Interpretation of results	28

Background

The Research Unit of the Child Support Team is currently involved in the collection of child support-related data from multiple court sites across Canada. A total of 32 courts are providing data from every province except Quebec. In support of this research activity, the research team has requested that supplementary statistical analysis and profiling of the Central Divorce Registry database be undertaken to show two things in particular. The first is a profile of how the selected court sites in each province compare to the court sites that were not chosen. The second is to apply a statistical technique (in this report it was cluster analysis) which will help to identify the "representativity" of the selected courts relative to the other courts within each of the provinces and territories.

Methodology

The information for this study was drawn from the Central Divorce Registry data base for 1996 which contains data originally collected by the Department of Justice Canada and provided to Statistics Canada for processing and public release. Both the adult and child data bases were included in the analysis. This data base is built from an administrative system. Therefore, the relevance of the data fields and the quality of the fields had to be determined and the design of the project built around what is possible with the amount and quality of information available.

The project was approached in two parts in order to be able to answer the two questions posed by the Child Support Team's Research Unit. For the first part of the study, data elements were chosen according to the quality and availability of information from the divorce data base. The criteria were that they had to be sufficiently robust to allow for national, provincial and territorial frequencies. These frequencies were intended to describe some of the high level differences or similarities between the courts that were included in the selected sites and those that were not. The second part of the study required additional subsetting of data, the normalization of data values and the derivation of variables. The purpose of this part of the study was to apply a cluster analysis technique in order to show the groupings of court sites according to selected variables that were considered to be important in defining the characteristics of courts at the individual record level. The use of cluster analysis is discussed in further detail in the methodology section of Section Two of this study.

The two parts of this study have some common links in that they identify the similarities and differences that exist between courts. It is important to note, however, that the type and level of analysis are very different. A frequency count of selected courts versus non-selected courts can show large differences or similarities between the two groups; however, the data are only applied in two or three dimensions. A cluster analysis, on the other hand, is a much more detailed level of analysis where each record for every court is included in the analysis and all courts are compared to each other by every variable. With a cluster analysis the data are plotted in multiple dimensions because of the linkages between the court level records, the courts themselves and the variables. Due to the

differences in the application of the analysis, the results between these two types of approaches may at times seem contradictory; however, much of this inconsistency can be explained by the different methodologies and analysis applied.

SECTION ONE: THE COMPARISON OF SELECTED AND NON-SELECTED COURT SITES

For comparative purposes, the court sites selected for the child support guidelines multiple site study are highlighted in the frequency distribution tables that follow. As well, in the second table of each provincial and territorial analysis, the comparison of frequencies between selected sites that seem especially relevant are also highlighted for easier identification. For each of the provinces and territories, some of the more notable differences between the court sites are indicated.

In order to make linkages between the comparison of frequencies and the outcome of the cluster analysis, some of the findings of the analysis are provided at the end of each provincial profile. The actual findings of the analysis can be found in greater detail in Section Two of this report.

Newfoundland

The selected court site in Newfoundland (1002, Unified Family Court, Supreme Court of Newfoundland) represents the largest court in Newfoundland in terms of volume. Nearly one-half (47 percent) of the provincial caseload is handled in this court.

COURTID	Frequency	Percent	Cumulative Frequency	Percent
1001	82	7.7	82	7.7
1002	495	46.7	577	54.4
1004	199	18.8	776	73.2
1005	90	8.5	866	81.7
1006	49	4.6	915	86.3
1007	79	7.5	994	93.8
1008	66	6.2	1060	100.0

In terms of numbers, it is more than sufficient to represent the province in a sample. However, there are some characteristics in the selected court site which differ from the other courts in the province that may, or may not, be relevant to the court site study:

- Fewer divorces without hearings and more uncontested hearings;
- Fewer dependants/children involved; and
- Considerably more joint custody awards and fewer awards to the wife only.

Variable	Court = 1002 N = 495 %	Court = all others N = 565 %
Applicants		
Husband	35.0	33.0

1	19.0	22.0
2	20.0	25.0
3	7.0	6.0
4+	1.0	2.0
Custody Code		
(1) Awarded to husband	6.0	10.0
(2) Awarded to wife	52.0	71.0
(3) Joint custody	42.0	19.0
(4) Awarded to another person	0.2	0.4

Cluster Analysis Results

Although there are a small number of sites in the province, the results of the cluster analysis shows a high degree of similarity (RMS=0.31 to 0.88), particularly among four of the seven sites including 1002, 1004, 1005 and 1007, which together account for 80 percent of the provincial caseload (see Section Two for additional information).

Prince Edward Island

Both courts reporting divorce data in the province are included in the Child Support Guidelines Study.

COURTID	Frequency	Percent	Cumulative Frequency	Percent
1101	153	64.6	153	64.6
1102	84	35.4	237	100.0

The characteristics of the two sites are similar; however, there are some differences in the proportions of the responses:

- Court 1101 has a slightly higher proportion of proceedings without a hearing and a lower proportion of uncontested cases;
- Court 1102 has more cases involving children; and
- There are some differences noted in the custody awards to the parents in that joint custody is more prevalent in site 1101 resulting in custody awards to husbands and wives being proportionally lower.

Variable	Court = 1101 N = 153 %	Court = 1102 N = 84 %
Applicants		
Husband	35	35
Wife	56	59

Variable	Court = 1101	Court = 1102
	N = 153 %	N = 84 %
Number of Children		
0	50	41
1	16	27
2	26	23
3	8	10
4+	1	
Custody Code		
(1) Awarded to husband	2	6
(2) Awarded to wife	39	41
(3) Joint custody	59	53
(4) Awarded to another person		

Cluster Analysis Results

There are only two courts in the province included in the data base and both are included in the study. However, the nature of the caseloads heard in these courts seems to be somewhat different statistically, resulting in a weak grouping as indicated by an RMS of 1.48 (see Section Two for further details).

Nova Scotia

The four selected sites in Nova Scotia (1201,1205,1206,1207—Supreme Court of Nova Scotia) account for over two-thirds (68 percent) of the provincial caseload total.

COURTID	Frequency	Percent	Cumulative	
			Frequency	Percent
1201	1004	45.1	1004	45.1
1202	67	3.0	1071	48.1
1203	122	5.5	1193	53.5
1204	189	8.5	1382	62.0
1205	117	5.3	1499	67.3
1206	265	11.9	1764	79.2
1207	136	6.1	1900	85.3
1208	123	5.5	2023	90.8
1209	72	3.2	2095	94.0
1210	46	2.1	2141	96.1
1211	5	0.2	2146	96.3
1213	10	0.4	2156	96.8
1214	8	0.4	2164	97.1
1215	9	0.4	2173	97.5
1217	22	1.0	2195	98.5
1218	10	0.4	2205	99.0
1220	23	1.0	2228	100.0

The chosen study sites are similar in a number of ways to the remaining sites; however, there are some differences noted:

- A smaller proportion of divorces without hearings in the study sites;
- Fewer cases involving children or the custody of children; and
- A slightly smaller proportion of cases resulting in sole custody to the mother and father and more cases with joint custody awards.

Variable	Court = 1201, 1205, 1206, 1207	Court = all others
	N = 1522 %	N = 706 %
Applicants		
Husband	28.0	27.0
Wife	60.0	59.0
Joint	12.0	13.0

(2) Awarded to wife	61.0	63.0
(3) Joint custody	33.0	28.0
(4) Awarded to another person	0.4	0.1

Cluster Analysis Results

The four selected sites were closely related (RMS less than 0.60) with six other sites that also fell below the level of association for the four selected sites. These sites in total account for well over 95 percent of the total caseload in the province (see Section Two for further details).

New Brunswick

The selected site (1301, Court of Appeal and Court of Queen's Bench) reported Fredericton divorce data only. It is estimated that this represents approximately 18 percent of the provincial caseload. During Phase Two of the survey, data from all court locations will be reported.

COURTID	Frequency	Percent	Cumulative Frequency	Percent

Quebec

As of writing, Quebec had not begun participating in the Survey of Child Support Awards. A separate project has been developed to collect child support data from Quebec due to the very different structure of its child support guidelines. Quebec has devised a sampling method to produce a representative sample.

COURTID	Frequency	Percent	Cumulative Frequency	Percent

Cluster Analysis Results

A cluster analysis of Quebec's court data indicates a high degree of similarity between many of the courts in the province. Out of a total of 43 sites, only three were somewhat outside of the range (RMS greater than 1.0) of the majority of courts and their volume was insignificant, accounting for only a handful of cases in total (see Section Two for details).

Ontario

The three selected sites (3543 Toronto, 3522 London and 3528 Ottawa) account for one-third of the provincial total.

COURTID	Frequency	Percent	Cumulative Frequency	Percent
3501	784	3.1	784	3.1
3502	310	1.2	1094	4.4

3551	102	0.4	25035	100.0

The selected court sites show characteristics that are fairly similar to the remaining sites in the province, although a few exceptions have been noted:

- There is a higher proportion of joint applications;
- The proportion of divorce cases without a hearing and uncontested hearing are less in the three sites;
- The proportion of cases involving children is smaller in the selected sites than throughout the rest of the sites; and
- There is a higher proportion of cases in which the wife received custody and a smaller proportion where joint custody was awarded.

Cluster Analysis Results

Of the three sites in the study (3543, 3522, 3528), one site appears to be somewhat less representative (3543=0.99) than the other two. With the exception of this one chosen site and several others that are not included in the study, the courts throughout the province are fairly closely clustered together.

The two selected sites that are strongly clustered together with many other sites in the province account for two-thirds of the provincial caseload. The one study site that is not as closely clustered with many other sites in the province is a large one with approximately one-quarter of the provincial total (see Section Two for further details).

Manitoba

The selected site (4601, Winnipeg, Court of Queen's Bench) reported the largest caseload in the province (79 percent).

COURTID	Frequency	Percent	Cumulative Frequency	Percent
4601	2055	78.9	2055	78.9
4602	227	8.7	2282	87.7
4603	57	2.2	2339	89.9
4604	32	1.2	2371	91.1
4605	53	2.0	2424	93.1
4606	28	1.1	2452	94.2
4607	7	0.3	2459	94.5
4608	24	0.9	2483	95.4
4610	11	0.4	2494	95.8
4611	29	1.1	2523	96.9
4612	3	0.1	2526	97.0
4613	58	2.2	2584	99.3
4614	18	0.7	2602	100.0
4615	1	0.0	2603	100.0

Despite considerable similarity between the selected site and the rest of the courts in the province, some variances were noted:

- The selected site had a lower proportion of cases involving divorce without a hearing and a higher proportion of uncontested cases; and
- The proportion of joint custody cases was higher while the proportion awarded to husbands and wives was a little lower.

(4) Awarded to another person	0.1	

Cluster Analysis Results

The single site in Manitoba is closely clustered (RMS=0.58) with eight other courts in the province, all of which are relatively close. There is, however, somewhat of a division between these courts and the remainder of the province which differ considerably and have a high value (RMS greater than 1.0).

Despite the diversity between the two groups of courts, the selected site in conjunction with the other sites which are comparable, account for approximately 90 percent of the provincial total (see Section Two for details).

Saskatchewan

In Saskatchewan, four court sites are included in the site study which include Regina (4713), Saskatoon (4720), Prince Albert (4712) and Battleford (4703). These four sites accounted for two-thirds of the provincial caseload. During Phase Two it is anticipated that only Regina and Saskatoon will continue to collect data. This still represents almost 60 percent of the provincial caseload.

COURTID	Frequency	Percent	Cumulative Frequency	Percent	
4702	11	0.5	11	0.5	
4703	188	8.5	199	9.0	
4704	47	2.1	246	11.1

4718	4	0.2	1496	67.5	
4719	88	4.0	1584	71.5	
4720	632	28.5	2216	100.0	

The four sites in the study were very similar proportionally to the remaining sites in the province. The only small variance noted in the comparison involved the parent receiving custody and whether there was a hearing:

- The selected sites had a slightly higher proportion of cases without a hearing; and
- The selected sites had a slightly lower proportion of custody awards to the mother with a correspondingly higher proportion of joint custody awards.

Cluster Analysis Results

The majority of courts in the province are closely clustered together. The four selected sites all fell below the value of 0.60 and were clustered together with the majority of sites in the province that together accounted for 96 percent of the total volume (See Section Two for details).

Alberta

During Phase Two, the study will include two sites in Alberta, including Edmonton (4803) and Calgary (4801). These two sites account for over three-quarters (77 percent) of the province's total caseload.

COURTID	Frequency	Percent	Cumulative Frequency	Percent
4801	2659	35.4	2659	35.4
4802	42	0.6	2701	36.0
4803	3158	42.1	5859	78.0

4812	157	2.1	7412	98.7
4813	97	1.3	7509	100.0

The case characteristics between the two selected sites and the rest of the province are similar although some of the variances are noted below:

- There is a lower proportion of cases involving children in the selected sites than in the remaining courts; and
- The selected sites have a higher proportion of cases resulting in joint custody of children with a corresponding lower proportion of custody awards to the mother and father than is the case in the other sites in the province.

Cluster Analysis Results

The two selected court sites are clustered together with approximately half of the sites in the province that have a value less than RMS=1.0. However, there is some distance between the value of selected site 4803 (RMS=0.69) and site 4801 (RMS=0.91). Overall, there is a considerable amount of variation among groups of sites in the province.

The grouping of courts into which the two selected sites fall account for approximately 97 percent of the total provincial volume (See Section Two for details).

British Columbia

The site selected in British Columbia (5939, Victoria) accounts for 10 percent of the provincial caseload. Among all of the provinces, British Columbia has the smallest proportion of its total cases included in the study.

While there are some similarities between the selected site and the rest of the province, there are some considerable differences in the proportions involved in the Victoria court relative to the other sites:

- A lower proportion of divorces without hearings in the selected sites and a higher proportion of uncontested cases;
- Considerably fewer cases involving children; and
- Considerably fewer custody awards to fathers, a higher proportion to mothers and a higher proportion of joint custody awards.

SECTION TWO: CLUSTER ANALYSIS

The second part of this project was to determine the extent to which similarities exist among the different courts in the provinces and territories and determine the "representativity" of selected courts. It was felt that a more statistically based exercise should be undertaken in order to derive a more refined picture of court categories and groupings. The previous section compared the selected sites to the sites not selected using a comparison of general frequencies to show a first cut of the differences or similarities that may exist between the two groups of courts. In order to get a more detailed view of the representativity of the different courts in the province, a cluster analysis approach was selected.

For the purposes of this report, a cluster analysis technique was chosen because of the nominal or categorical nature of most of the data elements in the data base which cannot be ranked and are not interval in nature.

Cluster analysis is a procedure which clusters or groups objects (courts) that are suggested by the data. These clusters bring together objects which tend to be similar to each other, creating groupings that identify these similar objects. The cluster analysis includes the individual records that are in the data base and uses the redefined variables as the common elements for purposes of categorization. (Source, SAS Users Guide: Statistics, Version 5).

Methodology

There were a total of four stages used to prepare the data for cluster analysis. The first stage was the running of national and provincial frequencies of every variable in the Central Divorce Registry Data Base to determine those which have sufficient responses to be included. This process also helps to eliminate the variables which are purely administrative and do not help define the characteristics of a case. The second stage was the merging of the selected variables from the Adult Master file and the Child file into one working data base. The third stage was the creation of derived variables and the normalizing of responses for these variables. The majority of variables in the base selected for analysis are nominal level data that are categorical in nature. To use these variables it was necessary to derive new variables and change the values of the responses. This stage involved the conversion of the variables, "applicant" for example, into multiple variables so that one derived variable includes applicant=husband with a binary response of 0 or 1, a second derived variable includes applicant=wife with a 0 or 1 and a third as applicant=joint with a 0 or 1 response. In the case of age of children, age of parents and duration of marriage the actual values were used as they currently stand since the values are meaningful. The fourth stage required running frequencies of these new derived variables with the results then being analyzed for the Mean (average) of the frequencies which were then output into a data base and used for the cluster analysis. This final data base was designed to provide both court level and provincial and territorial level data.

The variables used for the cluster analysis were selected on the basis that they were considered to be the most meaningful variables in defining the types of cases that were heard in the different court sites and for which data are available. The variables used for the cluster analysis include applicant, proceeding type, dependants, number of children, duration of marriage, age of children, age of parents at time of divorce and which parent obtains custody of the children .

Like the comparisons of frequencies, a cluster analysis is another technique to provide additional information to more appropriately group courts and to allow a measure of representativity between courts. There are many different ways to do cluster analysis and many different criteria that can be chosen. Each choice can have an impact on the results.

Interpretation of results

The results of the cluster analysis that follow are given in two formats. The first is the distribution of the clusters which are suggested by the data and the various courts that are included in them. With each of these groupings a Normalized Root Mean Square (RMS) Distance value is provided that indicates the distance that occurs between any two objects in the analysis. The closer the value is to 0, the more similar the objects are. There is no single cut-off value for the RMS under which the linkage is accepted or over which it is rejected. Rather, it is to be used as an indication of the strength of the commonality of the objects. The second format is a graphical representation of the distribution of the categories identified by the technique which is included in the appendix. The graphs show the distribution of the object (court) linkages by the level of the RMS. Therefore, the clustering of the bars in similar ranges of the RMS suggest common characteristics and strong linkages.
