## Canadian Technical Report of Fisheries and Aquatic Sciences

Technical reports contain scientific and technical information that contributes to existing knowledge but which is not normally appropriate for primary literature. Technical reports are directed primarily toward a worldwide audience and have an international distribution. No restriction is placed on subject matter and the series reflects the broad interests and policies of Fisheries and Oceans Canada, namely, fisheries and aquatic sciences.

Technical reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in the data base Aquatic Sciences and Fisheries Abstracts.

Technical reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page.

Numbers 1-456 in this series were issued as Technical Reports of the Fisheries Research Board of Canada. Numbers 457-714 were issued as Department of the Environment, Fisheries and Marine Service, Research and Development Directorate Technical Reports. Numbers 715-924 were issued as Department of Fisheries and Environment, Fisheries and Marine Service Technical Reports. The current series name was changed with report number 925.

## Rapport technique canadien des sciences halieutiques et aquatiques

Les rapports techniques contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais qui ne sont pas normalement appropriés pour la publication dans un journal scientifique. Les rapports techniques sont destinés essentiellement à un public international et ils sont distribués à cet échelon. II n'y a aucune restriction quant au sujet; de fait, la série reflète la vaste gamme des intérêts et des politiques de Pêches et Océans Canada, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports techniques peuvent être cités comme des publications à part entière. Le titre exact figure au-dessus du résumé de chaque rapport. Les rapports techniques sont résumés dans la base de données Résumés des sciences aquatiques et halieutiques.

Les rapports techniques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre.

Les numéros 1 à 456 de cette série ont été publiés à titre de Rapports techniques de l'Office des recherches sur les pêcheries du Canada. Les numéros 457 à 714 sont parus à titre de Rapports techniques de la Direction générale de la recherche et du développement, Service des pêches et de la mer, ministère de l'Environnement. Les numéros 715 à 924 ont été publiés à titre de Rapports techniques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 925.

#### Abstract

Lacko, L.C., Acheson, S.M. and Connors, B.M. 2021. Summary of the annual 2020 sablefish (Anoplopoma fimbria) trap survey, October 7 - November 21, 2020. Can. Tech. Rep. Fish. Aquat. Sci. 3431: vi +50 p.

This document describes sampling activities and summarizes results from the 2020 British Columbia Sablefish research and assessment survey. The survey was comprised of stratified random sets (StRS) at five depth-stratified areas. A portion of the survey (traditional inlet sets) was removed to shorten the survey in response to the COVID-19 pandemic. Biological sampling for sablefish included collection of length, weight, sex, maturity and age structures. Sablefish were randomly sampled from every third trap on all sets, up to a maximum sample size of 60 sablefish. The tag and release study conducted annually since 1991 was continued in 2020. Sablefish were selected randomly for tag and release from every third trap up to a maximum of 125 fish.

A total of 48,092 sablefish were caught in 2020 , of which 3,691 were used for biological samples and 8,200 were tagged and released. Catch per unit effort (CPUE) is an important product from this survey as it is used to infer population trends. In most recent years, survey data from stratified random sets showed increasing trends in CPUE in both mean weight and numbers of fish per trap. At the 2020 StRS sites, the stratified mean survey abundance was $35 \mathrm{~kg} / \mathrm{trap}$, down $-17 \%$ from 2019 and $-13 \%$ from the 2018-2019 average.

## RÉSUMÉ

Lacko, L.C., Acheson, S.M. and Connors, B.M. 2021. Summary of the annual 2020 sablefish (Anoplopoma fimbria) trap survey, October 7 - November 21, 2020. Can. Tech. Rep. Fish. Aquat. Sci. 3431: vi +50 p .

Le présent document décrit les activités d'échantillonnage réalisées dans le cadre du relevé d'évaluation et de recherche sur la morue charbonnière mené en Colombie-Britannique, et résume les résultats connexes. Ce relevé comprenait des traits ayant fait l'objet d'un échantillonnage aléatoire stratifié qui ont été effectués dans cinq zones stratifiées en fonction de la profondeur. On a éliminé une partie du relevé (traits habituels réalisés dans des bras de mer) pour raccourcir ce dernier en raison de la pandémie de COVID-19. L'échantillonnage biologique de la morue charbonnière comprend la collecte de données sur la longueur, le poids, le sexe, la maturité et les structures selon l'âge. On a échantillonné les morues charbonnières capturées de façon aléatoire à partir du troisième casier de chaque trait, jusqu'à l'atteinte d'une taille d'échantillon maximale de 60 individus. L'étude de marquage et de remise à l'eau menée annuellement depuis 1991 s'est poursuivie en 2020. Dans le cadre de celle-ci, les morues charbonnières ont été choisies de façon aléatoire à partir du troisième casier de chaque trait, jusqu'à l'atteinte d'une quantité maximale de 125 individus.

Au total, 48092 morues charbonnières ont été capturées en 2020. Parmi celles-ci, 3691 ont été utilisées pour le prélèvement d'échantillons biologiques et 8200 ont été marquées, puis remises à l'eau. Les captures par unité d'effort (CPUE) représentent des résultats importants du relevé parce qu'on les utilise pour inférer les tendances des populations. Au cours des dernières années, les données de relevé provenant des traits ayant fait l'objet d'un échantillonnage aléatoire stratifié ont montré des tendances à la hausse des CPUE, à la fois pour le poids moyen des prises et le nombre d'individus par casier. Aux sites où ces traits ont été effectués en 2020, l'abondance moyenne stratifiée du relevé était de $35 \mathrm{~kg} / \mathrm{casier}$, soit une diminution de $17 \% \mathrm{par}$ rapport à 2019 et de 13\% par rapport à la moyenne de 2018-2019.

## 1 Introduction

Sablefish (Anoplopoma fimbria) are a commercially valuable species that are harvested in British Columbia (BC) using trap, longline and trawl gear as part of the integrated management plan for the groundfish fishery. For the past ten years (2011 to 2020), BC fishermen have landed an average of 2,120 metric tons of sablefish annually. The majority of sablefish in 2020 were captured by longline trap gear (56\%) and longline hook gear (38\%). Commercial harvest of sablefish typically occurs at depths up to 985 fathoms, along the steep-walled slopes off the west coast of Haida Gwaii (formerly Queen Charlotte Islands), in the complex troughs of Queen Charlotte Sound, and in the steep canyons and ridges off the west coast of Vancouver Island.

Fishery-independent research and assessment surveys for sablefish have been conducted in BC coastal waters since 1988. Survey procedures have evolved over time, but each year they have consisted of fishing sets using trap gear at randomly selected and/or index sites. These surveys are used to obtain catch rate data, gather biological samples, capture oceanographic measurements and collect tag release and recapture data. This information is used as the key contemporary index of abundance for assessing the biological status of the sablefish stock, and to condition an operating model that serves as the biological basis of the coastal Management Strategy Evaluation (DFO 2020).

The design of the sablefish survey has remained consistent since 2011, and has been comprised of stratified random sampling (StRS) for sites along BC's continental shelf and the continuation of sampling at standardized index sites at four mainland inlets. Due to the COVID-19 pandemic, the 2020 survey was shortened and the inlet sites were not surveyed. In addition, a single science crew were contracted from Archipelago Marine Research (AMR) for the duration of the trip. For details about past survey designs, see the historic overview provided by Wyeth and Kronlund (2003) and Wyeth et al. (2004a). For details on specific surveys conducted from 1988 through 1993 see Smith et al. (1996); for surveys in 1994 and 1995 see Downes et al. (1997); for surveys from 1996 to 2000 see Wyeth and Kronlund (2003). For the 2001 through 2006 surveys see Wyeth and Kronlund (2003), Wyeth et al. (2004b), Wyeth et al. (2004a) and Wyeth et al. (2006), respectively. Surveys in 2018 and 2019 are found in Lacko et al. (2020).

This technical report describes survey operations and summarizes data collected on the 2020 chartered survey aboard the F/V Pacific Viking. Tables and figures referred to in the main text are numbered sequentially. Tables and figures in the appendices are labelled with a letter code.

## 2 Methods

### 2.1 SURVEY DESIGN

Methodology for the 2020 sablefish research and assessment surveys employed a stratified random sampling (StRS) design. The survey protocol required the StRS component to be completed from the southern end of Vancouver Island to the north coast of Haida Gwaii. The survey design was modified in 2020 in response to the COVID-19 pandemic. The length of the trip was reduced by removing the traditional inlet component of the survey.

### 2.1.1 STRATIFIED RANDOM SAMPLING SURVEY DESIGN COMPONENT

Since 2011, the StRS design has been conducted in all offshore survey areas. The StRS design began in 2003 with the purpose of distributing tag releases at random, collecting biological samples and developing a catch-rate based index of abundance (Wyeth and Kronlund 2003). It also provided an alternative design to the historic traditional offshore component of the survey (1990 to 2010) which occured at fixed locations.

Under the StRS design the offshore survey area is partitioned into five spatial strata ( $\mathrm{S}_{1}$ to $\left.S_{5}\right)$ and three depth strata $\left(R D_{1}\right.$ to $\left.R D_{3}\right)$ for a total of 15 (Figure 1). The five spatial strata are $\mathrm{S}_{1}$ (South West Coast Vancouver Island or SWCVI), $\mathrm{S}_{2}$ (North West Coast Vancouver Island or NWCVI), $\mathrm{S}_{3}$ (Queen Charlotte Sound or QCS), $\mathrm{S}_{4}$ (South West Coast of Haida Gwaii or SWCHG), and $\mathrm{S}_{5}$ (North West Coast of Haida Gwaii or NWCHG). The three targeted depth ranges are 100-250 fathoms $\left(R_{1}\right), 250-450$ fathoms $\left(R D D_{2}\right)$, and 450-750 fathoms $\left(R_{3}\right)$. The area within each of the 15 strata are sectioned into $2 \mathrm{~km} \times 2 \mathrm{~km}$ grid cells or 'fishing blocks' from which set locations are randomly chosen.

From 2003 through 2005, five grid cells were randomly selected in each spatial-depth stratum. From 2006 through 2010, the number was increased to six. An analysis was completed for the 2011 survey to optimize the allocation of the blocks to strata for the 2011 and 2012 survey. However, in order to lower survey costs, the number of blocks were further reduced for the 2013 survey, from a total of 110 to 91 offshore blocks while maintaining the same relative allocation of blocks to strata. This total number of blocks has been in place on all subsequent surveys (Table 1), including 2020 (Figure 2).

### 2.2 VESSELS

The 2020 survey of 87 sets was chartered aboard the 25.34 meter F/V Pacific Viking (Figure 3), skippered by Albert (Deacon) Melnychuk between Oct 7 - Nov 21, 2020 (Appendix A). Information about the vessel can be found at http://marinetraffic.com.

### 2.3 FISHING GEAR

The longline trap gear consisted of a groundline resting on the ocean floor with 25 baited traps attached to beckets at 150 foot intervals along its length and 90 pound anchors at each end (Figure 4, b). A flagpole was required for at least one end of the set to improve visibility for retrieval. The traps were steel frame with a bottom hoop diameter of 54 inches and covered with an North American \#84 black braided nylon web of 2.75 inch mesh (Figure 4, a). The tunnels were made of green braided, knotless, 1.25 inch mesh. The traps did not include escape rings, however included a 'rot panel' of \# 21 cotton located above the middle ring.

Standard bait bags (6 by 12 inches) made of $1 / 8$ inch web with a nylon drawstring and \#7 stainless trolling snaps were included with the traps.

### 2.4 FISHING OPERATIONS

During normal survey fishing operations gear was deployed on alternate days. Prior to deployment, the Fishing Master inspected the block to determine fishability and if it was within the targeted depth range. The goal was to have as much gear as possible within the block boundaries. If unfishable, the survey protocol requires that an alternate block is to be chosen to the east, west, north, and south, respectively. If none of those blocks meet the criteria, an alternate block of the same area and depth strata was randomly chosen. In 2020, the choice of alternate blocks were limited to a pre-selected list prepared by DFO in advance of the survey. Additionally, the crew size was reduced to three and all data collected during fishing operations were recorded on paper forms, rather than electronically.

Two science staff recorded information associated with the deployment of the gear. One science member was positioned in the wheelhouse and recorded set details on the bridge log data form. The start and end geo-referenced positions of each set were entered at the time when the first and last traps were set over the stern. Depths were recorded at one-minute intervals between the first and last anchors being set. Later, the duration of the set was calculated as the time elapsed between the first anchor being set over the stern and the first anchor hauled aboard (Appendix B, Figure B.1).

A set log was filled out on the deck by the science recorder who had maximum visibility of the crew setting the traps over the stern rail. The set log included the time and identity of the first and last buoys, anchor time, a tally of beckets and traps, as well as the unique identifying numbers of sensors deployed (Appendix B, Figure B.2)

### 2.4.1 Stratified Random Component (StRS)

Sets in StRS blocks had a targeted soak time of 24 hours. Fishing sets were designated useable if hauled between 22 and 26 hours. Traps were baited with 10 pounds of loose offshore Pacific Hake (Merluccius productus) and 2 pounds of bagged squid.

### 2.5 CATCH PROCESSING

Haulback speed allowed the science crew to accurately record catch. One science and one crew member were positioned on deck at the haul card station; the science staff recorded the catch and the crew member managed the movement of baskets. As the groundline was hauled, each becket and trap were entered in the charter catch log form (Appendix B, Figure B.3). Crew members alerted the recorder about any damage to a trap (i.e. holes) which was then recorded.

Catch by species from each trap was sorted into baskets by the crew. Baskets were then weighed to the nearest 0.2 kg on a motion compensating scale and given a basket use code of D, A, T, L, SD or F. Code D designated fish species as discards or commercial catch; code A allocated sablefish for age samples; code T allocated sablefish to be tagged and released; code L allocated fish for length samples; code SD identified sublegal sablefish discards; code F represented fish frames with amphipod or hagfish damage (Appendix B, Figure B.3). The next day, the entries on charter catch log form were transposed to tabular format on the charter catch log entry form (Appendix B, Figure B.4).

### 2.5.1 Sablefish Allocation Details

Prior to 2018, sablefish were tagged from $1 / 3$ of the traps on StRS sets and $1 / 2$ of the traps on the inlet sets. Due to high catch numbers, the survey protocol was revised in 2018 to designate $\sim 125$ sablefish to be tagged $(T)$ from $1 / 3$ of the traps on all sets. When catches were high, traps targeted for tagging were spread throughout the string to avoid tagging the first 125 fish. A biological sample was collected from the coded "A" traps with the goal of selecting 50 to 60 fish. If CPUE was high, the new survey protocol of 2018 designated a minimal of two traps to be used for samples. If both traps contained more than 60 sablefish, a random process was used to select $\sim 60$ specimens.

The remaining traps were allocated to the discard category and sorted by size into either legal (D) or sublegal (SD) discards. The SD (sublegal discards) code was added during the 2017 survey to account for the large numbers of juvenile sablefish and facilitate their quick return to the ocean. Legal discards (D) of sablefish were kept by the vessel and processed as commercial catch.

### 2.6 BIOLOGICAL SAMPLING (LWSMO)

Biological samples were collected from sablefish and rougheye/blackspotted rockfish (Sebastes aleutianus/Sebastes melanostictus) specimens. Measurements were recorded for fork length (L), body weight (W), sex (S) and maturity level (M) (Appendix B, Figure B.5). Sagittal otoliths (O) were collected and stored for potential ageing by the sclerochronology laboratory. In addition, tissue for DNA was collected from the rougheye/blackspotted rockfish complex for later species determination. Since this complex of two distinct species (Orr and Wildes 2008) have similar appearances with slight variations in colour markings and dorsal fin lengths, the sampler visually identifed each specimen as either a rougheye, a blackspotted or a hybrid species. All rockfish
and legal-sized sablefish (fork length > 55 cm ) that were sacrificed for biological samples were dressed, frozen, and landed as commercial catch.

### 2.7 SABLEFISH TAGGING

Fish destined to be tagged were transferred from the sorting area to a tagging tank. A vessel crew member was positioned to retrieve sablefish from the tank and provide assistance with fish handling. A scientist stood at the sample station and tagged fish with a Mark II Long Tagging gun loaded with Floy FD-94 T-bar anchor tags. The tag was inserted on the left side of the fish, 1 cm below and $2-3 \mathrm{~cm}$ behind the anterior insertion of the first dorsal fin. Fork length (mm) measurements were taken. Before release, any sampling errors, injuries or damage to the fish were recorded on the tagging form by a second scientist. Tag checks were performed systematically to ensure tag numbers on the data form matched those on the fish specimen (Appendix B, Figure B.6).

### 2.8 SABLEFISH TAG RECOVERY

Any previously tagged fish brought aboard may have been treated in one of two ways. First, sablefish with Canadian tags were re-released with a new tag and the previous tag was removed. In addition, any wounds from the old tag were recorded. Second, sablefish with a foreign agency tag or sablefish that had sustained numerous injuries were retained for biological sampling. For these specimens, the tag and otoliths were stored in a bar-coded vial that was later scanned into the GFBioField Tag Recovery Entry form by DFO staff (Olsen 2010). Foreign tags were returned to their country of origin.

### 2.9 OCEANOGRAPHIC SENSOR DATA COLLECTION

A Sea-bird Bird SBE 39 temperature and pressure logger was placed in a protective plastic pipe and attached to the middle trap on the string of gear. Data was successfully collected from 87 sets in 2020 (Appendix C). A SBE 39 was also placed in the tagging tank on hauling days to record water temperature. Data from the SBE temperature and pressure loggers were processed at sea after the set was complete.

### 2.10 ELECTRONIC MONITORING VIDEO DATA COLLECTION

During haulback, the electronic monitoring (EM) system cameras were activated by the hydraulic sensor. Three standard analog cameras were positioned at optimal viewing angles to record survey activities. Two cameras were stationed along the mast to record the catch as it was processed at the hopper. A third camera was stationed on the side of the wheelhouse to record the traps as they were brought over the rail. The video data from each set was reviewed by science staff the following day to provide quality control on catch data.

## 3 Results and Discussion

### 3.1 FISHING

The 2020 survey was 46 days long and divided into two legs of 16 and 29 days, with a single day between in Port Hardy. Several weeks of inclement weather contributed to a longer second leg. In total, 27 fishing days were recorded.

Of the 91 original blocks for the StRS portion of the survey, ten were replaced at-sea and four blocks were rejected, for a total of 87 blocks successfully fished (Table 1). Of the ten replacements, one was revoked after on-ground inspection, three were located within unfishable habitat, four had failed to meet depth strata requirements, one was located in a conservation area and one had a track-line in the neighboring block (Table 1).

### 3.2 CATCH PER UNIT EFFORT (CPUE)

The sablefish survey of 2020 have documented recent changes in the sablefish population structure.

### 3.2.1 Stratified Random Set CPUE

Catch per unit effort (CPUE), as indexed by kilograms of sablefish per trap, decreased in 2020 across the mid depth strata $\left(R_{2}\right)$; and remained steady in the shallow $\left(R_{1}\right)$ and deep $\left(R_{3}\right)$ depth strata (Figure 5). Comparison across spatial and depth strata indicate declining CPUE (kg/trap) in areas $S_{2}$ to $S_{5}$, but increasing in the most southern area $S_{1}$ (Figure 6). The CPUE (\#fish/trap) across all strata declined remarkably with the exception of the northern strata $\mathrm{S}_{5}$ (Figure 7). The mean weight was similar or slightly lower compared to 2019 (Figure 8). The stratified mean survey abundance in 2020 was $35 \mathrm{~kg} /$ trap, down $-17 \%$ from 2019 and $-13 \%$ from the 2018-2019 average (Figure 9).

### 3.3 CATCH COMPOSITION

A total of forty-two taxonomic groups were represented in the catches in StRS sets in 2020 (Table 2). These included ten roundfish species, seven rockfish species, four flatfish species and twenty-one invertebrate species. Other than sablefish, the most common species, by weight, were Pacific halibut (Hippoglossus stenolepis), lingcod (Ophiodon elongatus), spiny dogfish (Squalus acanthias), yelloweye rockfish (Sebastes ruberrimus) and redbanded rockfish (Sebastes babcocki).

### 3.4 SABLEFISH SAMPLING

A detailed breakdown of the fate of the catch in each trap for the 2020 survey is listed in Appendix D.

During the 2020 StRS, a total of 48,092 sablefish were caught. Of that total, 8,277 were tagged and released and 3,691 were retained for biological sampling. Of the tagged fish, 77 were previously tagged fish that were re-released with a new tag. One previously tagged fish was retained for sampling (Appendix E).

Overall, the StRS sets had a higher proportion of females than males over all spatial strata (Table 3). More females than males were caught in the shallow depth stratum within all spatial strata. In the mid depth stratum, there were more males than females in $S_{1}, S_{2}$ and $S_{5}$. The deepest depth stratum saw more females in spatial strata $S_{1}, S_{2}, S_{3}$ and $S_{4}$.

Differences in length distributions between female and male sablefish are exhibited in the data collected from the StRS portion of the 2003-2020 surveys. The mean fork length ( $\bar{x}$ ) for females was 65.0 cm and the mean fork length ( $\bar{x}$ ) for males was 58.4 cm (Figure 10).

In 2020, the average mean fork length for the 1,925 females was 60.4 cm and the average mean fork length for the 1,676 males was 54.8 cm . The mean length of both females and males reached their lowest mean size since 2003 (Figure 11).

On average, female sablefish grow faster and reach a far greater size (Figure 12a) compared to males (Figure 12b).

### 3.5 SABLEFISH SUB-LEGAL ENCOUNTERS

Distinct distribution patterns became apparent across strata of increasing sub-legal sablefish (<55 cm fork length), following highly anomalous warm ocean conditions known as the "Blob" and the "Blob 2.0". The first marine heat wave (Blob) began in the NE Pacific in late 2013 (Bond et al. 2015) and persisted until 2016 (Dorantes-Gilardi and Rivas 2019). A similar marine heat wave (Blob 2.0) with warm sea surface temperatures appeared again in the summer of 2019 (Amaya 2020).

More than half of the sub-legal specimens were captured in the southern strata $\left(\mathrm{S}_{1}\right)$ mid-depth waters $\left(R D_{2}\right)$ in 2014 and shallow waters $\left(R_{1}\right)$ in 2015. The sub-legal specimen count was above $50 \%$ in both 2017 and 2018 in the northern strata of $S_{4}$ and $S_{5}$ mid-depth waters $\left(R D_{2}\right)$. In 2019, the sub-legal specimens dominated in all StRS survey strata ( $S_{1}$ to $S_{5}$ ) mid-depth waters $\left(R_{2}\right)$. In 2020, the sub-legal specimen count was over $50 \%$ in $S_{1}, S_{4}$ and $S_{5}$ in the mid-depth waters $\left(\mathrm{RD}_{2}\right)$ (Figure 13).

### 3.6 RECOVERED TAGGED SABLEFISH

Of the 77 Canadian tagged fish that were recovered on the survey, the majority ( $79 \%$ ) had travelled no more than 50 kilometers from the release site. Most recoveries (70\%) were
recaptured within 5 years at liberty (Table 4). Three fish were recovered a second time and released a third time (Table 5).

### 3.7 OTHER FISH SAMPLING

Length, sex, maturity, otoliths and DNA samples were collected for 126 rougheye/blackspotted rockfish samples. The science samplers visually identified 68 as rougheye, 58 as blackspotted and none as hybrid species (Appendix F).

### 3.8 SABLEFISH AGES

At the time of this report, sablefish ages were only available prior to 2019. The highest proportion of female ages in StRS sets for 2003 through to 2010 were 3, 4, 5, 6, 7, 8, 9 and 10 years of age, respectively. Then, another cohort appeared in 2011 through to 2015, showing up as $3,4,5,6$ and 7 year olds. In 2016, 2017, and 2018 the highest proportion of female sablefish were ages 3, 4, and 5 (Figure 14a).

The highest proportion of male ages in StRS sets for 2003 through to 2011 were 3, 5, 5, 6, 8, 8, 8,10 and 12 years of age, respectively. Another cohort appeared in 2012 through to 2016 as 4, $5,7,7$ and 8 year olds. A cohort also appeared to arrive in 2017 which was dominated by 3 year olds and in 2018 by 5 year olds (Figure 14b).

Historic data from all samples lists the oldest female sablefish at 92 years of age, collected in 2003 where as the oldest male sablefish with the age of 96 years old was documented for the year 2018.

### 3.9 OCEANOGRAPHIC TEMPERATURES AND DEPTHS

Co-plots of average temperatures and average depths by 1-degree latitude intervals from southwest Vancouver Island to northwest Haida Gwaii indicate that 2020 survey data exhibited a general trend of decreasing temperature with depth over latitude. The coldest average temperature per set recorded was $2.6^{\circ} \mathrm{C}$ with an average depth of 1295 m in the latitude zone of $52^{\circ}-53^{\circ}$ (Figure 15).

SBE 39 recorders have been placed on survey fishing sets since 2006. In the shallow waters, the lowest average temperature of $4.1^{\circ} \mathrm{C}$ was recorded in 2016 (latitude zone $52^{\circ}-53^{\circ}$ ); the highest average temperature was $7.4^{\circ} \mathrm{C}$ in $2016\left(50^{\circ}-51^{\circ}\right)$. In the mid-depth waters, the lowest average temperature was $2.9^{\circ} \mathrm{C}$ in $2019\left(52^{\circ}-53^{\circ}\right)$; the highest average temperature was 6.4 ${ }^{\circ} \mathrm{C}$ in $2013\left(50^{\circ}-51^{\circ}\right)$. In the deepest waters, the lowest average temperature was $2.2^{\circ} \mathrm{C}$ in $2016\left(54^{\circ}-55^{\circ}\right)$ and the highest average temperature was $4.1^{\circ} \mathrm{C}$ in $2016\left(48^{\circ}-49^{\circ}\right)$ (Figure 16).

### 3.10 ACKNOWLEDGEMENTS

The stock assessment survey and data report is the result of the collaborative efforts of many individuals. Wild Canadian Sablefish has provided coordination and support of the annual Sablefish survey since 1994. The scientific staff that conducted the 2020 sablefish research charter included Guy Boxall, Dean Gaidica, Talyn Ridgway of Archipelago Marine Research Ltd (AMR). A special thanks to the Vessel Master and crew of the F/V Pacific Viking, whose efforts made the survey successful and safe during the COVID-19 pandemic. In 2020, the crew consisted of Deacon Melnychuk (skipper), Cody Melnychuk,Rick Schneider, David Holomego, Rory Johnson and Bruno Olsen.

## 4 Tables

Table 1. Spatial strata allocation and completed strata counts (blue) for the 2020 sablefish research and assessment survey.

|  | Depth Strata |  |  |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Spatia Strata | RD1 | RD1 | RD2 | RD2 | RD3 | RD3 | Total | Total |
|  |  | $\mathbf{2 0 2 0}$ |  | $\mathbf{2 0 2 0}$ | $\mathbf{2 0 2 0}$ | $\mathbf{2 0 2 0}$ |  |  |
| S1 (South West Coast Vancouver Island or SWCVI) | 6 | 6 | 8 | 8 | 5 | 5 | 19 | 19 |

5 Figures

Figure 1. Location of the boundaries of the five spatial areas $\left(S_{1}-S_{5}\right)$ of the 2020 stratified random survey design. The three depths strata $\left(R_{1}-R D_{3}\right)$ are colour-coded and nested within each of the five spatial strata.

Figure 2. Start locations of survey sets (red markers) conducted in 2020 for the stratified random survey areas $\mathrm{S}_{1}$ through $\mathrm{S}_{5}$.

Figure 3. Image of the F/V Pacific Viking used for the 2020 sablefish research and assessment survey. Photo credit: Cody Melnychuk.

Figure 4. Trap elements (A). Trap gear elements consisting of 25 baited traps snapped to beckets along a groundline (B).

Figure 5. Sablefish catch per unit effort (CPUE) by depth and year for StRS sets.
Dashed lines delineate depth strata (shallow $\left(R D_{1}\right)=100-450 \mathrm{~m}, \operatorname{mid}\left(R_{2}\right)=450-850 \mathrm{~m}$, $\left.\operatorname{deep}\left(R D_{3}\right)=850-1400 \mathrm{~m}\right)$.

Figure 6. Average Sablefish catch per unit effort (CPUE; mean +/- 95\% Cls) by survey strata since 2003. Panels run deep to shallow (left to right) and north to south (top to bottom).

Figure 7. Average number of sablefish per trap (mean +/- 95\% Cls) by StRS survey strata over time. Panels run shallow to deep (left to right) and south to north (top to bottom).

Figure 8. Average weight of sablefish (mean +/- 95\% Cls) by survey strata over time. Panels run shallow to deep (left to right) and south to north (top to bottom).

Figure 9. Annual mean weight of sablefish per trap (kg/trap) (A); annual mean number of sablefish per trap (\#fish/trap) (B); annual mean weight of sablefish (kg) (C) by StRS survey strata over time. Horizontal line is median and blue dots are arithmetic mean.

Figure 10. Length frequencies for female (grey) and male sablefish (steel blue) up to 2020 for all StRS sets. The number of specimens is denoted by the letter n, the mean indicated by the xbar $\bar{x}$ and the standard deviation is represented by the symbol sigma $\Sigma$.

Figure 11. Average length and ratios of male and female sablefish by year. Counts by sex are labelled on top of the plotted lines.

Figure 12. Sablefish fork length ( L in cm ) vs weight $(\mathrm{W}$ in kg ) for females ( A ) and males (B) for the 2020 survey.

Figure 13. The percentage of sub-legal sablefish ( $<55 \mathrm{~cm}$ fork length) sampled by area $\left(S_{1}-S_{5}\right)$ and depth strata ( $S=$ shallow, $R D_{1} ; M=$ mid, $R D_{2}$; $D=$ deep, $R D_{3}$ ) over time. Sub-legal specimen count above $50 \%$ sampled shown in blue.

A

8

Figure 14. Bubble plot for female (A) and male (B) sablefish ages by survey year from StRS sets that have been aged. The sizes of the circles are proportional to the number of fish with given ages. Fish age 35 and older are included in one bubble. The total number( $n$ ) of fish aged are listed across the top of each panel. The ages with the highest ratios are posted to the right of each bubble.

Figure 15. Coplot of average depth (m) vs average temperature ( ${ }^{\circ} \mathrm{C}$ ) for a given 1degree latitude range (blue bands) for 2020. The number of fishing sets deployed with a SBE 39 recorder are represented by $n$.

Depth Stratum

Figure 16. Vertical density ridgeplots of mean temperatures per year as reported by set from the Sea-bird SBE 39 loggers on traps at three depth intervals, $\mathrm{RD}_{1}=$ shallow $(100-450 \mathrm{~m}), \mathrm{RD}_{2}=$ mid $(450-850 \mathrm{~m}), \mathrm{RD}_{3}=\operatorname{deep}(850-1400 \mathrm{~m})$. Lines indicate the $2.5 \%$ and $97.5 \%$ tails.

## APPENDIX A LIST OF SABLEFISH RESEARCH AND ASSESSMENT SURVEYS.

## APPENDIX B DATA FORMS OF THE 2020 SABLEFISH SURVEY.

Figure B.1. Example of a completed bridge log data form with directions from the 2020 survey instruction manual.

Inspect each trap as it is deployed to ensure no damage to the web, correct baiting practices, etc. Record the trap number of any problem traps. *NOTE: survey-specific traps were purchased prior to the 2017 survey and do not have escape rings

It is important to verify the buoy numbers on both ends.

Record the time the first trap is deployed.
Traps should never be towed but vessels may tow the anchor prior to actually setting the string and the first trap may be snapped to the groundline long before the set is deployed.

Mark traps as they are deployed. Each box represents a becket: checks mean traps, X means missed traps. Then record the total number deployed.

Record the time when the last trap is deployed.
In 2020, every trap on every set should be baited with 2 lbs of squid in bag and 10 lbs of hake loose in the trap. Visually confirm that 10lbs is being added to the traps.

Record the trap number that is used for the data recorder. Do this when the trap is actually deployed. Record the serial number of the temperature-depth recorder (TDR).

Figure B.2. Example of a completed set log data form with directions from the 2020 survey instruction manual.

- Accurate count of traps is very important.
- Verify buoy numbers as they are retrieved.
- Record times the first trap and last trap are hauled aboard.
- Identify specific columns for common species.
- Ensure all species abbreviations are recorded on the worksheet.
- Label specific cells for uncommon species in the set. Species names in cells override the species name in a column for that row only. Subsequent rows revert back to the original species.
- Record species count and weight for each trap. Each row is a single trap but one trap can be in multiple rows.
- Indicate trace weights with a dash in the weight field
- Put a line through the sablefish column if there are no sablefish or record $\boldsymbol{M T}$ (empty). Never leave a row completely blank.
- Record how the catch was used:
- Sablefish: $\boldsymbol{T}$ :- sagged, $\boldsymbol{A}=$ age biosample, $\boldsymbol{D}=$ discarded, $\boldsymbol{D S}=$ discarded sublegal, $\boldsymbol{D F}=$ discarded frames,
TRA = tag recovery age (USA tags),
$\boldsymbol{T R T}=$ tag recovery tagged (CAN tags)
- All other species: assumed as discarded so indicate if frames or age biosample
- Track the number of Sablefish in the biosample and tagging in the margins
- Record the count and weight of each basket as they occur to ensure the form matches the video.
- If a fish is lost overboard, indicate if it was before or after weighing.
- Either in the trap row or in the comments section, record any opentraps, snarls, missed beckets, trap damage (include estimate in inches of hole size), gilled in mesh, gilled in tunnel, open escape panels, etc. Ensure the crew inspects the trap and reports any damage.

Figure B.3. Example of a completed catch log data form with directions from the 2020 survey instruction manual.

Set Comments:

- Record the date the set was hauled
- Enter records by trap
- Enter every basket. For each basket, enter:
- the species code
- the count (the only records without counts should be trace amounts)
- the weight or a dash ("-") for trace weights
- the basket use
- $\quad T=$ tagged
- $\boldsymbol{A}=$ age biosample
- $D=$ discarded
- DS = discarded sublegal|
- DF = discarded frames
- TRA = tag recovery age
(US tag recoveries)
- $\quad \underline{\boldsymbol{R} \boldsymbol{T}=\text { tag recovery tagged }}$
(Canadian tag recoveries)
- For the first basket in each trap, enter comments about the trap: record any open traps, snarls, missed beckets, trap damage (include the location (top, bottom, side, tunnel), as well as an estimated measure of the hole size in inches), gilled in mesh, gilled in tunnel, open escape panels, etc. If there are multiples holes of different sizes in the same area of the trap: the largest is the one that gets coded.
- If the trap is empty, enter " $\boldsymbol{M} \boldsymbol{T}^{\prime}$ " in the species code field
- Count the number of baskets and compare it to the number on the original catch log.

Figure B.4. Example of a tabular catch log data entry form transposed from the catch log in Figure B.3. Directions from the 2020 survey instruction manual.

Calibrate the scale with a basket on the platform
Always complete Vessel, Set Number, Sample Date, Page, Sampler, Recorder, and Species fields.

- If the sample is recovered tagged Sablefish (US tags), record 'Selected Tag Recoveries' in the Sample Source field. Otherwise leave the field blank.
- Record the Length Type you are measuring (Fork Length)
- Leave the all other fields blank.|

On the first page:

- Record the time the first fish is sampled in the Comments For each fish:
- Leave the Trap Num and Fish Number columns blank.
- Record Weight (grams), Length (mm), Sex ( $0=$ not looked at, 1=male, 2=female, $3=$ looked at but unknown), and Maturity. For otolith age samples:
- Record the otolith Tray Number in the Comments header
- For each fish record the Otolith Cell Num. Use a checkmark next to the cell number to indicate when an otolith is verified and ensure to verify the first fish, every fifth fish, and the last fish. The check mark signifies that the otolith in the cell matches thefish.
- If large otoliths occupy two cells, make a comment and record the last cell in the Cell No.
- The assumption is that 2 otoliths are collected from every fish. If this is not the case, make a note as to 0 or 1 otolith.
- If you break an otolith make a note ('BO' is acceptable). Otolith pieces are useful if larger than half an otolith. For DNA samples (Rqughexe/Blackspatted Rockfish only in 2020)
- DNA will be collected using vials. Each vial has a unique number as follows: $394-\# \# \# \# \# \# \# \#, \boldsymbol{V}$. Ignore the "- $\boldsymbol{V}$ " and record the "394_"part in the header and then verify and record the 8 digit number (\#\#\#\#\#\#\#\#) for each fish. It is acceptable to use some means to indicate repeated numbers after the first fish.
For Tag Recoveries (US tagged Sablefish), ensure to record the vial number, last three digits of the tag number, and the wound condition in the Comments section.
On the last page: Record the time the biosample is complete in the Comments

Figure B.5. Example of a completed Sablefish biological sampling form and directions from the 2020 survey instruction manual.

Figure B.6. Example of a completed tagging form with directions from the 2020 survey instruction manual.

## APPENDIX C SURVEY SET DETAILS 2020.

Details of sets completed during the 2020 survey program (F/V Pacific Viking). Sets are listed by stratum/inlet name, set type, depth stratum, start date, end of gear deployment time and duration in minutes. The depth strata for type 3 tagging sets include $\mathrm{RD}_{1}$ (100-250 fathoms), $\mathrm{RD}_{2}$ (250450 fathoms) and $\mathrm{RD}_{3}$ (450-750 fathoms). The position data includes the major area and start and end latitude and longitude in degrees decimal minutes. The bottom depths (in meters) of the fishing set are shown with the mean bottom depth calculated from recordings at one minute intervals between the start and end of the set. The number of traps fished for each set excludes open traps, while holed or fouled traps have been included. Sets that successfully deployed a Seabird SBE temperature and pressure recorder are indicated with an ' $x$ '.

## APPENDIX D SUMMARY OF BASKET USE BY TRAP 2020.

Summary of the basket use by trap number for StRS sets during the 2020 sablefish survey. The fate of the sablefish catch for each set and trap is indicated using the following abbreviations: $\mathrm{D}=$ Discarded after weighing (processed as commercial catch), $\mathrm{A}=$ Sampled for LSMWO, T = Tagged and released, SD = Sublegal discarded, F= Frames, NULL = No sablefish catch/Trap missing.

| Set | Trap. 1 | Trap. 2 | Trap. 3 | Trap. 4 | Trap. 5 | Trap. 6 | Trap. 7 | Trap. 8 | Trap. 9 | Trap. 10 | Trap. 11 | Trap. 12 | Trap. 13 | Trap. 14 | Trap. 15 | Trap. 16 | Trap. 17 | Trap. 18 | Trap. 19 | Trap. 20 | Trap. 21 | Trap. 22 | Trap. 23 | Trap. 24 | Trap. 25 |

## APPENDIX E SUMMARY OF SABLEFISH BIOLOGICAL DATA 2020.

Biological data collected for sablefish by set, catch weight in kilograms and numbers of fish. Sablefish counts by trap are represented by sparklines. Tagged fish counts by number for recovered, re-released, deceased and those released for the first time. Tagged fish fork lengths are presented by count and mean (millimeters). Specimen counts are listed by sample type; mean fork lengths are tabulated.

## APPENDIX F SUMMARY OF BIOLOGICAL DATA FOR ROUGHEYE/BLACKSPOTTED ROCKFISH COMPLEX.

Biological data collected for rougheye/blackspotted rockfish complex. Each set is listed with counts of specimens sampled, calculations of mean fork lengths and number of species visually identified as either a $\mathrm{RE}=$ rougheye rockfish, $\mathrm{BS}=$ blackspotted rockfish or a hybrid.
