## ***Seasonal Rise Stalls on Middle Lakes*** **Water Levels Drop at Montréal Harbour**

Lakes Superior and Ontario monthly mean water levels rose about 8 cm from April to May, while smaller increases on the middle lakes suggest their seasonal rise has stalled. Water levels dropped significantly at Montréal Harbour.

Precipitation on the Lake Superior basin caused water levels to rise steadily during the latter part of May. The lake's monthly mean level increased by about its usual amount for this time of year. At the beginning of June the lake remains about 17 cm below its long-term average, but levels have increased to above chart datum.

Despite precipitation received over the Victoria Day weekend, the middle lakes experienced lower than average increases during May. Daily levels actually fell slightly during parts of the month. Mean monthly levels on Lakes Michigan-Huron and Erie increased by just 4 and 3 cm, respectively, compared to last month. Lake St. Clair's level remains virtually unchanged. On average, these three lakes rise between 8 and 10 cm at this time of year.

Although Lake Ontario's May level was 8 cm higher than April's it usually increases by about 13 cm at this time of year.

At the beginning of June, Lakes Michigan-Huron and Ontario were between 25 and 30 cm below their long-term averages. Lakes St. Clair and Erie were 5 to 10 cm below their averages.

Montréal Harbour's mean level fell about 1.2 m from April to May. The harbour's May level was more than 1.7 m below average and was a new record low since 1967 for the month. This level is close to the low experienced in 1964. By the end of the May, the harbour's level was about 10 cm below chart datum.

### **Lower Water Levels Mean New Hazards**

A recent letter to the Opinions page of *The Hamilton Spectator* highlighted a hazard often forgotten when discussing the recent drop in Great Lakes water levels. With youngsters about to begin enjoying their summer vacations, the author of the letter wanted to warn children and those responsible for their well-being, of the danger they face with water levels down significantly from last year.

Running off the dock or down the beach for that first dive of the year can result in serious, permanent damage to the head, neck and back. With levels much lower than last year, it is imperative that anyone responsible for children—parents, grandparents and camp counsellors—make them aware that as much as 65 cm of water is not there due to the dry conditions we are currently experiencing. Please check where the rocks are for swimming as well as boating and have a fun-filled, accident-free summer.

Level News is grateful to Mr. K. B. Paulin, of Burlington, for allowing us to share his timely message here.

## Accessing Water Level Data by Telephone

Present water levels on the Great Lakes and St. Lawrence River are available from a network of gauging stations operated by the Canadian Hydrographic Service. Phone numbers for the stations are listed below. When you call a particular station, the answering equipment will ask you to press 1 for English or 2 for French, on the keypad of your touch-tone phone. If you do not have a touch-tone phone, the message will start after a few seconds delay. The present water level is given in metres relative to chart datum at that station. Next the message gives the high and low water levels recorded during the previous 12 hours, followed by the elevation of chart datum. You can press 1 or 2 at any time during the message to have it start again, or press 0 to end the call. Call (905) 336-4844 (fax: (905)-336-8916 or e-mail: solvasonr@dfo-mpo.gc.ca) to report any problems or to obtain additional information.
