RECOMMENDED CITATION

Kerr, D.E., 2022. Reconnaissance surficial geology, Keller Lake, Northwest Territories, NTS 95-P; Geological Survey of Canada, Canadian Geoscience Map 439, scale 1:125 000. <https://doi.org/10.4095/328293>

ABSTRACT

The Keller Lake map area contains three glacial terrains. First, ridged and fluted till cover the northeast region above 300 m elevation. Second, streamlined till, including mega-scale glacial lineations, and till plain with an extensive organic cover, dominate a low-lying basin in the north-central and central regions. Third, till blanket, ridged till, and undifferentiated till cover the highlands at 375 to 575 m elevation in the southeast, south, and west. A dominant regional northwestward ice flow first crossed the map area. Subsequently, an ice stream developed late during deglaciation, creating northwesterly oriented mega-scale glacial lineations in north-central regions. Late shifts in ice flow in the northeastern highlands also resulted in west-northwestward flutings superimposed on older northwestward-trending drumlinoids. Retreating remnant ice deposited minor moraines and other ridges over fluted till. In the extreme southeast, glacial Lake McConnell inundated lowlands to 275 m elevation, following retreat of southwesterly flowing ice. Meltwater corridors and glaciofluvial sediments are more prevalent in western regions and record variable flow directions.

RÉSUMÉ

La région cartographique de Keller Lake est caractérisée par trois terrains glaciaires. Premièrement, une couverture de till à crêtes et à cannelures occupe la région du nord-est à une altitude de 300 m ou plus. Deuxièmement, du till profilé, comprenant entre autres des mégalinéations glaciaires, ainsi qu'une plaine de till dotée d'une importante couverture organique s'étendent en prédominance dans un bassin de faible altitude dans les régions du centre nord et du centre. Troisièmement, une nappe de till, des crêtes de till et du till non différencié recouvrent les hautes terres entre 375 et 575 m d'altitude au sud-est, au sud et à l'ouest. Un écoulement glaciaire régional dominant vers le nord-ouest a d'abord traversé la région cartographique. Par la suite, un courant glaciaire s'est formé tard lors de la déglaciation, créant des mégalinéations glaciaires dans les régions du centre nord. Des changements tardifs de la direction de l'écoulement glaciaire dans les hautes terres du nord-est ont aussi donné lieu à la formation de cannelures glaciaires de direction ouest-nord-ouest qui se superposent à des drumlinoides plus anciens de direction nord-ouest. De la glace résiduelle en retrait a entraîné le dépôt de moraines mineures et d'autres crêtes sur du till cannelé. À l'extrême sud-est, le Lac glaciaire McConnell a inondé les basses terres jusqu'à 275 m d'altitude à la suite du retrait des glaces s'écoulant vers le sud-ouest. Des corridors d'eau de fonte et des sédiments fluvioglaciaires sont plus fréquents dans les régions de l'ouest et rendent compte de directions d'écoulement variables.

Vertical Datum: mean sea level

BOUNDING COORDINATES

Western longitude: 122°00'00"W

Eastern longitude: 120°00'00"W

Northern latitude: 64°00'00"N

Southern latitude: 63°00'00"N

SOFTWARE VERSION

Data has been originally compiled and formatted for use with ArcGIS™ desktop version 10.7.1 developed by ESRI®.

DATA MODEL INFORMATION

Surficial

The Geological Survey of Canada (GSC) through the Geo-mapping for Energy and Minerals Program (GEM) has undertaken the Geological Map Flow to develop protocols for the collection, management (compilation, interpretation), and dissemination of

surficial and bedrock geology data and map information. To this end, a data model has been created.

The Surficial Data Model (SDM) was designed using ESRI geodatabase architecture. The XML workspace document provided can be imported into a geodatabase, and the geodatabase will then be populated with the feature datasets, feature classes, tables, relationship classes, subtypes, and domains.

Shapefile and table (.dbf) versions of the data are included within the data. Column names have been simplified and the text values have been maintained within the shapefile attributes. The direction columns are numerical, to display rotation for points, and the symbol fields will hold the correct values to be matched to the appropriate style file.

For a more in depth description of the data model please refer to the official publication:
