WHAT IS **LEGIONELLA?**

Legionella is a group of bacteria found in natural water sources, such as lakes, streams and groundwater. It can also be found in human-made water systems and devices.

Legionella can become a health concern when it grows in these systems and devices, and is inhaled in the form of droplets and mists released into the air.

CONDITIONS THAT SUPPORT LEGIONELLA GROWTH

- Warm temperatures
- Standing or still water

 Settled particles and biofilm (a slimy, glue-like material containing microorganisms and nutrients)

HEALTH EFFECTS OF LEGIONELLA

Legionella can cause two types of illness in humans: Legionnaires' disease and Pontiac fever.

Legionnaires' disease is a serious respiratory illness that results in pneumonia, lasting weeks to months, and can lead to death.

Pontiac fever is a milder illness, causing flu-like symptoms. People with Pontiac fever generally recover in 2 to 5 days without treatment.

WHO IS AT GREATEST RISK?

 People over 40 years of age

Current and former smokers

 People with chronic lung disease

People with underlying illnesses and weakened immune systems

HOW TO REDUCE YOUR RISK?

 Maintain your water heater temperature at 60°C

To reduce the risk of scalding, the temperature of the water at the tap should be no higher than 49°C. You should contact a qualified plumber to install mixing valves to control the tap water temperature.

- Regularly clean and disinfect mist-producing devices in your home (shower heads, humidifiers, hot tubs) according to manufacturer directions
- Run the hot and cold water taps for a few minutes after not using them for more than two weeks
- Periodically drain and flush your water heater, according to manufacturer directions, to reduce settled particles
