Assessment of the 1986 4WX herring fishery
by

R. L. Stephenson, M. J. Power and T. D. Iles Marine Fish Division Department of Fisheries and Oceans Biological Station<br>St. Andrews, New Brunswick EOG $2 \times 0$

${ }^{1}$ This series documents the scientific basis for fisheries management advice in Atlantic Canada. As such, it addresses the issues of the day in the time frames required and the Research Documents it contains are not intended as definitive statements on the subjects addressed but rather as progress reports on ongoing investigations.

Research Documents are produced in the official language in which they are provided to the Secretariat by the author.
${ }^{1}$ Cette série documente les bases scientifiques des conseils de gestion des pêches sur la côte atlantique du Canada. Comme telle, elle couvre les problèmes actuels selon les échéanciers voulus et les Documents de recherche qu'elle contient ne doivent pas être considérés comme des énoncés finals sur les sujets traités mais plutôt comme des rapports d'étape sur les études en cours.

Les Documents de recherche sont publiés dans la langue officielle utilisée par les auteurs dans le manuscrit envoyé au secrétariat.

## ABSTRACT

Reported landings from the 1986 herring fishery in NAFO Div. 4WX totalled $101,800 \mathrm{t}$, of which $73,700 \mathrm{t}$ were attributable to the 4 WX stock. The fishery continued to be dominated by the roe market and focused on the spawning grounds off southwest Nova Scotia (purse seine and gillnet). Smaller fisheries took place off southern New Brunswick (weir and purse seine) and off Cape Breton (purse seine).

Sequential population analysis, calibrated with larval abundance as in previous assessments, indicated an increase in stock biomass.

## RÉSUME

En 1986, les débarquements de hareng dans la Division 4WX de l'OPANO ont ēté de 101800 t , dont 73700 t provenant du stock de 4 WX . La pêche a continué d'être dominée par le marché de la rogue et a été pratiquēe principalement dans les aires de frai du large situées au sud-ouest de la Nouvelle-Ecosse (senne coulissante et filet maillant). Une pêche hauturière de plus petite envergure a èté pratiquée au sud du Nouveau-Brunswick (pêche à fascines et senne coulissante) et du Cap-Breton (senne coulissante).

L'analyse séquentielle de population, ētalonnée à l'aide de l'abondance larvaire comme dans les évaluations précédentes, a indiqué une augmentation de la biomasse.

## INTRODUCTION

The 1986 herring fishery in NAFO Div. 4WX was similar to that in recent years: Purse seine was the major gear type, followed in importance by weirs, gillnet, traps, shutoffs and midwater trawl (Table 1). The major portion of the fishery took place off southwest Nova Scotia (4Xa; June-0ctober) with smaller concentrations of effort off southern New Brunswick (4Xb; June-January) and off Cape Breton (4W-Chedabucto Bay; November-February) (Fig. 1).

The fishery continued to be influenced strongly by markets, and dominated by the Japanese roe market.

## 1986 Management Plan

The 1986 Scotia-Fundy Region Herring Management Plan (Appendix 1) established a quota of $97,600 \mathrm{t}$. A total of $92,600 \mathrm{t}$ was for the purse seine fleet, allocated among temporal components-of the fishery in the traditional manner (Chedabucto Bay (4W), 4X summer and winter) and 5000 t was allocated to the drift gillnet sector. The remaining inshore gear components of the summer fishery (fixed gillnets, NS weirs and traps) were removed from the quota. They were allowed, on the basis of previous performance, an estimated $13,000 \mathrm{t}$, for a total projected catch in the plan of $110,600 \mathrm{t}$. The removal of inshore fixed gear from quota (to allowance) was to overcome the traditional $80 \%$ purse seine/ $20 \%$ inshore gear breakdown in quota allocation; the inshore gear allowance was recognized as being about the market capacity for those segments, and kept the estimated total catch near the biological advice ( $100,000 \mathrm{t}$ ). As in previous years, the N.B. Weir and shutoff fishery (considered to be on non-stock fish, i.e. from the Gulf of Maine stock) and a portion (50\%) of the fall 4 X purse seine fishery (around Grand Manan) were not included in the quota.

## Description of the Fishery

## 4Wa (Chedabucto Bay, Winter) Purse Seine Fishery

In accordance with the 1986 Management Plan, this fishery was open from November 7, 1985 to March 1, 1986, with a quota of $18,000 \mathrm{t}$. The reported catch of $9080 t$ was considerably lower than the quota, mainly because of market limitation. An acoustic survey of the area (Buerkle 1987) showed a large and persistent group of fish in the general area.

4Xb (Bay of Fundy) Fall and Winter Purse Seine Fishery
The Bay of Fundy "fall and winter" fisheries were open from October 16, 1985 to March 3i, 1986. A total of 7000 t was assigned in two segments: 6000 t before December 31 and 1000 t for the traditional "brit" fishery after January 1. Only $50 \%$ of the landings in the October-December segment were applied to the quota. The amount recorded ( 3365 t ) was somewhat lower than the landings in recent years ( $\sim 5000 \mathrm{t}$ ), the same as in 1984, but lower than the landings $(10,000-40,000 \mathrm{t})$ between 1965 and 1975.

4Xa (Southwest Nova Scotia) Summer Fishery
a) Purse seine

The 1986 Management Plan limited this fishery to the period June 1 to October 14, 1986 with a quota of $90,000 t$, minus what had been taken in the
$4 W$ and $4 X$ fall and winter fisheries. Nominal landings of $56,145 t$ were $35 \%$ lower than in the previous year. This was due primarily to market conditions, particularly dependence on the roe market. Logbook analys is (Power and Stephenson 1987) shows that fewer trips were made than in the previous year (particularly early in the season). Catch rates generally remained high.
b) Gillnet

The gillnet segment of this fishery took $3533 t$, only $2 / 3$ of what it took in 1985. Once again, the fishery was hampered by a lack of shore-based market and relied on a foreign over-the-side sale program.
c) Weirs

Nova Scotia weirs recorded 1958 t , a substantial decrease ( $\sim 50 \%$ ) in catch compared to 1985, but similar to the catch in 1984.

4Xb (New Brunswick) Weir and Shutoff Fishery
The New Brunswick weir and shutoff fishery recorded $27,886 t$, almost exactly what was taken in 1985. Again the weirs of Grand Manan Island dominated. Few fish were taken in inner weirs (Passamaquoddy Bay, Campobello and Deer Isfands and along the shore to Saint John).

## Catch Statistics

Reported landings for the 1986 fishery (DFO, Scotia-Fundy Region, Statistics Div. records) are listed by month and gear segment in Table 2. Long-term trends in landings by the major gear segments are shown in Table 3. Recorded landings for the stock in 1986 were $73,733 \mathrm{t}$, the second lowest value in the last two decades.-

Trends in reported stock, adjusted stock and total 4WX (stock + non-stock) landings and in TAC are as follows ('000 t):

| 1973 | 1974 | 1975 | 1976 | 1977 | 1978 | 1979 | 1980 | 1981 | 1982 | 1983 | 1984 | 1985 | 1986 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

[^0]
## Logbook Information

The new logbook design introduced for the 1985 fishery was used again in 1986. Coverage was good ( $92 \%$ of catch) as logbook submission was again a condition of the fragmented license scheme, and logs were generally complete. The results are dealt with in detail by Power and Stephenson (1987).

Research Surveys

## (i) Acoustic survey

An acoustic survey of overwintering herring in Chedabucto Bay, N.S., has been undertaken using the same survey strategy in each of the last 4 yr (Jan. 1984-1987) (Buerkle 1987). In 1985, ice cover disrupted the survey, but other years can be considered comparable. These show an increase in estimated biomass as follows (from Buerkle 1987):

| Year | 1984 | 1986 | 1987 |
| ---: | :---: | :---: | :---: |
| Acoustic scatter <br> $\left(\mathrm{m}^{2} \mathrm{sr}^{-1}\right)$ | 111,539 | 160,135 | 238,329 |
| Acoustic biomass <br> $($ '000 $t)$ | 424 | 568 | 789 |

(ii) Larval herring survey

The 1986 larval survey of the Bay of Fundy and eastern Gulf of Maine was undertaken between Oct. 21 and Nov. 15. The standard survey of 115 stations was completed successfully. The standard larval abundance index (geometric mean number of larvae per $\mathrm{m}^{2}$ to bottom of the 115 stations) was very near that calculated for 1985 and the second highest value in the series (Table 4).

Experimental offshore fishing
Surveys were continued on offshore banks suspected of having herring of potentially different stock origin. These focused on two areas: offshore Scotian Shelf banks (particularly Emerald and Western Banks) and Georges Bank. Results of these surveys are presented by Stephenson et a1. (1987). Spawning herring were found on both Georges Bank and Western Bank:

## Stock Components

As in previous assessments (e.g. Sinclair and Iles 1981; Stephenson et al. 1986), the 4WX fishery is divided into "stock" and "non=stock" components (Table 2). "Stock" fish are considered to belong primarily to the major SW Nova Scotia spawning groups, but this unit also encompases smaller local stocks (e.g. Grand Manan, Scotts Bay). The "non-stock" component is comprised of:

| 4XD (N.B.) weirs ) 4Xb (N.B.) shutoffs) | - considered for assessment purposes to be migrants from the $5 Y$ stocks |
| :---: | :---: |
| 4Xa miscellaneous | - small localized Nova Scotia South Shore stocks caught in $4 \times \mathrm{m}$ gill, $4 \times \mathrm{m}$ trap and bycatches in handline and longline fisheries |
| 4W miscellaneous | - 4W fish taken in gear other than purse seine, on the assumption that the fish are from local stocks. |

Also, as in previous assessments, those segments of the fishery which span the winter months ( 4 Wa and 4 Xb purse seine) are considered on a quota year basis (October 15, 1985-0ctober 14, 1986). All other segments are considered for the calendar year 1986.

Biological Sampling
As in previous years, sampling of commercial catches was stratified by area, gear segment and month following the guidelines of:

1) obtaining as many length frequencies from individual catches as possible; and
2) stratified "detail" samples (two fish per half cm size-class above 24 cm ; one per half cm size-class below 24 cm ) to a level of at least 200 fish per area, gear and month.

Sample coverage was high and resulted in 555 length frequencies 94,000 fish) and 12,591 fish analyzed in detail (including ages); however, some cells (area and gear by month) were undersampled according to the previous criteria (Table 5).

Biological samples were matched to landings by gear component on a monthly basis as in previous assessments. Numbers at age from commercial catches were generated on the St. Andrews HP 3000 in the traditional manner, using programs HERNLW02 and HERNAG09. For all gear components except 4Xa purse seine, length-frequency samples were applied on a monthly basis.

A correction of $2 \%$ was applied to length measurements to account for shrinkage due to freezing. This is within the range values observed in several studies in Scotia-Fundy and Gulf Regions summarized by Hunt et al. (1986).

Since the summer purse seine fishery involves several distinct fishing grounds and markets, including directed effort for ripe (roe) fish, a smaller spatial scale was considered necessary. As in the previous assessment, length frequencies were matched by-individual $10^{\prime}$ square and month. Catches were partitioned by square on the basis of logbook information and where samples and catches did not coincide, length-frequency information from adjacent squares was used (see also Power and Stephenson 1987):

## Age Composition

The age composition of the nominal catch in major gear segments of the fishery is presented in Table 6. The 1982 year-class (age 4) again dominated the $4 W \mathrm{X}$ stock by number and,-this year, dominated also by weight. Age 2 fish dominated the $4 W X$ non-stock (primarily $4 \times b$ ) fishery in number but age 3 (1983) was dominant in weight.

## Quality of Catch Information

Previous assessments (Stephenson et a1. 1985, 1986) have dealt at length with changes in the quality of catch information from this fishery. In 1984, (and a few preceeding years) misreporting was considerable and an adjusted catch biomass ( 1.7 times that reported) was used in assessment (Stephenson et a1. 1985):- In 1985, drastic measures were taken to curb misreporting including:

- an increase in the TAC (to reduce the need or incentive to misreport)
- increased monitoring including nightly verbal hails before landing, as well as collection of delivery slips, purchase slips and log records.
- fragmented (weekly) license scheme.

The result was a significant improvement in the amount and quality of statistical information on which to base the assessment, and it was considered unnecessary to adjust the 1985 catch figures (Stephenson et al. 1986).

In 1986, the TAC was slightly lower but large enough to reduce the need to misreport. A monitoring structure similar to that in 1985 (including nightly verbal hails prior to landing and a fragmented license scheme) was implemented, but wharf monitoring was lower. Misreporting was higher than in 1985 (particularly early in the summer purse seine fishery) but decreased later when it was apparent that the TAC and, more importantly, individual vessel quotas would not be met. Estimates of misreporting range as high as $30 \%$ but the general impression-(from personnel in Fisheries Operations) is that misreporting was not more than $15-20 \%$.

## Abundance Indices

a) CPUE

As a result of the new purse seine logbook introduced in the 1985 fishery, a set of CPUE indices were presented at the last assessment (Power and Stephenson 1986). We have analyzed the 1986 logbooks in the same manner (Power and Stephenson 1987) and are now able to make some comparisons (Tables 7, 8). The 1986 data set shows fewer trips (particularly early in the summer fishery), - presumably the result of very limited adult herring markets other than roe. Set rate was similar, indicating that fish were not harder to find. Lower catch per unit effort is linked to a higher rejection of fish as being unsuitable for market (higher releases).
b) Larval abundance

The larval abundance index (Table 5) was again calculated as the mean number of larvae per $\mathrm{m}^{2}$ to bottom of the 115 standard stations as in the previous assessment.

## ASSESSMENT PARAMETERS

A) Weights at Age

We have extended the series using average July weights at age compiled for the previous assessment (Table 9). The 1986 weight at age (mean July, for stock fish weighted by gear) are:-

| Age | 1985 weights at age (kg) |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
|  | - 055 | . 124 | . 182 | .239 | - 271 | .306 | .329 | . 360 | . 400 |

The historical record of weights at age used in previous assessments is presented in Table 10.
B) Catch Matrix

The catch matrix (Table 11) is an extension of the "adjusted" matrix (1973-84 adjustment to account for misreporting, omissions and previous errors: Mace (1985)) used in the previous two assessments (Stephenson et al. 1985, 1986).
C) Partial Recruitment

The historical series of PR values and reasons for their change are summarized in Table 12.

A flat-topped partial recruitment vector was chosen for 1986. Ages $4+$ were considered to be fully recruited. Age 3 was considered to have a value of .75 (based upon partial maturity and consistent with earlier years). The values for age 1 and 2 were set to yield geometric mean recruitment.
D) Natural Mortality

Natural mortality was assumed to be 0.2 .

ASSESSMENT RESULTS

## SPA

Sequential population analysis (SPA) was calibrated with larval abundance as in previous assessments. Tuning was based upon the best combination of high correlation; low-intercept and minimum residuals (Table 13; Fig. 3). -Regression of larval abundance on mature and $5+$ biomass (as in 1986) gave an F value of about . 1. These indicated an intercept not significantly different from zero:- Regression forced through the origin suggested an $F$ near .2. The 1986 point was off the line (the biomass estimates were higher than predicted by the larval abundance) but there was no reason to discount the point. An $F$ of .15 was chosen by minimizing the residuals of the last two points (1985 and-1986).

Cohort analysis (COHORT of Rivard 1982, Table 14) indicates a considerable increase in stock biomass: The trend in age $2+$ population biomass ('000 t) is as follows:

| 1975 | 1976 | 1977 | 1978 | 1979 | 1980 | 1981 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 456.6 | 370.8 | 274.6 | 234.4 | 350.7 | 358.6 | 303.5 |
| 1982 | 1983 | 1984 | 1985 | 1986 |  |  |

$2+$ biomass $\begin{array}{llllll}280.4 & 284.4 & 345.1 & 496.3 & 615.2\end{array}$
According to this analysis, $4+$ fishing mortality in 1985 was .45 , double that generated by the 1985 cohort analysis. The 1983 and 1984 year-classes are stronger than predicted in the last assessment.

Catch Projections
Projections are presented in Appendix II.

## MANAGEMENT CONSIDERATIONS

This analysis indicates a low fishing mortality, which is consistent with most observations from the fishery, including lack of market, high larval abundance, high acoustic biomass, a consistent overall set rate and a high release rate in the purse seine fishery. On the other hand, the analysis is weakened by evidence of misreporting and by the changes, which occurred in the Trinity Ledge fishery (particularly the lower purse seine catch rate), both of which indicate a possible higher $F$.

The steps taken in 1985 to reduce the level of misreporting resulted in a considerable increase in the quality of information which that assessment was based on. In 1986, the level of monitoring was less and there is evidence that misreporting occurred, particularly early in the season. No
adjustment was made in this assessment for misreporting but there is increased uncertainty caused by that misreporting. It should be noted, however, that an increase in catch to account for even the most extreme estimates of misreporting still results in low F (<.2).

The status of herring on offshore Scotian Shelf banks, in particular, the stock affiliation of Targe herring reported from Emerald, Western and Sable Island Banks has been questioned. In early October 1986; four commercial purse seine vessels made trips to Western Bank in response to reports of herring from groundfish draggers. -Herring were found, and several successful sets were made. Fish were large ( $29-36 \mathrm{~cm}$ ), between 4 and 9 yr of age and were in spawning condition. The herring are larger (and older) than those of the usual 4WX fishery (see details in Stephenson et al. 1987). Groundfish research survey data indicate a discrete aggregation on the Western/Sable Bank area in the fall - and the discovery of "ripe and running" fish there in 1986 indicates a discrete spawning unit. On the other hand, spawning had not been documented in the area previously, and the presence of egg beds and larvae have not been verified (a limited larval survey is planned for 1987). Little information exists on the size of this group of fish or of its distribution at other times of the year; length frequencies of herring taken in the spring from outer banks are similar and indicate possible affinity. Until such time as there is more evidence of a separate stock, this fishery should be considered part of the 4WX unit.

${ }^{1} 4 \mathrm{Xa}$ gillnet includes $4 \times 0 Q \mathrm{R}$ ( 4 Xm combined with 4 Xa misc.).
${ }^{2} 4 \mathrm{X}$ traps includes Liverpool and other traps.
${ }^{3} 4 \times \mathrm{Xa}$ misc. includes 4 Xm gillnet, handline + bycatches.
${ }^{4} 4 \mathrm{~N}$ misc. includes all gear other than purse seine.
${ }^{5}$ Not included in totals for 1986 quota year.
${ }^{6}$ OSS total may have been 910 ; total purse seine is correct (I. Marshall, DFO, Yarmouth, pers. comm.).

## 4WX Herring

Canadä

## PART I

## HERRING PURSE SEINE FLEET

## A. GENERAL

the total fleet quota for all scotia-fundy purse seine vessels in mwx herring FISHERIES WILL BE 90,000 T FOR 1986 (OCTOBER 15, 1985 TO OCTOBER 14, 1986), WHICH EXCEEDS BIOLOGICAL ADVICE IF INSHORE ALLOWANCES AND UNREPORTED LANDINGS OCCUR AS IN 1985.

## 1. VESSEL QUOTA

All purse seine vessels shall operate on an annual vessel quota as defined below:

Class A - $1.6 \%$ of purse seine quota, 1,440 tonnes*
Class B -- $2.7 \%$ of purse seine quota, 2,430 tonnes*
These figures do not account for quota purchases. For those vessels with quota purchases, the 1986 vessel quotas are as follows:

| LADY MELISSA | - | 3,600 |
| :--- | :---: | :---: |
| TOMMIE \& ARNIE | - | 2,880 |
| LISA ANNE | - | 2,880 |
| SEAFOAM I | - | 3,600 |
| LEROY \& BARRY I | - | 3,600 |
| MARGARET ELIZABETH | - | 3,600 |
| CANADA 100 | - | 3,600 |
| CPRD | - | 1,710 |
| MATTUNA MARINER | - | 3,500 |
| MARIF LYNN ANITA | - | 3,600 |

All vessels which have purchased quota shares must have circulating chilling systems prior to obtaining the 1986 purchased quota amount.

* Subject to Part A 4(g) of this plan.

2. ALL VESSEL QUOTAS WILL OCCUR. AS A CONDITION OF LICENSING.
3. PARTICIPATION

Any Scotia-Fundy purse seine vessel may participate in any or all of the following herring fisheries: 4W, 4 X (fall), 4 X (winter), 4 X (summer). Restrictions will be limited to area quota and overall vessel quotas.

## PART I (CONT'D)

## A cont'd

4. MONITORING

Government/industry coordinated monitoring of the purse seine quota will occur through continual monitoring of all catches. The following procedures will be followed:
a) Industry/government monitoring of all nightly catches via verbal hail from each purse seine vessel captain identifying:
i) amount caught;
ii) port of unloading; and i ivi) - estimated time of unloading.
b) Written copy (DFO Landing Slip or Industry Delivery Note) of all verbal catch reports to be completed and forwarded to the industry/government central monitoring unit.
c) Accurate $\log$ records to be completed for each fishing trip and forwarded to DFO.
d) Purchase slip information to be completed by each purchaser and forwarded to DFO.
e) Fragmented (i.e., valid for specified periods) Condition of Licence Forms to be utilized in all purse seine fisheries within the Scotia-Fundy Region.
f) The fishery will be closed in the event of misreporting.
g) All documented individual vessel quota overruns in the 1985 fishery will be deducted from 1986 individual vesse? quotas.
B. PURSE SEINE FISHERIES

1. SYONEY BIGHT (4VN)
a) The season for purse seine vessels shall run from November 7, 1985 to March 1, 1986.
b) The quota will be 3,500 tonnes, to be taken by Gulf based purse seine vessels .
c) The area of activity shall be north and west of a line drawn from Pt. Aconi in Cape Breton to the 3 Pn Division intersect with the 4 Vn line.
d) The area east of the Pt. Aconi line in $4 V n$ shall not be fished by purse seine vessels.

B cont'd
2. CHEDABUCTO BAY (4W)
a) The season for purse seine vessels shall run from November 7, 1985 to March 1, 1986.
b) The quota shall not exceed 18,000 tonnes, to be taken by Scotia-Fundy vessels.
c) The following closure line wili be in effect until January 1, 1986, after which $40 \%$ ( $7,200 \mathrm{t}$ ) of the overall quota may be harvested inside this line. Waters of Chedahucto Bay in $4 W$ lying west of straight line extending from Cape Canso at $45^{\circ} 18^{\prime}$ north latitude, $60^{\circ} 56^{\prime}$ west longitude to Green Island at $45^{\circ} 29^{\prime}$ north latitude, $60^{\circ} 54^{\prime}$ west longitude.
3. BAY OF FUNDY - FALL AND WINTER "BRIT" FISHERY
a) The fall and winter Bay of Fundy purse seine fisheries will be combined into one fishery with the following provisions:
(1) The season will be October $16 / 85$ to March 31 of the next year.
(2) A total of $7,000 \mathrm{t}$ will be assigned in the following manner:
(i) up to 6,000 t to be caught in the October 15 - December 31 portion of the fishery.
(ii) of the amount captured in (i) above, $50 \%$ will be counted against the quota up to a maximum of $3,000 \mathrm{t}$;
(iii) the "brit" fishery will comprise the second portion of the fall and winter Bay of Fundy purse seine fishery with a January 1 - March 31 season;
(iv) the quota for the 1986 "brit" fishery will be $1 ; 000 \mathrm{t}$;
(v) all catches will be deducted from individual vessel quotas for the 1986 season ( $50 \%$ of fall catch $+100 \%$ of the "brit" catch).
b) The fishery will be closed when:
(1) quotas are reached;
(2) seasonal closures are reached; or
(3) irreqularities in quality, size or end-product use.

## PART I (CONT'D)

## B cont.'d

4. BAY OF FUNDY - SUMMER FISHERY
a) The season for purse seine vessels shall run from June 1, 1986 to October 14, 1986.
b) The quota will be $(90,000 t-(X+Y+Z))$, to be taken by Scotia-Fundy vessels.

$$
\begin{aligned}
& X=4 W \text { catch } \\
& Y=\text { fall } 4 X \text { catch }(50 \%) \\
& Z=4 X \text { winter "brit" catch }
\end{aligned}
$$

c) A separate bait quota of $2,600 \mathrm{t}$ will be authorized for the 1986 fishing. The allocation of this allotment will be determined by the Advisory Committee in April 1986.
d) No purse seine fishery in Area 21 (June 1 - October 14) for 1986.
e) The Trinity Ledge spawning Area (Schedule III, Item 5 - Atlantic Coast Herring Regulations) will be closed to purse seine activities August 25 to September 7 for 1986.
f) Provision will be made prior to the beginning of the summer fishery to place controls on the upper limit of harvest and/or harvest intensity on the Trinity Ledge spawning area in response to concerns expressed regarding the potential biological implication of such intense roe harvest.
q) A Georges Bank purse seine fishery is authorized under the following conditions:
(1) fishing to occur in the Canadian zone of 5Ze;
(2) a DFO observer must be present on all trips;
(3) 24 hours' notice must be given to DFO prior to departure; and
(4) failure to comply with parts, (a), (b) and (c) will result in any catch being assigned to that vessel's $4 X$ quota.
h) A 6,000 t Over-The-Side Sales Program will occur.
i) The provision for an Over-The-Side or Over-The-Wharf Sale of $4,000 \mathrm{t}$ of sex sorted males. This Program is for sorted male herring only and cannot be used in a quota manner to supplement any existing
$\because \quad$ Over-The-Side Sale arrangement for purse seines or gill net fishermen.

PART II

## SCOTIA-FUNDY (4X) INSHORE HERRING GEAR TYPES

A. GENERAL

1. All catch information shall be provided to the Department for each catch.
2. All purchase slip information shall be provided for each purchase and shall include identification of amount purchased, fisherman and date of purchase.:
3. All Nova Scotia inshore gear (weirs, traps and gill nets) previously under quota control will be assigned an allowance of anticipated catch for 1986. This catch in 1984 approximated 7,500t, and for 1985, 10,500t.
4. No effort increases will occur in any inshore fishery.
5. All herring sold for bait will be recorded.
B. WEIR FISHERY
6. The Split Rock to Gannet Rock closure line will remain in effect from April 15, 1986, to September 30, 1986.
C. HERRING SET NET FISHERY .
7. After the season, all moorings must be removed from the water.
D. HERRING DRIFT NET FISHERY
8. Licences for drift nets are limited to those holding same for 1983.
9. a) An Over-the-Side Sales Program for $5,000 \mathrm{t}$ is to occur.
b) A cooperative agreement will occur between the two management groups for OSS (MFU and Fundy Coordinators) to ensure daily OSS capacity is filled.
10. An Over-The-Wharf Sales Program of 1,000 t is to occur.
E. TRAP FISHERY
11. All mackerel traps in the $4 X$ Area are limited to a $10 \%$ by-catch of herring up to a maximum of 100 t .

SUMMARY TABLE OF OUOTAS DIVISION FOR 1985

| GEAR TYPE | AREA | SEASON | QUOTA | ALLOWANCE GUIDE |
| :---: | :---: | :---: | :---: | :---: |
| Purse Seine |  |  |  |  |
| 4 X (Fall) | Bay of Fundy | October 15 - December 31/85 | 3,000* |  |
| 4X (Winter) | Bay of Fundy | January 1-March $31 / 86$ | 1,000 |  |
| 4W | Chedabucto Bay | November 7/85-March 1/86 | 18,000 |  |
| 4X (Summer) | Bay of Fundy | June 1/86 - October 14/86 | $\frac{68,000}{90,000}$ |  |
| 4X Bait | Bay of Fundy | Sept. 15/86-October 14/86 | 2,600 |  |
| Drift Gillnet | S.W. Nova | June 1/86-October 15/86 | 5,000** |  |
| Set Gillnet | S.W. Nova | June 1/86-October 15/86 |  |  |
| N.S. Weir | Nova Scotia | June 1/86-October 15/86 |  |  |
| Traps | Liverpool Bay | February 1/86-May 1/86 |  |  |
| TOTAL QUOTA <br> TOTAL PROJECTED CATCH (QUOTA + ALLOCATION) |  |  | 97,600 |  |
|  |  |  |  | 110,600 |

* Qunta represents $50 \%$ of T.A.C.
** OSS quota which is deducted from allowance total.

## Appendix II - Prognosis: 4WX Herring 1987-90

| Age | PR | Mean <br> wt (kg) | 1986 population <br> (numbers) | 1986 catch <br> (numbers) |
| :---: | :---: | :---: | :---: | ---: |
| 1 | .003 | .009 | $1319777^{1}$ | 40 |
| 2 | -36 | -055 | $1054076^{1}$ | 80019 |
| 3 | -75 | -124 | 1823639 | 176197 |
| 4 | 1 | -182 | 1477399 | 186983 |
| 5 | 1 | -239 | -287297 | -36361 |
| 6 | 1 | .271 | 159447 | 20180 |
| 7 | 1 | .306 | 54345 | 6878 |
| 8 | 1 | .329 | 21800 | 2759 |
| 9 | 1 | .360 | 14846 | 1879 |
| 10 | 1 | .400 | - | -8642 |
|  |  |  | - |  |

${ }^{1}$ Age 1 and 2 population numbers set to 1974-83 geometric mean.

Two projections were made:
A) Assuming a 1987 catch of 126,500 and $F_{0.1}=.3$ thereafter:-

|  | 87 | 88 | 89 | 90 |
| :---: | :---: | :---: | :---: | :---: |
| Quota | 126,500 | . 3 | . 3 | . 3 |
| Projected catch | 126,500 | 159,800 | 140;900 | 126,500 |
| F | $\bigcirc .140$ | - . 183 | - . 174 | .167 |
| B) Assuming 1987 and future years at $\mathrm{F}_{0.1}=3$ : |  |  |  |  |
|  | 87 | 88 | 89 | 90 |
| Quota | . 3 | . 3 | . 3 | . 3 |
| Projected catch | 166,500 | 149;200 | 133,300 | 121,400 |
| F | $\cdots 191$ | - . 179 | -. 171 | . 165 |

[^0]:    ${ }^{1}$ TAC raised from $60.0 t$ to $65.0 t$ in mid-season.
    ${ }^{2}$ Excludes an allowance of $13,000 \mathrm{t}$ for inshore $4 \times n$ fixed gear.
    ${ }^{3}$ Excludes 4Xb wier + shutoff, 4Xn gill + trap, 4W inshore gear.
    ${ }^{4}$ Includes 1978-1984 adjustment for misreporting and omissions.

[^1]:    *Result of one set with 0.1 hours searching and a catch of 59.0 mt .
