e.*, the composition of the aggregated national accounts), there exists a broad range of direct and indirect intervention mechanisms that render the activity of an economic unit more or less profitable and therefore influence both input allocation and output distribution. The techniques of *direct* intervention at the microlevel include subsidies, tax incentives and disincentives, credit privileges, price supports, supply management, tariffs, import-export restrictions, foreign controls, and foreign investment restrictions.[10] The last two techniques are especially significant in their impact on securities markets, but because all of these techniques are usually applied to achieve policy goals that consciously displace or are extraneous to the operation of the market system, they too will not be further discussed in this paper.[11]

Closely related to these techniques are the methods of *indirect* intervention used by governments to administer public utilities in the infrastructure or natural monopoly sectors, particularly energy, transportation and communications, where a firm is given a specifically circumscribed monopoly licence subject to the conditions that it furnish services to all members of the public on equal terms and that it comply with the policies of the licence-granting authority, policies that are generally determined in accordance with broad public interest, convenience and necessity standards. The state could achieve the same end by directly owning and administering these services, but for ideological reasons it is often

maintaining growth and output over time at a level consistent with reasonable price stability and a sound international payments position.

10 Price and wage controls - or to use the economist's euphemism, incomes policy - are not considered here on the ground that they displace the price mechanism rather than influence input allocation and output distribution. Although selective controls may not completely displace the price mechanism, they do constitute controls, a form of ad hoc planning.

11 *See* on this subject Wilson, *The Politics of Regulation*, in SOCIAL RESPONSIBILITY AND THE BUSINESS PREDICAMENT 135, 136 (J. McKie ed. 1974).

Note too that this paper eschews any discussion of *social* as distinct from *economic* regulation. Although it has clear economic impact, social regulation focuses on social objectives such as consumer protection, safe working environments, and environmental protection. For a very useful comparison of economic and social regulation, *see* W. LILLEY & J. MILLER, THE NEW "SOCIAL REGULATION" (Am. Enterprise Inst., Rept. No. 66, 1977); B. MONTADOR & H. BAUMANN, GOVERNMENT INTERVENTION IN THE MARKETPLACE AND THE CASE FOR SOCIAL REGULATION (Planning Branch, Treasury Board Secretariat, Canada 1977).

more politic to delegate this function to private sector units.[12] In addition, because these utilities operate within the context of at least a proximate market system in which they compete to obtain resources and to sell alternative services, it is frequently possible to apply some extraneous, objective performance measures established by comparison with like units or with the costs of alternative services in order to determine how well the unit performs the economic task assigned to it.[13] This paper does not attempt to analyze or evaluate utility regulation, but since the techniques used to administer utilities apply in part to all forms of market regulation, utility regulation furnishes an abundance of illustrations based on extensive experience and in-depth analyses.[14]

In the securities market context we are not concerned with *direct* microlevel mechanisms that displace market decisions or that constrain market actions. We are concerned, instead, with *indirect* microlevel mechanisms that attempt to minimize market imperfections engendered by government policies to protect investors through cartel-like structures consciously designed to give the objectives of stability and investor security priority over market efficiency. In short, we are concerned not with displacing the market but with making a constrained market work better. The ideal goal is the economist's paradigm of the perfect market in which there are many buyers and sellers, no market actor has enough power to affect prices materially, all products or services exchanged are homogeneous or interchangeable, all buyers have equal information about all variables, transaction costs are immaterial, all buyers and sellers have freedom of entry and exit, all actors behave rationally, and no government constraints are imposed on the market to achieve extraneous goals.[15] The perfect market, particularly because of the last two conditions, is very

12 Any proposed state acquisition of a public utility must also overcome a number of practical hurdles - enormous acquisition costs, the reluctance of foreigners to deal with a state-owned enterprise, and more complicated performance measurement because of the almost inevitable diffusion of enterprise objectives to achieve broad social and economic goals.

13 The performance measure used is the litmus test to distinguish between a price system and a command system, between competitive management and bureaucratic management; *see* A. DOWNS, INSIDE BUREAUCRACY 25 (1967).

14 On this subject *see generally* W. SHEPHERD & T. GIES, UTILITY REGULATION: NEW DIRECTIONS IN THEORY AND POLICY (1966).

15 *See* R. LEFTWICH, PRICE SYSTEM AND RESOURCE ALLOCATION 25 (1963), *cited in* A. Berczi, The Stock Exchange - A Total System Approach vi (unpublished paper of Faculty of Commerce and Administration, Sir George Williams University July 1971). *See also* 1 D. SHAW & R. ARCHIBALD, *supra* note 2, CANADA'S CAPITAL MARKET iv (June 1972); Demsetz, *Perfect Competition, Regulation and the Stock Market*, in ECONOMIC POLICY AND THE REGULATION OF CORPORATE SECURITIES 1, 1-11 (H. Manne ed. 1969).

much a hypothetical construct, but it furnishes a useful benchmark when evaluating a regulated market system.

The three techniques of *indirect* market regulations – balancing market power, institutionalizing responsibility within market actors, and oversight of the market by an external agency – assume that the market or price system, where it is politically feasible, is the best mechanism to determine the allocation of resources and distribution of goods and services.[16]

The first technique, the balancing of market power, is best illustrated by the competition laws, which prohibit cartel agreements that restrain competition and attempt to block the development of monopoly,[17] and by the industrial relations laws, which confer legitimacy on corporate bodies designated as appropriate bargaining units that have power to bargain effectively on behalf of wage earners with the professional managers of business corporations.[18] The second technique, the institutionalization of responsibility within market actors, is illustrated by the corporation laws[19] and certain labor union laws,[20] both of which attempt to ensure that professional managers and the majority shareholders or members will exercise their powers fairly and in the interests of the corporate body. Other illustrations are the European corporation laws that attempt, through internal supervisory boards on which wage earners are represented, to further solidarity among the wage earners, managers and shareholders within a corporation with a view to reducing industrial disputes, and the various schemes that are designed to induce wage earners to become shareholders of the corporation that employs them.[21]

16 Wilson, *supra* note 11, at 141-46, demonstrates that the distribution of costs and benefits of a regulatory policy will determine the means of regulation.

17 *See* J. Bain, Industrial Organization 515-17 (2d ed. 1968); R. Caves, American Industry: Structure, Conduct, Performance 93-94 (3d ed. 1972).

18 *See generally* C. Wilcox, *supra* note 6, at 14, 718-20; M. Fainsod, *supra* note 6, at 187-95; V. Mund, Government and Business (4th ed. 1965).

19 This was the principal policy goal of the Canada Business Corporations Act, which received Royal Assent on March 24, 1975.

20 The best illustration is the Labor-Management Reporting and Disclosure Act of 1959, Pub. L. No. 86-257 (1959) (Landrum-Griffin Act), referred to in R. Freeman, Labor Economics 125 (1972) and analyzed in detail in A. McAdams, Power and Politics in Labor Legislation (1964).

The Québec government enacted a similar but more stringent law in response to the sensational disclosures made to and the recommendations of the Cliche Commission; *see* an Act Respecting the Placing of Certain Labour Unions Under Trusteeship, S.Q. 1975, c. 57.

21 *See e.g.* Proposed Statute for the European Company, E.E.C. Bull. Supp. 115, art. 137 (1970). Since this institution is limited to one corporation there is no implication of cartelization of an industry as was attempted through the NRA codes during the New Deal era in the United States; *see* S. Shonfield, Modern Capitalism 309-18 (1965); M. Fainsod, *supra* note 6, at 525-43.

Another interesting variation is the Kelso Plan, designed to induce employee

The third technique, the creation of an external private or public sector agency with power to supervise public utilities or markets such as the securities market, is the central concern of this paper, not only because the North American securities markets have been subject to external regulation for a number of years, but also because the external regulatory agency, particularly in a federal context, is the most versatile instrument of regulation. Looking at the myriad agencies that have been set up to regulate infrastructure utilities and markets in various North American jurisdictions, one is at first dazzled by the permutations of purposes, structures and powers of these agencies, but close scrutiny reveals that, although often not too clearly expressed, they have only one goal and a relatively short list of powers. Their goal is to reconcile natural monopoly enterprises or contrived cartel structures with an overall market economy, seeking as far as possible to exploit the respective advantages of planning and market systems.[22] To achieve this goal they exercise regulation making, administrative, investigatory and adjudicative powers to supervise or constrain the activities of each regulated enterprise. In exercising these powers they tend to concentrate their attention on three market characteristics: (1) market entry; (2) the structure of the market and the conduct of the actors in that market; and (3) the direct setting of prices or the indirect setting of prices through the management of supply of the goods or services exchanged in that market.[23]

The foregoing discussion concerning alternative economic systems, the functions of government, and the techniques of economic regulation (summarized in table 1), furnishes a background to develop a framework for analysis of the regulatory process that can be applied to analyze the regulation of securities markets. This is not a novel undertaking. In a landmark article published in 1940, M. Fainsod outlined the concepts of regulation, summarized the

---

share purchases, *discussed in* INTERIM REPORT OF THE SELECT COMM. OF ONT. LEG. ON ECONOMIC AND CULTURAL NATIONALISM, CAPITAL MARKETS, FOREIGN OWNERSHIP AND ECONOMIC DEVELOPMENT 92-99 (1974).

22 Note that these regulatory techniques can be characterized in many ways. C. WILCOX, *supra* note 6, categorizes regulatory techniques as aspects of competition: (1) controlling monopoly by maintaining competition; (2) controlling monopoly ("natural monopoly") by regulation; (3) controlling monopoly by public enterprise; (4) setting the plane of competition (consumer, investor, resource protection); and (5) moderating competition to achieve a higher priority policy goal (labor law, agricultural cartels, etc.). M. FAINSOD, *supra* note 6, at 187-95 employs different categories.

See also Feller, *Public Policy of Industrial Control*, in PUBLIC POLICY 130 (C. Friedrich & E. Mason eds. 1940).

23 B. SCHWARTZ & H. WADE, LEGAL CONTROL OF GOVERNMENT 29 (1972).

Table 1
Alternative Objectives and Techniques of Regulation

Level and nature of regulation	Objective of regulation	Technique of regulation	Selected illustrations
Macrolevel	To stabilize the economy with a view to maintaining a high level of production and employment with minimum inflation	Adjusting aggregate demand through tax, government spending, and money supply and credit policies	Government budget and central bank actions
Microlevel direct intervention	To influence directly input allocation, production and output distribution	Subsidies	Shipbuilding
		Tax incentives	Investment credits
		Price supports	Agricultural product marketing cartels
		Tariffs or quotas	Textiles
		Foreign exchange controls	Exchange only to acquire capital goods
		Export restrictions	Military technology
		Foreign investment controls	Land ownership prohibitions
Microlevel indirect intervention	To influence indirectly input allocation, production and output distribution	Equalizing the respective powers of market actors	Competition laws and labor relations laws
		Institutionalizing responsibility for good market conduct in specific actors	Corporation laws and labor union laws
		Setting up an external agency with power to adjust market structures and operations through constraints on entry, conduct and prices	Utilities (Canada): CRTC; CTC; NEB Utilities (U.S.): ICC; FPC; FCC; CAB Other (Canada): RTPC Provincial securities commissions Other (U.S.): FTC; SEC

basic issues and recommended that any analysis of the regulatory process should proceed on three levels – analysis of (1) the institutional matrix, (2) the parties in interest concerned with the character of the regulation and (3) the policy instruments employed.[24] Fainsod particularized the institutional matrix to include technology, economic organization, ideology and law. He defined the parties in interest concerned with the nature of the regulation or, in other words, with the constraints imposed, to include policy-makers, investors, managers, employees and consumers. And he described the political instruments invoked to implement a regulatory system to include legislation and regulations, administrative discretion and judicial review of the substantive law and its application. In short, Fainsod recommends that any analysis of the regulatory process take into account the many dimensions of the issue as seen from the point of view of the legislator, the administrator, the economist, the political scientist and the lawyer.

Such an analysis, even if restricted only to the securities industry, is a formidable task, but in view of the current controversy over freely negotiated brokerage commission rates and the rapid development of computer-communications technology, this kind of analysis is more important than ever in order to seek answers to questions such as the following. Is there any reason to continue to view the securities industry – particularly the stock exchanges – as a kind of monopoly enterprise that must be treated as a public utility? Can we convert the present utility nature of the enterprise to a free market enterprise by removing fixed commission rates and eliminating barriers to market entry? Are the present constraints on competition – controls over entry, structure, conduct, and rates – essential, or are they required only because the securities industry is artificially structured as a quasi-monopoly? Should an electronic information and trading system be characterized as a pure public utility and controlled accordingly? Does the present system of administrative law applicable to the securities industry, which law is predicated on regulated market assumptions, actually make the securities industry function better or has it become an end in itself to prop up an artificial system? It

ACAD. POL. & SOC. SCI. 14 (March 1972); G. DOERN, I. HUNTER, D. SWARTZ & V. WILSON, APPROACHES TO THE STUDY OF FEDERAL ADMINISTRATIVE AND REGULATORY AGENCIES, BOARDS, COMMISSIONS AND TRIBUNALS 47-60 (Report Prepared for the Canada Law Reform Commission April 1974).

For a recent review of this subject *see* Sabatier, *Regulatory Policy Making: Toward a Framework of Analysis*, 17 NAT. RESOURCES J. 415 (1977).

is impossible to deal exhaustively with each of these issues in a brief monograph, but it is possible to analyze succinctly the economic functions of the securities market, examine the techniques of market regulation, scrutinize the policy assumptions underlying that regulation, and consider alternative means to deal with the securities industry within the analytical framework suggested by Fainsod.

To simplify and abridge the analysis of this vast subject, this paper is expressly predicated on several basic assumptions. First, with respect to the institutional matrix, the ideal securities market is a free market, regulated only as required reasonably to reconcile the conflicting public interests in investor protection and dynamic promotion of new enterprises. Second, also with respect to the institutional matrix, computer-communications technology will within the next decade largely supplant the present securities market institutions and, as a corollary, will require a complete rethinking of present regulatory techniques. Third, with respect to the parties in interest, this paper assumes that regulation of the securities market, because of its strategic role in a market economy, concerns all members of society, whether in their capacity as policy-makers, investors, managers, employees or consumers, and therefore must seek to achieve a reasonable balance among their particular interests. Accordingly, this paper focuses largely on the alternative policy instruments that may be invoked to regulate the securities market.

Chapter III
Economic Function of Securities Markets

Because of the intrinsic difference between a command economy and a market economy, it follows that each system will employ altogether different techniques to allocate capital among government, households and business firms. Between these polar extremes there is the contemporary mixed economy such as the Canadian economy, which employs a broad mix of mechanisms to direct or, more frequently, to influence the allocation of capital.

In a command economy all savings, even those generated internally within subsystem units are taken into account and allocated in accordance with the overall economic plan. In contrast, in a mixed economy, only rarely does government directly allocate savings among users of capital, but it can – and frequently does – invoke several policy instruments to bring to bear a strong, indirect influence on the allocation process. For example, it may grant direct subsidies or tax concessions to a specific sector with a view to developing that sector generally or in a specific region. It

may allocate savings obtained through the tax system or the securities markets directly to government enterprises.[25] It may indirectly allocate capital through government controlled financial intermediaries set up to influence development in certain sectors or regions or to promote small business.[26] It may sponsor the operation of the securities market by furnishing intermediate financing to strategic market actors, particularly underwriters and secondary market-makers.[27] It may regulate the securities market on the assumption that it is a kind of natural monopoly, paralleling the controls over entry, conduct and prices that are applied to regulate public utilities. It may, on the other hand, regulate or even operate the securities market on the assumption that it is intrinsically an absolute monopoly.[28] Or it may employ a mix of two or more of these techniques, depending on the prevailing economic ideology and political environment. There is no one technique that can be characterized as more or less obtrusive than the other, for the technique employed depends on assumptions about whether a market is desirable or even possible and about the prevailing concept of the acceptable role of government.

Before proceeding to determine how the securities market might be regulated, it is essential to determine what functions it

25 *See e.g.* the Petro Canada Act, S.C. 1975, c. 61.

For an excellent analysis of indirect techniques of capital allocation employed in the United States, *see* L. YEAGER, PROPOSALS FOR GOVERNMENT CREDIT ALLOCATION (American Enterprise Institute 1977).

26 *See e.g.* the Canada Development Corporation Act, S.C. 1970-71-72, c. 49, s. 2, which states that the purpose of the Act is "to establish a corporation that will help develop and maintain strong Canadian controlled and managed corporations in the private sector of the economy and will give Canadians greater opportunities to invest and participate in the economic development of Canada".

See also the Federal Business Development Bank Act, S.C. 1974-75, c. 14, s. 4, which was created "to promote and assist in the establishment and development of business enterprises in Canada...".

27 Arguing that the pervasive influence of development banks has prevented the development of a securities market in developing countries, Kleinman advocates that governments sponsor a liquidity fund to finance the interim holdings of securities by underwriters and market makers; *see, Hearings on Capital Markets and Economic Development: The Kleinman Plan, Subcomm. of Inter-American Affairs of House Comm. on Foreign Affairs*, 92d Cong., 2d Sess. 2-17 (1972) [hereinafter cited as the *Kleinman Plan*].

28 *See* J. STONE, AN ECONOMIC STUDY OF THE SECURITIES INDUSTRY 40-41 (1975), where the author argues that economic analysis requires government ownership or full regulation. For a similar argument *see* F. Weil, The Securities Industry: Myth v. Reality - And a Proposal (paper published by Paine, Webber, Jackson and Curtis, N.Y. June 1975), *reprinted in Securities Amendments Act of 1975: Hearings on S. 249 Before Subcomm. on Securities of Senate Comm. on Banking, Housing and Urban Affairs*, 94th Cong., 1st Sess. 268 (February 1975).

One author underlines, however, that at least in the U.S., government has a strong bias toward regulation and away from public ownership or management; *see* Wilson, *supra* note 11.

performs, show how they fit into the overall capital market structure and consider whether they are important enough to justify costly, detailed government surveillance. In conceptual terms, securities markets make available formal trading centres, establish guides to the value of securities, and furnish a mechanism to enhance the liquidity of government and corporate securities in the sense that they permit an investor to exchange his freely transferable securities for money at low cost with a minimum reduction of market price engendered by the transaction. Indeed, it is this latter function that is the principal reason for having a securities market, that is, to bridge the manifold liquidity preferences of savers and the requirements of governments and enterprises for medium-term and long-term capital. In more concrete terms, the functions of the securities market can best be expressed by reference to five general categories of market outputs (table 2).[29]

In short, the general function of the securities market complex – which includes underwriters, stock exchanges, clearinghouses, transfer agents, investment advisors, securities depositories and, at least peripherally, the accounting profession – is to act as one more financial intermediary in the overall capital market.[30] Virtually all financial intermediaries are subject, like public utilities, to regulation designed to protect those persons who entrust their savings to the intermediaries as money managers. It is not surprising, therefore, that analogous techniques are employed to regulate the securities market, particularly utility-type controls over market entry, structure, conduct and prices, which vary from one jurisdiction to another depending upon prevailing attitudes about the desirability of open competition – as distinct from mere service competition – among financial intermediaries. The policy in each jurisdiction will reflect the weight given on the one hand to investor security and on the other to

29 J. STONE, *supra* note 28, at 14-15. *See also* Friend, *The SEC and the Economic Performance of Securities Markets*, in ECONOMIC POLICY AND THE REGULATION OF CORPORATE SECURITIES, *supra* note 15, at 185.

30 *See* Werner, *Management, Stockmarket and Corporate Reform: Berle and Means Reconsidered*, 77 COLUM. L. REV. 388, 407 (1977) where the author points out that the nexus between distributing corporations and the securities market and the integration of the securities markets into national and international financial markets has even obscured the distinction between financial and non-financial institutions, for the latter, when they use funds obtained externally to finance the sale of their products or to purchase money market instruments or other securities, are themselves functioning as financial intermediaries.

For a general discussion on financial intermediaries *see* D. BOND & R. SHEARER, THE ECONOMICS OF THE CANADIAN FINANCIAL SYSTEM (1972); ECONOMIC COUNCIL OF CANADA, EFFICIENCY AND REGULATION: A STUDY OF DEPOSIT INSTITUTIONS (1976).

Table 2
General Categories of Securities Market Functions

Function	Description
Nondiscretionary exchange services	Matching buyers and sellers, clearing and settling securities ownership claims and cash claims
Liquidity services	Assumption of risk by an intermediary acting as an underwriter or secondary market-maker both to spread the risk of loss and to satisfy immediate liquidity preferences
Information services	Disclosure of information about each market actor and about market trades that can affect price decisions
Administrative services	Investment advice, portfolio management, and record keeping
Corporate finance services	Advice to and distribution services for issuers of securities

Table 3
Financial Intermediaries: In Order of Increasing Direct Investor Exposure to Risk

Financial instrument employed	Financial intermediaries							
	Commercial bank	Savings bank	Trust company	Insurance company	Loan company	Mutual fund (open-end)	Investment company	Securities market
Demand deposit contract	X							
Term deposit contract	X	X	X					
Life insurance policy				X				
Annuity contract				X				
Variable life insurance policy				X				
Variable annuity contract				X

Variable share of securities portfolio						X	X	
Broker's pooled account						X		
Individual's securities trading contract								X

speculative enterprise or, in other words, will reflect the relative community values attributed to order and to creative freedom.

Refracted through an analytical prism, the broad spectrum of financial intermediaries can be divided into several discrete kinds of institution, the salient characteristic[31] of each being the potential risk[32] of loss borne by the owner of savings channeled through a particular intermediary. Table 3 attempts to illustrate concisely this characteristic of each financial intermediary, setting out in the columns the kinds of intermediaries in order of increasing investor risk from left to right, and setting out in the rows the kind of financial instrument employed, again in order of increasing investor risk from top to bottom.

Table 3, because it cannot set out all the variables that relate to each intermediary, only reflects generally the trend of investor exposure to increased risk of loss. For example, at the one extreme, with respect to a commercial bank the first risk of any loss is borne directly by bank shareholders and not depositors; but even this security is reinforced by minimum net capital rules and deposit insurance. At the other extreme, with respect to the securities market complex – where the investor bears directly all risk of loss connected with the security – the investor who leaves cash or securities in the custody of a broker is further protected from loss caused by the insolvency of a broker – whether caused by mismanagement or fraud – by minimum net capital rules and a form of deposit insurance furnished by the industry Contingency Fund. In between these polar extremes are a number of variations that relate to the instrument employed, the relative stability of the issuer of the instrument, and the regulatory safeguards used to support payment by a defaulting intermediary. In any event, it is clear that the investor faces the greatest potential risk of loss when he purchases securities for his own account in the securities market. This is partly because he does not have the benefit of professional portfolio management, but more importantly, because he generally cannot, as an individual, spread his risk of loss over a broadly diversified portfolio of loans or securities as can the manager of a bank, trust company, insurance company, investment company, mutual fund or pooled account.

Notwithstanding his relatively greater exposure to potential

31 Another important characteristic is the transferability of the financial instrument purchased, which largely determines the liquidity of the investment. All these instruments are, however, only various means to carry out the intermediation function.

32 The emphasis is on *potential* as distinct from *actual* risk, since an investor may invest relatively very securely through the intermediary that makes available the

risk of loss, an investor who acquires securities through the facilities of the securities market can narrowly confine his risk by purchasing only securities issued by governments or very stable business corporations. As a result, assuming fair disclosure and reasonable protection from fraud, an extensive and complicated system to regulate the securities market could not be justified only on the basis of the investor's exposure to risk of loss of his savings. There is, however, another very important factor which must be considered; that is, the aggregate amount of savings channeled each year through the securities market.

Although the relative importance of the securities market is frequently – and understandably – overstated by industry participants, who tend to characterize it as the hub of all business activity, it is clear that it forms only a relatively small part of the overall capital market in Canada. To show its role in general perspective table 4 summarizes the approximate total funds raised through the Canadian financial markets in 1975.[33]

For the purposes of this analysis, the ideal graphic presentation would show the sources of funds (saving of households, businesses, governments), the financial intermediaries through which they flow, and the ultimate uses of those funds.[34] Unfortunately, however, the data available tend to ignore the intermediation function and to focus instead on the sources and uses of funds, thus only implying by the kind of borrower and the nature of the financial instrument used by the financial intermediary that linked the source and the user of funds. If one defines the securities market arbitrarily to encompass only funds raised by the issue of bonds or shares of non-financial private corporations and non-financial government enterprises, then the flow of funds through that market in 1975 as shown in the national accounts of Canada totalled some $6.36 billion.[35] While a relatively small percentage of the total (about 18%), this $6.36 billion is still an enormous absolute

---

greatest possible risk - the securities market - by investing only in blue-chip securities.

33 These data are derived from the *Financial Market Summary Table* set out and described in McCollum, *Measuring Financial Activity: A Macroeconomic Perspective*, [1977] CAN. STAT. REV. 9. McCollum also sets out a summary Total Sources and Uses of Funds table.

34 An excellent model for such a graphic presentation is set out in BOARD OF GOVERNORS OF THE FEDERAL RESERVE SYSTEM, INTRODUCTION TO FLOW OF FUNDS 12 (February 1975).

35 This is the total of the following items set out in table 4 *supra*: Funds raised in credit markets for bonds and shares by non-financial private corporations and by non-financial government enterprises.

To this one could justifiably add both government bonds and short-term paper (money market instruments) issued by governments and non-financial institutions. They have been omitted, however, because of problems of data definition.

Table 4
Financial Market Summary, Canada

1975
In millions of dollars

Funds raised in credit markets by:		
Persons and unincorporated businesses		13,541
Nonfinancial private corporations		
Bank loans	1,307	
Other loans	893	
Short-term paper	102	
Mortgages	345	
Bonds	2,160	
Shares	1,054	5,861
Nonfinancial government enterprises		
Bank loans	375	
Other loans	452	
Short-term paper	-57	
Mortgages	123	
Bonds	3,065	
Shares	80	4,038
General government		8,823
Total borrowing by domestic nonfinancial sectors		32,263
Rest of world (foreign borrowing)		1,495
Total borrowing excluding domestic financial institutions		33,758
Domestic financial institutions		2,320
Total funds raised		36,078
Funds supplied directly to credit markets by:		
Persons and unincorporated businesses		3,954
Nonfinancial private enterprises		543
Public sector (general government and nonfinancial)		2,331
Public financial institutions		2,283
Rest of world		5,438
Bank of Canada		747
Chartered banks		8,903
Private domestic financial institutions (except banks)		11,879
Total funds supplied		36,078

amount that is of special significance for two reasons. First, it probably tends to be used more to extend the productive capacity of Canadian enterprises rather than to finance inventories or credit sales.[36] Second, because of the relative objectivity of allocation by the securities market, any funds raised through that market – particularly where a corporation issues shares – tend to have a catalytic effect, often qualifying the user to receive funds from other sources simply because its overall business prospects and management have been so closely scrutinized by underwriters, investment advisors and securities purchasers. It is clear, therefore, that the very substantial amount of funds channeled through the securities markets justifies a regulatory system similar to that applicable to other financial intermediaries.

But to look only at the risk of investor exposure to loss and the aggregate amount of securities traded is to ignore what are probably – even if unquantifiable – still more important aspects of the issue; that is, the extraneous goals that are achieved by a properly functioning securities market. In addition to allocating capital on a competitive basis, it permits individuals and institutions to participate in the ownership and control of business enterprises; it encourages the investment of savings in equity securities issued by productive enterprises as distinct from investments in passive assets such as unproductive land and gold;[37] it furnishes a means to encourage Canadian ownership of domestic enterprises and so reduces our obligations to pay dividends and to repay capital to foreigners and so also reduces the upward pressure on our exchange rates that is a corollary of large capital inflows; it furnishes a means to attract foreign portfolio investment instead of foreign direct investment, thus contributing further to Canadian control of domestic enterprises; and, as a result of these factors, it assures that the Canadian government can control more effectively the domestic economy.

In summary, because of the exposure of the investor to risk of loss, because of the very large, absolute dollar amount of securities traded, and because of the extraneous goals attained through a smoothly functioning securities market, there is no doubt that the securities market is important to Canada as a whole and, if that

36 For an interesting analysis of the decline of common share issues of Canadian corporations, *see* Gorman, *The Decline of the Equity Market System in Canada*, [1977] Bus. Q. 48 (Summer).

A detailed statistical analysis of the Canadian financial market is set out in two other papers in this volume: *see*, *Williamson*, *Financial Institutions*; *Williamson*, *Capital Markets*.

37 *See* P. DRUCKER, THE UNSEEN REVOLUTION 75 (1976), where the author argues that Canada has the lowest rate of "true savings" of any industrialized nation and has for forty years made up its capital formation deficiency by borrowing U.S. savings.

market is not performing satisfactorily, that considerable government intervention is justified. But the appropriate form of intervention can only be determined by analysis of the kind of market that now exists or can be foreseen and the regulatory mechanisms available.

Chapter IV
Development of Securities Market Regulation

Reading through the foregoing explanation of the nature of regulation, a contemporary securities regulator, unlike Molière's bourgeois gentleman, would not be too surprised to learn that he had been speaking prose for a long time, and that he had been acting as an objective, external agent to impose constraints on market entry, conduct and prices with a view to making the securities market more stable and more secure, or, in other words, trading off ideal market efficiency for stability and investor security. Like most legal institutions, however, the present securities laws did not develop deductively from preconceived, clearly understood principles but rather grew out of a consolidation of a number of separate policy initiatives designed over some three centuries to resolve specific problems.

During the seventeenth century, at the same time as the closed guilds of the feudal period were being forced to yield to a market system, more and ever larger trading corporations with transferable shares were being set up in England, particularly to take part in foreign trading ventures. Until the end of the century the constraints set out in the corporate charters constituted a sufficient safeguard for investors and creditors, but as the volume of share trading grew fraud became more frequent, causing the English Parliament to enact the first law to regulate the activities of stockbrokers in 1698.[38] After the passage of the Bubble Act in 1720, which was intended to curb the fraudulent promotion of speculative enterprises, until 1844, when the Joint Stock Companies Act, 1844 became law, few corporations were created, although substantial trading in the shares of existing corporations did continue. The latter Act of 1844 established the foundation of modern English company law: it distinguished between partnerships and companies by introducing a companies registration system; it enabled incorporation by registration under the general law; and it required full disclosure in the company's constitution

38 Act of 8 & 9 Wm. 3, c. 32, *cited in* L. GOWER at 38 n. 82. The modern English statute is the Prevention of Fraud (Investments) Act, 1958, 6 & 7 Eliz. 2, c. 45 *as amended*.

and in any prospectus issued by promoters. But it did not grant limited liability, a policy that was not adopted until 1855.[39] Subsequently, the Directors Liability Act, 1890 made it clear that a director was liable for misstatements negligently set out in a prospectus, and the Companies Act, 1900 introduced the modern concept of broad prospectus disclosure,[40] completing the basic policy framework of English corporations and securities law as it remains to this day. In sum, the policy expressed by the statutes and implied by the leading cases[41] was as far as possible to institutionalize responsibility in the promoters, directors and the company itself rather than to regulate the market activities of issuers, underwriters and brokers through an external government agency, the latter function having been left to the discretion of self-regulatory bodies such as the stock exchanges and the City Working Party, which drafted and enforces the City Code on Take-overs and Mergers through the City Panel. Whether the present English system, which is administered at four levels – the courts applying the laws concerning fraud, the Department of Trade through the companies and broker registration laws, the council of the Stock Exchange, and the City Panel – should be supplanted by some form of regulatory commission is currently being considered by the United Kingdom government. Predictably, the topic generates a great deal of heated discussion.[42]

In contrast, throughout North America, apparently because markets were more open to newcomers and speculative securities promotions more commonplace, state and provincial governments from the beginning of this century impliedly characterized the securities market as a kind of public utility and accordingly regulated it in each jurisdiction through an external state agency.

L. Gower at 35 n. 58 points out that Parliament made several rather ineffective attempts during the 18th century to preclude stock market abuses.

40 *Id.* at 5-6.

41 Ashbury Carriage Co. v. Riche, L.R. 7 H.L. 653 (1875), introduced the notion of *ultra vires* to constrain adventurous management; Trevor v. Whitworth, 12 App. Cas. 409 (H.L. 1887), barred a corporation from acquiring its own shares; Erlanger v. New Sombrero Phosphate Co., 3 App. Cas. 1218 (H.L. 1878), made clear that promoters, directors and officers were fiduciaries and, as such, had a duty to act in good faith even if not a duty of care.

42 *See* the responses to the Questionnaire of the Department of Trade (U.K. June 1974): Capital Markets Committee, The Industry Bill (memorandum June 3, 1975); Panel on Take-overs and Mergers (memorandum January 1975); The Law Society (memorandum January 1975).

The London financial community recently published proposals, under the leadership of the Governor of the Bank of England, to set up a new self-regulatory body, the Council for the Securities Industry, which will exercise broad rule-making and enforcement powers; *see* articles cited in note 2 *supra*.

Beginning with Kansas in 1911 and Manitoba in 1912, nearly all the states and all the Canadian provinces have adopted quite comprehensive securities regulation laws, which tend generally to apply three techniques – licensing market participants such as investment advisors, brokers and salesmen; licensing the distribution of specified issues of securities; and stipulating strict anti-fraud rules.[43] In economic terms these early securities acts regulated the market entry of corporate issuers and market actors and imposed stricter conduct rules with respect to primary distributions of securities. In most cases there was no direct regulation of prices charged by market actors for the services they rendered in connection with primary distributions, although some corporation laws and some securities commissions did set limits on the charges of promoters and underwriters. The salient characteristic of these state and provincial securities laws, commonly called "blue sky" laws, is the broad delegation of discretionary power to the pertinent securities commission to license salesmen and other actors and to determine what constituted full prospectus disclosure or, in other words, to determine when a prospectus is free of any fraudulent misrepresentation, whether made by way of omission or commission, and even to refuse to qualify a prospectus where, in the opinion of the commission, a proposed business is not a viable enterprise. Since 1911 both the scope and application of the state and provincial securities laws have expanded considerably; for example, in most jurisdictions the scope of the laws has been extended by broadening the definition of "securities" to encompass almost any kind of scheme to raise money from the public for investment in an enterprise. In Canada, moreover, the provincial securities laws have been extended to apply to secondary trading activity through the stock exchanges and even to the objectives and practices of certain intermediaries, particularly mutual funds.

In each case the securities laws were pragmatically adapted or expanded to resolve specific problems with a minimum of conceptual soul searching about the nature and purposes of economic regulation, the best means to regulate securities markets, or the acceptable role of a government agency as a regulator. Thus at the state and provincial levels in North America the legislatures tacitly cast the securities commissions as public utility regulators with broad discretionary power to regulate market entry, conduct and even prices for services in respect of primary security distributions, applying broad public interest standards. In Canada these

43 *See generally* 1 L. Loss, Securities Regulation (2d ed., vols. 1-3, 1961 & Supp., vols. 4-6, 1969) at 23-25; L. Loss & E. Cowett, Blue Sky Law 1-10 (1958); J. Williamson

broad discretionary powers were extended with little controversy to apply to the secondary markets, particularly the stock exchanges, giving the securities commissions power to regulate all actors in the securities market complex as one integrated financial intermediary. Securities law did not develop so smoothly at the federal level in the United States, however, partly because of preconceptions that the securities market was indeed a market and not a kind of natural monopoly requiring comprehensive utility-type control, partly because at the time it was introduced – 1933 and 1934 – there was considerable political ferment about the desirability of any markets, and partly because of an innate suspicion of any grant of broad discretionary powers to an independent regulatory agency.

Indeed, the feeling then in the United States that the securities industry did operate in a market context was so strong that there was, notwithstanding the cartel-like powers exercised by the stock exchanges, relatively little debate urging regulation of the securities market as a kind of public utility through a commission in accordance with broad public interest standards. Instead the final debate centered on whether the securities bill – which would apply only to primary distributions – should contain only anti-fraud rules or both anti-fraud rules and comprehensive prospectus disclosure rules as did the English Companies Act, 1929.[44] The Securities Act of 1933 as finally enacted by Congress did contain both anti-fraud and disclosure rules, adopting expressly the English model, and thus encompassing both prospectus disclosure rules and anti-fraud rules that are buttressed by stiff civil sanctions. The disclosure rules did not make promoters, directors, officers and experts the insurers of prospectus statements but did impose a positive standard of care – due diligence – on those persons, making them personally liable where they negligently permitted a false statement to be published in a prospectus.[45] Thus with respect to primary distributions the emphasis of the United States federal law, in contrast to state "blue sky" laws, was on full and fair disclosure, that is, the imposition of responsibility on an issuer and its principals, and not external government regulation based on broad public interest standards. In theory, therefore, any person could have free access to the securities

45 Landis, *supra* note 44, at 34-35.

market for any purpose, subject only to compliance with the disclosure rules.[46] After its passage, administration of the Securities Act of 1933 was assigned to the Federal Trade Commission while Congress considered how it should deal with the regulation of secondary trading in securities through the stock exchanges and the over-the-counter market.

Concurrently with their consideration of the securities market, the President and Congress were wrestling with the overall economic problems engendered by the great depression, particularly the implementation of the National Industrial Recovery Act (NIRA), which had become law on June 16, 1933, and which, had its full potential been realized, would have structured each sector of the economy into a cartel that would operate under government supervision, in effect substituting a command system for the market economy. Under NIRA each sector was required to develop a plan called a "code" that would include production and price controls and set out clear labour standards for the protection of employees. Each code was then submitted to the responsible agency, the National Recovery Administration (NRA) and, if accepted, became the law applicable to that sector, thus displacing the competition or anti-trust laws that would otherwise apply to prohibit such cartel agreements as being in restraint of trade.[47] One of the early codes accepted under the NIRA was the code of fair competition for investment bankers that was approved in November 1933, encompassing the activities of underwriters, brokers and dealers.[48] Although that specific code was abrogated when the Supreme Court held the NIRA to be unconstitutional,[49] its basic concept of regulating the securities industry as a kind of cartel subject to the scrutiny of a government regulatory agency proved to be a tenacious idea.

The NRA policies were not yet crystallized when the Securities Exchange Act of 1934 was enacted to expand the scope of regulation to include secondary trading and to create the Securities and Exchange Commission (SEC) as the agency to administer both the Securities Act of 1933 and the Securities Exchange Act of 1934. The latter act, although somewhat ambiguously, did tacitly adopt a philosophy of cooperative regulation, that is, stock exchange control – or in other words, cartel control – over market entry, conduct and prices, subject to a number of express

46 But Congress deliberately did not preempt the field and therefore left to the states the power to impose any higher public interest standards at the local level: *see* L. Loss & E. Cowett, *supra* note 43, at 237.

49 Schechter v. U.S., 295 U.S. 495 (1935).

statutory conduct rules and subject to general SEC surveillance. This policy was later expressly adopted in the Maloney Act of 1938, which was clearly based on the earlier NRA code, and which added section 15A to the Securities Exchange Act of 1934 to legitimate the cartel-like activities of national securities associations registered under the Act, giving them an even clearer cartel status than that enjoyed by the exchanges, in particular express power to discriminate against non-members without running afoul of the anti-trust laws.[50]

As a result of these developments, the policies underlying securities regulation in the United States became both obscure and complex. The federal law impliedly denied the existence of a natural or government legitimated monopoly that required comprehensive, utility-type regulation and expressed a policy based on disclosure and self-regulation under vague SEC surveillance. But it did not displace the broad, discretionary state laws and so required compliance at all times with both federal law and the state "blue sky" laws. Moreover, the federal law expressly legitimated the fixing of brokerage commission rates by stock exchanges and also specific trade discrimination rules, which require certain transactions to be executed on the exchange, and which preclude an exchange member from seeking better execution elsewhere until he has determined that the transaction cannot be executed on the exchange of which he is a member. But it did not clearly give the stock exchanges immunity from the application of the anti-trust laws and so left open a major area of conflict between the securities laws and the anti-trust laws.[51] Thus from a

50 The SEC surveillance powers are set out in s. 19 of the Securities Exchange Act of 1934.

Only one association, the National Association of Securities Dealers (NASD), a Delaware non-profit corporation, has ever been registered; *see generally* S. ROBBINS, *supra* note 48, at 112; 2 L. Loss at 1365.

Its Canadian counterpart, the Investment Dealers Association (IDA) is an unincorporated association that has never had statutory legitimacy but has been recognized in statutory provisions such as Ontario Securities Regulations, s. 2(1)3.

51 This subject is discussed generally in 5 L. Loss at 3153-86. *See also* Pozen, *Competition and Regulation in the Stock Markets*, 73 MICH. L. REV. 317 (1974); and *Statement of Dept. of Justice at SEC Hearings on the Structure, Operation and Regulation of the Securities Markets* (December 1, 1971), *reprinted in* 6 *Study of the Securities Industry: Hearings Before the Subcomm. on Commerce and Finance of the House Comm. on Interstate and Foreign Commerce*, 92d Cong., 2d Sess. 3135 (January 26-28, 1972) (app. LL).

For a recent analysis of this issue, *see* Linden, *A Reconciliation of Antitrust Law with Securities Regulation: The Judicial Approach*, 45 GEO. WASH. L. REV. 179 (1977).

The proposed new s. 4.5 of the Combines Investigation Act, R.S.C. 1970, c. C-23, set out in cl. 6 of Bill C-13, 30th Parl., 3d Sess. (first reading November 18, 1977), An Act to Amend the Combines Investigation Act and to Amend the Bank Act and Other Acts in Relation Thereto or in Consequence Thereof, purports to resolve

policy point of view the federal securities laws of the United States reflect an inherent ambivalence: on the one hand they promote competitive markets by forcing broad disclosure and barring misrepresentation, market manipulation and other kinds of fraud; on the other hand they attempt to shield the actors in the securities market – albeit ambiguously – from the rigours of the competition laws with a view to strengthening securities market actors and thus increasing investor protection.

It is because the SEC,[52] the Antitrust Division of the Department of Justice,[53] the Department of the Treasury[54] and a number of private sector critics[55] tried to force a clear resolution of these issues that the proposed Securities Reform Act of 1975 elicited so much sharp controversy, particularly in respect of market entry controls, the fixing of commission rates and the trade discrimination rules – the three strategic cartel powers of the exchanges and the National Association of Securities Dealers (NASD). In the final compromise among the parties in interest the stock exchanges may still require members to pay for exchange seats, the present ban on fixed commission rates is continued but may be lifted at any time by the SEC, and the present New York Stock Exchange (NYSE) Rule 390, which bars an exchange member from dealing in a listed security other than through the exchange's facilities, continues partly in force.[56] In short, although there was broad

55 *See* studies cited in note 2 *supra*; and *Hearings on S. 2519 Before the Subcomm. on Securities of the Senate Comm. on Banking, Housing and Urban Affairs*, *supra* note 53.

56 *See* Securities Reform Act of 1975, ss. 6(b)(5), 15A(b)(6), 19(c), discussed in REPORT OF THE SENATE-HOUSE CONFERENCE COMMITTEE, H.R. REP. No. 94-229, 94th Cong., 1st Sess. 99 (1975).

The Congressional Reports relating to the enactment of the 1975 amendments strongly criticized two stock exchange rules, exemplified by NYSE Rules 390 and 394, as being anti-competitive. Rule 390 bars an exchange member from dealing as *principal* in listed securities through over-the-counter facilities. Rule 394 as amended in 1966, barred a member from effecting a trade as *agent* for a customer in a listed equity security off the exchange floor with a third market-maker unless the member demonstrated he could effect execution at a lower price in the third market and also obtained the exchange's consent to the trade.

Rule 394, which even as amended in 1966 continued to be a bar to third market execution, was repealed on March 31, 1976.

agreement on the central objective of the bill – to permit a restructuring of the securities market to allow price competition as well as service competition – there is still no clear resolution of the basic problem. Is the SEC to continue to pretend that the securities industry operates within a relatively free market context and so requires only limited tinkering to remove market imperfections? Or is the SEC to consider the securities industry as a special case of monopoly, which, if not a natural monopoly, is an essential, government legitimated monopoly required to give market stability and investor security clear priority over free market efficiency, and which therefore must be regulated like any other financial intermediary or even as a public utility?

Fortunately, in Canada, we have been spared much of this conflict, not because of any superior wisdom but because the provinces tended from the outset to follow the U.S. state models which presuppose that the securities industry is a kind of public utility and therefore that an external government regulatory body should have broad powers to regulate market entry, conduct and commission rates,[57] subject to full consideration of industry views and to judicial review of the administrative process. That is not to suggest, however, that all problems have been resolved in Canada. Indeed, it is clear they have not. First, we have not yet confronted the fundamental problem of developing a central market system, which will require considerable rethinking about the competitive issues; and second, unless we insulate the Canadian securities market from foreign influences, we must enable it to adapt to major institutional changes in the United States market, in particular fully competitive commission rates and freer access to the proposed central market. It follows therefore that there are two basic policy alternatives available to Canada. The first is to build up protective walls around the Canadian industry and permit it to develop independently of outside influences. The second and obviously preferable strategy is to attempt to coordinate industry and regulatory efforts in Canada with a view to developing a Canada-wide market that does not have to be sheltered from

---

Rule 390, however, continues in force. Although uneasy about its anti-competitive effects, the SEC has been clearly concerned that its repeal could damage the auction markets operated through the exchange and substitute dealer markets. The SEC is therefore temporizing on this issue, but it recently decided to prohibit all off-board *agency* restrictions except certain "in-house" agency cross transactions but continues to permit off-board *principal* restrictions: *see* SEC, Securities Exchange Act of 1934 Release No. 14325, December 30, 1977, [1977-78 Transfer Binder] CCH FED. SEC. L. REP. ¶81,397; NYSE, Information Memo No. 78-11 (March 3, 1978).

57 *See e.g.* the reference to the industry as a kind of "combine" in the report on the proposed national brokerage commission rates, [1973] OSC Bull. 107, 108 (August).

international competition and that will serve to attract and allocate both Canadian and foreign capital.[58]

Irrespective of the strategy adopted to regulate Canadian securities markets, and irrespective of the different weights attributed by any one jurisdiction to the policy antinomies of investor security and entrepreneurial freedom, there is broad consensus about the ultimate objective: a securities market that operates fairly and efficiently. It must be fair in the sense that returns are reasonably related to risks, that the actors in the market have unquestioned financial stability and integrity, and that the individual investor is not placed at a disadvantage with respect to the institutional investor.[59] It must be efficient in the sense that the prices of securities respond rapidly to new information, and that the trading, clearing, settlement and ownership transfer functions are effected quickly and at low cost.[60] In other words the goals are to instil confidence in the securities market in order to create an environment that will induce greater saving or at least greater investment of existing savings in equity and long-term debt securities, to enable Canadians to acquire more securities issued by Canadian corporations, and to generate sufficient market activity so that an investor can realize his investment at its fair value at any time.

The first strategy – building protective walls around the Canadian industry to shelter it from outside influences – is, from a market economist's point of view, to compound a felony, building up further entry barriers around a market that is already structured in part along cartel lines.[61] Nevertheless a number of recent Canadian reports have argued forcefully that Canada must maintain considerable governmental control over the securities market complex as well as over other financial intermediaries in order to retain political control over the domestic economy, even if that

58 Details of alternative coordinating mechanisms are discussed in ch. VI *infra* under the heading "Institutions of Federal-Provincial Cooperation".

59 The polarization of individual and institutional investor interests should not be overstated, for the institutional investors indirectly represent the interests of a group of individual investors.

60 LORIE REPORT, *supra* note 2, at 3-6.

61 This extends beyond the secondary market, where there is detailed regulation of entry and commission rates, and includes the underwriting function in the primary market which tends strongly to monopoly because of the inherent need for underwriters to work closely together in order to spread the risk of any underwriting loss; *see* the REPORT ON FOREIGN DIRECT INVESTMENT IN CANADA 101-02 (Gray Report 1972), where it is argued that barriers to competition should be lowered and the need to collaborate lessened by creation of a special insurance fund. *Compare* the *Kleinman Plan*, *supra* note 27.

In any event, on the basis of long experience, there is good reason to doubt that

requires foregoing the stimulus of greater competition from foreign firms.[62] But even if some such constraints are essential, we should be aware of their heretical character and therefore should seek other alternatives where feasible.

The second strategy – fostering development of a Canada-wide market – implies dealing effectively with a number of topical background issues that have been forced to the front of the stage by fundamental changes in the political and technological environment, changes that require a rewrite of much of the original play by amending the plot and recasting certain roles. Indeed, the rapid acceleration of change since 1960 has compelled all jurisdictions to reconsider not only the ends and means of securities regulation but also the more basic issue whether governmental regulation is required at all. At the one pole proponents argue that the present cartel nature of the securities industry should be further fortified against competitive influences, subject to detailed government regulation.[63] At the other pole the market oriented critics argue that cartel control, to the extent it is required at all, should relate only to the central information and operational system and not at all to market entry or commission rates.[64] The fundamental changes that gave rise to this sharp debate are both structural and technological.

A. STRUCTURAL CHANGES

The structural changes that are taking place in the securities market can be attributed to several causes: the growing complexity of financial instruments and the resulting consumer desire for comprehensive service from one firm; the rapid growth of the securities holdings of institutions such as pension funds and mutu-

---

any protective walls - even detailed foreign exchange controls - can effectively control capital outflows.

62 *See* especially the REPORT OF THE COMMITTEE TO STUDY THE REQUIREMENTS OF CAPITAL AND THE IMPLICATIONS OF NONRESIDENT CAPITAL FOR THE CANADIAN SECURITIES INDUSTRY (May 1970) [hereinafter cited as the MOORE COMMITTEE REPORT]; STUDY OF THE SECURITIES INDUSTRY IN QUEBEC (June 1972) [hereinafter cited as the BOUCHARD REPORT]; OSC, REPORT OF THE SECURITIES INDUSTRY OWNERSHIP STUDY (April 1972).

In contrast to the MOORE COMMITTEE REPORT, the BOUCHARD REPORT at 135-36, recommends permitting foreign securities firms to enter the Quebec markets but subject to broad discretionary powers of the Securities Commission to bar entry where required to prevent destructive competition.

63 *See* W. MARTIN, THE SECURITIES MARKETS (1971) [hereinafter cited as the MARTIN REPORT] *reprinted in* 6 *Study of the Securities Industry: Hearings Before the Subcomm. on Commerce and Finance of the House Comm. on Interstate and Foreign Commerce*, *supra* note 51, at 3189; F. Weil, *supra* note 28.

64 *See* J. STONE, *supra* note 28, at 40-41.

al funds that have sufficient market power to circumvent the formal market and so avoid paying the fixed brokerage commission rates;[65] the need of brokerage firms to have access to outside capital, particularly in an environment of negotiable commission rates; the doubt about the securities market as a fair means to furnish capital for highly speculative resource undertakings; the balkanization of the Canadian market by regional exchange rivalry and provincial regulatory policy; and finally the desire to achieve as much Canadian control as possible over brokerage firms.

The strong demand of consumers for financial department stores that offer comprehensive services has compelled financial intermediaries of all kinds to extend the services they offer, with the result that the functional distinctions among intermediaries are tending to appear arbitrary and artificial. Currently, in Canada, banks are moving into the fields of underwriting and management of trusteed plans such as the registered home ownership plans. Trust companies are offering demand deposit services. Brokers are selling mutual fund shares, managing pooled accounts and even selling insurance. Insurance companies are selling variable life insurance and variable annuities. And an affiliate of two department stores – Eaton's and The Bay – offers a wide range of financial services, from money management to liability insurance.[66] As a result a great deal of service competition exists among intermediaries in the Canadian capital markets, giving the individual investor greater choice but also luring him away from direct securities trading, which is now dominated by the institutional traders.[67]

65 The SEC required all U.S. stock exchanges to eliminate fixed commission rates on May 1, 1975, a move that has already had deep impact upon the market: *see* Securities Week (New York), May 26, 1975, at 1-3; SECURITIES AND EXCHANGE COMMISSION, REPORT TO CONGRESS ON THE EFFECT OF THE ABSENCE OF FIXED RATES OF COMMISSION (December 1, 1975).

66 The ultimate financial department store is the Merrill Lynch scheme which will enable customers to borrow, write cheques and make Visa card purchases against funds held in client margin accounts: *see* BUSINESS WEEK, August 8, 1977, at 50.

Underlining the present concentration in the Canadian banking industry, the securities industry has recommended that banks not be allowed to participate in underwriting, distributing, market-making functions, or even advisory functions in the securities market context: *see* Submission of the Joint Industry Committee of the Canadian Securities Industry on the Proposed Revision of the Bank Act (September 1975).

CANADA, DEPARTMENT OF FINANCE, WHITE PAPER ON THE REVISION OF CANADIAN BANKING LEGISLATION 34-35 (August 1976) had recommended that banks be barred from underwriting securities issues but be allowed to continue to distribute government securities and to participate in a selling group (and be referred to in the prospectus) in respect of corporate securities.

67 In the U.S. individuals have been net sellers of securities consistently since 1959: *see*

The growing size and power of these intermediaries enabled them to seek means to circumvent the formal securities markets – or at least the exchange rules – and so obtain brokers' services at less than the fixed commission rates. To this end a large intermediary would compel a broker to give up part of his commission to other brokers who furnished services to the intermediary or to furnish research and other ancillary services free of charge. Alternatively the intermediary would acquire membership on an exchange with a view to executing its own trades.[68] And if these tactics didn't work the intermediary could execute its transactions through the third market (over-the-counter market for listed securities) or the fourth market (direct trades among intermediaries) and so circumvent the stock exchanges altogether.[69] The result was a partial balkanization of the securities market into a number of specialized markets that could serve the intermediaries at lower cost.

This pressure on commission rates – particularly in the United States now that rates are fully negotiable – and progressive tax rates have reduced the amount of capital that brokerage firms can generate internally, compelling firms to seek outside capital, that is, capital from persons who are not active principals of the firm. This form of capitalization departs radically from the original concept of reliance on the individual member of a brokerage firm for the financial security of the firm and its customers. Although the standards vary from one jurisdiction to another,[70] certain brokerage firms are now entitled to incorporate and, at least in the United States, even to distribute securities to the public, substitu-

---

CHASE MANHATTAN BANK, BUSINESS IN BRIEF No. 115 (April 1974). Institutions now account for some 70% of NYSE trading. The amount was 59.7% in the U.S. in 1971; NYSE FACT BOOK 53 (1972). The dominance of institutions is probably the same or even greater in Canada. Meyer alleges 75% in normal times and as high as 90% during the current recession; Meyer, *Where Lies the New Jerusalem*, EXECUTIVE, July 1974, at 13.

For more detail about the Canadian market *see, Cleland, Applications of Automation.*

68 These practices have been adduced as evidence that fixed commission rates did tend to excessive monopoly rents: Mann, *The New York Stock Exchange: A Cartel at the End of Its Reign*, *in* PROMOTING COMPETITION IN REGULATED MARKETS 301, 314 (A. Phillips ed. 1975). The latest refinement, introduced after fixed commission rates were abolished in the U.S., is a cooperative that remits to a customer a patronage dividend based on the volume of the customer's business, in effect returning to the customer the brokerage commission less a management surcharge. *See* Elia, *Broker Firm...Structured Like a Co-op*, The Wall Street Journal, May 27, 1975, at 33, col. 3.

69 *See* S. ROBBINS, *supra* note 48, at 252-61; HOUSE SECURITIES INDUSTRY STUDY, *supra* note 1, at 77; INSTITUTIONAL INVESTOR REPORT at 2311-22.

70 This topic is discussed at length in the MOORE COMMITTEE REPORT, *supra* note 62, at 70-78; BOUCHARD REPORT, *supra* note 62, at 130; OSC, REPORT OF THE SECURITIES INDUSTRY OWNERSHIP STUDY, *supra* note 62, at 95, 120.

ting a large capital base for the personal wealth of the firm's principals. There is, as yet, no uniform policy in the Canadian provinces with respect to this issue. Even less uniform are the policies concerning the entry of foreign owned firms into Canada, although the trend is clearly to require dominant Canadian control of all financial intermediaries.[71]

Far more serious than policy conflicts about the capitalization or degree of foreign ownership of brokerage firms is the recent tendency of provincial jurisdictions to impose rules on brokers that preclude them from seeking better execution on a market outside Canada, in effect building up barriers to an international market to insulate Canadian brokers from the impact of competition rates in the United States.[72] Moreover, recent Ontario and Québec reports have recommended that certain trades initiated in a province must be executed through registrants licensed as brokers in that province, policies that would constrain not only international trading but also interprovincial trading,[73] adding a further barrier to service competition in the Canadian securities market.

A final illustration of an externally imposed structural issue is the current consideration by the provincial securities commissions of new issues of securities by speculative resource enterprises.[74] Since nearly all successful resource exploration and development in Canada is now carried on by large corporations, the commissions are questioning whether the shares of small, speculative resource firms are an appropriate investment for the small investor who must bear directly the risk of loss. Indeed, can any amount of

71 *See* the reports cited in note 62 *supra*.

72 *See*, *Must Deal Canadian*, The Financial Post (Toronto), May 24, 1975, at 16, col. 3 (concerning alleged QSC pressure on institutions to execute in Canada).

73 *See* OSC, REPORT OF THE SECURITIES INDUSTRY OWNERSHIP STUDY, *supra* note 62, at 122; BOUCHARD REPORT, *supra* note 62, at 146.

These recommendations are not being adopted. Indeed, the Canadian securities market is moving gradually away from balkanized submarkets to a Canada-wide market.

(1) As of September 1, 1977, the QSC repealed its Policy No. 4, which required a Quebec broker to execute a securities trade in Quebec where possible even if the broker could obtain better execution for his client on some market outside Quebec; *see* 8 QSC Bull., No. 35 (Decision No. 5316, September 6, 1977).

(2) On February 3, 1978, the MSE announced that the MSE and the TSE were negotiating removal of the prohibitions against arbitrage transactions between the two exchanges: *see* The Globe and Mail (Toronto), February 3, 1978, at B2, col. 1.

74 *See* QSC Statement further to Repeal of its Policy No. 8 imposing higher standards on new issues by mining, oil and natural gas corporations; 5 QSC Bull., No. 42 (Decision No. 4463, October 21, 1974); and *see* OSC Enquiry discussed in Zehr, *OSC Gets Noticeably Tougher*, The Northern Miner (Toronto), April 14, 1975.

This re-examination led to new, parallel policies applicable to junior mining exploration development companies in Québec and Ontario: *see* QSC Policy No. 8, April 1, 1976, 3 CCH CAN. SEC. L. REP. ¶66-019; OSC Policy No. 3-02, April 1, 1976, 2 CCH CAN. SEC. L. REP. ¶54-896.

disclosure and regulation of promoters' profits adequately protect the small investor in such cases? In short, ignoring the usual market rhetoric, is the securities market fulfilling a useful function in allocating capital to such undertakings when we know that very little of the capital is actually spent on exploration and development and, even if it is so spent, that the likelihood of establishing a new resource enterprise is very small?[75] To examine this issue is to question long established dogma, but given the rapidly increasing demands for capital it is clear that no economy can afford to dissipate its savings on highly improbable ventures or even less to legitimate a market institution that exposes individuals to demonstrably unreasonable risk. If it is more efficient to develop resources through very large private or even public sector firms because the structure of the resource industry has changed, then the securities industry must adapt accordingly to such change.

B. TECHNOLOGICAL CHANGES

Concurrently with attempting to adapt to these structural changes, the securities industry is being compelled to adapt to the new computer-communications technology that in turn can require further structural changes, particularly because it enables creation of a single electronic market where all material information can be relayed contemporaneously to all actors. Beginning with the rapid capture, processing and dissemination of trading data, the elctronic system is logically and inevitably expanding to encompass also the clearing and settlement functions, brokerage office accounting, new issues, and even ownership transfer through entries in the records of securities depositories. Although still only in the development stage, the ultimate electronic system is possible and, within a decade, is even probable; that is, the execution of securities trades (whether new issues or secondary trades) through remote, direct access terminals and the immediate capture of the trading data to generate market reports, to clear and settle inter-broker claims and to transfer ownership, thus eliminating the need for specialized markets, formal stock exchanges, market-makers, clearinghouses, transfer agents and even depositories, which will have to transform completely their character when electronic records instead of security certificates are relied on as proof of ownership.[76] The logical complement of

75 This issue was also raised in the PORTER REPORT at 341.

76 These ideas are discussed in detail in M. MENDELSON, FROM AUTOMATED QUOTES TO AUTOMATED TRADING: RESTRUCTURING THE STOCK MARKET IN THE UNITED STATES

such an automated trading system is the integration of trading data with current data about issuers that is disclosed on a continuous basis. This in turn will permit continuous disclosing corporations to enter the securities market at any time to increase or decrease their capital requirements, which will, as a corollary, free such corporations from reliance on the present underwriting system with its emphasis on snapshot disclosure and immediate distribution through a large network of wholesalers and distributors.[77]

Although the structural issues such as the growth of financial intermediaries and the concentration of the resource exploration and development industry have forced sweeping changes in the securities market, the market as presently constituted probably can adapt to these changes without serious trauma. But the new computer-communications technology is change of an altogether different order, a Copernican turn that compels reconsideration not only of all facets of securities market structure and operations but also of the nature, means and required degree of securities market regulation, for to the extent computerized systems coupled with continuous disclosure obviate the use of present primary and secondary market institutions they also render redundant many if not most of the regulatory techniques directed at limiting or removing the perceived imperfections of those market institutions.

There is a broad consensus about the inevitable development of a unique, nation-wide - and even international - securities market,[78] but the computer-communications issue has brought

(1972); A. Berczi, *supra* note 13; 5-6 *Study of the Securities Industry: Hearings Before the Subcomm. on Commerce and Finance of the House Committee on Interstate and Foreign Commerce*, 92d Cong., 2d Sess. (1972); *National Securities Market System Act of 1973, Hearings on S. 2519 Before the Subcomm. on Securities of the Senate Comm. on Banking, Housing and Urban Affairs*, 93d Cong., 1st Sess. (1973).

The first major step in this direction was implementation of the "Consolidated Tape" on June 16, 1975, to report concurrently all trades of NYSE listed securities on several markets; *see* 3 AUTOTRANSACTION INDUSTRY REPORT OF INTERNATIONAL DATA CORPORATION, No. 5 (June 11, 1975).

77 Under the present system liability for false representations focuses on statements set out in the prospectus, which remains in force for only a limited period of time. Moreover, to minimize their risk of loss, underwriters attempt to distribute a new issue in the shortest possible time, a requirement that gives great market power to any one firm having a comprehensive network of retail outlets.

78 *See* the reports cited in note 52 *supra*. Even the MARTIN REPORT, *supra* note 63, which has a strong bias toward cartel control of the market, concedes this point. For a critical view of the inevitability of this development, *see* Werner, *Adventure in Social Control of Finance: The National Market System for Securities*, 75 COLUM. L. REV. 1233 (1975).

With respect to Canada, *see* HONEYWELL CORP., CANADA-WIDE SECURITIES MARKET SYSTEM - PRELIMINARY PROPOSAL (MSE report March 1975).

into even sharper focus the central regulatory issue: who will control entry, trading conduct and prices with respect to the system? Although this problem has existed since the inception of regulation, as long as there existed considerable service and even price competition among regional exchanges and specialized securities markets it caused little concern. In a unique central market, however, power to determine rights of market entry and prices becomes almost an absolute power over the securities industry, since it is unlikely that any alternative to central market membership will be feasible. A number of mechanisms have been proposed to exercise this power, and although many variations are possible the mechanisms can best be categorized with reference to three basic models.

The first model, advocated by W. Martin,[79] is essentially a private sector cartel that would regulate entry, conduct and prices, subject to indirect public regulation through public representatives on the board of directors governing the central market[80] and subject to comprehensive securities commission surveillance. The securities industry would be immune from the competition laws to the extent it is subject to external securities commission control. And since commission control, although not clearly expressed in the *Martin Report*, would in theory be unlimited, the industry would be almost completely immune from the strictures of the competition laws.

The second model, proposed by F. Weil,[81] would continue a cartel structure but would give an external government agency rather than a private sector agency power to create a central electronic market and to regulate prices in and presumably entry into that market. Weil defines the central problem as the concentration of savings in a small number of institutions who trade through a small number of brokers, displacing both the small investor and the small retail broker to such an extent that the

79 MARTIN REPORT, *supra* note 63. *See also* the commentaries on the MARTIN REPORT reprinted in 6 *Study of the Securities Industry: Hearings Before the Subcomm. on Commerce and Finance of the House Comm. on Interstate and Foreign Commerce*, *supra* note 51.

80 The value of public representatives on the board of an exchange has been seriously questioned in Canada, partly because they are always in a minority position, and partly because they do not purport to represent the public but only to furnish policy criticism from the viewpoint of an objective outsider; *see* Pritchard, *Not Exchange Watchdogs*, The Globe and Mail (Toronto), May 14, 1977, at B1, col. 1.

81 F. Weil, *supra* note 28. For a similar Canadian view *see* R. Lafferty, A New Design for Capital Markets in Canada (paper presented to Invest. Sec. of the Can. Life Ins. Assoc. May 12, 1970). Davant, chairman of Paine, Webber disagrees with Weil, arguing that the SEC has done enough by removing fixed commission rates and that the industry should be empowered to develop any required new structure; 303 BNA SEC. REG. & L. REP., May 21, 1975, at A-17.

traditional auction market has largely disappeared. To resolve this problem he would empower the regulating agency to control, in addition to prices and entry, the activities of financial institutions with a view to maximizing service competition (as distinct from price competition) among the largest practicable number of individual and institutional investors on the one hand and the largest possible number of retail brokerage firms on the other. The effect would be to reverse the trend toward a dealer market and back to an atomized auction market dominated by brokers, where securities prices are determined principally by the supply of and demand for securities in the market.[82]

The third model, proposed by J. Stone,[83] would eliminate all the cartel characteristics of the securities industry by charging the securities commission to set up and administer an electronic market system, which would be open to all qualified persons upon payment of a rateable fee to cover operating costs, and by abolishing any fixed brokerage commission rates. Stone would also repeal most of the current regulatory rules relating to primary distributions by continuous disclosing corporations and relating to secondary trading, most of which – particularly prospectus qualification and market-making – are responses to current market imperfections that inhere in any market regulated as a cartel system. In brief, he would, like Weil, acknowledge that the central electronic market is a natural monopoly that must be operated by government or under close government surveillance; but in contrast to Weil he would abolish any artificial constraints on market entry or brokerage rates, leaving it to market forces to determine how many firms should survive[84] and what prices would be charged.

All three of the foregoing models are predicated on the assumption that an external government agency must control, directly or indirectly, the structure and operation of any central

82 In this context an auction market is a market that determines prices through the matching of buyers' bids and sellers' offers, whereas in a dealer market a dealer holds large inventories, giving the dealers some control over supply and probably power to influence price.

One analyst argues that trading on the NYSE is now made up of only 6% auction trading and 94% dealer trading; *see* Brown, *Small Orders and Auction Market Myths*, The Commercial and Financial Chronicle, January 13, 1975, at 8, cols. 3-4.

83 J. STONE, *supra* note 28, at 37-41, 96-110, 111-22. A computerized securities market remains a hypothetical construct, but the SEC is moving incrementally in that direction, beginning with a composite quotation system that will present all trading information in one market centre; *see* SEC, Securities Exchange Act of 1934 Release No. 14416, January 26, 1978, CCH FED. SEC. L. REP. (extra edition February 1, 1978) (No. 735). The Canadian market appears to be moving even faster toward a computerized market, using the CATS (Computer-Assisted Trading System) developed by the TSE; *see*, *Cleland*.

84 J. STONE, *supra* note 28, impliedly assumes the existence of an insurance system to protect investors from losses caused by securities firm failures.

electronic market, which is by definition an unqualified monopoly. Although difficult to forecast, it is probable that the model of the future Canadian central market will be a composite of the Weil and Stone models, largely eliminating artificial barriers to entry and fixed prices and thereby fostering greater competition.[85] This change in the structure and operation of the market will require a corresponding change of the philosophy and techniques of market regulation. Reflecting a truism of systems analysis that you can never change just one element of a system, the regulatory philosophy must expand from a narrow focus on specific entry, price and conduct rules to include not only an overview of the system and its function within the overall capital markets but also the design and implementation of alternative systems that render much of the traditional approach to securities regulation - entry constraints on actors, fixed rates, and anti-fraud rules - largely irrelevant.[86] As in the United States, the probable system will evolve from a Canada-wide trading disclosure system coupled with continuous disclosure by large corporations to the ultimate system of automated trading and automatic capture of the data required for clearing, settlement and ownership transfer purposes. If so, then the strategy of regulation will swing away from cartel management to continuous surveillance of the conduct of actors in the system with a view to minimizing market manipulation. In this context any conflict between self-regulation and government regulation becomes minor since both the market actors and the regulators have a common interest in identifying and disciplining any actor who attempts to beat the system and so bring discredit on the entire industry.[87] In sum, the securities industry of the relatively near future will probably be far less a regulated cartel and more a free market and therefore should require less but much more sophisticated government surveillance to detect more subtle and more complicated schemes of market manipulation.[88]

85 This is the practical result of the U.S. Securities Reform Act of 1975 that became law on June 14, 1975; *see* discussion in text accompanying notes 52-56 *supra*.

86 This development from reacting to block abuses to design of an overall system - *i.e.* from policing to planning - is not a new phenomenon; *see* M. FAINSOD, *supra* note 6, at 267-70; *see also* Wilson, *supra* note 11, at 152; T. LOWI, THE END OF LIBERALISM 141 (1969).

87 *See* SENATE SECURITIES INDUSTRY STUDY, *supra* note 2, at 2, 158. *Contrast* the fuzzy platitudes about cooperative regulation in HOUSE SECURITIES INDUSTRY STUDY, *supra* note 1, at viii-xvii.

88 The economic case is cogently urged by Mann, *supra* note 68.

C. SUMMARY

Keeping in mind M. Fainsod's admonition that any analysis of the regulatory process should encompass the institutional matrix, the parties in interest concerned with the regulation and the policy instruments employed, I shall summarize briefly the concepts already outlined before proceeding to consider the specific mechanisms that might be employed to regulate the securities market.

(1) In a contemporary mixed economy there is an inevitable mix of the institutions of both command and market economies to achieve the three basic functions of government: to allocate resources among alternate uses, adjust the distribution of income and wealth among individuals, and stabilize the operation of the overall economy to achieve a high level of resource use with a minimum of inflation. To reconcile command institutions – particularly planning – with market institutions, the mixed economies have developed a hybrid institution called economic regulation to constrain the market activities of enterprises by equalizing market power, institutionalizing responsibility with the enterprise, or directing the structure and operation of a particular market through an external agency with power to control entry, conduct and prices in that market.

(2) Regulation through an external agency to plan and direct the structure and operation of a particular industry is applied in two common cases: first, where there is a natural monopoly as in the infrastructure industries – energy, transportation and communications; and second, where the government has artificially created a monopoly or cartel structure to achieve stability or security for specific actors in a market (for example, agricultural marketing boards to protect producers or a securities commission to protect investors), long-term political goals that are consciously given priority over the goal of ideal market efficiency.[89]

(3) The regulation of capital markets to ensure investor protection from fraud is a typical example of a government legitimated cartel structure, but the regulation of securities mar-

89 For an excellent discussion of this phenomenon, *see* Wilson, *supra* note 11, at 135-36. Section 4.1 of the Combines Investigation Act, R.S.C. 1970, c. C-23, *as amended*, reconciles one central problem, *i.e.* the potential clash between the competition law and underwriting arrangements. The proposed new s. 4.6 set out in cl. 6 of Bill C-13, 30th Parl., 3d Sess. (1977), *supra* note 51, extends much further and attempts to codify a variation of the U.S. primary jurisdiction concept to reconcile generally the conflict that inheres between the competition law and any regulatory law.

kets has one unique characteristic:[90] much of the regulatory power is delegated to private sector agencies that exercise this power under the surveillance of the securities commissions. Within the overall capital market complex, however, the securities market complex – made up of a stock exchange, clearinghouse, brokers, transfer agents and depository – is one more financial intermediary. Its distinguishing characteristic is that it permits an investor to participate directly in the ownership and control of enterprises on such conditions that the investor bears directly the risk of loss.

(4) A securities market is a valuable institution because of the large aggregate value of the transactions executed in that market, but probably even more important are the secondary consequences of those transactions: that is, to induce investment in productive enterprise, to empower investors to participate in the ownership and control of firms, and to decrease the need for and so reduce the undesirable effects of extensive foreign direct investment.

(5) Securities market regulation did not develop from preconceived premises but grew out of a number of separate policy initiatives set out in corporation laws and securities laws. Although the rhetoric to justify securities market regulation varies from one jurisdiction to another, depending upon the prevalent political doctrine and economic dogma, there developed an implied consensus that a securities market should be cartelized – at least in part – to ensure investor confidence and, as a corollary, should be subjected to close government surveillance, employing techniques analogous to those applied to regulate the public utilities or, in other words, the natural monopolies.

(6) Recent developments in the securities market, particularly the immense growth of the financial intermediaries such as banks, pension funds and mutual funds and the implementation of computer-communications technology, have compelled reconsideration of the cartel-like structure and operations of the market and of the institutions designed to regulate that market. Current proposals – all of which assume a central information system – can be distinguished as three models: (a) a continuation of the present quasi-cartel structure with only service competition, managed by a private sector agency under the close surveillance of a securities commission; (b) a

90 While unique in the domain of conventional regulation, this strategy has long been employed with respect to the professions, which in most jurisdictions, exercise very broad powers through self-regulatory organizations.

straightforward cartel system with only service competition, regulated as a public utility by a securities commission having full powers over entry, conduct and prices; and (c) management of the central information system by government as a public utility but with no constraints on market entry or prices and only those conduct constraints required to ensure full and fair disclosure and to prohibit fraud with a view to achieving full price and service competition.

Chapter V
Regulatory Mechanisms

Even assuming the development of an electronic market over the next decade, there remains the obvious need to regulate the existing system, to participate in the development of the new system during the transition period, and also to develop new regulatory techniques to maintain surveillance over the electronic market. As at present, future securities market regulators must exploit all three regulatory techniques – balancing power to preclude monopoly control, institutionalizing responsibility within firms, and regulating the market through an external agency. But the first technique – balancing power – will continue to concern mainly the distribution of capital market functions among competing intermediaries and reconciliation of securities law with competition law; and the second technique – institutionalizing responsibility – will largely concern the reconciliation of securities law with corporation law, including the particularly thorny problem of imposing personal responsibility on directors and officers of securities firms. The emphasis of this paper, therefore, will continue to focus on the third technique, that is, the regulation of entry, structure, conduct and prices in the securities market through an external government agency or a self-regulatory agency subject to close government surveillance. Indeed, the institution of the so-called independent regulatory commission is so established as the means to regulate a securities market that the only practical way to analyze this issue is to outline briefly the background, structure, functions, constraints on and the criticisms of the independent regulatory commission and then proceed to consider the relative advantages of the independent commission as compared with administration through a department or an integrated department-commission.

Beginning with the Massachusetts Banking Commission created in 1838,[91] governments in North America have continually

91 M. FAINSOD, *supra* note 6. Canadian authors frequently admonish us to be wary of

exploited the concept of the independent regulatory commission to deal with economic problems that appeared too intractable to be resolved through the existing government agencies applying conventional legal techniques. That the institution has been frequently invoked for 150 years, however, does not mean that it has been uncritically accepted. Indeed, political scientists have castigated it as a "headless fourth branch" of government,[92] lawyers have commonly condemned it as a usurpation of judicial powers to deal with property, contract and unfair competition issues,[93] and economists never tire of demonstrating that it is a poor substitute for the market to allocate resources.[94] While there is some merit in all three criticisms, each is largely predicated on a false assumption: first, that it is possible to effect a clear separation of government powers;[95] second, that a commission is essentially a regulation making or adjudicative body created to achieve specific objectives as distinct from a political body set up in part to select among alternative policy objectives;[96] and third, that policy-makers can satisfy public demands by achieving presumed market efficiency relying on nineteenth century laissez-faire mythology.[97] Although the point is frequently reiterated by leading authors,[98] because of their ideological preconceptions critics will not readily acknowledge that a regulatory commission is a complete anomaly

---

drawing conclusions from comparisons between U.S. and Canadian regulatory commissions; *see* Bailllie, *Securities Regulation in the Seventies*, in 2 STUDIES IN CANADIAN COMPANY LAW 343, 350 (J. Ziegel ed. 1973); Doern, *supra* note 7, at 29. Close study shows however, that the problems defined and the solutions proposed are close analogues. Similar problems in the U.K. are commonly resolved by departmentalization or state ownership rather than by regulatory agencies; *see* B. SCHWARTZ & H. WADE, *supra* note 23, at 20; and *see* text accompanying note 115 *infra*.

Ironically, U.K. experience was heavily relied upon to justify setting up the first U.S. federal commission; *see* M. BERNSTEIN, REGULATING BUSINESS BY INDEPENDENT COMMISSION 25 (1955).

97 *See* M. BERNSTEIN, *supra* note 91, at 126, where the author discusses the political effects of this doctrine.

98 J. LANDIS, THE ADMINISTRATIVE PROCESS 11-15 (1938); Jaffe, *The Effective Limits of the Administrative Process: A Re-evaluation*, 67 HARV. L. REV. 1105, 1129 (1954); T. LOWI, *supra* note 86, at 140, 141.

in a market economy: it is a mechanism to substitute planning in large part for market forces, for example, to minimize the wasteful allocation of resources in natural monopoly sectors, to stabilize the income of agricultural producers, or to ensure greater security for investors.

Like all generalizations this statement of the nature of a regulatory commission is only partly true, for the regulatory commissions developed at different times for different reasons to exercise different functions and to achieve different goals. There is therefore no homogeneous mass of agencies that can be subsumed under the category of regulatory commission, although there are some characteristics common to all commissions. For example, where the purpose of the regulatory law was to equalize bargaining power in markets as under the competition laws and the labor laws, a commission was set up not to plan markets but to make the markets work more effectively. In theory this power could have been left to the common law and the courts, but when these laws were enacted there was a widely felt distrust that for three reasons the judiciary was incapable of achieving such broad goals: first, the judiciary had no powers of investigation and economic analysis and therefore could not initiate action but must rely on actions begun by private persons and on the evidence furnished by them; second, the judiciary could not maintain the required continuous surveillance over the operation to determine whether the policies were working or whether they needed adjustment; and finally, the judicial process was too cumbersome a means, with its lengthy appeal processes, to achieve reasonable uniformity of policy. Moreover, where the purpose of the regulatory law was to displace a market with a view to directing the structure and operations of an industry, the commission was set up to exercise a broad spectrum of legislative and administrative as well as judicial powers to enable it to achieve its planned goals.[99]

A regulatory system tends to develop by accretion. At first regulation is restricted to specific, concrete goals that can be achieved merely by prohibitions enforced in accordance with clear standards. Gradually power is extended to a typical commission to deal with the structure and quality of conduct in an industry. Finally regulatory power is further extended, usually under the pressure of an economic crisis, to plan the overall system, that is, to set objectives within the overall framework of a public interest standard to establish priorities and to control the details of entry, structure, conduct and prices. As Landis has pointed out, the development of the institution of the regulatory commission re-

99 J. LANDIS, *supra* note 98, at 1-46.

flects an understanding that where the state undertakes to direct a sector of the economy it must give the planning agency broad powers to plan, promote and police that sector, powers that had been traditionally characterized as exclusively legislative, administrative or judicial.[100]

Thus the regulatory commission gradually came to be perceived as a mini-government in itself, created to exercise legislative powers to resolve detailed problems with which a legislature could not cope, to exercise judicial powers based on its own investigations and expert analyses, to acquire information to which a court would not ordinarily have access, and to exercise executive powers to plan, measure and control performance. In essence, the independent regulatory commission at its final stage of development is a composite of the executive, the legislature, and the judiciary, which is probably not wholly satisfactory to any one branch of government, but which fulfils an essential planning function without requiring that any one branch abdicate its powers altogether. Although "independent" to a degree, a regulatory commission is constantly subject to legislative control over its enabling legislation and annual budgetary appropriations, subject to executive power over the appointment of commission members and, in some cases, to express executive policy direction,[101] and also subject to judicial power to interpret its enabling statute and to review the exercise of its regulation-making powers and its adjudication procedures.

The regulatory commission has elicited tremendous controversy, but even one of its severest critics concedes that there is a very broad consensus that it is a useful institution, even if different critics like it for very different reasons.[102] As a result, with a few notable exceptions,[103] most of the criticism of the regulatory commission concept has been directed not at its existence but at

100 T. Lowi, *supra* note 86, at 130-43; J. Landis, *supra* note 98, at 15-16, 46; and *see* the works cited in note 86 *supra*.

101 For an excellent discussion on express executive power to issue policy directives to administrative commissions in Canada, *see* H. Jänisch, The Role of the Independent Regulatory Agency in Canada (unpublished paper presented to Canadian Assoc. of Law Teachers May 30, 1977).

102 M. Bernstein, *supra* note 91, at 71; and *see* 9 Ontario Committee on Government Productivity 3, 38 (1973).

103 The Sherman Act of 1890 was originally administered by the Bureau of Corporations in the original Department of Commerce and Labor; *see* T. Lowi, *supra* note 86, at 119. The Brownlow Committee, *supra* note 92, recommended that all programs including those administered by regulatory agencies be integrated in a department under the authority of a cabinet member; *see* Bernstein, *supra* note 24, at 15. This thesis was reiterated in the report by F. Redford, The President and the Regulatory Commissions (1960) (submitted to the President's Committee on Gov-

its performance, not at alternative institutions but at means to make the regulatory commission function more effectively within the context of overall national policy by better defining its legislative goals through more refined statutory standards, by subjecting it to more – or less – judicial review, by tinkering with its structure and functions, or by requiring it to permit more competition, particularly service competition, whenever feasible in a regulated industry.

The ubiquitous problem of standards relating to the delegation by the legislature of broad regulation-making, investigative, adjudicative and administrative powers takes on particular significance in an enabling act setting up a regulatory commission because of its relative independence of the normal political processes. To compound the problem, like any government program it is exceedingly difficult to specify precisely the objective that a regulatory agency is expected to achieve in exercising its powers. For example, if a securities commission is given broad powers to regulate the securities industry in the public interest without further qualification, the commission, even if only to give its own staff a sense of purpose, must specify its own objectives and particularize as far as possible how and when it will exercise its powers to achieve those objectives, which may range from a cautious policy that focuses only on investor protection to a venturesome policy that emphasizes the creation of new enterprises irrespective of investor risk.

In effect, where there is such broad delegation, the legislature is consciously assigning to the commission the task of identifying the specific problems in the industry and working out solutions.[104] That is not to say, however, that the legislature is abdicating its responsibility but rather that it is temporarily empowering an expert body to deal with the problem until such time as further legislation is required to define better the commission's purposes and powers, to expand or restrict those powers, or even to dissolve the commission altogether.

This basic problem of expressing statutory standards was clearly recognized by Landis, who, although he advocated very broad delegations of power to commissions, stated that each case presented a paradox of "applying Procrustean standards to a

ernment Organization). *See also* Hector, *Problems of the CAB and the Independent Regulatory Commissions*, 69 YALE L. J. 931, 960 (1960).

This parallels the ministry concept recommended in 9 ONTARIO COMMITTEE ON GOVERNMENT PRODUCTIVITY 19-28 (1973).

104 Jaffe, *supra* note 96, at 1183, 1190, 1197. For a general discussion of the application of administrative law principles in the field of securities regulation, *see* 3 L. Loss at 1877.

world that breeds both pygmies and giants".[105] If the standards are too broad the commission may fail to define its objective or be too timid to exercise its powers, or, conversely, may exercise its discretion arbitrarily. If the standards are too narrow the commission may quickly lapse into the kind of bureaucratic routine that precludes it from developing imaginative means to regulate a dynamic industry.[106]

The broad delegation model urged by Landis became the focal point of two criticisms of ineffective agencies: first, an agency with no clear legislative mandate appears unable either to define or achieve its objectives and therefore tends to become the captive of the regulated industry and to characterize the public interest as congruent with the industry's interest; and second, such an agency appears to exercise its discretion arbitrarily in the sense that a person appearing before the agency never knows what case he has to make in order to qualify for the privilege he seeks.[107] The only answer to the first criticism is that the legislature must express the purposes and powers of the commission more clearly and must set up a review mechanism to review commission performance on a continual basis. The second criticism may be answered in two ways: either by clarifying the standards of delegation or by bringing pressure to bear on the commission to compel it to exercise its regulation-making powers continually to refine, particularize and publicize the standards it applies when making a decision, so that like cases will be dealt with in the same manner in accordance with consistent policies. The latter technique in particular will better enable an affected person to predict with reasonable certainty future agency action and also will enable the agency to circumscribe the cases it will consider.[108] One American authority, taking a position between Landis on the one hand and the proponents of regulation-making on the other, argues that regulation-making,

105 J. LANDIS, *supra* note 98, at 72. *See also* the discussion *id.* at 51, 66. To the same effect *see* H. FRIENDLY, THE FEDERAL ADMINISTRATIVE AGENCIES 13 (1962).

Landis, without recanting his earlier views completely, underlined in a later report that the legislature must, to fulfil its planning responsibilities, define each agency's objectives and powers more clearly; *see* J. LANDIS, REPORT ON THE REGULATORY AGENCIES TO THE PRESIDENT-ELECT (1960), *discussed in* McFarland, *Landis Report: The Voice of One Crying in the Wilderness*, 47 VA. L. REV. 373, 425-27, 433-38 (1961).

106 This is a good illustration of the paradox that "any large organization has to strive continuously for the orderliness of order and the disorderliness of creative freedom"; *see* E. SCHUMACHER, SMALL IS BEAUTIFUL 203, 209 (1974).

107 *See* M. BERNSTEIN, *supra* note 91, at 294-95.

108 The leading advocates of expressing clearer, detailed standards are H. FRIENDLY, *supra* note 105, at 142-46; K. DAVIS, DISCRETIONARY JUSTICE 56-65 (1969). *See also* the critique of Davis by Anisman, Book Review, 47 CAN. B. REV. 670 (1969); Jowell, *The Legal Control of Administrative Discretion*, [1973] PUB. L. 178, 203-06.

while undoubtedly beneficial, is at best only a very limited response to the problem.[109]

As usual in dealing with an administrative law problem, one must look at the overall spectrum of administrative agencies and then develop the best mix of techniques to resolve a specific problem. In theory the refinement of statutory standards is always desirable; but some agencies have difficulty developing any specific regulations within a broad statutory delegation because of the dynamic nature of the industry regulated, whereas other agencies with narrowly specified goals in a more static environment can make and thrive on detailed regulations. It is important therefore that the delegation of power be broad enough to enable an agency to act effectively, that pressures to induce continual policy refinement through regulation-making be built into the statutory system, and that the exercise by a commission of broad powers be subject to continued scrutiny by the legislature. Legislative scrutiny is especially important because no broad delegation of power to regulate an industry can be exercised without applying value judgments, which may be based on beliefs ranging between laissez-faire liberalism and cartelism, and which may therefore – consciously or unconsciously – subvert the original policy goal of the enabling act.

Concurrently with bringing pressure on the legislature and the commission better to define statutory standards or to refine those standards through detailed regulations, the critics, particularly the lawyers, have repeatedly pressed forcefully for greater procedural safeguards – characterized as due process or natural justice rules – in order to preclude administrators from exercising arbitrarily the wide discretion implied by broad public interest standards. This movement for law reform led to the enactment of the Administrative Procedure Act of 1946 in the United States,[110] the Tribunals and Inquiries Act, 1958 in the United Kingdom,[111] and, more recently, the Federal Court Act and the Statutory Instruments Act[112] in Canada and the Statutory Powers Procedure Act and the Judicial Review Procedure Act in Ontario.[113] The United Kingdom legislation, because of the ab-

sence of the regulatory commission as an institution,[114] effected a largely non-controversial reform of administrative procedures. The United States law and its Canadian counterparts[115] have, however, engendered a long and heated debate that has until recently focused mainly on the regulatory commissions, partly because the commissions are the most visible administrative bodies and partly because the reforms were largely directed at such bodies.

While the procedural safeguards implemented by these laws were generally acknowledged to be desirable, particularly where the administrative action was essentially adjudicative in the sense of applying a relatively narrow statutory rule or standard to a factual situation, administrative law scholars questioned whether such laws, which were frankly modeled after the adverse party trial system, were appropriate to govern the conduct of the regulatory commissions.[116] The American literature on the subject is very extensive, but most of the criticisms can be distilled down to the following basic themes. In general, the adverse party process is ill-suited to the functioning of the regulatory commissions which were set up to enable administrators, acting under the aegis of broad public interest standards, to achieve comprehensive policy goals through the application of expertise to analyze difficult technical fact situations and to make complex judgments affecting many parties and even the general public. These were functions that the courts were not qualified to deal with. Moreover, in an adverse party context the parties tend to control the proceedings by defining the issues, investigating the facts and furnishing the evidence, thus tending to displace expert investigation and analysis that would otherwise be done by objective commission staff. And as a corollary the parties became preoccupied with building a record for the purposes of judicial review instead of concentrating on analysis of the issues. In sum, by emphasizing the judicial approach, the administrative procedure laws frag-

Act, S.O. 1971, c. 49, and the Civil Rights Statute Law Amendments Act, S.O. 1971, c. 50, all of which are discussed in Baillie, *supra* note 91, at 16-17.

114 B. Schwartz & H. Wade, *supra* note 23, at 26-31. Amendments to the B.C. Securities Act in 1974 have reconstituted that Commission more on an English model, vesting all policy making and administrative powers in a departmental office, the Superintendent of Brokers, and relegating the Commission to the status of adjudicative appellate agency; *see* British Columbia Securities Act, ss. 3-6; and *see* Getz, *Appellate Functions Planned*, [1974] Vancouver Stock Exchange Rev. (October).

115 Professor Willis points out that it is "from the United States that we have borrowed most of our regulatory legislation together with our preference for the American board, as opposed to the English civil service, method of implementing it"; Willis, *Canadian Administrative Law in Retrospect*, 24 U. Toronto L. J. 225, 235 (1975).

116 M. Bernstein, *supra* note 91, at 192-209.

ment the process of policy development by over-emphasizing case by case analysis; they pre-empt the time of the commissions to hear specific cases; and they divert the commissions from their basic task of developing, advocating, evaluating and implementing policy or, in other words, they prevent them from planning.[117]

The recent enactment of administrative procedure laws in Canada, which are clearly predicated on the assumption that more judicial review is inherently desirable, has evoked similar comments as well as criticism that the legislature should not attempt to apply one set of rules to straightforward adjudication cases – such as entitlement to unemployment insurance – and also to complex market regulation cases – such as energy pipelines. Among other things, critics urge that the courts use restraint in reviewing the substance of administrative decisions and that they uphold decisions that do not conflict with the law or with values fundamental to the legal system,[118] or alternatively that judicial review be completely abolished – or at least expressly limited to jurisdiction and procedural issues – and that the enabling acts be reviewed one by one to permit an express right of appeal where an appeal from an adjudicative decision appears appropriate.[119] Whether these broader review powers in the Canadian laws will engender practical problems or whether the courts will show the same kind of restraint shown by the United States courts in applying the Administrative Procedure Act remains to be seen.[120]

In any case, there is a clear even if largely tacit consensus that there are certain functions, particularly the exercise of broad policy-making powers by commissions responsible for the regulation of markets, that are not appropriate matters for judicial review. Assuming the issues are clearly defined and the court has access to all relevant evidence, a court probably could decide these issues as well as a regulatory commission. But this hypothetical case begs the entire question by assuming resolution of the judicial

117 *See id.* at 179-82; Jaffe, *supra* note 96, at 1183; Massel, *The Regulatory Process*, 26 LAW & CONTEMP. PROB. 181 (1961); Jowell, *supra* note 108, at 213.

B. SCHWARTZ & H. WADE, *supra* note 23, at 111, concluded that the U.S. Administrative Procedure Act "has elevated the procedural level without crippling the administrative process".

Note that the U.S. Securities Reform Act of 1975 has substantially amended s. 25 of the Securities Exchange Act of 1934 to extend express judicial review powers, particularly to encompass rule-making as well as adjudicative orders; *see* H.R. REP. No. 94-229, 94th Cong., 1st Sess. 100 (1975).

120 A comparison of trends in the U.K. and the U.S. is made in B. SCHWARTZ & H. WADE, *supra* note 23, at 26-27, 117-20.

shortcomings that constituted the basic reasons for setting up commissions in the first place, that is, the need for expertise to define issues, do in-depth analyses, investigate and determine the material facts, and maintain continuous surveillance over the regulated industry to forecast the emergence of new issues and to adjust policies accordingly. Thus although judicial review is useful – even necessary – to constrain a commission to act within its statutory jurisdiction, to preclude it from acting arbitrarily, and to ensure that it adheres to fair procedures, it is not a useful institution to second-guess the substance of commission decisions. Above all a commission is not a subordinate court conducting an adverse party trial but rather a political body developing, evaluating and applying alternative policies. In short, a reviewing court should only look at the legality of a decision, not the correctness of the policy decision made. The underlying reason is clear. There can no more be value-free adjudication within the context of broad standards than there can be value-free administration. Any decision rendered under such broad standards is a choice of a policy alternative, a choice that is better left to the legislature or, if the policy choices are too nebulous for statutory expression, to a commission that will have the expert resources and the means – investigation powers, powers to adjudicate specific cases, and regulation-making powers – to develop, enunciate and evaluate alternative policies.[121]

Acknowledging that market regulation through a commission requires the exercise of broad policy-making powers to achieve political objectives, many critics have eschewed reform through the better definition of statutory standards or judicial review and have recommended, instead, changes in government machinery that will make the regulatory commissions function better or render them more directly accountable to the executive and the legislature. These changes fall generally into two classes: first, changes directed at the internal structure and functions of the commissions; and second, changes directed at overall government restructuring, particularly by what has come to be called departmentalization, that is, the absorption of commission functions into executive departments or at least the clear subordination of commission policy-making power to executive direction.

The internal changes suggested range from relatively minor matters – such as the substitution of a single chief executive officer

121 *See* Massel, *supra* note 117, at 195-97. Jaffe, *Basic Issues: An Analysis*, 30 N.Y.U.L. Rev. 1273, 1285 (1955). For a recent discussion of this issue, *see* Cutler and Johnson, *Regulation and the Political Process*, 84 Yale L. J. 1395 (1975).

for the present collegiate commissions,[122] the improvement of commission personnel,[123] and the improvement of internal operations procedures[124] – to basic organic changes – such as the complete separation of the investigation and prosecution functions from the adjudication function[125] and the de-emphasis of adjudication (particularly the excessive judicial formalities that have rendered regulation unduly cumbersome) so that a commission may apply more of its time, expertise and experience to other means of policy analysis and formulation.[126] Although they have generated some controversy, these recommendations concerning internal change reflect more a desire to tinker with structures, functions and organizations than to resolve fundamental problems.

In contrast, the recommendations concerning basic changes of government machinery by merging commissions into executive departments[127] (that is, reducing their independence[128]) or at least better coordinating their activities with executive department policies[129] are changes of an altogether different order, requiring reconsideration of the reasons for setting up indepen-

122 These issues are all summarized with respect to the U.S. commissions in Bernstein, *supra* note 24, at 14. *See also* STAFF OF SENATE COMM. ON GOVERNMENTAL AFFAIRS, 95TH CONG., 1ST SESS., STUDY ON FEDERAL REGULATION (Comm. Print 1977); STAFF OF SUBCOMM. ON OVERSIGHT AND INVESTIGATIONS OF H.R. COMM. ON INTERSTATE AND FOREIGN COMMERCE, 94TH CONG., 2D SESS., REPORT ON FEDERAL REGULATION AND REGULATORY REFORM (Subcomm. Print 1976); D. WELBORN, GOVERNANCE OF FEDERAL REGULATORY AGENCIES 131-43 (1977).

128 M. BERNSTEIN, *supra* note 91, at 145-50. The author points out that independence may be desired by industry to ensure control over the regulators.

One proposed change of U.S. securities laws would have institutionalized industry influence over the SEC. This proposal was rejected at the Conference Committee stage; *see* H.R. REP. NO. 94-229, 94th Cong., 1st Sess. 96 (1975).

129 COMMISSION ON THE ORGANIZATION OF THE EXECUTIVE BRANCH OF GOVERNMENT, THE INDEPENDENT REGULATORY COMMISSION (1949) (First Hoover Report); J. LANDIS, REPORT, *supra* note 105; A NEW REGULATORY FRAMEWORK: REPORT ON SELECTED

dent regulatory commissions in the first place. Fortunately, in Canada, these problems generate far less heat than in the United States.[130] This is partly because we have always assumed that the regulatory commissions must be subject to the oversight of executive departments,[131] at least in respect of strategic policy issues,[132] and partly because, until recently, the operations of the

INDEPENDENT REGULATORY AGENCIES (1971) (Ash Report), *cited in* Bernstein, *supra* note 24, at 16, 18, 19.

The most recent U.S. federal, economic regulatory commission, the Commodity Futures Trading Commission created by Pub. L. No. 93-463 (1974), involved a transfer of regulatory authority from the Dept. of Agriculture to an independent commission; but the commission is structured to ensure close, continuous liaison with the Secretary of Agriculture; *see* STAFF OF SENATE COMM. ON AGRICULTURE AND FORESTRY, THE COMMODITY FUTURES TRADING COMMISSION ACT OF 1974 21 (Comm. Print 1974); DEPT. OF AGRICULTURE, REPORT TO CONG. ON THE COMMODITY EXCHANGE AUTHORITY AND ON COMMODITY FUTURES TRADING 12-13 (May 1974).

130 Bernstein characterizes the concept of "independence" from the executive as a "curious American concept" M. BERNSTEIN, *supra* note 91, at 150. *See also* Massel, *supra* note 117, at 186.

131 *See e.g.* 9 ONTARIO COMMITTEE ON GOVERNMENT PRODUCTIVITY, *supra* note 102, at 45; but Baillie, *supra* note 91, at 353, points out that Canadian securities commissions are in practice substantially independent of both the legislature and the executive.

For an analysis of executive directive powers at the federal level in Canada, *see* H. Jänisch, *supra* note 101; *see also* H. JÄNISCH, Political Accountability for Administrative Tribunals (unpublished paper presented at Conference on Administrative Justice, University of Ottawa, January 1978).

The executive directive powers in the key federal regulatory statutes can be briefly summarized.

	Minister or Governor in Council directive power	Governor in Council power to transfer authority from comm. to minister	Governor in Council power to override comm. or refer back
National Transportation Act, R.S.C. 1970, c.N-17			s. 64(1)
Broadcasting Act, R.S.C. 1970, c.B-11	s. 22		
National Transportation Amendment Act. Bill C-33, 2d Sess. 30th Parl., 1977	s. 3.2	s. 3.1	
Telecommunications Act, Bill C-24, 3d Sess., 30th Parl., 1978	s. 9		ss. 11, 12

132 This theme is frequently reiterated but it defies any kind of clear definition; *see e.g.* Jaffe, *supra* note 98, at 1105, 1135; W. CARY, *supra* note 96, at 25.

regulatory agencies were largely confined to technical problems and therefore not too visible. But recent crises in the energy, communications and transportation sectors have forced these agencies to the front of the stage, compelling Canadian governments to confront and deal with these issues.[133]

While these recommendations to change commission structures and relationships raise alternatives that may be useful in specific cases, preoccupation with them has undoubtedly built up unrealistic expectations about what can be achieved by restructuring organizations and has diverted attention from the basic problem, which is how to make the regulated industries perform better. Whether the task of regulation is assigned to a department or an independent commission, as English experience establishes, is not of central importance. What is essential is to recognize that all regulation problems are multidimensional in the sense that they may involve several conflicting social and economic interests in a changing environment and that they may be subject to numerous alternative regulatory mechanisms. Therefore each regulatory issue – assuming regulation is the best solution – requires careful analysis of all these factors and not just of government machinery.

Indeed, the topical criticism[134] of the regulatory process largely ignores the questions of delegation, judicial review and administrative mechanisms and launches a frontal attack on the regulatory citadel, questioning how much regulation is really essential or even whether regulation is required at all, and advocating more empirical analysis to permit a more rational approach to answering these problems. The critics of this school acknowledge that governments deliberately structure certain industries as monopolies or cartels in order to limit destructive competition.[135] However, they argue that the onus should be on an industry to prove the existence of any destructive competition in an open policy debate in order to justify new regulatory initiatives or even the continuance of existing, well-established regulatory systems.[136] If there is some destructive competition but only of a

133 The federal government has recently taken steps to clarify departmental control over strategic policy decisions with respect to transportation and communications; *see* materials in note 131 *supra*. *See also* Cutler and Johnson, *supra* note 121, at 1395, where the authors recommend greater presidential power to intervene in the process of policy making by regulatory agencies.

134 *See* especially, Wilson, *supra* note 94; Promoting Competition in Regulated Markets, *supra* note 68.

135 *See* Jaffe, *supra* note 98, at 1114, 1127, where the author criticizes a too simplistic free market approach.

136 For an excellent illustration of this kind of analysis, *see* Mann, *supra* note 68, at 301. This approach is not altogether new. In 1954 Schwartz advocated that the courts be

temporary or minor nature, then instead of overall regulation a program of adjustment assistance or insurance can be instituted to permit equitable treatment of any hardship cases, a solution that obviates continuous government surveillance. If, on the other hand, the industry is in fact a natural monopoly or must be cartelized for stability or public security reasons, then the regulatory system should be openly characterized as a planning mechanism that displaces the market and should be designed accordingly, keeping in mind the criticisms outlined above. Particularly, one should note the point that behind each criticism is a political conviction for or against planning as a process or an ingenuous belief that politicians can actually sacrifice equitable treatment in a large number of cases in order to achieve overall economic efficiency for all.[137]

As Wilson has pointed out,[138] all of these criticisms of the regulatory process involve a tradeoff between equity and efficiency. Those who advocate greater equity press for fairer procedures and wider scope for judicial review over jurisdiction, procedures and even substance. Those who advocate greater regulatory efficiency press for better policy coordination with the executive – particularly to specify objectives – through departmentalization or other organic change or better definition of regulatory standards. Finally, the new critics press for overall industrial efficiency on the ground that even the most sophisticated regulatory system cannot achieve what a market does well, that is, evaluate the performance of a firm or an industry through the price mechanism in order to determine whether resources should be allocated to it.[139]

---

empowered to quash agency decisions that reduce competition except where the agency establishes that it cannot otherwise achieve its statutory objectives; *see* Jaffe, *supra* note 98, at 1134. Schwartz's idea is now reflected in s. 23 of the Securities Exchange Act of 1934 as amended by the Securities Reform Act of 1975.

137 This form of criticism has been nicely characterized as "a renewed interest in the reductionist theories of economists and philosophers that seek to dissolve collective choice into individual exchange and public law into private law, thus limiting the administrative function". Stewart, *The Reformation of American Administrative Law*, 88 HARV. L. REV. 1667, 1807 (1975).

138 Wilson, *supra* note 93, at 40-42.

139 These critics are currently having great impact. Several U.S. bills have recently been tabled in Congress recommending a study of the functions of the regulatory commissions; *see e.g.* S. 4145 and S. 4167, 93d Cong., 2d Sess. (1974), *discussed in* 690 BNA ANTITRUST AND TRADE REG. REP., at A-17; *but contrast* the views of Stewart, *supra* note 137.

Since then the President and a bipartisan congressional delegation have met to discuss the issues raised by the bills and have concluded that deregulation should be effected wherever practicable, particularly the price-fixing of the commissions regulating infrastructure industries; *see* The Wall Street Journal, June 26, 1975, at 2, col. 3.

In any event it is very probable that legislatures, for valid political reasons, will continue frequently to invoke the institution of the independent regulatory commission – that is, a commission set up outside the conventional government departments – to resolve problems that are too complex to be resolved through ordinary bureaucratic administrators who apply relatively static statutory rules and standards. I shall therefore summarize the above arguments and then outline briefly the advantages frequently attributed to the commission.

(1) The independent regulatory commission is a minigovernment, which is empowered to exercise legislative, judicial and administrative powers with a view to planning the structure and operations of an industry or a market.

(2) As a general rule, a commission must have a relatively broad delegation of power under its enabling act if it is to be able to regulate imaginatively and effectively. Delegation under broad "public interest" standards is in effect authority to develop and enunciate policy as distinct from applying value-free rules and standards to specific cases. It is in this sense that each regulatory commission is in politics.

(3) For the same reason – the absence of value-free rules and standards – judicial review of the decisions of a regulatory commission is not a satisfactory means to control commission decisions, except to constrain a commission from acting outside the limits of its jurisdiction, acting arbitrarily, or following unfair procedures.[140] A court should adjudge only the legality of a commission's decision, not the correctness of a policy decision made in the context of broad public interest standards.

(4) Rather than focus on delegation standards or judicial review, it is more appropriate, particularly in the Canadian context where scant attention is accorded separation of powers mythology, to structure a commission in a way that achieves a workable balance between the commission's relative independence on the one hand and its responsiveness to the executive as well as its accountability, through a minister, to the legislature on the other.

(5) Assuming regulation is politically necessary the legislators and the regulators should be constantly aware when undertaking to regulate an industry or a market that to displace market competition – and particularly price competition – is to bureaucratize the industry or market. To do so is to aban-

140 Note especially the judicial review provisions set out in s. 25 of the Securities Reform Act of 1975.

don the price mechanism as a means to determine value and measure performance and to substitute other performance measures. Wherever possible, therefore, regulation should be limited to conduct rules and standards and should only be extended to govern entry and prices – the strategic elements of a competitive market – when no other solution is politically acceptable.

(6) In summary, in addition to the general economic criticism that regulation is a poor substitute for a competitive market, regulation through a regulatory commission is frequently attacked on three fronts. First, the exercise of broad discretion within the context of a public interest standard may empower a commission to dilute the force or even subvert the original policy of the law unless the standard is further refined or the agency subjected to continual policy oversight by the executive and the legislature. Second, again because of the broad discretion exercised by a typical commission, it may act unlawfully, unfairly or arbitrarily unless it is subjected to judicial review. Third, because of its relative independence, a commission may become ineffective or even become a captive of the regulated industry unless its planning is closely coordinated with the executive to ensure that the commission's goals and priorities are consistent with the government's overall goals and priorities.[141]

(7) The regulatory commission is widely acknowledged to have a number of specific advantages over conventional department structures that clearly outweigh its disadvantages.[142]
(a) It permits flexible and expert administration where bureaucratic administration of rules and standards as interpreted by the courts would not work. A commission can take on a novel and complex task, explore and analyze an industry, apply its expertise to refine very broad statutory policy through adjudication and regulation-making, and maintain

141 *See generally* Massel, *supra* note 121, at 183; M. BERNSTEIN, *supra* note 91, at 24, 100; McFarland, *supra* note 105, at 423.

142 *See* M. BERNSTEIN, *supra* note 91, at 24, 70; ONTARIO COMMITTEE ON GOVERNMENT PRODUCTIVITY, *supra* note 102, at 37; Fainsod, *Some Reflections on the Nature of the Regulatory Process*, in PUBLIC POLICY, *supra* note 22, at 297, 312 n. 6. *See also* J. BALDWIN, THE REGULATORY AGENCY AND THE PUBLIC CORPORATION 6-9 (1975), where the author expresses bluntly the usually only implied, major factor that impels a government to establish an "independent" regulatory agency: to insulate the government from making an enemy in circumstances where the effect of a difficult policy decision is necessarily to benefit one person and to deny another.

The U.S. Senate Committee on Governmental Affairs has very recently, as a result of a comprehensive study of the U.S. federal-administrative system, confirmed its confidence in the concept of the regulatory commission; *see* in particular 5 STAFF OF SENATE COMM. ON GOVERNMENTAL AFFAIRS, *supra* note 122, at 80-81.

continuous oversight of the regulated market or industry to determine the effectiveness of that policy.

(b) It permits the resolution of conflicts among rival interest groups, if not free from politics, at least free from the immediate pressure of short-term, partisan politics, permitting it to avoid expedients and so develop policies that will have considerable continuity. A commission can, particularly when adjudicating a specific case, retain enough independence from the executive to decide the case impartially.

(c) Presumably it can, as a collegiate body, render better judgments and permit broader representation in the regulation-making (that is, policy-making) process[143] than can an agency with a single head.

(d) It enables interested persons better to aim their criticisms and to recommend policy changes to government because the establishment of a commission tends to focus program responsibility. A commission can also be structured to balance conflicting interests. It may include members who are clearly capable of considering the interests of groups that are not well represented because the benefits of regulation or deregulation are widely diffused among the public whereas the costs are concentrated and borne, for example, by a small group of producers.[144]

(e) It can offer a number of administrative advantages, particularly freedom from the constraint of the bureaucratic rigidities of government personnel and financial management rules and from the requirement of queuing up to receive general services such as legal, data processing and public relations services. A commission can achieve better program performance at lower cost through the use of term employees or service contracts. This also precludes the growth of tenured employees and so facilitates winding up when a limited program goal has been achieved.

(f) It permits government to assume a quasi-commercial activity, for example the administration of a computer-communications system, with less hostility from the business community.[145]

(g) It facilitates regional representation and also the coordi-

143 This is an important consideration in Canada, where most - but not all - regulation-making power is vested in the Cabinet to ensure regional representation in the policy-making process; *see* Mallory, *Parliamentary Scrutiny of Delegated Legislation in Canada: A Large Step Forward and a Small Step Back*, [1972] PUB. L. 30.

144 *See* Wilson, *supra* note 11, at 143-46.

145 Weil argues that the U.S. Government should set up a state corporation to adminis-

nation of programs that cut across the traditional jurisdiction of several departments.

(h) And finally, it is a versatile institution to coordinate intergovernmental program, which is an especially important characteristic of a commission in a federal system.

Chapter VI
Institutions of Federal-Provincial Cooperation

Although the regulatory commission is widely acknowledged to be an especially versatile instrument to coordinate intergovernmental programs, it is only an alternative means to achieve an objective and not in any sense a solution of the underlying problem, which is to render overlapping, federal-provincial programs more effective. For as Derthick points out, "Organizations are instruments of purpose, and they ought not to be judged apart from the objectives they purport to serve".[146] In other words, one should not have exaggerated expectations about what can be achieved by organizational change, for absent at least broad consensus among the federal and provincial governments about joint program objectives, not even an ideal form of organization can administer a joint or overlapping program effectively.

It is however, a reasonably safe assumption, if we ignore peripheral issues[147] and bargaining rhetoric, that all Canadian governments share a common general objective with respect to securities market regulation:[148] to develop and maintain a Canada-wide securities market that, within the context of the prevailing general economic policies is effective in the sense that it tends

---

ter a computerized securities market as a public utility on a cost recovery basis; *see* F. Weil, *supra* note 28.

146 M. Derthick, Between State and Nation 224 (1974).

147 The most important peripheral issue is the emphasis to be placed on investor protection as opposed to entrepreneurial freedom. These are mutually exclusive goals, therefore one can be increased only at the expense of the other. This problem inheres in any system of securities regulation. It can be dealt with by setting high investor protection standards in federal law and permitting more promoter-oriented standards in provincial laws that apply to intraprovincial trades, and also by establishing different standards in federal and provincial laws with respect to different enterprises (*e.g.* by distinguishing among financial, industrial, resource extraction, and resource exploration firms).

Other peripheral - but important - policy issues are foreign ownership of securities firms, introduction of electronic systems, accounting disclosure standards and the functions of other financial intermediaries.

148 Since 1937 a number of royal commissions have discussed the desirability of securities regulation without any detailed analysis of alternative means; *see* Report of the Royal Commission on Price Spreads 44 (1937); 2 Report of the Royal Commission on Dominion-Provincial Relations 57 (Rowell-Sirois Report, 1940); Porter Report at 348.

to allocate capital to enterprises than can make optimum use of it, and efficient in the sense that it enables capital to flow from savers to users with a minimum of unnecessary cost. The central problem therefore is to determine what institutions of federal-provincial cooperation will best enable the government of Canada to contribute to this objective, which involves consideration of the existing framework of federal-provincial relations and the alternative coordinating mechanisms that can realistically be employed within it.

The present framework of federal-provincial relations can best be explained by a brief explanation of its evolution. The original concept of federalism, both in the United States and Canada, was "dual federalism", which was based on the assumption that federal and provincial powers could be separated into watertight compartments and that any program conflicts could be resolved through the arbitral powers of the supreme court, or, if judicial arbitration did not result in a solution satisfactory to the parties, then through the process of formal constitutional amendment.[149] As government intervention in the social and economic life of the federal states grew, it became obvious that with respect to complex systems all matters become interdependent and the larger the resource commitment to any one program the greater the impact on all other programs. The response to this new state of affairs was the concept of "cooperative federalism", which is based on a negotiating process to define common program goals and determine the amount of resources to be allocated to each common or shared program by each government involved.[150] This ap-

149 *See* R. Van Loon & M. Whittington, The Canadian Political System: Environment, Structure & Process 165-228 (1971) (especially 206-28); J. Sundquist & D. Davis, Making Federalism Work 6-13 (1969); Mallory, *The Five Faces of Federalism*, in Canadian Federalism: Myth v. Reality 55 (J. Meekison ed., 2d ed. 1971); P. Hogg, Constitutional Law of Canada 29-76 (1977).

For an extensive bibliography of these issues, *see* Institute of Intergovernmental Relations, Queen's University, Bibliography of Federalism and Intergovernmental Relations in Canada, Australia, the United States and Other Countries (1967 & Supp. 1976).

150 A further refinement on this in Canada is "consultative federalism", which is based on the idea of intergovernmental consultation, particularly among first ministers, before a proposed new program is introduced with a view to identifying and minimizing program conflicts; *see* D. Smiley, Constitutional Adaptation and Canadian Federalism Since 1945 90-94 (Study No. 4 of Royal Commission on Bilingualism and Biculturalism 1971).

Where consultation does not lead to a satisfactory solution a province may opt out of a shared program and instead accept a lump sum of income tax revenues to finance its own program. This alternative has been raised most recently by the Ontario government with respect to health care programs; *see* speech of Ontario Treasurer, W.D. McKeough, in revised budget; Leg. Ont. Deb., 29th Leg., 5th Sess., No. 95, at 3673 (1975).

The U.S. variation is called "creative federalism", which is based on the idea of

proach, although only a qualified success, has if nothing else highlighted the importance of defining program objectives, particularly where there can be substantial overlap or even conflict among federal and provincial programs.

As already pointed out, there is probably little conflict in principle between federal and provincial objectives with respect to securities market regulation, but absence of conflict about general objectives - and the means to achieve those objectives - does not resolve all the problems. Experience with shared programs has clearly underlined the importance of looking at a whole system and not just its constituent parts. For example, when considering the securities market one should consider the overall capital market of which the securities market is only a subsystem unit, other programs such as taxation and resource development programs that have direct impact on capital market and securities market policies, and also particular regional and local requirements. Since, however, there is at present in Canada no permanent intergovernmental machinery to deal on a continuous basis with capital market or even securities market policies,[151] the federal government must consider the alternative coordinating mechanisms that will best enable it to achieve its program goals and at the same time reconcile those goals with provincial policies before it can consider becoming involved in securities market regulation. Although other, extraneous coordinating mechanisms such as intergovernmental policy committees are possible, assuming the federal government does decide to enter the securities field, then within the context of the securities laws there exist only two probable strategies. The first is a dual system, which implies superimposing a federal law and a federal regulatory system on the existing provincial systems. The second is an integrated system, which implies vesting in one commission authority to exercise powers under discrete federal and provincial securities acts.[152]

---

national leadership to establish goals and priorities and to furnish resources to local governments for program execution, a system that sounds good but that fails to resolve the paradox of program execution by local governments that have different or even hostile policies; *see* J. SUNDQUIST & D. DAVIS, *supra* note 149, at 12-13.

151 *See* Smiley, *supra* note 50, at 89-90, where the author outlines a number of alternative institutions of federal-provincial coordination. *See also* A. SAFARIAN, CANADIAN FEDERALISM AND ECONOMIC INTEGRATION (1974); FEDERAL-PROVINCIAL RELATIONS OFFICE, FEDERAL-PROVINCIAL PROGRAMS AND ACTIVITIES, A DESCRIPTIVE INVENTORY (1977).

152 This paper presumes there is no constitutional restriction on the delegation of powers from both Parliament and one or more legislatures to a joint commission; *see* B. LASKIN, CANADIAN CONSTITUTIONAL LAW 39-41 (3d ed. rev. 1969); Lederman, *The Limitations of Co-operative Federalism*, in CONTEMPORARY ISSUES IN CANADIAN POLITICS 22, 28 (F. Vaughan, P. Kyba & O. Dwiredi eds. 1970); P. HOGG *supra* note 149, at 213-37; and *see*, *Anisman and Hogg*, ch. III. I.

These two conceptual approaches to federal-provincial program coordination can best be illustrated by reference to actual experience with attempts to coordinate corporation and securities laws in three federal jurisdictions that share a common legal tradition – the United States, Australia and Canada.

In all three jurisdictions little thought has been given to the kinds of policy goals sought to be achieved by the corporation laws on the one hand and the securities laws on the other, therefore there is considerable confusion about which policy goal should be pursued under one statute or the other. In an ideal world the corporation law would be limited to the institutionalization of responsibility in corporate managers, majority shareholders and the corporation itself with a view to protecting shareholders, creditors and the public generally, whereas the securities law would be limited to regulating, directly or indirectly through self-regulatory agencies, the entry, structure, conduct and price aspects of the securities market. These reasonably clear distinctions did not develop in any one of these jurisdictions, however, because of the different distribution of powers under the constitution of each and because of confusion about certain institutions such as insider trading, proxy, takeover bid, and financial disclosure rules that had to be set out in both the corporation laws and the securities laws to ensure they applied in specific cases to closely held corporations as well as publicly distributing corporations. Moreover, in the United States the securities laws have had to reach out to include such topics as proxies, insider trading, cash takeover bids, and financial disclosure because there is no federal corporation law that can be used to superimpose federal standards on public distributing corporations which raise capital in the federally regulated securities market but which are incorporated under and otherwise governed only by the notoriously lax state laws.[153] In Australia, constitutional powers to enact corporation laws and securities laws (except in respect of federal territories) were until recently assumed to be exclusively state powers. And in Canada, to add to the confusion, the federal and provincial corporation laws are essentially coequal, whereas the securities laws exist only at the provincial level because the provinces first entered the field and because there is some uncertainty about federal powers to enact a securities law. But notwithstanding these constitutional differences, the concepts employed in each jurisdiction

153 *See* Cary, *Federalism and Corporate Law: Reflections upon Delaware*, 83 YALE L.J. 663 (1974); STAFF OF SENATE COMM. ON INTERIOR AND INSULAR AFFAIRS, 93D CONG., 2D SESS., FEDERAL CHARTERS FOR ENERGY PROBLEMS – SELECTED MATERIALS (Comm. Print 1974).

to coordinate these different laws can be related to any federal system.

As already pointed out, when it enacted the Securities Act of 1933 and the Securities Exchange Act of 1934 the U.S. Congress deliberately maintained a dual or two-tier regulatory system based on disclosure and self-regulation at the federal level and broad administrative discretion at the state level, thus assuring a broad, minimum national standard and at the same time permitting more stringent state standards.[154] It follows, therefore, that in connection with each public distribution of securities a prospectus must be qualified at the federal level and in each state where the securities are to be distributed, a policy that is continued in the *ALI Federal Securities Code* on the grounds that the dual system is required to empower the states to enact laws which better reflect local capital market conditions and which give regulators broader, more subjective discretion to deal with local market actors.[155] Starting from this premise, law reform in the United States has therefore been directed not at federal pre-emption or federal-state uniformity but instead at federal-state coordination and state law uniformity. In the federal Securities Act of 1933 coordination is achieved largely through the intrastate exemption, which in effect excepts from the application of the federal law any securities distribution that is confined to a state or a state and certain defined contiguous areas.[156] At the state level coordination is commonly achieved by automatic qualification of a prospectus that has already been cleared at the federal level, obviating repeated scrutiny in several jurisdictions.[157] And both federal and state administrators collaborate to minimize duplication of effort, for example, to reduce the paperwork burden of firms required to file information returns with both federal and state securities commissions.[158]

L. Rev. 367 (1976).

157 L. Loss & E. Cowett, *supra* note 43, at 241-42. Similarly some states automatically exempt private offerings that have qualified as exempt offerings under federal law; *see* Delaware and Maryland joint release of October 24, 1974 in 1 CCH Blue Sky L. Rep. ¶11,653.

158 A recent example is the new broker-dealer reporting form adopted by SEC, Securities Exchange Act of 1934 Release No. 11424, May 16, 1975, [1975-1976 Transfer Binder] CCH Fed. Sec. L. Rep. ¶80,176. Moreover, a nation-wide system to register U.S. broker-dealers has been developed in the U.S. and approved by the NYSE

Although cumbersome because based on two contrasting policy views at the federal and state levels, the United States system has worked with a minimum of federal-state conflict. In contrast, in Australia, where the states have long exercised sole jurisdiction over corporate and securities matters, the federal government, basing its policy on a recent constitutional case that extended widely the federal commerce power,[159] moved quickly to occupy much of the traditional corporation and securities law field, apparently without any extensive discussions with the state governments. Shortly after the federal government had set up a committee to determine what role it should play with respect to securities market regulation, three of the state governments – New South Wales, Victoria and Queensland – made an apparent pre-emptive strike on February 18, 1974, setting up an Interstate Corporate Affairs Commission by multilateral agreement to achieve most of the goals projected to be achieved by federal law.[160] Undeterred, the federal Senate Select Committee continued its work and on July 18, 1974 issued a report entitled *Australian Securities Markets and Their Regulation*,[161] which recommended that the Commonwealth – that is, federal – government should enact a statute to occupy and regulate unilaterally much of the corporate and securities law field now occupied by the states. Several months later, on February 26, 1975, the Commonwealth Lower House passed the Corporations and Securities Industry Act to achieve this purpose. The Senate, not satisfied with the House Bill, on April 10, 1975 again set up a select committee and assigned to it the task of reviewing the statute enacted by the Lower House. Concurrently, the state governments urged the federal government to reconsider the statute, particularly to consider restructuring any proposed federal commission as a joint federal-state commission.[162]

While the federal bill was still before the Senate a federal election intervened, the government changed, and the new government undertook a complete review of the previous govern-

ment's policy relating to the corporation and securities laws. To further consolidate their position, the four states that had joined the Interstate Corporate Affairs Commission – New South Wales, Victoria, Queensland and Western Australia, on March 1, 1976 brought into force the uniform Securities Industries Act,[163] which was designed to meet many of the criticisms of balkanized state securities regulation set out in the *Rae Report*.

By July 1976 the new federal government had reviewed the issue and, although it had while in opposition agreed in principle with the conclusions of the *Rae Report*, decided on an altogether different means to implement its policy objective of uniform corporation and securities laws. Instead of pre-empting the field and thus displacing the state laws, the federal government would recommend the creation of a federal-state council of ministers, which would be empowered to determine the policy content of federal laws that would be adopted as the uniform corporation law and securities law in each state.[164] The responsible state ministers met with the federal minister to discuss this proposal and agreed, in early 1977, to recommend to their respective governments a detailed, integrated scheme that adopts the major recommendations of the federal minister.[165] To date, however, no progress has been made beyond this agreement in principle, partly because of an intervening federal election (and a change of ministers) and partly because of basic disagreements among the states as to the substantive provisions to be set out in the proposed uniform law.[166] In the meantime, the larger states continue to consolidate their position through the Interstate Corporate Affairs Commission.

In Canada, as in Australia, there is no federal securities law and therefore the problem of coordinating federal and provincial laws has not yet been faced, although serious efforts have been

166 *See* Short, *Securities Reform Dogged by Delays*, Australian Financial Review, February 20, 1978, at 1.

A more recent release of the Australian federal Department of Business and Consumer Affairs dated May 14, 1978, announced that the "Commonwealth and State Ministers responsible for corporate affairs had reached final agreement, for recommendation to their respective governments, on a national scheme of legislation and administration for company law and the regulation of the securities industry".

made for more then forty years to achieve a reasonable degree of uniformity of policy. By 1930 several of the provinces had adopted the Ontario model, but because of differences in local securities markets, policy differences among provincial governments and uneven administration, the uniform base was rather quickly eroded, resulting in a number of similar but still different securities acts across Canada.[167] Following enactment of the Ontario Securities Act of 1966, there was once again a strong uniformity movement that produced relatively uniform securities laws in Ontario and the Western Provinces and a securities law in Québec that adheres closely in principle to the Ontario act. In addition, spurred on by a renewed federal interest in the securities field, the provincial securities administrators have set up a quite formal organization – the Provincial Securities Administrators – to coordinate their policies and procedures with a view to simplifying compliance with the several provincial acts. The securities administrators have together produced a set of uniform policy statements[168] and have collaborated closely to develop a new Ontario Securities Bill,[169] the most recent version of which was tabled in the Ontario legislature on February 28, 1978, and which is intended to be the model statute for all the provinces. In short, the provinces, following the strategy employed by the Australian states, are attempting to develop a system of securities law and administration that will in effect have Canada-wide application and will therefore render unnecessary any federal occupation of or even participation in the securities regulation field.

Like their Australian counterparts the provinces have as part of their in-depth defence strategy another position that can be invoked as an alternative to exclusive federal occupation of the field, that is, a joint federal-provincial commission to administer the securities laws at both the federal and provincial levels. First suggested by the Ontario Securities Commission in 1967 in its published CANSEC proposal, the topic was recently referred to again by the Ontario Securities Commission as a possible means to coordinate federal and provincial activities relating to securities.[170] This alternative approach has the advantage that it can

167 *See* J. WILLIAMSON at 24–28.

168 These policy statements fall into three classes: (1) National Policy Statements that apply in all provinces except Newfoundland and Nova Scotia: (2) Uniform Act Policies that apply in Ontario and the Western Provinces; and (3) Provincial Policies that apply only in the one province. *See* 2 CCH CAN. SEC. L. REP. ¶¶54-838–54-956.

169 Ontario Bill 30, which was tabled for first reading on June 29, 1977.

170 The 1968 CANSEC proposal is discussed in Banwell, *Proposals for a National Securities Commission*, 1 QUEEN'S INTRA. L.J. 3 (1969). The recent references to CANSEC arose during OSC hearings concerning the proposed "national commission schedule" of brokerage commission rates; [1973] OSC Bull. 108 (August).

lead to one uniform law and one set of policies and procedures, whereas the dual system of the United States, based as it is on two different philosophies, institutionalizes a multiple statute system.

Where a dual system obtains, it is probable that the federal and provincial securities laws – even if based in principle on similar policy objectives – will differ in material respects. To minimize conflict-of-law problems and duplication of administrative effort it is therefore essential to distinguish clearly the cases to which either federal law or provincial law applies exclusively and so limit the cases where a person is required to comply with two substantially different legal systems. Although this need to distinguish is true with respect to all aspects of regulatory control over entry and conduct in both the new issues market and the secondary trading market, it is especially significant with respect to documents such as prospectuses, applications for licences and financial statements which, if they are not essentially uniform in all jurisdictions, engender both unnecessary frustration and excessive costs. Indeed, many critics argue that in the long run, in a federal system, it is impossible to maintain uniformity of policy and administration in respect of the securities laws. Thus, although there is no concensus in Canada about an acceptable means of federal involvement in securities regulation, there is a widely-held view that for these reasons alone Canada should not adopt a dual system that would superimpose a second, federal level of regulation on top of the existing provincial systems.

In the United States, where Congress clearly had power to pre-empt the entire securities field (except the relatively unimportant area of intrastate transactions), it opted for a dual system of concurrent jurisdiction that permits a state to impose more stringent rules in any case or less stringent rules where an issue is confined exclusively to that state.[171] For example, in the case of prospectus qualification the federal standard is limited to full and fair disclosure, whereas many state statutes superimpose a more stringent, highly subjective – and therefore broadly discretionary – standard based on the administrator's opinion as to whether the enterprise is viable or whether the transaction is fair, just and equitable to the prospective shareholders.[172] On the other hand, a state may in fact establish lower prospectus qualification stand-

171 Securities Act of 1933, s. 18; L. Loss & E. COWETT, *supra* note 43, at 237-38; 1 L. Loss at 30-31, 156, 591; and *see* Engdahl, *Presumptive Capability of Federal Power*, 45 U. COLO. L. REV. 51 (1973); B. LASKIN, *supra* note 152, at 104-11.

172 *See e.g.* CAL. CORP. CODE, s. 25140 (West 1977). The Quebec Securities Act, ss. 20, 24, like the California law, grants very broad discretionary powers to the administrators. The divergent U.S. state standards are discussed in L. Loss & E. COWETT, *supra* note 43, at 34-42.

ards on intrastate issues with a view, for example, to promoting local resource development.[173] Concluding that the dual system of federal and state securities regulation was too deeply entrenched in the United States to make federal pre-emption practicable there, the most prominent U.S. scholar in this field has concluded that "the only hope for simplification lies in uniformity and federal-state coordination",[174] that is, uniformity of statutory provisions and coordination of statutory systems, administrative forms, and administrative procedures.

The major attempt at uniformity of state statutes in the United States is the Uniform Securities Act sponsored by the National Conference of Commissioners on Uniform State Laws.[175] Although very influential, this model uniform act has not been able to overcome the predilection of local legislatures to attempt to improve policy through subtle drafting changes to substantive provisions and of administrators to develop different procedures. Fortunately, the coordination of statutory systems through the intrastate exemption technique has proved to be a slightly more fruitful approach because it permits a state to express local values in its laws and at the same time to subordinate those laws to federal laws and so give priority to interstate distributions that comply substantially with the local laws.

The key provision in the United States federal law that was designed to accommodate different state laws is the intrastate exemption set out in section 3(a)(11) of the Securities Act of 1933. This exemption was so narrowly interpreted by the courts, however, that it became a trap for the unwary and therefore was seldom relied on as a means to avoid qualification under federal law.[176] In order to clarify the exemption so that counsel can render an unqualified opinion that an intrastate issue is exempt from the federal securities laws, the SEC recently adopted a new Rule 147, which does not render the exemption more flexible but does make clear that an issuer is in a safe haven if it was incorporated in the state, has its principal office in the state, earns 80% of its gross revenue in the state, has 80% of its assets in the state, will employ

173 Québec experimented with lower standards for resource companies between 1967 and 1974 but reimposed the general standards applied to industrial companies by repealing its Policy No. 8; *see* 5 QSC Bull., No. 42, *supra* note 74; *see also* Zehr, *supra* note 74, where the author alleges the QSC policy effectively prohibits use of the securities markets to raise capital for speculative resource exploration ventures. For the present policy, *see* Policy No. 8 referred to in note 74 *supra*.

174 L. Loss & E. Cowett, *supra* note 43, at 238; ALI Federal Securities Code, Tent. Draft No. 3, s. 1603.

175 The Uniform Securities Act is set out in L. Loss & E. Cowett, *supra* note 43, at 245.

80% of the capital raised by the issue in the state, and will bar transfers of the issued securities to persons outside of the state for at least nine months.[177] The *ALI Federal Securities Code* essentially continues this policy but underlines that its purpose is to encourage rather than to constrain exempt intrastate distributions.[178]

This attempt to induce greater use of the intrastate exemption is not just window dressing, for the *Code* also expressly continues the dual system of the present law by empowering a state to superimpose its standards on the federal standards, particularly in respect of substantive market entry standards that apply to prospectuses or licence applications forms.[179] But the *Code* does not forgo altogether federal pre-emption power, which is invoked in a subtle manner to induce each state to harmonize its law with the federal law, employing the concepts of registration by coordination and notification that had been developed under the Uniform Securities Act as alternatives to the usual registration by qualification procedure. Briefly, registration by qualification means compliance with the statutory standards to render an issuer eligible to distribute specified securities to the public. Registration by notification means that a "blue chip" issuer is automatically entitled to distribute its securities to the public upon filing the required disclosure documents unless the securities administrator takes affirmative action to stop the distribution. Registration by coordination, as the name implies, means coordination with federal law, which is effected through two techniques: first, the federal forms are accepted but supplemented by further local documents where required to comply with additional local criteria; or alternatively, qualification is concurrent with federal qualification unless the local administrator takes affirmative action to delay or stop distribution and so advises the issuer before the issuer seeks last minute clearance for the distribution.[180]

The Uniform Securities Act reflects a carrot approach to the problem, suggesting techniques of administration that are more efficient but that still do not detract from local autonomy since the state administrator retains residual power to issue stop orders on an exceptions basis. The *ALI Federal Securities Code*, however, employs a stick approach, continuing state residual control over

177 SEC, Securities Act of 1933 Release No. 5450, January 7, 1974, [1973-1974 Transfer Binder] CCH FED. SEC. L. REP. ¶79,617, *discussed in* Kant, *SEC Rule 147 - a Further Narrowing of the Intrastate Offering Exemption*, 30 BUS. LAW. 73 (1974).

178 ALI FEDERAL SECURITIES CODE, Tent. Draft No. 3, at 150-54. Although they can render local distributions more practicable, the private placement and small issue exemptions are ignored here because they are not essentially coordination mechanisms.

179 ALI FEDERAL SECURITIES CODE, Tent. Draft No. 3, s. 1603.

180 *See* L. LOSS & E. COWETT, *supra* note 43, at 241-42, 290-99.

substantive standards but displacing the state laws with respect to disclosure requirements where the state law requires different disclosure or additional disclosure that is not essential to the application of a unique state substantive standard. As a result, although it preserves state power to apply substantive policy differences, the code clearly displaces state law and substitutes federal law with respect to prospectus disclosure and broker and investment advisor disclosure. Even more important the code displaces unqualifiedly any state law relating to secondary trades and "blue chip" securities distributions that can now be qualified by notification only under those state laws that contain the notification procedures of the Uniform Securities Act.[181]

In summary, the *ALI Federal Securities Code* suggests three ways to deal with overlapping federal-state laws in the United States:[182] first, pre-empt the field and largely abrogate the state laws; second, continue the present dual system of substantive laws but urge the states to develop uniform laws and procedures and to adopt notification and qualification procedures that minimize duplication of disclosure; or third, continue the dual system with respect to the substantive standards that apply to the new issues market but impose uniform disclosure standards and regulate the secondary trading market exclusively under federal law, a technique the *Code* characterizes as harmonization of federal and state laws.

Although the constitutional jargon varies slightly,[183] and although federal power to legislate in the field of securities regulation is less clear in Canada, the basic problems identified and the alternative solutions suggested in the *Code* to coordinate federal and state securities laws apply equally to the coordination of any federal and provincial securities laws. But the *Code* does not discuss another alternative that has been frequently invoked and therefore is of special significance in Canada, that is, integration of regulation through a commission exercising both federal and provincial powers, either exclusively or concurrently with regulation through provincial commissions.

Until recently in Canada there was considerable doubt about integrated federal-provincial regulatory schemes, for it was clear under the constitution that one legislature could not delegate any part of its authority to another legislature in order to empower the second legislature to deal with both interprovincial and intra-

181 ALI Federal Securities Code, Tent. Draft No. 3, s. 1603. S. 1603(b)(3) also makes Canadian blue chip issuers eligible for the qualification by notification procedure.

182 ALI Federal Securities Code, Tent. Draft No. 3, at 137.

183 B. Laskin, *supra* note 152, at 104–11.

provincial aspects of a regulatory problem.[184] The legislatures succeeded, however, to break out of this impasse through the patently legalistic device of setting up a regulatory agency under either federal or provincial law to which both federal and provincial legislatures may delegate regulation-making authority. As a result, although the federal government cannot, for example, delegate to a provincial legislature power to legislate with respect to interprovincial highway transport, the federal government can delegate regulation-making, adjudicative and administrative powers to a regulatory agency that has been set up under provincial law to regulate highway transport under broad public interest standards.[185] Even if lacking logical symmetry, this constitutional doctrine has given to the Canadian legislatures an extraordinarily flexible mechanism to deal with regulatory problems that are not clearly exclusively within the jurisdiction of either the federal or a provincial legislature. Although infrequently used, this mechanism has been invoked in at least three statutes by the federal Parliament to legitimate regulation of three sectors – highway transport, agriculture, and energy supplies – that are of strategic importance to the Canadian economy.[186]

The first of these provisions, section 3 of the Motor Vehicle Transport Act, which was enacted specifically to empower provincial transport commissions to make regulations concerning interprovincial transport,[187] directly authorizes a provincial commission to issue an interprovincial licence in accordance with the same standards and subject to the same conditions it applies when it issues an intraprovincial licence. The Energy Supplies Emergency Act sets up a federal board and, under section 9, authorizes that board to subdelegate any or all of its powers to any other person or agency. Even more versatile, the Farm Products Marketing Agencies Act contemplates the creation by the Governor in Council of federal-provincial marketing agencies that are expressly authorized under section 23 to exercise federal powers relating to interprovincial trade, to accept a delegation of provincial powers

184 Attorney-General for Nova Scotia v. Attorney-General for Canada, [1951] S.C.R. 31, [1950] 4 D.L.R. 369, *discussed in* B. LASKIN, *supra* note 152, at 39-41.

185 *See generally id.* at 43-66; P. HOGG, *supra* note 149, at 213-37. The converse case, delegation of powers by a provincial legislature to a federal regulatory agency was assumed to be unexceptionable by Laskin C.J.C. in Reference re Agricultural Products Marketing Act, 19 N.R. 361 (S.C.C. 1978).

186 Motor Vehicle Transport Act, R.S.C. 1970, c. M-14, s. 3; Farm Products Marketing Agencies Act, S.C. 1970-71-72, c. 65, s. 23; Energy Supplies Emergency Act, S.C. 1973-74, c. 52, s. 9(2).

187 In Attorney-General for Ontario v. Winner, [1954] A.C. 541, [1954] D.L.R. 657, 13 W.W.R. (N.S.) 657, the Privy Council had decided that Parliament had exclusive jurisdiction over interprovincial highway transport; *see* B. LASKIN, *supra* note 152, at 522-24.

relating to intraprovincial trade, and also, with the consent of the Governor in Council, to subdelegate federal powers to a local marketing board set up under provincial law.

In the securities regulation context, therefore, it would be possible to set up a federal commission, staff it with outsiders, federal departmental officers, provincial departmental or commission officers, provincial securities commissioners or any combination of these persons,[188] authorize it to exercise federal powers and to accept delegations of provincial powers, and even authorize it to subdelegate any of these powers to a provincial securities commission or to a self-regulatory body.[189] Thus in Canada, in addition to coordinating federal and provincial regulatory functions through complementary statutory provisions (*e.g.*, with respect to primary or secondary markets and disclosure as well as substantive standards), there exists another coordinating mechanism – delegation of broad authority to a regulatory commission – that can be employed with or even as a substitute for complementary statutes. But the creation of any commission exercising both federal and provincial powers poses a paradox: if there are material policy differences between the federal government and a provincial government, how can the commission be given clear policy direction? In other words, what minister is ultimately responsible for the development and enunciation of statutory policy and for the implementation of that policy by the commission? Although it did not clearly resolve this problem, the CANSEC proposal set out in a research paper published by the Ontario Securities Commission in 1967[190] defines the basic issues and recommends an imaginative approach that merits detailed discussion.[191]

188 The executive presumably would have broad staffing discretion as under other federal regulatory statutes.

189 The Farm Products Marketing Agencies Act creates a federal agency called the National Farm Products Marketing Council, which has as its purposes, among others, to advise the federal minister of agriculture with respect to the agriculture industry, to recommend the creation of marketing agencies, and to review agency performance. It is thus more a policy advisory council than a regulatory agency, although it can regulate indirectly through a federal agency set up under s. 17 of the Act. Note too that under s. 23(2) an agency may accept a delegation of powers from a province pursuant to an agreement made under s. 32.

Although the current structure of integrated regulation of farm products marketing was struck down because wrongly predicated on the assumption than an equalization levy was an indirect tax, a recent Supreme Court decision strongly confirms the validity of integrated regulatory schemes; *see* Reference re Agricultural Products Marketing Act, *supra* note 185.

190 The CANSEC research paper is published in [1967] OSC Bull. 61 (November). It is discussed in Langford & Johnston, *The Case for a National Securities Commission*, [1968] U. TORONTO COMM. J. 21; D. JOHNSTON at 17-18.

191 Ontario has on more than one occasion advocated a joint federal-provincial commission to exercise overlapping regulatory powers. With respect to interprovincial

In its discussion paper on CANSEC the Ontario Securities Commission pointed out that with respect to securities market regulation in Canada the ideal system would embody uniform laws, uniform administration, a common data base and an expert staff to do policy analyses and research specific problems, to investigate problem cases and to administer the overall system.[192] However, the discussion paper goes on to point out that the present Canadian system did not develop with ideal goals in mind but rather in response to different problems in different jurisdictions. Consequently the issue was characterized not as development of an altogether new system but coordination of existing systems to increase administrative efficiency and to develop a mechanism that will enable policy makers and administrators realistically to seek to achieve those ideal goals and so overcome the present dilemma of balkanized provincial regulation: on the one hand, if a province puts few resources into securities regulation either the law or its administration must be substandard; on the other hand, only the larger provinces have the volume of securities business to justify both a sound act and the expenditure of substantial resources on effective administration. As a result the larger provinces – through sheer competence – necessarily attract the major business and thus tend to dominate the field. The major problem therefore in designing a Canada-wide securities regulation system is to reconcile centralized policy making with decentralized administration in a way that does not relegate any jurisdiction, federal or provincial, to an ineffective status.

To resolve this problem the CANSEC proposal recommended creation of a Crown corporation with a three-tier administrative structure: (1) a council of ministers made up of the interested ministers from each participating jurisdiction (participation would be optional); (2) a commission made up essentially of the members of the provincial securities commissions;[193] and (3) a

trucking Ontario made a similar recommendation in 1969; *see* Schultz, *Intergovernmental Cooperation, Regulatory Agencies and Transportation Regulation in Canada*, 19 CAN. PUB. ADMIN. 183 (1976).

192 Ontario Securities Commission, CANSEC Proposal ¶22 (research paper presented to Federal-Provincial Securities Conference June 15, 1967).

193 A province would have the option to maintain its provincial commission or merge that commission into CANSEC. In any event it would be subordinated to CANSEC and therefore would not require an independent staff.

The Australian variation of this theme, discussed in the text at note 164 *supra*, assumes one federal law that is adopted in each state and that is subject to amendment on the recommendation of the council of ministers. Any state would be entitled to enact a non-uniform provision recommended by the council of ministers on six-months' notice to the council of ministers, a result that would arise only where the federal parliament refused to enact an amendment recommended by the federal minister who is a member of that council.

director at the central office as well as associate directors at each regional office and at certain local offices. The residual decision-making powers would be vested in the council of ministers, the federal minister to exercise some 33% of the votes and each province to exercise votes in accordance with its relative gross personal and corporate income tax collections at that time, giving Ontario roughly 29%, Québec 17%, British Columbia 7%, and the other provinces the balance of the votes. A decision of the council of ministers would require not only a two-thirds majority vote but also the approval of a majority of the participating governments.[194]

The second tier, the commission, would be a decentralized structure having its head office in Ontario, regional offices in Québec and British Columbia, and a local office in each other province.[195] The commission chairman would be selected from among the regional office commissioners. Each of the commissioners would have tenure of office for a ten-year period, but only five commissioners would be employed full-time, three in Ontario and one at each of the other two regional offices. A quorum for a commission decision would be two commissioners (which assumes at least one part-time commissioner for each region) to ensure that each regional office would be empowered to act for the full commission on a continuous basis. One or more commissioners would go, as required, to a local office to deal with any local issues. The third tier, the director level, would be made up of a director at the regional office where the chairman is located and an associate director at each regional office.

The functions of each administrative tier would be designed to characterize the council of ministers as essentially an overall policy evaluation body, the commission as a policy development and administrative review body, and the director as the chief administrative officer. More specifically, the council of ministers' functions would be to appoint commissioners and senior officers, review budgets and review policies and procedures with a view to recommending legislative changes. The key functions of the commission, continuing the policy of the uniform securities acts, would be to review decisions of the director based on the application of standards and rules set out in the statute, to grant administrative remedies such as orders to freeze assets and stop trading, and to make recommendations to the council of ministers concerning

194 This is a variation of the proposed Fulton-Favreau formula to amend the constitution where all provinces are affected, which formula required the approval of 2/3 of the provinces representing at least 50% of the population; *see* B. LASKIN, *supra* note 152, at 1076.

195 This model assumes that all provinces would opt to join CANSEC.

policy changes.[196] The director, subject to the direction of the chairman, would be the chief administrative officer, responsible in the first instance for application of the law and policies to specific cases, for enforcement,[197] and for the overall administration of personnel, finances, and capital assets.[198]

The CANSEC proposal has clearly been thought through in detail and with great care, and even if it cannot satisfy all Canadian governments, it furnishes a useful benchmark, identifying the structural, substantive, and procedural problems and also underlining, at least by implication, the advantages and disadvantages of such a cooperative scheme.

Certainly the great advantage of the CANSEC proposal is that it furnishes a coordinating mechanism that preserves substantial provincial autonomy, enables the efficient use of experienced commission staffs, and therefore could lead to better and more efficient securities regulation in Canada. More particularly, it could result in more uniform laws and procedures, elimination of much duplication of effort by applicants and administrators, and greater insulation from local, short-term political pressures. In addition, the CANSEC proposal would make possible centralized policy research and information processing that in turn would better enable decision makers to develop, refine and apply policies, looking at the Canadian securities market as an articulated, Canada-wide system. But what is most important, although the CANSEC proposal would require each participating province to yield some powers it presently exercises with respect to securities market regulation, the proposal ensures that each province continues to have substantial policy influence within the overall regulatory system.

From the federal perspective, however, some of these strengths of the CANSEC proposal are also its greatest weaknesses. It does not commit any province to join or to remain in CANSEC. It sets up a very rigid constitutional framework that makes amendment difficult except under threat of withdrawal. It virtually requires withdrawal where there is a sharp policy conflict

196 The CANSEC proposal sets out a random list of ends and means of a commission: (1) to regulate the entry of issuers and other actors; (2) to regulate the conduct of actors through rules concerning proxies, takeover bids, insider trading, financial disclosure, and stock exchange trading; and (3) as means to achieve these objectives - financial audits, investigations, issuing administrative remedies, and seeking court appointments of receivers.

197 The director could initiate administrative proceedings but only recommend criminal prosecutions to the provincial attorney-general who would retain prosecutorial discretion.

198 The foregoing discussion sets out only the more material elements of the CANSEC proposal, which is elaborated in greater detail in the source document.

between the council and any one minister acting under instructions from his government. It tends to perpetuate a system of eleven separate securities laws. It renders the commission extremely independent of and therefore possibly unresponsive to the political process. And it diffuses responsibility in such a way that no minister has clear responsibility to answer to any legislature for program performance.[199] In sum, even if a federal government were to acknowledge that the CANSEC proposal is incisive, imaginative and constructive, for two reasons it would be difficult for it to accede to the proposal as originally presented. First, because the proposal refuses to acknowledge any federal jurisdiction over the interprovincial aspects of the securities markets, it leaves the federal government in a perpetual minority position with no assurance that it will have even residual power to resolve a policy impasse or, indeed, any effective influence over securities market policies. And second, because of the absence of any mechanism to resolve policy conflicts, it might set a bad precedent, substituting for clear political responsibility in one or more legislatures, a complicated structure that diffuses responsibility among three internal organs of CANSEC and among eleven ministers, extending the concept of cooperative federalism to the point where no one is clearly responsible for the good governance of the securities markets.

The main emphasis, therefore, of the CANSEC proposal is to seek uniform *administration* of the different provincial securities laws and a limited federal law. The latter would legitimate the integrated commission concept and delegate to it authority to deal with federal corporate,[200] international, and criminal matters that are not clearly within provincial jurisdiction. As a result it implies a division of jurisdiction that leaves nearly all substantive issues in the several provinces – or undetermined[201] – and so

199 This was one of the principal reasons why the RAE REPORT (Australia) recommended that the federal government should occupy the corporation and securities regulation fields rather than set up an integrated federal-state commission; *see* R. BAXT, *supra* note 161, at 86.

200 The limited federal law would clear up jurisdictional ambiguities in cases such as Multiple Access Ltd. v. McCutcheon, 16 O.R. (2d) 593 (Div'l Ct. 1977), where the Ontario Divisional Court concluded that the federal corporation law provisions relating to insider trading were in essence congruent with the provincial law and therefore, pursuant to the paramountcy doctrine, displaced the like provisions of the Ontario Securities Act; *see generally* P. HOGG, *supra* note 149, at 110-13; and *see*, *Anisman and Hogg*, ch. III.H.

201 The key issue is jurisdiction over interprovincial transactions in both new issue and secondary markets. The question is whether the securities regulation system should be equated with a nationwide commodities market system (federal) or viewed as an aggregate of discrete contracts like insurance contracts (provincial); *see* J. WILLIAMSON at 189-201. A new dimension of this is raised in MacDonald v.Vapour

narrowly confines federal bargaining power. Since jurisdiction, or in other words, decision-making power, is the core of the problem, a brief tabulation of some of the possible models is essential to place this problem in overall perspective.

Literally hundreds of combinations are possible because each alternative model has at least eight dimensions, each of which contains a number of variables as indicated in table 5.

To set out in matrix form all of the possible models based on these variables is patently impossible; therefore table 6 sets out only the more probable combinations of the foregoing elements. Even if not exhaustive these combinations illustrate clearly the broad range of possible models, moving from a strongly centralized system at the top left to a completely decentralized system at the bottom right.

Table 6 brings into sharp focus the fundamental – although largely tacit – conflict between the OSC and the federal government over the CANSEC proposal. What the OSC recommended was a system that would give the larger provinces – and particularly Ontario – power to decide the substantive policy issues, subject to the constraining influence of the federal government with respect to general issues such as the content of the very limited federal enabling legislation, the appointment of key commission personnel, and amendments to the provincial laws. But the residual power to deal with the substance of the basic regulatory system would be determined by the several provincial legislatures, which presumably would be inclined but not required to enact uniform laws as approved by the council of ministers.

At the time the CANSEC proposal was published, the federal government, although it was then deliberating the creation of a federal securities law and a federal commission that would be superimposed on the provincial systems, was not convinced that such a dual system was workable or even desirable. As a result, even if the CANSEC proposal did not elicit an express response from the federal government, it did compel the federal government to temporize and to consider alternative coordinating mechanisms that would obviate a dual or two-tier regulatory system such as the system that obtains in the United States. The need for such further consideration was underlined by the response to the BUSINESS CORPORATION PROPOSALS,[201a] which were published in 1971, and which had recommended superimposing on the provin-

5. Regulatory powers based on securities *issues* International issues Interprovincial issues Intraprovincial issues
6. Regulatory powers based on subject matter (criminal law)
7. Regulatory powers based on territory
8. Regulatory powers based on interprovincial computer-communications systems

cial law a federal prospectus qualification system that would apply to federal corporations. The responses were ambiguous with respect to the desirability of a paramount federal system that would largely displace the provincial securities laws; but the responses were virtually unanimous in denouncing the proposed two-tier system. The detailed prospectus qualification provisions were therefore omitted from the Canada Business Corporations Act and federal policy analysts turned their attention to other alternatives.

Because of its ambivalent views at that time – not only about the best means of regulation but also about the need for any federal involvement in the field of securities regulation – the federal government was not in a position to respond in any positive way to the CANSEC proposal. But as already explained, the federal government was clearly aware of two particular shortcomings that inhere in any integrated model such as the CANSEC model; first, the extreme independence of the commission, which would be two steps removed from any legislature (a minister and the council of ministers are in between) and therefore might be unresponsive to the political process at any level; and second, the diffusion of responsibility for policy and administration among several ministers, which might preclude clear accountability to any legislature. Because they are inherent in any integrated system, these elements may have to be accepted as reasonable risks to be taken to make the regulatory system work in a federal context. If they prove to be real problems, probably all governments involved will be highly motivated to work together to resolve them.

There was one other shortcoming of the CANSEC model that is clearly even less attractive to the federal government, that is, relegation of any federal securities legislation to the level of complementing provincial legislation. In contrast, the proposed integrated system for Australia[202] would be based on an inverse policy. The federal government would enact a comprehensive securities law based on a composite of the existing state laws, and each state would adopt the federal law as state law with reservation of the right to each state, with the approval of the proposed council of ministers, to enact non-uniform provisions on giving six-months' notice to the other states and the federal government. The proposed Australian model clearly accords better with the federal perspective, emphasizing as it does central, uniform policy over local autonomy.

Indeed, the CANSEC and Australian models clearly highlight

202 *See* J. WILLIAMSON, *supra* note 201; and *see*, *Anisman and Hogg*, *supra* note 201.

the problem of achieving a policy balance within an integrated system, one that avoids both a centrifugal spinoff of power to the several provinces and an excessive centripetal flow of power to the federal government. The policy antinomies are self-evident. Centralized order is desirable, but it may stultify imaginative development at the provincial level. Local autonomy (*i.e.*, small) is beautiful, but it may result in an overall system that is complicated, costly, and even ineffective. The problem therefore is to achieve a workable balance between centralized order and local autonomy.

Table 6 sets out a broad spectrum of alternative models, ranging on the one hand from a centralized federal system, through several variations of both dual and integrated systems to, on the other hand, a totally decentralized system of discrete provincial laws. In retrospect, had the federal government been in a position seriously to discuss securities regulation in 1967 when the CANSEC proposal surfaced, models 4 to 10 probably would have been negotiable. In the light of the declared public hostility to a dual or two-tier system, however, only three of those models – models 4, 6 and 10 – now merit detailed discussion. Even they, however, are probably less acceptable than model 13. In sum, assuming the federal government decides to regulate the securities markets, only four obviously feasible alternatives can be distilled from among the many alternatives set out in table 6. The first is model 4, a highly centralized dual system that would relegate the application of provincial law to the relatively unimportant area of intraprovincial primary issues. The second is model 6, a decentralized unitary system that would give the federal Parliament broad policy powers but leave administration in the hands of the several provinces. The third is model 10, a dual system where both federal and provincial law would apply to each primary distribution other than an intraprovincial distribution. The fourth is model 13, an integrated system that would acknowledge the desirability of a comprehensive federal securities law but that would in effect give the provinces at least an equal voice in determining the policy content and directing administration of that law.

Although the bias of this paper is admittedly towards an integrated system, its purpose is not to recommend dogmatically – or even emphatically – any particular structural model but rather to analyze the functions that inhere in any securities market regulatory system and to demonstrate how these functions may be synthesized on the bases of different policy premises to establish a number of alternative structural models. Again I underline that an organization is only an instrument of purpose, a means to an end that may have an influence on purpose but that

	Primary market	Secondary market
6	Federal law applies to: federal issuers foreign issuers interprovincial issues Provincial law applies to: intraprovincial issues But all administration powers delegated to the several provinces	Federal law – all (except intraprovincial trades not made through an interprovincial system)
10	Federal law and provincial law (province of incorporation or head office) both apply to: federal issuers foreign issuers interprovincial issues Provincial law applies to: intraprovincial issues (even if federal and foreign corporations)	Federal law – all (except intraprovincial trades not made through an interprovincial system)
13	Joint federal-provincial commission that acknowledges federal jurisdiction over federal issuers, foreign issuers, and interprovincial trades	

should not become an end in itself and thus obscure the substantive policy goal which is to establish an effective regulatory system. Although necessarily more specific because conceived as a comprehensive, stand-alone system, the proposals should be drafted to accommodate virtually any of the structural models set out in table 6, which vary in accordance with the degree of federal participation in the regulatory system.

Chapter VII
Alternative Models - Securities Regulation

In the event the federal government concludes that regulation of the securities market is a high priority issue, if the provinces refuse or fail to negotiate to establish an integrated system within a reasonable time, the obvious federal strategy would be to enact a comprehensive federal law to implement model 4 set out in table 6.[203] That model, as already pointed out, would implement a dual system, but a highly centralized dual system that would leave within provincial jurisdiction only intraprovincial trades. And assuming establishment of a Canada-wide secondary trading network, jurisdiction over intraprovincial trades implies jurisdiction over essentially only intraprovincial primary issues, a locally significant but relatively small part of overall securities market activity. Most secondary trades would be made through the secondary trading network, and most of the intraprovincial secondary trades not made through that network would probably be isolated trades that are excluded from the regulatory system in any event.

Given the existing environment of federal-provincial relations, it is unlikely that any federal government will give such high priority to securities market regulation. Model 4, therefore, is not a probable strategy. But the mere possibility of its implementation confers on the federal government considerable bargaining power. The more probable strategies available to the federal government are reflected in model 6 and model 13.

To place these models in clearer perspective, table 7 recapitulates models 6, 10 and 13 as set out in table 6.

These three models have been selected to highlight the differences among unitary, dual, and integrated regulatory systems. In effect, model 6 would give the federal government an important voice in policy but leave administration to the provinces (unitary administrative system); model 10 would involve the federal gov-

203 This approach assumes broad, federal legislative power under the constitution to implement a comprehensive regulatory scheme; *see id.*

ernment in both policy and administration through a federal commission that coexists with the provincial commissions (dual system); and model 13 would give the federal government a voice in policy and administration through a joint federal-provincial commission (integrated system).

Table 8 compares graphically these three models, particularizing the functions of the regulatory bodies and assigning primary and secondary roles to those bodies in respect of each major function.

A true unitary system is one that would unite all policy and administration functions in one body, a virtual impossibility in the Canadian federal system where – even assuming very broad federal powers – each province continues to have jurisdiction over intraprovincial trades. Of all the unitary models set out in table 7, the only one that has any probability of adoption is model 6, and it is unitary only in the sense that all administration is vested in one level of government, that is, the provincial level. The several provincial commissions would continue to exist, exercising powers delegated to each commission by the respective provincial legislature and the federal parliament.

Model 6 has several distinct advantages: it gives the federal government considerable influence over Canada-wide securities market policies with a minimum of administrative overlap and, as a corollary, preserves much provincial autonomy; it obviates compliance with two levels of regulation; it makes maximum use of experienced personnel, and it is flexible in the sense that it enables decentralized decision making in a manner that is sensitive to local conditions. The signal disadvantages of such a system are that federal influence may prove to be rather tenuous, particularly where federal policy is not congruent with provincial policy or administrative practice; that there is no strong incentive to develop uniform statutes and procedures, and that centralized information processing is improbable. Although a possible model, for these reasons it is unlikely to obtain much support.

Model 10 has the advantage that it preserves both provincial and federal autonomy within their respective jurisdictions, but because it requires a separate federal commission inherent in it are two clear disadvantages. First, it institutionalizes a dual system and therefore creates few if any incentives to achieve uniformity of policies and administration. Second, and even more important, assuming a decentralized federal commission administered through regional offices, it does not make the most efficient use of experienced regulators. In effect, it would superimpose another level of regulation on the existing system, except to the extent duplication of work could be avoided through the use of common

disclosure standards and the use of techniques of notification and coordination to simplify the qualification of prospectuses. Judging from the almost unanimously hostile response to the partial two-level system proposed in part XV of the BUSINESS CORPORATION PROPOSALS, published by Consumer and Corporate Affairs Canada in 1971, model 10 is not likely to find favor with the federal government, any provincial government, the securities firms, or the professional advisers of those firms.

The third alternative is the integrated system referred to as model 13, which assumes broad, federal legislative power and delegation from the federal Parliament and the several provincial legislatures of comprehensive regulation-making (*i.e.*, legislative), adjudicative and administrative powers to a common regulatory commission. The choice between model 10 and model 13 poses – like most complicated issues – a policy dilemma. Model 10 would lead eventually to a clear demarcation between federal and provincial powers; but it is not likely to gain much support from any quarter. Model 13 would avoid creation of a two-tier, dual system; but it places the federal government in an awkward minority position from which it can extricate itself only with great difficulty, that is, by withdrawing from the integrated system and setting up an independent federal system. Such action would almost certainly result in a lengthy constitutional struggle to determine the respective legislative powers of the federal parliament and provincial legislatures and probably would not gain much public support. As a result, once it agrees to an integrated system the federal government will probably be, in the absence of any crisis, locked into that system.

Nevertheless model 13, a variation of the CANSEC proposal that assumes the existence of a comprehensive federal securities act, has a number of desirable characteristics: it permits some federal and provincial autonomy; it tends strongly to statutory and administrative uniformity; it necessarily leads to a common system of information processing; it renders the duplication of facilities unnecessary; it permits more efficient use of experienced personnel, and it permits flexible, decentralized administration at little added cost. It is the requirement of a comprehensive federal securities act that distinguishes model 13 from the CANSEC proposal. The CANSEC proposal is directed at *uniform administration* of a narrow, supplemental federal law and several discrete provincial laws, whereas model 13 is directed at *uniform administration* of a *uniform law* with a substratum of provincial laws that preserves provincial autonomy with respect to intraprovincial transactions.

Table 9
Comparison of Models for a Regulatory System

Characteristics	Model 6	
	Advantages	Disadvantages
Federal autonomy	Yes but constrained	No administrative control except to withhold resources
Provincial autonomy	Yes but constrained	Federal superimposed at least in part *re* disclosure
Political accountability	Yes	Responsibility diffused therefore accountability is attenuated
Uniform laws and procedures	No	Tends to a dual system
Obviates duplication of regulation	Yes	Tenuous federal control
Makes use of experienced regulators	Yes	Ontario and Quebec dominate
Makes possible central information processing and overall systems analysis	No	Requires coordination of discrete provincial files
Flexible – decentralized decision making and responsive to local conditions	Yes	Lack of uniformity of standards and procedures
Flexible – efficient use of personnel, finances, capital assets	Yes	Ontario and Quebec dominate

Model 10		Model 13	
Advantages	Disadvantages	Advantages	Disadvantages
Yes	Dual system	Yes but constrained	Minority position
Yes	Dual system	Yes but constrained	Threat of federal withdrawal
Yes	Dual system	No	Responsibility completely diffused
No	Dual system	No but tends to uniformity	Less local experi-mentation
No	Dual system	Yes	Complicated system to approve change
Yes at pro-vincial level	No, particularly at regional offices	Yes	
Yes	Yes, except intra-provincial operations	Yes	
No	Dual system of regional offices	Yes	
No	Almost certain duplication	Yes	

The respective advantages and disadvantages of models 6, 10 and 13 are summarized in table 9.

Table 9 indicates that the integrated system reflected by model 13 is, at least in theory, clearly the most advantageous. Assuming that both the federal and provincial governments are willing to negotiate the implementation of an integrated system, they are likely to gain considerable support from the securities industry and the professional bodies that have all been critical in the past of any dual system such as the system that prevails in the United States. Aside from the one clearly negative factor - the diffusion of political responsibility - the integrated system is the easiest case to justify on political, economic and administrative grounds. And as already pointed out, should the diffusion of political responsibility tend to bureaucratize the system excessively in the sense of rendering it unresponsive to political direction, all participating governments probably will be strongly motivated to amend the structure of the system to remedy the problem.

Model 13 does not define a specific model but only connotes a conceptual approach to developing a Canada-wide regulatory system. Aside from the specific problem of political decision-making power, there exists a broad scope of integration models, any one of which is feasible, depending upon the federal-provincial political environment, the specific policy conflicts among the experts involved, and the demonstrable need for a broader-based regulatory system. The three basic types of integrated system - decentralized, median, and centralized - can be recapitulated briefly.

The CANSEC proposal is probably at the one pole as a decentralized type of integrated system, for it relegates federal law to a minor, complementary role, renders participation in the integrated system optional and presupposes the existence of a discrete - and possibly non-uniform - securities law in each province. At the opposite pole is the centralized type of integrated system proposed by the Australian federal government in 1977. It is based on a comprehensive federal law that is in turn adopted by each state,[204] subject to the right of any state to enact a non-uniform provision if the council of ministers recommends that the federal Parliament enact that provision by way of amendment of the uniform federal law, and if the federal Parliament fails to make the recommended amendment within six months of receiving the

204 The Australian model presupposes that the federal law will be based on existing uniform state laws, but the scheme has bogged down because of disagreements among the states about specific, non-uniform provisions in the existing state laws; *see* Short, *supra* note 166. The Australian proposal is an analogue of s. 94 of the BNA Act, which was intended to lead to uniformity of laws among the common law provinces.

recommendation from the council of ministers. This structure clearly renders enactment of any non-uniform provision very unlikely, for it would appear to require intentionally obstructive conduct on the part of the federal government.

In between these two poles – but admittedly much closer to the Australian proposal – is the integrated model recommended by this paper. First, the federal Parliament enacts a comprehensive federal securities act that applies to all primary market and all secondary market transactions other than intraprovincial transactions and that establishes an integrated federal-provincial commission. Second, the federal and provincial governments delegate to the integrated commission authority to exercise the broad policy-making, adjudicative and administrative powers under their respective securities acts. And finally, the federal government and the provinces bind themselves by a multilateral agreement to an express decision-making structure that predetermines how basic policy-making – that is, political – power is to be exercised in the system.

To ensure that the integrated system can be adequately tested, the multilateral agreement should require that each party is bound for a minimum period, say five years. The only mechanism to resolve policy disputes during that term would be the exercise of voting powers pursuant to the agreement. At the end of the term of the agreement any party would be entitled to withdraw from the system and to force determination of any outstanding constitutional issues, which inevitably means determination of whether federal legislative power encompasses foreign issuers and interprovincial transactions as well as federal issuers.

To discuss in detail all the elements of an integrated system is not only beyond the scope but unnecessary for the purposes of this paper. Virtually all the issues have been raised in the CANSEC proposal. All inhere in the constitution of any federal organization and can only be determined by extensive negotiations. What this paper is concerned with is the conceptual foundation of an integrated securities regulation system, its general structure, and the decision-making powers of the parties to it.

A conclusion arrived at with respect to any of these three issues is necessarily based as much on political intuition as analysis since each issue is heavily charged with value judgments – albeit largely tacit – as to the advantages of a federal system, the need for centralized policy-making, the feasibility of local administration, and the desirability of assigning broad policy-making functions to a regulatory commission, which always connotes detracting from direct ministerial responsibility.

In any event, in addition to these value judgments, the forego-

ing analysis inclines me strongly to recommend an integrated regulatory system that is based on comprehensive - and preferably uniform - securities laws at both the federal and provincial levels. Assuming substantial uniformity or, in other words, assuming no fundamental policy conflicts are reflected in the several securities laws, the constitutional disabilities of any one jurisdiction become largely theoretical, for when in doubt in any specific case the commission or administrator will rely on powers under both the federal and the applicable provincial law. The one other feature of an integrated system that has been widely perceived as disadvantageous is the diffusion of power - and responsibility - among a council of ministers, a commission and administrative officers in a manner that could in effect insulate any minister from being held accountable in Parliament or in any legislature. That, admittedly, is a risk. But in reality the risk is probably not great. The perception is largely predicated on an anachronistic concept of direct ministerial responsibility. In an era of detailed regulation a minister rarely if ever attempts to deal with individual cases. His responsibility is to adjudge the fairness and the administrative effectiveness of the overall regulatory system. If as a member of a council of ministers he concludes the system is not working well, he has a responsibility to change it or recommend withdrawal from it. It is in this sense that he is accountable to Parliament or to a legislature.

The general structure of an integrated securities regulation system in a federal context is, if not self-evident, at least largely predetermined by the imperatives of balanced representation in the internal decision-making process and balanced delivery of services to the public at the national, regional and local levels. Accordingly, a council of ministers - whether constituted formally or informally - with general powers of policy oversight, appointment and budget control, as recommended in both the CANSEC and Australian proposals, is clearly essential. In the Canadian political context a regulatory commission, as already demonstrated, is the obvious mechanism to coordinate administration of both federal and provincial securities acts. And experience at the provincial level in Canada has demonstrated the value of assigning all routine administrative functions to one executive officer (usually designated the director), so that the commission decides most specific cases[205] only on an exceptions basis, that is, an appeal from a decision of the director. This basic structure of an integrated

205 The commission may reserve certain strategic decisions such as certain investigation orders, freeze orders, or stop-trading orders for collegiate decision.

system is probably largely unexceptionable.[206] If so, then specific issues such as the number and location of commissioners, the location of the central, regional and local offices, the number and location of administrators, and the distribution of functions among administrators – even if controversial – are negotiable details.

The thorniest problem to be resolved in establishing an integrated securities regulation system – as in the constitution of any political organization – is the distribution of decision-making power at the top policy level.[207]

Under the CANSEC proposal the federal government would exercise 33% of the votes and each province would exercise the number of votes determined as the ratio of its total collections of personal and corporate income taxes to the aggregate collections by all provinces of personal and corporate income taxes. Applying that formula at that time, Ontario would exercise approximately 29% of the votes, Quebec 17%, British Columbia 7%, and the other provinces the remaining 14%. A decision of the council of ministers would require not only a two-thirds majority vote but also the approval of a majority of the participating governments, an added constraint that would preclude the federal government and the large provinces from dominating the system without taking into account the minority interests.[208]

The Australian proposal was similar. Although not very explicit, apparently any change of the federal, uniform law would require the approval – through the council of ministers – of the federal government and at least four of the six states.[209] Where, however, the council of ministers approves a proposed amendment to the federal law, if the federal parliament fails to enact the amendment within six months after the date of approval by the council of ministers, each state would be free to enact the proposed amendment as a non-uniform provision in the state law. The signal difference between the CANSEC and the Australian proposals is

206 As pointed out in note 114 *supra* B.C. has a unique model in the sense that the appellate body is structured to be more remote from the administrator, with the advantage of rendering any administrative bias less likely but with the disadvantage of insulating the appellate body from continuous exposure to administrative problems. Bias is a rare problem that is always subject to judicial review.
On this point *see* Cary, *supra* note 125.

207 The commission too may have some special rules distinguishing between decisions made at the national, region and local level, but the discussion here relates only to the organ having overall policy and administration powers, *i.e.* the council of ministers.

208 *See* text accompanying note 194 *supra*.

209 *See* the speech of the Honourable John Howard, then the federal Minister of Business and Consumer Affairs (August 12, 1976); and *see* text accompanying notes 166, 204 *supra*.

that under the latter the federal government would appear to have an implied veto power, whereas under the CANSEC proposal the federal government would be merely one more voting member, albeit a member with considerable voting strength.

A further variation for confining decision-making power in a federal system that is of particular interest in Canada is the proposed formula to amend the Canadian constitution that was set out in the Victoria Charter of 1971.[210] To preclude domination by the federal government and any specific group of provinces, any proposed amendment would require the approval of the federal Parliament and a majority of the provincial legislatures, which majority must include a province that has or ever had at any time 25% of the population of Canada, at least two Atlantic provinces, and at least two western provinces that together represent at least 50% of all the inhabitants of those provinces. This proposal, although it achieves some balance among the regions of Canada, is in effect quite rigid, for it impliedly confers a veto power on the federal government, on the two largest provinces and on a combination of other provinces. It is therefore even more rigid than the Australian proposal.

Given the history of the development of corporation law and securities regulation in Canada, which has been to treat the federal level as just one more jurisdiction, the CANSEC voting formula - or some variation of that formula - is probably more acceptable. The best way to illustrate that formula (Federal 33%; Ontario 29%; Québec 17%; British Columbia 7%; Other Provinces 14%) is to apply it to a hypothetical case. Assume, for example, a conflict over access of foreign-owned securities firms to the Canadian market. The federal government plus Ontario plus one other province could exercise the required votes to achieve a two-thirds majority, but in addition the vote would have to be supported by a majority of the participating governments. A similar result could be achieved by distributing the voting rights as follows: federal government, Québec and Ontario each 12%; each other province 8%. Assuming only a majority is required to effect a decision, this model diffuses power further than does the CANSEC proposal, enabling seven of the smaller provinces to outvote the federal government, Québec and Ontario combined. If unacceptable to the federal government and the large provinces it too could be modifed to require the approval of at least one or even two of those three jurisdictions. Although necessarily the most difficult problem in any federal system, in the relatively narrow context of

210 This issue is discussed in P. HOGG, *supra* note 149, at 21.

securities market regulation, determination of a workable voting formula should not be an insurmountable problem.

In sum, for historical, political and logical reasons the seemingly obvious securities regulation system in the context of Canadian federalism is an integrated system that operates through a formal or informal council of ministers and a regulatory commission and that assigns decision-making power in accordance with some variation of the CANSEC voting formula.

Chapter VIII
Conclusions

Although there has been much criticism in recent years of the effectiveness of the securities market as a financial intermediary, there is nevertheless a broad consensus that the securities market is an essential institution in a market economy to allocate capital, to direct savings to productive enterprise, to induce investors to invest in equity securities, and to ensure greater Canadian ownership of Canadian enterprise. But recent developments in the securities markets, particularly the growth of intermediaries such as pension funds, insurance companies and mutual funds and the rapid development of computer-communications technology, have compelled a reexamination not only of regulatory techniques but also of the basic assumptions that underlie securities regulation to determine whether the securities market should continue to be regulated as a quasi-cartel, as an outright cartel, or as an essentially competitive market subject only to close public controls over the computer-communications system as a public utility.

Irrespective of the nature of the regulatory goals, there will continue to be available three basic means to regulate markets. The first is to balance power among potential competitors – for example, among banks, underwriters and brokers – to maximize interindustry competition under the aegis of the competition laws. The second is to institutionalize responsibility in market actors, for example, by establishing public councils to advise government, adding public members to stock exchange boards, and imposing personal liability on the principals of securities firms and on individuals connected with a securities issue. The third – and still by far the most important – is to regulate through an external regulatory commission that acts under relatively broad public interest standards, exercising legislative, administrative, adjudicative and investigative powers over the main levers of market control – entry, conduct and prices – to control the behaviour of actors in the market.

Although the regulatory commission concept has recently

come under heavy fire – particularly in respect of the regulation of infrastructure utilities – as being too independent of the political process, too arbitrary, too much under the influence of the regulated industry, and even as being ineffective, the regulatory commission for several reasons offers advantages that more than outweigh its disadvantages. For example, it permits expert policy development and expert administration within a context of broad statutory standards, relative independence from the immediate pressures of partisan politics, freedom from many of the bureaucratic constraints imposed on government departments, and, above all, a very flexible means to coordinate interdepartmental and even intergovernmental programs. Before acceding to criticisms of the regulatory commission, it is therefore essential that the means and ends of each regulatory scheme be closely scrutinized to determine whether the criticisms have any bearing on that scheme.

Indeed, because of the Canadian constitutional law relating to the delegation of powers from the federal and provincial legislatures to a regulatory commission, a commission is an ideal vehicle to coordinate the exercise of federal and provincial powers that relate to a common program objective such as securities market regulation. The present law permits the use of three coordinating techniques: (1) the federal government may delegate authority to administer a federal law to provincial commissions; (2) the federal government may set up a federal commission and invoke statutory coordinating mechanisms to minimize the overlap of functions carried out by discrete federal and provincial commissions; or (3) the federal and provincial governments may agree to set up a joint federal-provincial commission to which legislatures at both levels delegate quite broad regulatory authority.

Although not free from political and technical difficulties, particularly the reluctance of the provinces to acknowledge even tacitly that the federal Parliament has any jurisdiction over interprovincial securities transactions, the third alternative – an integrated federal-provincial commission – is clearly preferable. It tends strongly to the development of uniform laws and procedures without requiring any legislature expressly to yield jurisdiction. It permits continued use of the most experienced securities administrators in a context that allows consideration of local as well as national conditions. And above all, it furnishes a mechanism that can be adapted to the probable future regulatory environment, which will focus less on detailed market structures and functions and more on the overall design and regulation of a Canada-wide securities transactions system based on computer-communications technology.

But to consider only the conceptual and technical advantages of an integrated securities regulation system in Canada is to ignore what is probably the most important consequence of implementing such a system. In a decentralized federal structure like that of Canada, an integrated system – like the banking system – fulfils a vital secondary function of linking the diverse geographic and economic components of the federal system. It is part of the warp on which the pattern of the federal system is woven, usually inconspicuous but continuously functioning to bind together the federal state.

List of Contributors

Philip Anisman, B.A., LL.B. (Toronto), LL.M., J.S.D. (California, Berkeley), is a professor of law at Osgoode Hall Law School, York University, and from 1973 to 1978 was the Director of the Corporate Research Branch in Consumer and Corporate Affairs Canada, Ottawa. He is the author of two books, *Takeover Bid Legislation in Canada: A Comparative Analysis* (1974) and *A Catalogue of Discretionary Powers in the Revised Statutes of Canada 1970* (1975), and of articles on corporate and securities law.

James C. Baillie, Q.C., B.A., LL.B. (Toronto), LL.M. (Harvard), is currently the chairman of the Ontario Securities Commission. He was the director of the study conducted by the Canadian Committee on Mutual Funds and Investment Contracts whose report was published in 1969 and is a coauthor of the *Proposals for a Mutual Fund Law for Canada* (1974) and the author of a number of articles on securities regulation. At the time of completion of the paper in this volume he was engaged in the practice of law in Toronto.

Hugh J. Cleland, B.A. (Harvard), has been a consultant to a number of institutions in the securities industry and since December 1977 has been the Vice-President, Policy Development and External Relations, of the Toronto Stock Exchange.

Mark Q. Connelly, B.A. (Toronto), J.D. (Columbia), is an associate professor of law at Osgoode Hall Law School, York University. He is the author of a number of articles on securities and business law.

Peter Dey, B.Sc. (Queen's), LL.B. (Dalhousie), LL.M. (Harvard), is engaged in the practice of law in Toronto. He was the research director of the Committee of the Ontario Securities Commission on the Problems of Disclosure Raised for Investors by Business Combinations and Private Placements which published its report in 1970 and is the author of several articles on securities regulation.

Byran Gibson, B.A. (Toronto), LL.B. (British Columbia), LL.M. (Yale), is engaged in the practice of law in Vancouver. He is a former assistant professor of law in the Faculty of Law, University of British Columbia, and the author of articles on corporate-securities law.

Warren M. H. Grover, Q.C., B.A.Sc., LL.B. (Toronto), LL.M. (California, Berkeley), is engaged in the practice of law in Toronto. He has been a professor of law at Osgoode Hall Law School, York University and counsel to the Foreign Investment Review Agency. He is a coauthor of the *Proposals for a Mutual Fund Law for Canada* (1974) and the author of a number of articles on corporate and commercial law.

Dleap S. Hall, B.A. (British Columbia), is a member of the staff of the Corporate Research Branch, Consumer and Corporate Affairs Canada, and was formerly director of research of the Montreal Stock Exchange.

Sholto Hebenton, B.A. (British Columbia), B.A., B.C.L. (Oxon.), LL.M. (Harvard), was a visiting professor of law at Osgoode Hall Law School, York University, and the Faculty of Law, University of Toronto, in 1973–74 and is currently engaged in the practice of law in Vancouver. He is the author of articles on international law and the conflict of laws.

Peter W. Hogg, LL.B. (New Zealand), LL.M. (Harvard), Ph.D. (Monash), is a professor of law at Osgoode Hall Law School, York University. He is the author of two books, *Liability of the Crown* (1970) and *Constitutional Law of Canada* (1977), and of numerous articles.

John Honsberger, Q.C., B.A. (Toronto), is engaged in the practice of law in Toronto. He is a sessional lecturer at Osgoode Hall Law

School, York University, and a member of the American National Bankruptcy Conference. He is a coauthor of books on *Bankruptcy in Canada* and the *Canadian Law of Real Property*, the author of numerous articles, and was a member of the Study Committee on Bankruptcy and Insolvency Legislation which published its *Report: Bankruptcy and Insolvency* in 1970.

John L. Howard, Q.C., B.Comm., LL.B. (British Columbia), LL.M. (Harvard), is currently the Assistant Deputy Minister for Corporate Affairs in Consumer and Corporate Affairs Canada, Ottawa. He is a coauthor of the *Proposals for a New Business Corporations Law for Canada* (1971) and the author of several articles on corporation law.

Frank Iacobucci, B.Comm., LL.B. (British Columbia), LL.B., Dipl. Int. Law (Cantab.), is a professor of law in the Faculty of Law, University of Toronto. He is a coauthor of a recent book on *Canadian Business Corporations* and the author of a number of articles on corporation law.

Michael A. Jenkins, B.Sc. (Hons.) (Queen's), M.S., Ph.D. (Stanford), is an associate professor in and head of the Department of Computing and Information Science, Queen's University. He is the author of a number of articles on computer science.

Leonard H. Leigh, B.A., LL.B. (Alberta), Ph.D. (London), is a lecturer in the Department of Law, London School of Economics and Political Science. He is the author of books on *The Criminal Liability of Corporations in English Law* (1969) and *Police Powers in England and Wales* (1976) and is the coauthor of *An Introduction to Company Law* (1971). He has also published articles on corporate, criminal and constitutional law.

Stanley Makuch, B.A. (Toronto), M.A. (Carleton), LL.B. (Osgoode), LL.M. (Harvard), is an associate professor of law in the Faculty of Law, University of Toronto. He is the author of articles on self-regulation, administrative tribunals, municipal law and urban planning.

J. Peter Williamson, B.A. (Toronto), LL.B., M.B.A., D.B.A. (Harvard), is a professor of business administration at the Amos Tuck School of Business Administration, Dartmouth College. He was the director of the Federal Securities Task Force in 1966–67 and is the author of numerous books and articles including *Securities*

Regulation in Canada (1960, Supplement 1966), *Taxation of United States Private Investment In Canada* (1963) and *Funds for the Future: Report of the Twentieth Century Fund Task Force on College and University Endowment Policy* (1975).

Marvin Yontef, LL.B. (Osgoode), LL.M. (Harvard), is engaged in the practice of law in Toronto and has written on securities regulation.
