### 1.0 Context

This report was prepared for the Council of Science and Technology Advisors who required a comparative demographic analysis of Canadian labour market conditions and trends for science and technology workers in government, academe and in identified private sector segments. This report is a follow-up to the demographic analysis of the federal science and technology (S\&T) workforce analysis prepared under separate cover.

This reports provides information on the following:

- University enrolment trends in science and technology fields in Canada
- University graduation in science and technology fields in Canada
- Salaries of science graduates
- Science and technology careers in Canada
- The Canadian labour market for science occupations
- The international labour market for science occupations
- The aging Canadian workforce

### 2.0 Canadian University Enrolment and Graduation In Science Disciplines

The following 9 tables present the number of enrolments and graduates in science disciplines in Canada between 1994 and 1998 (more recent data is scheduled to be released in May 2002). University enrolment is covered in tables 1-3; the number of graduates is presented in tables 4-8. Table 9 presents trends in both enrolment and graduation.

## Enrolment

Tables 1-3 indicate the following:

- The number of enrolments in science disciplines at the undergraduate and graduate level has increased marginally over the 5 -year period under review.
- Full-time, undergraduate enrolment in science has increased by $5 \%$ between 1994 and 1999 from 138,676 enrolments in 1994-95 to 145,881 in 145,881. In contrast, enrolments in non-science fields declined $2 \%$ during the period under review. (Note that Statistics Canada includes Computer Science in the science fields. When excluded from the analysis the increase is $3 \%$ ).
- Of the 21 sub-categories of undergraduate enrolment in science fields noted in Table 2, eleven fields had an increase in enrolment, 4 fields by more than 10\% (excludes computer science).
- The fields of agriculture ( $11 \%$ ), other agricultural and biological sciences ( $11 \%$ ) and geology ( $23 \%$ ) experlenced the greatest gains in enrolments over the period.
- Caution should be used when reviewing the data by category (Table 1) given the inclusion of computer science. For example, the table indicates that the most significant increased occurred in the Mathematics and physical sciences category, (an 11\% increase). A closer look at this category (Table 2) reveals that when computer science is excluded, the category experienced a $17 \%$ decline in enrolment.
- At the graduate level, enrolments have increased $3 \%$ over the period. There were gains in the health professions category (12\%); and the agricultural and biological sciences fields ( $6 \%$ ) and declines in the mathematics and physical sciences $(-4.3 \%)$ and the engineering and applied sciences category ( $-10 \%$ ).

## Graduates

Tables 4 to 8 indicate the following:

- The number of graduates in science fields at all levels is increasing. At the Bachelor level, there was a $9 \%$ increase in graduates; $2 \%$ at the master's level and an $8 \%$ increase the number of doctorate degrees granted.
- Of the 20 sub-categories of graduates at the bachelor and first degree granted level for science fields noted in Table 4, thirteen fields had an increase in graduates, 7 fields by more than $15 \%$ (excludes computer science).
- The fields of agriculture ( $22 \%$ ), biology ( $23 \%$ ) and geology ( $32 \%$ ) experienced the greatest gains in bachelor and first degree granted over the period.
- An analysis by gender (Tables $6,7,8$ ) indicated that while the number of males exceeds the number of females in science fields, the percentage increase of females graduating exceeds that of males at the bachelor, master and PhD levels. For example, there was a $3 \%$ increase in the number of males receiving science related doctorate degrees and an increase of $24 \%$ in the number of females receiving a doctorate.
- The chart (Table 9) prepared by the Association of Universities and Colleges of Canada, indicates that recent trends (1988 - 1998) suggest stable PhD production in the mid-term.

## Salary of University Graduates in Science Disciplines

- While the information is somewhat dated (June 1995), a review of the salary levels of 1990 university graduates working full time in June 1995 indicates that science grads at the bachelor level earned between $\$ 35,000$ and $\$ 52,000$. For those with master's degrees, the salary ranged between $\$ 40,000$ and $\$ 50,000$. At the doctorate level, salary ranges were $\$ 38,000-\$ 59,000$.
- Generally speaking, women earned less than men. The only exceptions were: women in the mathematics and physical sciences category at the doctorate level; women in health professions at the masters levels; and, in agricultural and biological sciences where women ether earned the same as their male counterparts or earned $\$ 1000$ more annually.

Table 10
Estimated Median Annual Earnings of 1990 university graduates working full time in June 1995, by major field of Study and sex, Canada

### 3.0 Science and Technology Careers in Canada ${ }^{1}$

In the fall of 1997, Statistics Canada published an analysis of the careers of recent university graduates in science and technology. The following highlights were extracted verbatim from that report:

- Developing an interesting career in the applied sciences seems to have required going beyond the bachelor's degree, since employment opportunities, earnings and job satisfaction levels have generally been amongst the lowest for all graduates at the level but have been considerably higher at the master's and especially the doctorate level.
- Applied sciences graduates generally expressed the lowest levels of satisfaction with their choice of educational program (especially at the bachelor's level). The dissatisfaction may be a good summary measure of the relative lack of opportunities for interesting and rewarding careers they face, as well as an indication of the difficulties that may be encountered in attracting talented individuals into these disciplines in the future.
- Choosing a career in pure sciences has generally been associated with more positive outcomes than choosing one in applied sciences, but graduates have generally lagged behind those of the other science and technology fields (health, computer science, engineering) and in many cases have not fared as well as the SSH (social sciences, humanities and others) comparison group. Thu, a degree in pure sciences has been no guarantee of particularly abundant or interesting job opportunities at least not ones directly related to the degree. Overall satisfaction with the program choice has also not been very high.
- A degree in a health discipline has generally led to the greatest certainty of finding a job, and of that job being one closely related to the education program and one in which earnings and satisfaction levels are high. Health graduates have also expressed high levels of overall satisfaction with their choice of education program.
- Despite their moderately high unemployment rates in certain years, engineering graduates have generally expressed high levels of satisfaction with their jobs and their choices of education program, and have enjoyed reasonably high earnings levels. Regarding the job education skill match and job prerequisites, engineers seem to have been particularly well prepared for the job market: otherwise viewed, the marker for engineers seems to have done well at matching graduates to jobs.

[^0]
### 4.0 Science and Technology Labour Market

Statistics Canada defines the labour market in many ways - by industry, by broad occupational categories, by detailed industry, by industry division. In all cases it is necessary to make assumptions as to where science and technology workers with similar skills and qualifications to the federal government may be employed.

For purposes of this analysis of the science and technology labour market, the "broad occupational category" was used because it most closely follows S\&T categories. Table 11 is extracted from Statistics Canada data relating to the distribution of the labour force by broad occupational categories for males and females based on the 1991 census and the 1996 census. For purposes of this analysis it has been assumed that the following occupations categories contain science workers:

- Natural and applied sciences and related occupations
- Health occupations
- Occupations unique to primary industry

Given these assumptions, the table indicates that science and technology workers accounted for $30 \%$ of the labour market in 1991 and in 1996. The table also indicated that there are more males than females in the science and technology labour market.

By way of comparison, Table 12 presents a graph extracted from a review of S\&T labour markets in OECD Countries. The graph indicates and the reports states that persons working in an S\&T occupation accounted for $20-30 \%$ of the labour force in the European Union countries surveyed.

The report - Background Report An analysis of S\&T Labour Markets in OECD Countries by Mario Cervantes, science and Technology Division, OECD, presented at the OECD Workshop on S\&T Labour markets, May 17, 1999 concluded the following:
"Human resources in science and technology labour markets are of vital importance to the competitiveness of OECD economies. While measuring the number of people working and/or educated in science and technology is a highly complex issue, the above analysis confirms the growing demand for S\&T labour across sectors and countries but also reveals profound mutations in the labour market for S\&T personnel. A trend rise in temporary employment, a decline in public employment and rapidly changing skill requirements all increase pressures for greater flexibility and mobility in S\&T labour markets. Across sectors and firms, employers are seeking S\&T personnel with multiple skills who can adapt quickly to new tasks and to changing market demands. Even the public research sector which still employs a significant share of S\&T personnel in some countries, is facing the same challenges as industry (e.g. globalization of research, rising research costs, shrinking budgets, and need for

### 4.0 Science and Technology Labour Market

Statistics Canada defines the labour market in many ways - by industry, by broad occupational categories, by detailed industry, by industry division. In all cases it is necessary to make assumptions as to where science and technology workers with similar skills and qualifications to the federal government may be employed.

For purposes of this analysis of the science and technology labour market, the "broad occupational category" was used because it most closely follows S\&T categories. Table 11 is extracted from Statistics Canada data relating to the distribution of the labour force by broad occupational categories for males and females based on the 1991 census and the 1996 census. For purposes of this analysis it has been assumed that the following occupations categories contain science workers:

- Natural and applied sciences and related occupations
- Health occupations
- Occupations unique to primary industry

Given these assumptions, the table indicates that science and technology workers accounted for $30 \%$ of the labour market in 1991 and in 1996. The table also indicated that there are more males than females in the science and technology labour market.

By way of comparison, Table 12 presents a graph extracted from a review of S\&T labour markets in OECD Countries. The graph indicates and the reports states that persons working in an S\&T occupation accounted for $20-30 \%$ of the labour force in the European Union countries surveyed.

The report - Background Report An analysis of S\&T Labour Markets in OECD Countries by Mario Cervantes, science and Technology Division, OECD, presented at the OECD Workshop on S\&T Labour markets, May 17, 1999 concluded the following:
"Human resources in science and technology labour markets are of vital importance to the competitiveness of OECD economies. While measuring the number of people working and/or educated in science and technology is a highly complex issue, the above analysis confirms the growing demand for S\&T labour across sectors and countries but also reveals profound mutations in the labour market for S\&T personnel. A trend rise in temporary employment, a decline in public employment and rapidly changing skill requirements all increase pressures for greater flexibility and mobility in S\&T labour markets. Across sectors and firms, employers are seeking S\&T personnel with multiple skills who can adapt quickly to new tasks and to changing market demands. Even the public research sector which still employs a significant share of S\&T personnel in some countries, is facing the same challenges as industry (e.g. globalization of research, rising research costs, shrinking budgets, and need for
multidisciplinary skills) with implications for supply and demand of S\&T personnel. ${ }^{\text {2 }}$

It would appear that the issues facing the Canadian S\&T labour market are similar to those experienced in other countries specifically the use of temporary workers (i.e. terms), decline in public employment (although there have been gains over the last 2 years), and rapidly changing skill requiréments.

That report concludes with the following recommendation:
> "Meeting the challenges that lie ahead for S\&T personnel will require strengthening partnerships between OECD governments and business to provide workers with the skills for the knowledge economy and to remove impediments to their contribution to advancing research and innovation."3

### 5.0 The Aging Workforce

The demographic analysis of the federal Science and Technology workforce indicated that the population was aging. In fact, as of November 30, 2001, 13.3\% of the population was 55 years or older. Table 13 presents the age profile of the Canadian population based on the 2001 census. The table indicates that $22 \%$ of Canadians are 55 years of age or over.

William B.P. Robson writes in Aging Populations and the Workforce - Challenges for Employers that the birth rate has declined since the 1960's and that, as a result, the growth in the population considered to be of labour force age (15-64-years olds) is slowing. By the second decade it is projected to grow very sluggishly and by the following decade, the population aged $15-64$ is likely to stagnate or shrink (Table 14).

The study of the impact of this trend on employers indicates:
... the potentially chronic labour shortages that loom ahead will require responses in many areas - hiring and contracting, work scheduling, training, compensation and job assignment, and workplace organization. Many current public policies are inconsistent with future needs, and the long lead times for reform mean that employers need to keep policy makers abreast of the challenges and urge them to timely action."4
