DISCLAIMER

CANADA MORTGAGE AND HOUSING CORPORATION (CMHC), THE FEDERAL GOVERNMENT'S HOUSING AGENCY, IS RESPONSIBLE FOR ADMINISTERING THE NATIONAL HOUSING ACT.

THIS LEGISLATION IS DESIGNED TO AID IN THE IMPROVEMENT OF HOUSING AND LIVING CONDITIONS IN CANADA. AS A RESULT, CMHC HAS INTERESTS IN ALL ASPECTS OF HOUSING AND URBAN GROWTH AND DEVELOPMENT.

UNDER PART IX OF THIS ACT, THE GOVERNMENT OF CANADA PROVIDES FUNDS TO CMHC TO CONDUCT RESEARCH INTO THE SOCIAL, ECONOMIC AND TECHNICAL ASPECTS OF HOUSING AND RELATED FIELDS, AND TO UNDERTAKE THE PUBLISHING AND DISTRIBUTION OF THE RESULTS OF THIS RESEARCH. CMHC THEREFORE HAS A STATUTORY RESPONSIBILITY TO MAKE WIDELY AVAILABLE, INFORMATION WHICH MAY BE USEFUL IN THE IMPROVEMENT OF HOUSING AND LIVING CONDITIONS.

THIS PUBLICATION IS ONE OF THE MANY ITEMS OF INFORMATION PUBLISHED BY CMHC WITH THE ASSISTANCE OF FEDERAL FUNDS. THE VIEWS EXPRESSED ARE THOSE OF THE AUTHOR(S) AND DO NOT NECESSARILY REPRESENT THE OFFICIAL VIEWS OF CANADA MORTGAGE AND HOUSING CORPORATION.

EXECUTIVE SUMMARY

The Whitesand First Nation is proposing to construct an Elders Housing project on their territory near Armstrong Ontario.

This report has determined the energy loads for a small cogeneration facility to serve this 10 unit Seniors housing project as follows.

| | | |
|---------------------------|------|--------|
| Design Heat Loss @ -38 °C | k W | 67.39 |
| Annual Space Heating | k Wh | 123836 |
| Annual DHW Heating | k Wh | 56973 |
| Annual Appliances | k Wh | 64363 |
| Total Annual Energy | k Wh | 245172 |

The report has also identified areas where the First Nations Architect can improve the energy efficiency of building components and design. These modifications, introduced with little additional capital costs, will reduce the annual operation costs by over \$4,500. The savings based on an "unsubsidized" electrical energy rate of \$0.18 per kWh will be \$10,100 per year.

The recommendations present a system compatible with the hot water delivered by the cogeneration facility in an efficient manner. Attention to detail in the construction phase while adhering to these suggestions will provide a comfortable and efficient building complex.

RÉSUMÉ

La Première nation de Whitesand propose la construction d'un ensemble de logements pour personnes âgées sur son territoire, près d'Armstrong (Ontario)

D'après le rapport, voici les caractéristiques énergétiques pour une petite centrale de cogénération qui desservirait un ensemble de 10 logements pour personnes âgées :

| | | |
|------------------------------------|-----|---------|
| Perte de chaleur nominale à -38 °C | kWh | 67,39 |
| Consommation annuelle | | |
| Chauffage des logements | kWh | 123 836 |
| Chauffe-eau | kWh | 56 973 |
| Appareils | kWh | 64 363 |
| Quantité annuelle totale d'énergie | kWh | 245 172 |

Le rapport indique également les éléments pour lesquels l'architecte des premières nations peut améliorer le rendement énergétique des composantes du bâtiment. Ces modifications, dont les coûts en immobilisations supplémentaires seront minimes, réduiront de plus de 4 500 \$ les coûts de fonctionnement annuels. Les économies, calculées à l'aide d'un prix de l'énergie non subventionné de 0,18 \$ le kWh, s'élèveront à 10 100 \$ par année.

Les recommandations font état d'une installation utilisant efficacement l'eau chaude distribuée par la centrale de cogénération. Grâce à l'attention apportée aux détails durant la phase de construction et à l'application des suggestions, on aura un ensemble résidentiel confortable et éconergétique.

COMMUNITY ENERGY SYSTEM PROJECT

Energy Evaluation of Seniors Housing Units

Whitesand First Nation

FINAL REPORT

1.0 GENERAL

1.1 Introduction

The Whitesand First Nation is proposing to construct an Elders Housing project on their territory near Armstrong Ontario. The architects have prepared preliminary drawings which indicate that electric heating will be used. The community is remote, off the hydro grid and presently being serviced with electricity from diesel powered generators. Heating with electricity is expected to be extremely expensive.

In order to reduce the O&M costs for the project, Mr. Christopher Ives, Technical Policies and Research CMHC, is investigating the viability of providing a small cogeneration facility which will provide both electrical energy and energy for space heat and domestic hot water.

1.2 Objective of this Report

The objective of this report is to accurately determine the energy loads for a small cogeneration facility to serve a 10 unit Seniors housing project at Whitesand First Nation, near Armstrong, Ontario. The terms of reference are set out in Schedule "A". This report consists of the following parts.

- | | |
|-------------|--|
| 1.0 General | Project Description |
| 2.0 Phase 1 | Heat Loss calculations, "what if" scenario |
| 3.0 Phase 2 | Recommendations |

1.3 Proposed Construction

Excerpts of the project drawings have been included in this report. For further details on construction refer to the proposed drawings as prepared by Ininew Project Management Ltd. (Note: The architect's drawings have used the Imperial scale. To remain consistent references to the drawings will also be Imperial. Metric (SI) units have been used elsewhere in this report.)

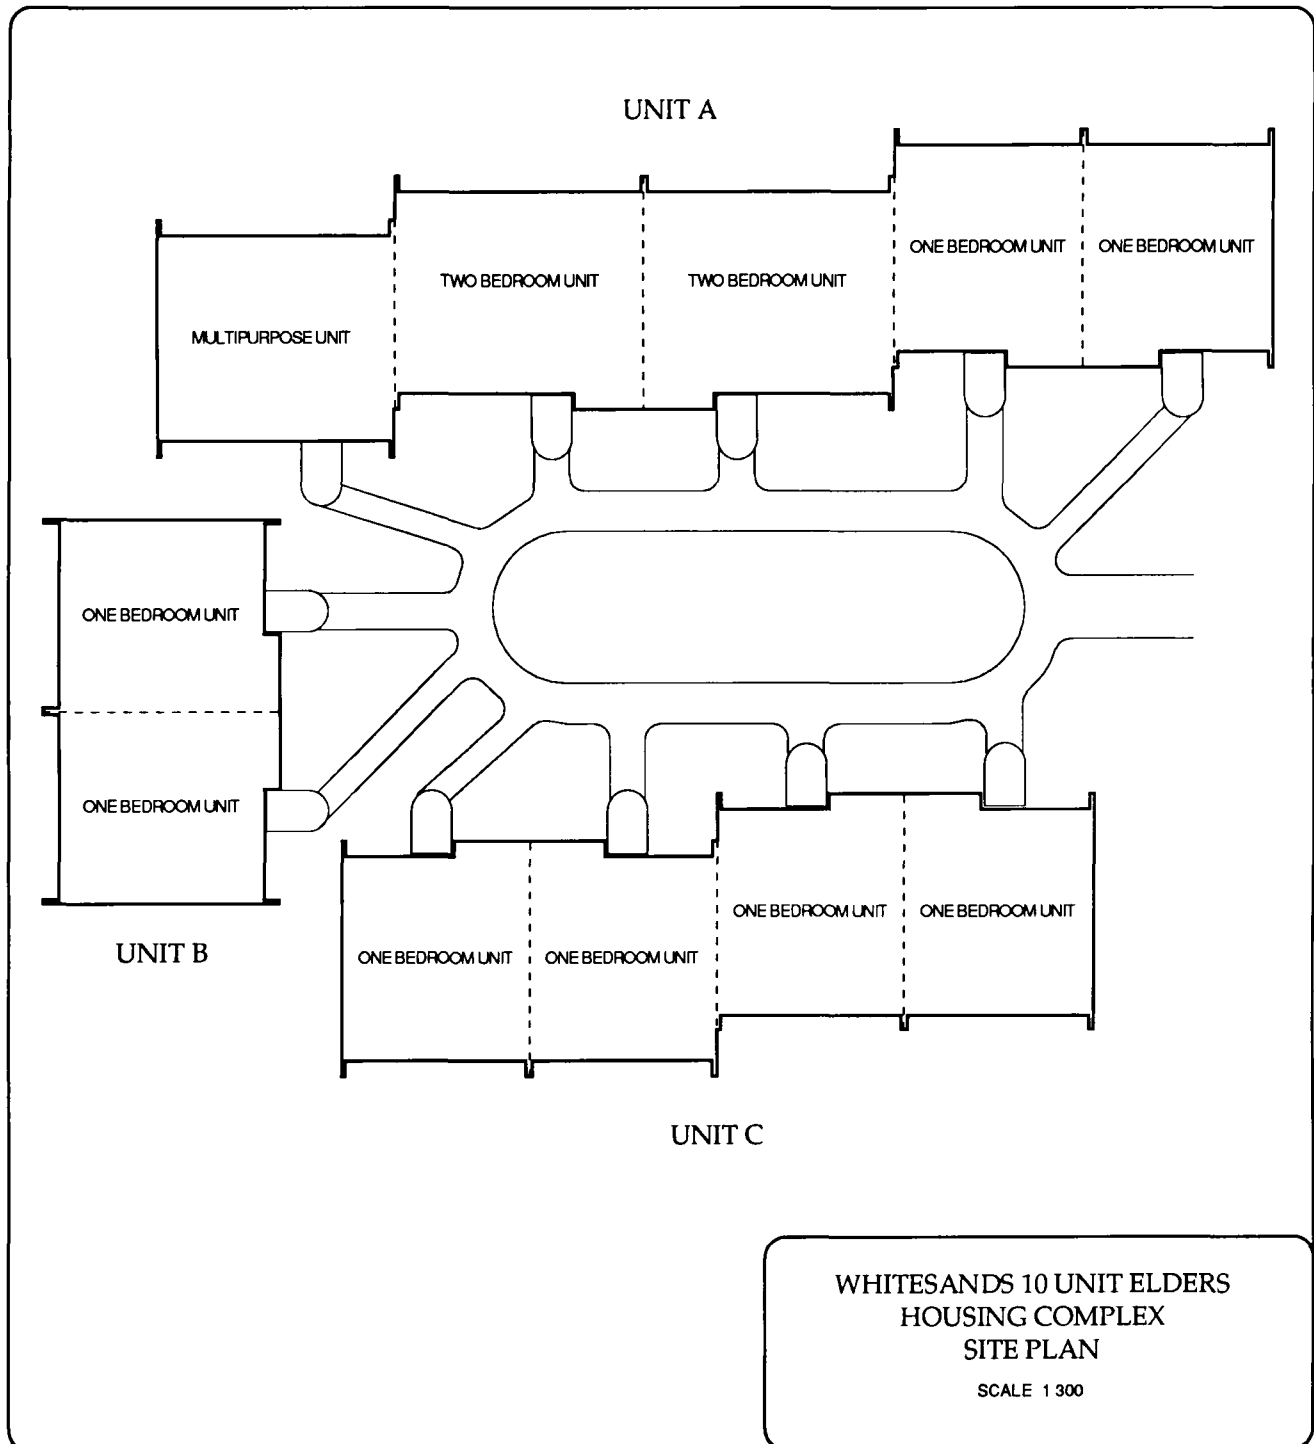

The seniors housing is an arrangement of one and two bedroom apartments in groups referred to as Unit "A", Unit "B" and Unit "C". Unit "A" contains a Multi Purpose room for the common use of all of the tenants.

The proposed construction is single storey wood frame on a concrete foundation in the form of a crawl space. The insulation levels are ceiling R 40, exterior walls R 20, exterior doors R 8, average window R 2.50, header R 10 and below grade walls R 10.

The heating system is proposed to be individually electrically heated baseboard. Domestic hot water is generated in electric hot water tanks. Ventilation air is provided by Heat recovery Ventilators.

1.4 Site Layout

The proposed arrangement of Unit "A", Unit "B" and Unit "C" which comprises the 10 Unit Elders Housing complex is shown below.

1.5 Typical Floor Plans

The typical floor plans of the one and two bedroom apartments and the multi purpose room are shown below.

TYPICAL ONE BEDROOM UNIT

TYPICAL TWO BEDROOM UNIT

MULTIPURPOSE UNIT

TYPICAL FLOOR PLANS

SCALE 3/32" = 1'-0"

1.6 Typical Wall Section Details

The typical wall section proposed to be used by the Architect is shown below.

2.0 PHASE 1 - HEAT LOSS CALCULATIONS

2.1 Heat Loss

The heat loss calculations were performed on the CANMET Hot 2000 v 6.02 program. The results should give some guidance in recommendations concerning energy efficiency and form the basis for determining the design loads for the cogeneration project.

The heat loss determination evaluates the energy performance for the proposed building envelope. The complete calculations are shown in Appendix "A".

The individual apartments in each of the three housing units have been analyzed separately and the results have been summarized.

| SUMMARY of PROPOSED ELDERS HOUSING HEAT LOSS | | | | | | | | | |
|---|------------|--------------------|--------------|--------------------|--------------|--------------------|--------------|-------------------------|--------------|
| | R Value | Elders Unit "A" | | Elders Unit "B" | | Elders Unit "C" | | Total for Complex | |
| | | Area or Volume | | Area or Volume | | Area or Volume | | Area or Volume | |
| | | Imperial sf | Metric sm | Imperial sf | Metric sm | Imperial sf | Metric sm | Imperial sf | Metric sm |
| Building Components | | | | | | | | | |
| Ceiling | 40 | 3592 | 334 | 1248 | 116 | 2496 | 232 | 7337 | 682 |
| Main Walls | 20 | 2942 | 273 | 1225 | 114 | 2129 | 198 | 6297 | 585 |
| Doors | 8 | 180 | 17 | 80 | 7 | 160 | 15 | 420 | 39 |
| Crawl Space Walls above grade | 10 | 306 | 28 | 128 | 12 | 222 | 21 | 656 | 61 |
| Crawl Space Walls below grade | 10 | 1532 | 142 | 638 | 59 | 1109 | 103 | 3280 | 305 |
| Crawl Space Perimeter | 0 | 1169 | 109 | 452 | 42 | 821 | 76 | 2442 | 227 |
| Crawl Space Centre | 0 | 2424 | 225 | 796 | 74 | 1675 | 156 | 4894 | 455 |
| Windows (average) | 2.55 | 185 | 17 | 65 | 6 | 130 | 12 | 379 | 35 |
| Volume | | 46700 | 1322 | 16226 | 459 | 32452 | 919 | 95377 | 2701 |
| Design Loads and Consumption | | | | | | | | | |
| Design Heat Loss @ -36.4°F | BTU | | 108468 | | 41494 | | 80044 | | 230006 |
| Design Heat Loss @ -38.0 °C | kW | | 31.78 | | 12.16 | | 23.45 | | 67.39 |
| Annual Space Heating | kwh | | 60652 | | 22145 | | 41039 | | 123836 |
| Annual DHW Heating | kwh | | 27994 | | 9660 | | 19320 | | 56973 |
| Annual Appliances | kwh | | 29262 | | 11700 | | 23400 | | 64363 |
| Annual Total | kwh | | 117908 | | 43505 | | 83759 | | 245172 |
| Annual Space + DHW | kwh | | 88642 | | 31805 | | 60359 | | 180806 |
| R-2000 Target | kwh | | 62047 | | 22898 | | 45797 | | 130742 |

2.1 Heat Loss (Continued)

The summary compares the proposed performance level to the R 2000 target which is used as a benchmark. (Normally the cumulative value of the R 2000 targets is adjusted downward if the unit is to be registered in the R 2000 program, however, in this evaluation no adjustments have been made.)

2.2 Assumptions and Parameters

Building Construction

- Detail of the Party Wall Type 1 shows a 2 inch air space in the main wall. For the purposes of this report (and in keeping with good building practices) it is assumed that this air gap is insulated and sealed to prevent outside air from entering the space.
- The Typical Wall Construction detail shows no insulation on a portion of the concrete header. This report assumes the rigid insulation extends upward over the entire header.
- No dimension is shown for the exterior grade wall and it is assumed to be 5'-0" which is the depth of the center piers.

Occupancy

- One bedroom units 2 adults for 80% of the time
- Two bedroom units 2 adults for 80% of the time, 1 child for 50% of the time
- Multi Purpose unit 6 adults for 20% of the time, 2 children for 20% of the time

Domestic Hot Water Consumption

A low value of 49 lgp/d was used for the One Bedroom units and a medium value of 62 lgp/d was used for the Two Bedroom and Multi Purpose units.

Base Loads

The base electrical loads for each unit were 16.0 kW per day for lighting and appliances
2.0 kW per day for exterior use

Location and Weather Data

The weather data used is for Armstrong and is shown below.

| | | | |
|-------------------------------------|---------|-------------------------------|--------|
| Latitude | 50.33°N | Annual Degree Days below 18°C | 6991 |
| Dry Bulb Temp | 28.0 °C | Wet Bulb Temp | 21.0°C |
| January Design Temperature (2 1/2%) | -38°C | | |
| January Design Temperature (1%) | -42°C | | |
| Design Temperature Difference | 59.0 °C | | |
| Ave Deep Ground Temp | 5.9 °C | | |
| f-value Solar index | 0.95 | | |

Air Tightness

- The air tightness level is for present type of construction or 3.57 ACH @ 50 Pa. (The R-2000 level is 1.50 ACH @ 50 Pa)

2.3 "What If" Scenario

In this "What If", various component of the building construction have been altered to show how some improvements in energy efficiency can be made. The example included is for the Elders Housing Unit "A". The changes to the components are as follows:

- Substituted a slab on grade for the crawl space. The slab has been insulated on the perimeter to R 10 and the centre to R 5.
- Increased main wall insulation to R 30.
- Reduced air infiltration to R 2000 level (i.e. 1.50 ACH @ 50 Pa).
- Reduced building volume.

The Hot 2000 Run and the calculation sheet for Unit "A" are shown in Appendix "B". The results are compared in the table below.

| COMPARISON of HEAT LOSS with DIFFERENT INSULATION LEVELS | | | | | | | |
|--|-----------------|----------------|--------------|----------------------------|----------------|--------------|--------------------------------|
| (Slab on Grade Substituted for Crawl Space) | | | | | | | |
| | Elders Unit "A" | | | Elders Unit "A" Revised | | | |
| | R | Area or Volume | | R | Area or Volume | | |
| | Value | Imperial sf | Metric sm | Value | Imperial sf | Metric sm | |
| Building Components | | | | | | | Building Components |
| Ceiling | 40 | 3592 | 334 | 40 | 3592 | 334 | Ceiling |
| Main Walls | 20 | 2942 | 273 | 30 | 2942 | 273 | Main Walls |
| Doors | 8 | 180 | 17 | 8 | 180 | 17 | Doors |
| Crawl Space Walls above grade | 10 | 306 | 28 | 10 | 1169 | 109 | Slab Perimeter |
| Crawl Space Walls below grade | 10 | 1532 | 142 | 5 | 2424 | 225 | Slab Centre |
| Crawl Space Perimeter | 0 | 1169 | 109 | | | | |
| Crawl Space Centre | 0 | 2424 | 225 | | | | |
| Windows (average) | 2.55 | 185 | 17 | 2.55 | 185 | 17 | Windows |
| Volume | | 46700 | 1322 | | 28778 | 815 | |
| Design Loads and Consumption | | | | | | | |
| Design Heat Loss @ -36.4°F BTU | | | 108468 | | | 82499 | Space Heat Reduction kWh |
| Design Heat Loss @ -38.0 °C kW | | | 31.78 | | | 24.17 | |
| Annual Space Heating kwh | | | 60652 | | | 33100 | |
| Annual DHW Heating kwh | | | 27994 | | | 27994 | 27552 |
| Annual Appliances kwh | | | 29262 | | | 29262 | |
| Annual Total kwh | | | 117908 | | | 90356 | |
| Annual Space + DHW kwh | | | 88642 | | | 61094 | |
| R-2000 Target kwh | | | 62047 | | | 48023 | |

2.3 "What If" Scenario (Continued)

The reduction in the annual space heat requirements in the "What If " scenario is 27552 kWh. If this reduction in space heat requirements is prorated on an area basis this could amount to 56300 kWh annually for the Complex.

At a rate of \$0.0802 per kWh, this will mean a saving of \$4515 annually. In addition to this consumption charge is an Ontario Hydro service charge for the complex of \$5062 per year, a portion of which may be saved with a cogeneration system

2.4 Cost Implications

A detailed cost analysis is not part of the scope of work for this report, however, the following table shows the component cost to be reviewed.

| Cost Implications | | | |
|-------------------|-----------------------|--|--|
| Item | Component | Increase in Cost | Decrease in cost |
| 1 | Exterior Wall | | |
| | Exterior Sheathing | | Delete Sheathing cost @ \$ 4.50 per l.f. of wall |
| | Studs | | Increase spacing to 24" from 16" |
| | Interior Strapping | \$2.30 per l.f. of wall (material) | |
| | Inner Insulation | \$1.45 per l.f. of wall (material) | |
| 2 | Slab on Grade | | |
| | Site Preparation | No increase | |
| | Excavation | | Reduced excavation costs |
| | Imported Fill | Additional fill may be required | |
| | Concrete Form work | | Reduced forming costs |
| | Concrete | No Increase in concrete cost | |
| | Rigid Insulation | No Increase in material cost | |
| 3 | Plumbing and Drainage | Small increase for excavation and material | Delete weeping tile, Drainage sumps |
| 4 | Hydronic System | Capital Cost | Credit for Electrical |
| | | Heat Exchanger for DHW | Credit for electric DHW tanks |

In general terms, it would appear that deleting the exterior sheathing will almost off set the additional cost of upgrading the exterior walls and the slab on grade uses no more material than the proposed crawl space with the exception of cost for any additional fill that may be required. Labour costs are not expected to rise appreciably.

2.5 Other Comments

- Armstrong has the lowest design temperatures listed in the "Climatic Data" of the Ontario Building Code.
- The percentage of the total building annual heat loss through the crawl space is 29.8 %
- Several variations to insulation levels are possible although all will increase the capital cost.
- If hydronic heating is to be considered, the slab on grade will lend itself to in floor radiant heat.

3.0 PHASE 2 - RECOMMENDATIONS

3.1 Introduction

The purpose of Phase 2 is to offer suggestions to the Owner's Architect as to how the Elders housing building envelope may be improved to provide better energy efficiency. The discussions are general in nature and are for information only. Increases in insulation levels may add to the capital cost of the project, however, decreased energy consumption will greatly reduce the operation costs and improve the life cycle cost of the complex. Cost Implications, which are modest, are shown on Page 8.

3.2 Suggested Changes to Building Components

Ceiling Insulation.

The heat loss through the combined ceilings of the housing units is 72.8 mil BTU (21332 kWh) annually. Adding insulation to this component is probably the least costly way to reduce heat loss. A cost evaluation should be done prior to final plan preparation to determine what extent insulation should be added, however, the material cost of R 20 Fibre Glass Batt insulation is approximately \$0.38 per square foot.

Exterior Walls.

The heat loss through the combined main walls of Units "A", "B", and "C" is 104.6 mil BTU (30635 kWh) annually and some upgrading of the insulation levels should be considered. The Ontario Building Code requires a minimum of R22 in exterior wall in areas where the annual degree days below 18°C exceed 5000. Two methods to be considered are:

- a) Provide additional insulation to the exterior of the walls. This could be in the form of rigid SM insulation board (R 5 per inch) or glass fiber stock board (R 4.2 to 4.5 per inch).

See Figure 1

The advantages of using insulative sheathing are:

- Plywood or similar sheathing on the walls can be eliminated if diagonal bracing of wood or preformed metal "Tee" is used.
- Incremental costs over standard framing are relatively small.
- Construction materials are readily available.

The disadvantages are:

- Some backing problems may be encountered when installing siding.
- Electrical boxes and plumbing penetrations require separate sealing.
- "Build out" around windows and doors is required.

Exterior Walls. (Continued)

Exterior Walls. (Continued)

- b) Install an inner wall (either horizontal strapping or staggered vertical studs). Using 2x3 material will provide a space for an additional R8 in the form of fiber glass batts. The air barrier or vapor barrier is placed between the studs and strapping.

See Figure 2

The advantages are:

- The inner layer of insulation covers the studs and reduces thermal bridging.
- Insulation levels of R28 or higher can be achieved.
- Electrical boxes can be installed without penetrating the vapor barrier.
- Backing difficulties for siding installation are avoided.
- This method can be used with the insulative sheathing described in a)

The disadvantages are:

- If horizontal strapping is used, blocking to support kitchen cabinets, baseboards, etc. must be considered.
- "Build outs or extensions" are required around windows and doors.
- Some interior floor space area will be lost.

Windows.

The combined annual heat loss through the windows is 58.4 Mil BTU (17125 kWh). These heat losses have been calculated using a fairly lenient R value of 2.52. The windows being proposed are triple pane with the outer layer of lexan. The Architect should be encouraged to investigate high performance windows.

Long-wave radiative heat transfer is the major heat loss mechanism in conventional windows. This heat transfer is reduced by including a low emissivity (Low-E) coating in the window construction. Another source of heat transfer often overlooked is the spacers used to separate the glazings. Various insulative values for these spacers are available from window manufacturers.

It is not the intention here to investigate all the available window products but some attention should be given to the performance of various types of windows and a cost vs. benefit comparison made.

Floor, Foundation and Crawl Space

Almost one third of the annual heat loss on the buildings proposed is through the foundation and crawl space. The combined annual heat loss is 170.5 Mil BTU (49943 kWh).

Before considering possible upgrades to this building component, it would be wise to discuss the various heating systems. Since the intent of the cogeneration project is to deliver electricity and hot water to the Elder's complex, it is assumed that the heating system will be a hydronic type. The types of systems generally used are radiant floor, radiant ceiling, radiant baseboard panels, hydronic convectors or fin tube radiators and forced air (using hot water coils in an air handling unit).

Floor, Foundation and Crawl Space (Continued)

The following table makes some comparisons of these systems.

| Type | Pros | Cons | Relative Operating Cost |
|--------------------------|---|---|-------------------------|
| Radiant floor | occupant comfort best cost performance system not visible | higher capital cost | 1.00 |
| Radiant ceiling | good for retrofits | not common | 1.08 |
| Radiant baseboard Panels | easily installed attractive | not widely used high cost | 1.08 |
| Convectors | widely used | capital cost visible | 1.27 |
| Forced air | lowest installation cost | moves dust & micro organisms about dwelling | 1.47 |

The preferred system is generally thought to be radiant in floor which provides comfort as well as economy of operation. Initial reaction from some designers is that this type of system is too expensive, however, recently introduced Pex pipe (a cross linked polyethylene plastic), simple manifolds and related equipment have reduced the cost of materials and labor requirements.

Slab on Grade

Details of the slab on grade are shown in Figure 1 and Figure 2

A slab on grade consists of a concrete slab with a thickened perimeter edge reinforcing, or a slab with a perimeter foundation wall. This type of foundation can be insulated beneath the slab and on the edge.

Advantages of a slab on grade.

- Can be less expense than traditionally framed and poured foundation
- Properly insulated the slab can be used for thermal storage
- A slab on grade is less susceptible to moisture damage than crawl spaces
- The heating system can be placed in the floor. (i.e. radiant in floor)

When considering a slab on grade foundation the following points should be addressed.

- The designer should thoroughly investigate the site conditions.
- The slab shall be designed to resist frost heave.
- The slab should be placed on a well draining granular layer
- Care should be taken to properly insulate the slab edge and lower wall plates.

3.3 Recommendation Summary

It is recommended that the insulation levels in the ceiling be upgraded to R 60. The cost of insulation material will be approximately \$0.38 for an additional 6" layer.

The insulation in the exterior walls must be upgraded to R22 in order to meet the Ontario Building code and should be at least R 30.

With the assumption that a hydronic heating system is to be installed for the Elders Housing Complex, in-floor radiant heat with a slab on grade foundation is the preferred choice. The higher capital cost of the heating system is offset by the time and material savings of installing a slab on grade rather than a crawl space. Superior comfort and the best cost performance are also factors in the choice of this system.

The combined annual heat loss through the windows of the Elders Housing complex accounts for over 8% of total concentrated heat loss. Therefore, in order to keep heating costs down and to maintain an environment of comfort, care must be taken in choosing an appropriate item.

The plans that represent the proposed building construction are typical of minimum building requirements and should be checked to see if they conform to the current Ontario Building Code.

The suggestions forwarded represent a system compatible with the hot water delivered by the cogeneration facility in an efficient manner. Attention to detail in the construction phase while adhering to these suggestions will provide a comfortable and efficient building complex.

House Data Filename=Scott:H2k:H2k:Dat:ELDERA1.HDF

Weather Data is for ARMSTRONG, ONTARIO

Builder Code =n/a Data Entry by:RDM

Client name: CMHC C Ives
 Street address: for Whitesand F N
 City: Region:
 Postal code: Telephone:

*** GENERAL HOUSE CHARACTERISTICS ***

House type: (Individual) Apartment unit
 Number of storeys: One storey
 South side obstruction: 1% to 25% obstruction by Buildings
 Wall construction: Single stud wall

SOIL TYPE: Normal Conductivity: dry sand, loam, clay, low water table

HOUSE THERMAL MASS LEVEL: (A) Wood frame construction, 0.5 in. gyproc walls
 and ceiling, wooden floor

Occupants : 2 Adults for 80.0 % of the time
 0 Children for 20.0 % of the time

*** HOUSE TEMPERATURES ***

Heating Temperatures Main Floor = 72.0 F
 Basement = 68.0 F
 TEMP. Swing from 72.0 F = 6.3 F

*** FOUNDATION CONSTRUCTION CHARACTERISTICS ***

| Foundation Construction | Attachment Sides | Insulation Placement |
|-------------------------|------------------|----------------------|
| Shallow Basement | None | Exterior |

*** WINDOW CHARACTERISTICS ***

*** AIR LEAKAGE AND VENTILATION ***

Building Envelope Surface Area = 2243.6 Ft2
 Air Tightness Level is Present (3.57 ACH @50 Pa.)
 Building Envelope is NOT Sheltered from the Wind.
 Estimated Equivalent Leakage Area = 44.2 in2
 Normalized Leakage Area = .0197 in2/ft2
 Estimated Airflow to cause a 5 Pa Pressure Difference = 38 cfm
 Estimated Airflow to cause a 10 Pa Pressure Difference = 60 cfm
 ELA used to calculate Estimated Airflows = 17.7 in2

F-326 VENTILATION REQUIREMENTS:

Kitchen,living,dining: 3 rooms @ 10 cfm = 30 cfm
 Bedrooms: 1 rooms @ 20 cfm = 20 cfm
 Bathrooms: 1 rooms @ 10 cfm = 10 cfm
 Basement Rooms: 0 cfm

F-326 Required continuous ventilation rate = 53.0 cfm (.39 ACH)
 Average Ventilation Supply Rate (Balanced) = 55.0 cfm (.41 ACH)

Ventilation System: Heat recovery ventilator (HRV)
 Manufacturer: Flair
 Model Number: 3055

Fan and Preheater Power at 32.0 F = 97. Watts
 Fan and Preheater Power at -13.0 F = 76. Watts
 PreHeater Capacity: = 0. Watts
 Sensible Heat Recovery Efficiency at 32.0 F = 61. %
 Sensible Heat Recovery Efficiency at -13.0 F = 60. %
 Total Heat Recovery Efficiency in Cooling mode = 0. %

 Low Temperature Ventilation Reduction = 16. %
 Low Temperature Ventilation Reduction: Airflow Adjustment= 10 cfm (18.4 %)

NO Vented combustion appliance specified

Gross Air Leakage and Ventilation Energy Load = 35.577 Mil.BTU
 Seasonal Heat Recovery Ventilator Efficiency = 60.074 %
 Estimated Ventilation Electrical Load: Heating Hours = 2.711 Mil.BTU
 Estimated Ventilation Electrical Load: Non-Heating Hours = .035 Mil.BTU
 Net Air Leakage and Ventilation Energy Load = 20.324 Mil.BTU

*** SPACE HEATING SYSTEM ***

PRIMARY Heating Fuel : Electricity
 Equipment : Baseboard/Hydronic/Plenum (duct) heaters
 Manufacturer :
 Model :
 Output Capacity = 50000.0 BTU/hr

 Steady State Efficiency = 100.0 %

*** ANNUAL SPACE HEATING SUMMARY ***

Design Heat Loss at -36.4 F = 2.56 BTU/hr/Ft3 = 20747. BTU/hr

 Gross Space Heating Load = 60.691 Mil.BTU
 Sensible Daily Heat Gain From Occupants = 2.56 kWh/day
 Usable Internal Gains = 21.883 Mil.BTU
 Usable Internal Gains Fraction = 36.1 %
 Usable Solar Gains = 2.384 Mil.BTU
 Usable Solar Gains Fraction = 3.9 %
 Ventilation Equipment Electrical Contribution = 1.356 Mil.BTU
 Auxiliary Energy Required = 36.425 Mil.BTU

 Space Heating System Load = 36.425 Mil.BTU
 Furnace/Boiler Seasonal efficiency = 100.0 %
 Furnace/Boiler Annual Energy Consumption = 36.425 Mil.BTU

*** DOMESTIC WATER HEATING SYSTEM ***

PRIMARY Water Heating Fuel : Electricity
Water Heating Equipment : Electric tank

Manufacturer :
Model :
Tank Capacity = 40.0 Imp Gal
Seasonal Efficiency = 93.0 %

*** ANNUAL DOMESTIC WATER HEATING SUMMARY ***

Daily Hot Water Consumption = 49.0 Imp Gal /day
Estimated Domestic Water Heating Load = 15.327 Mil.BTU

PRIMARY Domestic Water Heating Energy Consumption = 16.480 Mil.BTU

*** LIGHTING AND APPLIANCES SUMMARY ***

Total Electrical Load = 16.0 kWh/day
Average External Electrical Load = 2.0 kWh/day
Total Annual Energy Consumption = 5840. kWh

*** FAN OPERATION SUMMARY (kWh) ***

| Hours | HRV/Exhaust Fans | Space Heating | Space Cooling |
|---------|------------------|---------------|---------------|
| Heating | 794.6 | .0 | .0 |
| Neither | 10.1 | .0 | .0 |
| Cooling | .0 | .0 | .0 |
| Total | 804.8 | .0 | .0 |

*** R-2000 HOME PROGRAM ENERGY CONSUMPTION SUMMARY REPORT ***

Estimated Annual Space Heating Energy Consumption = 38430. MJ = 10675.1 kWh
Ventilator Electrical Consumption: Heating Hours = 2861. MJ = 794.6 kWh
Estimated Annual DHW Heating Energy Consumption = 17388. MJ = 4829.9 kWh

ESTIMATED ANNUAL SPACE + DHW ENERGY CONSUMPTION = 58678. MJ = 16299.6 kWh
ANNUAL R-2000 SPACE + DHW ENERGY CONSUMPTION TARGET = 41217. MJ = 11449.2 kWh

Estimated Annual Base Electrical Energy Consumption= 21024. MJ = 5840.0 kWh
Ventilator Electrical Consumption: Non Heating Hours= 36. MJ = 10.1 kWh

*** ESTIMATED ANNUAL FUEL CONSUMPTION SUMMARY ***

| Fuel | Space Heating | Space Cooling | DHW Heating | Appliances | Total |
|-------------------|------------------|------------------|----------------|------------|---------|
| Electricity (kWh) | 11469.7 | .0 | 4829.9 | 5850.1 | 22149.7 |

Energy units: MIL.BTU = Million British Thermal Units (3413 BTU = 1 kWh)

The calculated heat losses and energy consumptions are only estimates, based upon the data entered and assumptions within the program. Actual energy consumption and heat losses will be influenced by construction practices, localized weather, equipment characteristics and the lifestyle of the occupants.

House Data Filename=Scott:H2k:H2k:Dat:ELDERA1R.HDF

Weather Data is for ARMSTRONG, ONTARIO

Builder Code =n/a Data Entry by:RDM

Client name: CMHC C Ives
 Street address: for Whitesand F N
 City: Region:
 Postal code: Telephone:

*** GENERAL HOUSE CHARACTERISTICS ***

House type: (Individual) Apartment unit
 Number of storeys: One storey
 South side obstruction: 1% to 25% obstruction by Buildings
 Wall construction: Single stud wall

SOIL TYPE: Normal Conductivity: dry sand, loam, clay, low water table

HOUSE THERMAL MASS LEVEL: (A) Wood frame construction, 0.5 in. gyproc walls
 and ceiling, wooden floor

Occupants : 2 Adults for 80.0 % of the time
 0 Children for 20.0 % of the time

*** HOUSE TEMPERATURES ***

Heating Temperatures Main Floor = 72.0 F
 Basement = 68.0 F
 TEMP. Swing from 72.0 F = 6.3 F

*** FOUNDATION CONSTRUCTION CHARACTERISTICS ***

Foundation Construction Attachment Sides Insulation Placement
 Slab on Grade None Edge/Exterior

*** WINDOW CHARACTERISTICS ***

*** AIR LEAKAGE AND VENTILATION ***

Building Envelope Surface Area = 1860.7 Ft2
 Air Tightness Level is Energy tight (1.5 ACH @50 Pa.)
 Building Envelope is NOT Sheltered from the Wind.
 Estimated Equivalent Leakage Area = 11.9 in2
 Normalized Leakage Area = .0064 in2/ft2
 Estimated Airflow to cause a 5 Pa Pressure Difference = 10 cfm
 Estimated Airflow to cause a 10 Pa Pressure Difference = 16 cfm
 ELA used to calculate Estimated Airflows = 4.7 in2

F-326 VENTILATION REQUIREMENTS:

Kitchen, living, dining: 3 rooms @ 10 cfm = 30 cfm
 Bedrooms: 1 rooms @ 20 cfm = 20 cfm
 Bathrooms: 1 rooms @ 10 cfm = 10 cfm
 Basement Rooms: 0 cfm

F-326 Required continuous ventilation rate = 63.6 cfm (.76 ACH)
 Average Ventilation Supply Rate (Balanced) = 64.0 cfm (.77 ACH)

Ventilation System: Heat recovery ventilator (HRV)
 Manufacturer: Flair
 Model Number: 3055

| | | |
|--|---|------------------|

| Furnace/Boiler Annual Energy Consumption | = | 18.610 Mil.BTU | | |

*** DOMESTIC WATER HEATING SYSTEM ***

PRIMARY Water Heating Fuel : Electricity
 Water Heating Equipment : Electric tank

Manufacturer :
 Model :
 Tank Capacity = 40.0 Imp Gal
 Seasonal Efficiency = 93.0 %

*** ANNUAL DOMESTIC WATER HEATING SUMMARY ***

Daily Hot Water Consumption = 49.0 Imp Gal /day
 Estimated Domestic Water Heating Load = 15.327 Mil.BTU

PRIMARY Domestic Water Heating Energy Consumption = 16.480 Mil.BTU

*** LIGHTING AND APPLIANCES SUMMARY ***

Total Electrical Load = 16.0 kWh/day
 Average External Electrical Load = 2.0 kWh/day
 Total Annual Energy Consumption = 5840. kWh

*** FAN OPERATION SUMMARY (kWh) ***

| Hours | HRV/Exhaust Fans | Space Heating | Space Cooling |
|---------|------------------|---------------|---------------|
| Heating | 794.6 | .0 | .0 |
| Neither | 10.1 | .0 | .0 |
| Cooling | .0 | .0 | .0 |
| Total | 804.8 | .0 | .0 |

*** R-2000 HOME PROGRAM ENERGY CONSUMPTION SUMMARY REPORT ***

Estimated Annual Space Heating Energy Consumption = 19634. MJ = 5454.0 kWh
 Ventilator Electrical Consumption: Heating Hours = 2861. MJ = 794.6 kWh
 Estimated Annual DHW Heating Energy Consumption = 17388. MJ = 4829.9 kWh

ESTIMATED ANNUAL SPACE + DHW ENERGY CONSUMPTION = 39883. MJ = 11078.5 kWh
 ANNUAL R-2000 SPACE + DHW ENERGY CONSUMPTION TARGET = 32456. MJ = 9015.5 kWh

Estimated Annual Base Electrical Energy Consumption= 21024. MJ = 5840.0 kWh
 Ventilator Electrical Consumption: Non Heating Hours= 36. MJ = 10.1 kWh

*** ESTIMATED ANNUAL FUEL CONSUMPTION SUMMARY ***

| Fuel | Space Heating | Space Cooling | DHW Heating | Appliances | Total |
|-------------------|---------------|---------------|-------------|------------|---------|
| Electricity (kWh) | 6248.6 | .0 | 4829.9 | 5850.1 | 16928.6 |

Energy units: MIL.BTU = Million British Thermal Units (3413 BTU = 1 kWh)

The calculated heat losses and energy consumptions are only estimates, based upon the data entered and assumptions within the program. Actual energy consumption and heat losses will be influenced by construction practices, localized weather, equipment characteristics and the lifestyle of the occupants.

APPENDIX "C"

Pragmatic Engineering

"Our Product is Knowledge and Experience"

Our discipline is Civil Engineering and our base is Knowledge and Experience. Today's new and rapidly changing technology has given us the tools to establish a unique place in the Engineering Service Sector in Canada and Abroad. Our dynamic, efficient, personal firm offers expert solutions to many of the Engineering enigmas which exist in these times of business streamlining and uncertain economy.

Problem solving by the use of careful study and research techniques followed by intelligent cost effective design is Practical Engineering. Our firm is dedicated to Practical Engineering.

We welcome the opportunity to assess new challenges. Your inquiries for proposals and preliminary discussions will receive prompt attention.

PERSONNEL

SENIOR ENGINEER

Donn Milligan, B.Sc., P.Eng. has been practicing Engineering for over 35 years. He has been engaged in the construction industry as project engineer or contractor since 1963 in Northwestern Ontario. During that time he has applied practical engineering fundamentals to construction and project management. He has seen a variety of designs used on a large number of projects with varying degrees of difficulty. This varied experience has provided Mr. Milligan with ability to assess not only the proper design for the client, but the sensible approach to keep construction costs to a minimum. In short, a completely balanced design.

EDUCATION

Bachelor of Science in Civil Engineering, University of Alberta, 1957

PROFESSIONAL STATUS

Registered Professional Engineer in Ontario

MEMBERSHIP

Association of Professional Engineers of Ontario
Chamber of Commerce
Kenora Construction Association

PROFESSIONAL EXPERIENCE

Studies

Project Development Proposals, Land Use, Community Plans, Capital Plans, Cost Estimates and Analysis, Evaluation of Existing Services, Terrain and Topography Analysis, Environmental Impact and Assessment, Investigative and Feasibility Reports.

Design

District Heating Systems, Residential Subdivisions, Municipal Works, Roads, Water Supply, Water Distribution, Water Treatment, Sewage Collection and Waste Water Treatment.

Energy Efficient Housing.

Small Commercial, Educational and Community Buildings.

Recreational Facilities such as marinas, docks, cottages, small water systems and septic treatment systems.

Construction

° **Municipal** ° Installation of piped services by open cut, rock excavation, wood and steel sheeting, well points and boring for such works as extensions to existing water and sewer systems, storm sewers, interceptor sewers, force mains and outfalls. Municipal Plants such as water pumping stations, sewage lift stations, elevated water storage tanks and standpipes, sewage treatment plants and lagoons.

° **Industrial** ° Construction of irrigation systems, process piping, installation of pre-fabricated treatment plants and treatment lagoons, outfalls, land fill site work, excavations and dewatering for Mines, Paper companies and Government agencies.

° **Commercial** ° Excavation and preparation of foundations, site work, road access, parking lots, storm drainage, landscaping for numerous commercial buildings.

Field Services

Topographical and construction surveys, site layouts, technical inspections, construction supervision, project management and contract administration, start-up monitoring, operation and maintenance manuals.

Energy Conservation

Energy efficiency in housing and small buildings, R-2000 evaluation and inspections, air tightness testing, heat loss calculations, energy efficiency audits, efficiency retrofitting, efficient lighting, HRAI ventilation design.

Computer

Computer assisted drafting and design, modelling, graphics, word and data processing.

SPECIALISTS

Mr. Milligan has a good understanding of the fundamentals of specialized fields such as architecture, soil mechanics, structural design and mechanical and electrical processes, however to ensure quality projects, the expertise of specialists may be required and engaged.

EMPLOYMENT HISTORY

- 1956 - 62 During this period, Mr. Milligan was employed in the Yukon and Northern British Columbia on a variety of Engineering projects with the following firms or agencies:
 Northwest Power & Industries Ltd. - Party chief and Topographical Surveyor.
 Yukon Territorial Government - Highway Inspector/Designer
 T Newton Engineering - Resident Engineer.
- 1963 - 65 L. W. Wardrop and Associates, Consulting Engineers, - Project Engineer on various projects in Fort William (Thunder Bay) and Fort Frances, Ontario; Rankin Inlet, NWT
- 1965 - 82 President and General Manager of Sub-Strata Construction Ltd., Thunder Bay. Mainly concerned with construction of municipal services in Northwestern Ontario
- 1983 - Self employed as an Engineer in Private Practice

RESOURCE PERSON

Irene Milligan has established herself as a very capable Resource Person. Her expertise includes accounting, finance and administration.

EDUCATION

Secondary School Diploma, St. Patrick High School, Fort William (Thunder Bay).
2 Credits, Fine Arts - Lakehead University.
1 Credit, Native People and the Law - Confederation College.
Various non credit courses in computers, time management and business relations.

PROFESSIONAL EXPERIENCE

Accounting

Accounting Procedures for Businesses, Construction Companies, Mining Exploration firms and First Nations Bands. Use of ACCPAC software.

Studies

Community Surveys, Needs Assessment, Housing Studies, Natural Resource and Economic Studies, Cost Benefit Analysis, Project Funding Proposals, Business Plans.

Management

Effective Business Management, Continuous Project Quality Control and Monitoring.

Training

Development and Implementation of Training Plans in various Construction Trades, Office Procedures and Management, Proper Accounting Practices, Computers.

Liaison

Consultation and Communication between Client and Political Leaders, Civil Service or Financial Supporters.

EMPLOYMENT HISTORY

| | |
|-----------|---|
| 1956 - 59 | F.H. Black & Co. Chartered Accountants - Auditor Trainee. |
| 1959 - 64 | T.A. Jones General Contractor - Bookkeeper/Office Manager. |
| 1964 - 68 | Grant & Oja Mining Exploration Company - Office Manager. |
| 1968 - 70 | Tom Jones & Sons, General Contractor - Accountant. |
| 1970 - 81 | Sub-Strata Construction Ltd. - Secretary/Treasurer, Office Manager /Accountant. |
| 1983 - 87 | Wauzhushk Onigum First Nation - Band Administrator/Accountant. |
| 1987 - 88 | Wauzhushk Onigum First Nation - Economic Development Officer. |
| 1988 - | Self employed as a Resource Person. |

DESIGN TECHNICIAN

Scott Degagne is the most recent addition to the Corporation. His education and previous work experience have given him a broad base of knowledge and will continue to add yet another dimension to the services provided by the company.

ACADEMIC BACKGROUND

- 1995 R2000 Builders workshop
Energy efficient systems and building techniques
- 1994 HRIA Residential air system design
Heat loss calculations, heating, cooling, duct layout and design
- 1993 Industrial Design Diploma (co-op)
Fanshawe College, London, Ontario
AutoCAD, Technical Illustration, Product Design and Presentation
Textiles, Photography, 3D Model Fabrication
- 1990 Architectural Design and Technology
Confederation College, Thunder Bay, Ontario.
Drafting, Design Rendering Techniques, AutoCAD
- 1988 O.A.C. Graduate
Beaver Brae Secondary School, Kenora, Ontario

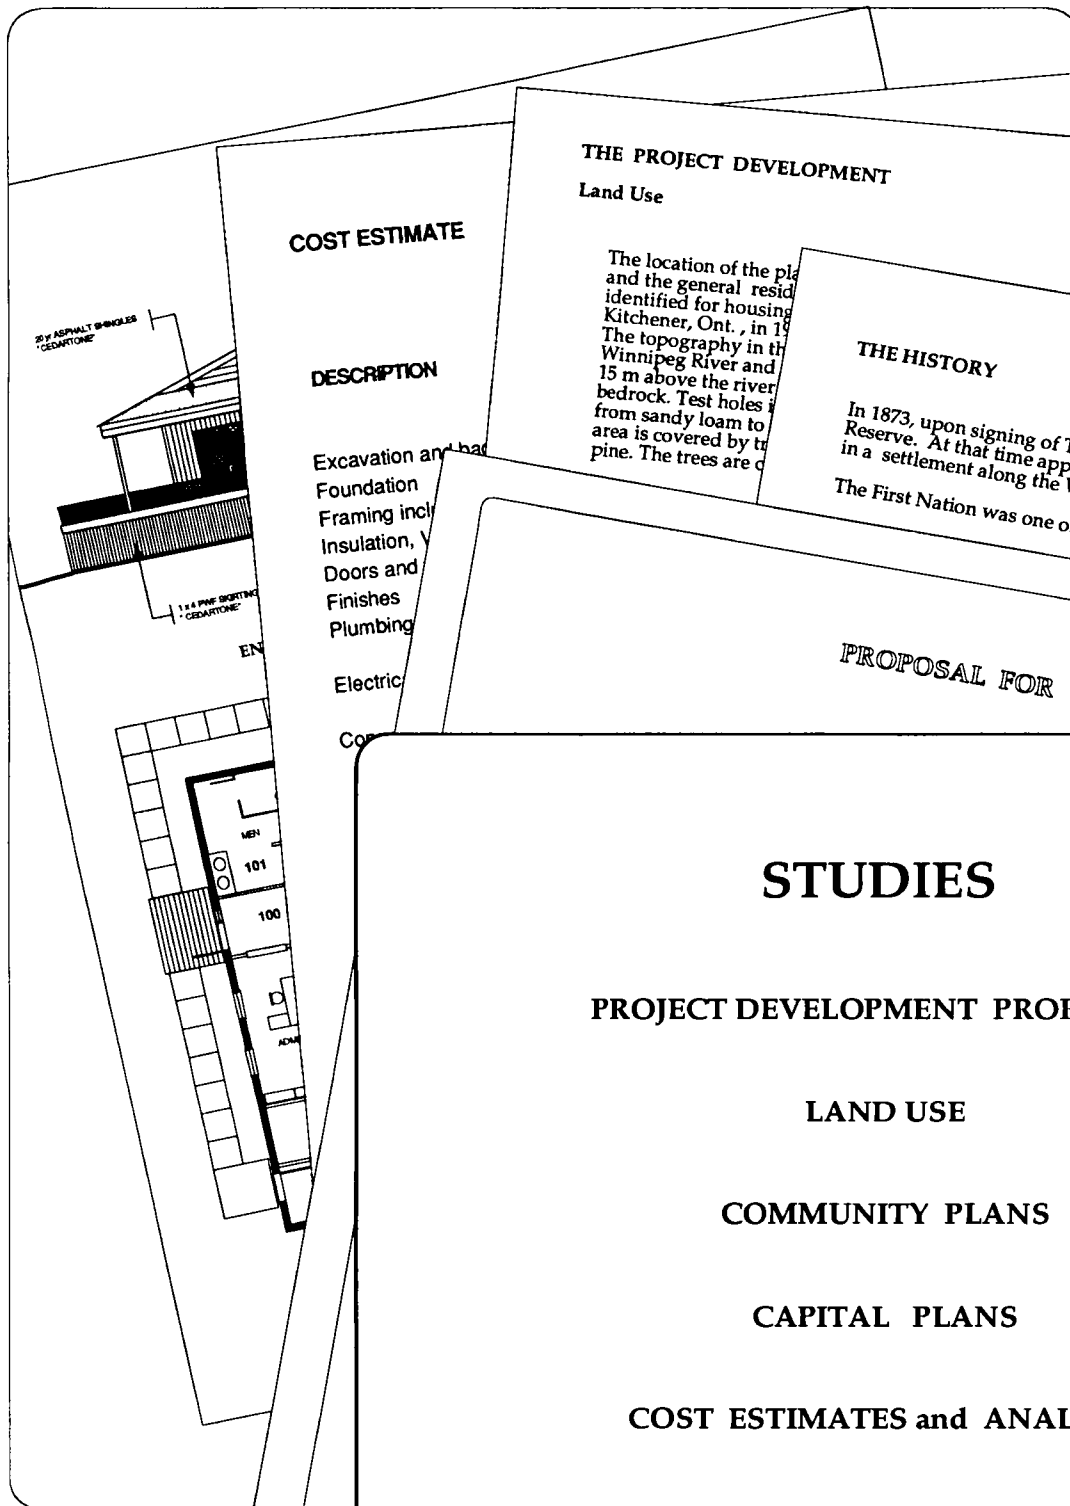

EMPLOYMENT EXPERIENCE

- 1995 Design Technician - 1050633 Ontario Inc. (Pragmatic Engineering)
- 1993 Signage Design and Fabrication - Parkway Gardens, Hyde Park, ON
- 1992 Handwear / Footwear Specification and Design - D.N.D., Hull, PQ
- 1990 Survey Technicians Assistant - BA Construction, Winnipeg, MB
- 1988 Hotel Maintenance - Lakeside Hotel, Kenora, ON

MEMBERSHIP

Mr. Degagne was a registered student member of the Association of Chartered Industrial Designers of Ontario (ACIDO) and is in the process of obtaining his professional membership.

SCHEDULE "A"
Terms Of Reference

SCHEDULE A -- TERMS OF REFERENCE

NO CHANGES TO THIS SECTION AND THE FOLLOWING UNLESS WRITTEN PERMISSION OF THE CORPORATION IS GIVEN.

1. PROJECT MANAGEMENT:

Principal Investigator:

Mr. R. Donn Milligan

CMHC Project Officer:

Mr. Christopher Ives
Research Division

2. STATEMENT OF WORK:

2.1 INTRODUCTION

The Whitesands First Nation is proposing to construct an Elders Housing project on their territory near Armstrong, Ontario. The architects have prepared preliminary drawings which indicate that electric heating will be used. The community is remote, off the Hydro grid and presently being service with electricity from diesel powered generators. Heating with electricity is expected to be extremely expensive.

In order to reduce the O&M costs for the project, CMHC is investigating the viability of providing a small cogeneration facility which will provide both electrical energy and energy for space heat and domestic hot water.

2.2 SCOPE OF WORK

The accurate determination of the heat loss and energy requirements for space heat, ventilation and domestic hot water will give some guidance in recommendations concerning energy efficiency and form the basis for determining the design loads for the cogeneration project. This work will be undertaken in the following manner.

Phase 1 - Preliminary Report

The preliminary report will analyse the building units as they are currently being proposed by the Architect. The report will show:

- ° Heat Loss calculations performed on the CANMET Hot 2000 computer program.

- ° List assumptions regarding building plans, occupancy, domestic hot water consumption and base electrical loads for appliances, etc.
- ° Show location and weather data.
- ° Air tightness type of building construction.

The preliminary report will also show a "what if" scenario should various components of the building be altered to show how some improvements in energy efficiency can be made.

Phase 2 - Recommendations regarding changes to Building Envelope

The final design of the building complex will be the decision of the Owner and his Architect, however, suggestions will be made for the owner to consider when reviewing the energy efficiency of the Elder's Units and incorporating a heating system which will be compatible to the hot water delivered by the cogeneration facility. These suggestions will consider:

- ° Ceiling insulation
- ° Exterior wall construction and insulation
- ° Floor and foundation
- ° Preferred hydronic heating systems

3. SCHEDULE OF TASKS AND ALLOCATION OF STAFF BY PHASES:

Phase 1: (Preliminary Calculation) - by 10 April 1995

Phase 2: (Final Report) - by 15 April 1995
