Groundwater Geoscience Program (GGP) Public presentation of project plans for 2019-2024

On October 13, 2021 all five project leaders under the GGP presented the status of six research projects to 60 participants (50 internal and 10 external).

All six of the PowerPoint presentations prepared for this event are included in this synthesis and the recorded presentations can be seen on YouTube:

<https://www.youtube.com/channel/UChIc7ff3vEdII708VhgsLsg>

Key words: groundwater classification, methods development, groundwater portal, characterization, shallow aquifers, Fox Creek, water resource, modelling, Ring of Fire, regional assessment, Canada 1 Water and modelling framework.

Impacts des changements climatiques sur les eaux souterraines et de surface pour un développement durable au Canada

Canada 1 Water

Projet
 Ressources naturelles Canada (RNC/Can) lance le projet **Canada 1 Water (CIW)** : une plateforme de modification des eaux souterraines et des eaux de surface intégrée à des informations sur les changements climatiques et sur l'utilisation du sol afin de fournir une aide à la prise de décision pour les évaluations fondées sur les risques. Des modèles de pointe seront construits et des scénarios de changements climatiques seront simulés pour les six principaux bassins de drainage du Canada, couvrant près de dix millions de kilomètres carrés.

Pour la première fois, le Canada disposera d'une plateforme complète basée sur la physique de l'écoulement de l'eau pour simuler le système intégré d'évaluation des risques climat / eau souterraine / eau de surface. Il pourra ainsi bénéficier d'outils d'aide à la prise de décision sur les sécheresses, les inondations, la capture du carbone, les risques d'incendie, les changements du pergélisol, les services écosystémiques et la quantité d'eau de surface et d'eau souterraine.

Le projet contribuera à relever un défi de longue date identifié par le Conseil des académies canadiennes, c'est à dire de comprendre la durabilité des ressources en eau du Canada. Le cadre d'aide à la prise de décision de la plateforme fournira un moyen intégré d'évaluer les réponses, les risques associés aux produits utiles

(e.-à d., foresterie, agriculture, exploitation minière) et les risques associés aux changements climatiques projetés et aux changements induits par l'utilisation des sols.

CIW abordera les questions relatives aux ressources en eau de surface et en eau souterraine associées aux préoccupations des autochtones, telles que les effets cumulatifs des impacts de la perte de pergélisol et les inondations.

Partenaires et financement
 CIW est une initiative de RNC/Can (Programme géoscience sur les eaux souterraines) et d'Aquany Inc. ainsi qu'Agriculture et Agroalimentaire Canada (AAC), et les universités de Toronto et de Waterloo.

Le projet est cofinancé par l'appel de propositions 2019 du Programme canadien pour la sûreté et la sécurité (PCSS) de Recherche et développement pour la défense

Canada (RDDC) dans le cadre du volet Sécurité et sûreté publiques. Le projet contribue à la mission du PCSS, qui consiste à renforcer la capacité du Canada à s'adapter au changement climatique. L'engagement avec d'autres partenaires stratégiques du projet est en cours.

- identified refinements in data analyses and interpretation workflows integrating MS logs and grain size information to improve K_{NMR} estimates in these higher MS environments

Bells Corners Deep Borehole Research Site

GSC Borehole Calibration Facility, Bells Corners Ottawa, Ontario New core and downhole geophysical data sets

- The Bells Corners site has a 40 plus year history as a bedrock geophysics calibration facility.
- Over the past few years the site has been rehabilitated and new data collected to enhance the role as a calibration facility and to broaden the use of the site for groundwater work.
- Borehole arrangement and lithological succession to left.

- The boreholes intercept Paleozoic carbonates and sandstones that overlie Precambrian granitoid rocks with varying mineralogy and alteration.
- Illustrative examples to the left are from Figure 9 in the report and are i) sandstone, ii) granitic gneiss, and iii) granitic gneiss with chlorite alteration

Analyses reported include:

- i) laboratory strength and permeability testing (left, servo-controlled MTS Rock Mechanics Testing System, photo S.Gaines);
- ii) Nuclear magnetic resonance measurements of water content and pore size distributions;
- iii) complex resistivity measurements on core samples;
- iv) downhole geophysical data include: optical and acoustic televiewer, total gamma, full waveform sonic, fluid temperature, fluid conductivity, heat pulse flow meter, and p- and s-wave velocity.

Ongoing work with respect to:

- geochemical characterization
- hydrogeological setting
- CTscan porosity analysis
- NMR logging
- comparative studies with University of Guelph borehole facility –Fractured Rock Observatory (FRO)
- integration with other sites intercepting Nepean sandstone

An analytical protocol for determining the elemental chemistry of Quaternary sediments using a portable X-ray fluorescence spectrometer

Ross D. Knight¹, Bruce A. Kjarsgaard, Hazen A.J. Russell

Geological Survey of Canada, 601 Booth St. Ottawa, Ontario K1A 0B8, Canada

ARTICLE INFO ABSTRACT

Editorial handling by Prof. M. Kempe

Keywords: Portable X-ray fluorescence; Quaternary sediments; Sample preparation; Dwell time; Instrument drift; Variable grain size

The modern geologist has a plethora of portable digital tools at their disposal including, GPS, in-field computer providing access to imagery, maps, and on site real time geochemistry provided by portable X-ray fluorescence spectrometry (pXRF). This paper presents an analytical protocol for the examination of Quaternary glaciogenic sediments derived from different bedrock terrains using a portable spectrometer. The protocol outlines best practices for the collection of geochemical data using pXRF from glaciogenic sediments with generally coarser-textured clastic mineral concentrations at a fraction of the cost of traditional laboratory methods. The analytical protocol considers 1) sample preparation, 2) sample analysis, and 3) data cleaning, examination and presentation. The protocol takes into consideration pXRF fundamentals related to instrument configuration, and an assessment of measurement parameters including peak overlaps, dwell time, instrument drift, in-situ versus processed samples, variable grain size and moisture content effects, and comparisons to traditional laboratory methods. Protocol development occurred over a number of years and analysis of over 4000 geological samples and ~9000 analysis of Certified and Standard Reference Materials.

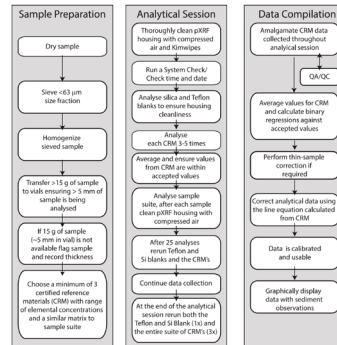

Fig. 13. Protocol flow chart to ensure precise and accurate data collection of glaciogenic sediment samples using pXRF.

Groundwater Information Network

GIN

Réseau d'Information sur les Eaux Souterraines

Boyan Brodaric & GIN Team

October 13, 2021

ABSTRACT

• Groundwater Information Network

Fed-prov-terr-int'l collaboration to share groundwater data online, using international standards; aligned with FGP, GOC Open Data Portal and Open Science, Google Dataset Search.

Third program cycle, since 2010.

<https://gw-info.net>

The screenshot shows the homepage of the Groundwater Information Network (GIN). The header includes the GIN logo and the text "Welcome to GIN". Below this, a paragraph describes the network's purpose: to improve knowledge of groundwater systems and enhance management through increased access to information. It lists various data sources and collaborating jurisdictions: Provincial and territorial collaborators include British Columbia, Alberta, Saskatchewan, Manitoba, Ontario, Québec, Nova Scotia, and Yukon; international collaborators include the USGS and others. A "Learn more" button is provided.

The main content area is divided into several sections:

- Explore Maps:** Offers links to "Basic map viewer (more data)" and "Advanced map viewer with 3D (less data)".
- Find Information:** Includes search boxes for "Find water wells or monitoring sites", "Find key Canadian aquifers", and "Find other groundwater information".
- News:** Features a "GIN RSS News Feed" button and a news item titled "NEW! Multipatform groundwater level viewer now online" dated Thu, 22 Jun 2017 09:00:00 EDT. The news item mentions that groundwater levels are now displayed in a new mobile-friendly time series viewer and that GroundwaterML 2 (GWML2) is now officially recognized as an OGD standard.
- Under the Hood:** Lists reusable GIN tools for incorporation into web sites or applications, such as "GIN Catalog", "Well-Log Viewer", "Time-Series Viewer", "Geotiffzr", "OGD Resources", and "Data Standards".
- Partners:** Lists the success of the GIN network as a result of active collaboration with provincial, territorial, and federal stakeholders, including Yukon, British Columbia, Alberta, Saskatchewan, Manitoba, Ontario, Québec, Nova Scotia, Canada, and USGS.
- Contact Us:** Provides an "Online form" for general enquiries or technical issues.

The footer contains the copyright notice "© Groundwater Information Network 2014" and a navigation bar with icons for home, search, and other site functions.

Caractérisation des aquifères superficiels et évaluation des impacts potentiels liés aux activités pétrolières et gazières sur ces aquifères dans la région de Fox Creek (AB) – mise à jour d'octobre 2021

Characterization of shallow aquifers and assessment of potential impacts of oil and gas development activities on these aquifers in the Fox Creek area (AB) - October 2021 update

Christine Rivard

ABSTRACT

A multidisciplinary and multi-institutional project was initiated in the **Fox Creek** area (west-central Alberta) in April 2019 to study environmental impacts of hydrocarbon development activities. **The initial objective** was to specifically **study potential impacts on shallow groundwater**. However, different Sectors within NRCan later identified the Fox Creek area as a region of interest for developing regional **cumulative effects evaluation methods** in support of new impact assessment legislation. As a result, the **scope is now much broader** and the project includes studies of **vegetation, forest, snow cover, wetlands**, and contributes to a **woodland caribou habitat** study. The project involves many collaborators from the federal and provincial governments, as well as from the academic community. This project is supported by the GGP and EGP programs.

Description of the study area

Fox Creek, west-central Alberta: one of the most active regions for O&G production in the last 50 years

The study area is mainly forested and unpopulated

Elevations range from 785 to 1180 m

The regional aquifer is located in the Paskapoo Fm.: a complex succession of interbedded mudstone and siltstone with sandstone channels

Canada

Canada

Canada

Project objectives

- 1) Characterize the regional shallow aquifer (GGP)
- 2) Study the intermediate zone integrity (EGP)
- 3) Assess cumulative effects (CE)

Mean water-well depth in the Paskapoo Fm: ≈ 50 m

Mean O&G well depth: 3000-3500 m

Surficial aquifers

Intermediate zone

Zone targeted by the industry

- 3) Assess cumulative effects (CE)

Fieldwork in 2021

(August - October 2021)

Monitoring wells (9): depths from 35 to 90 m

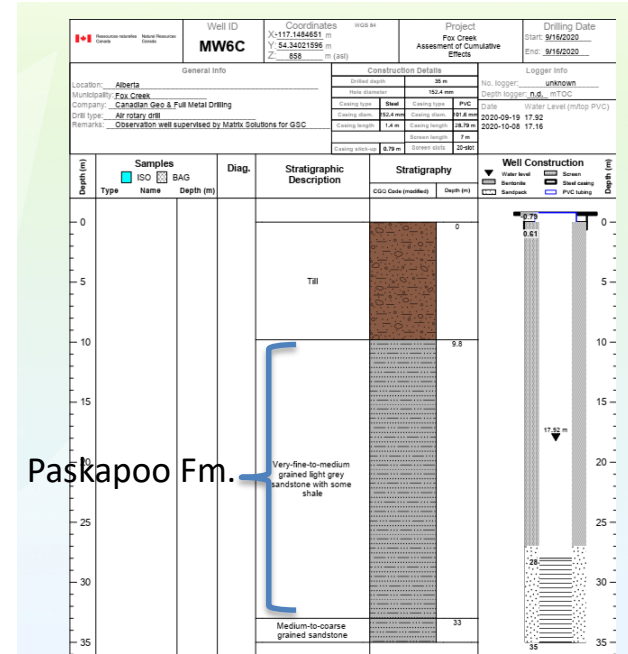

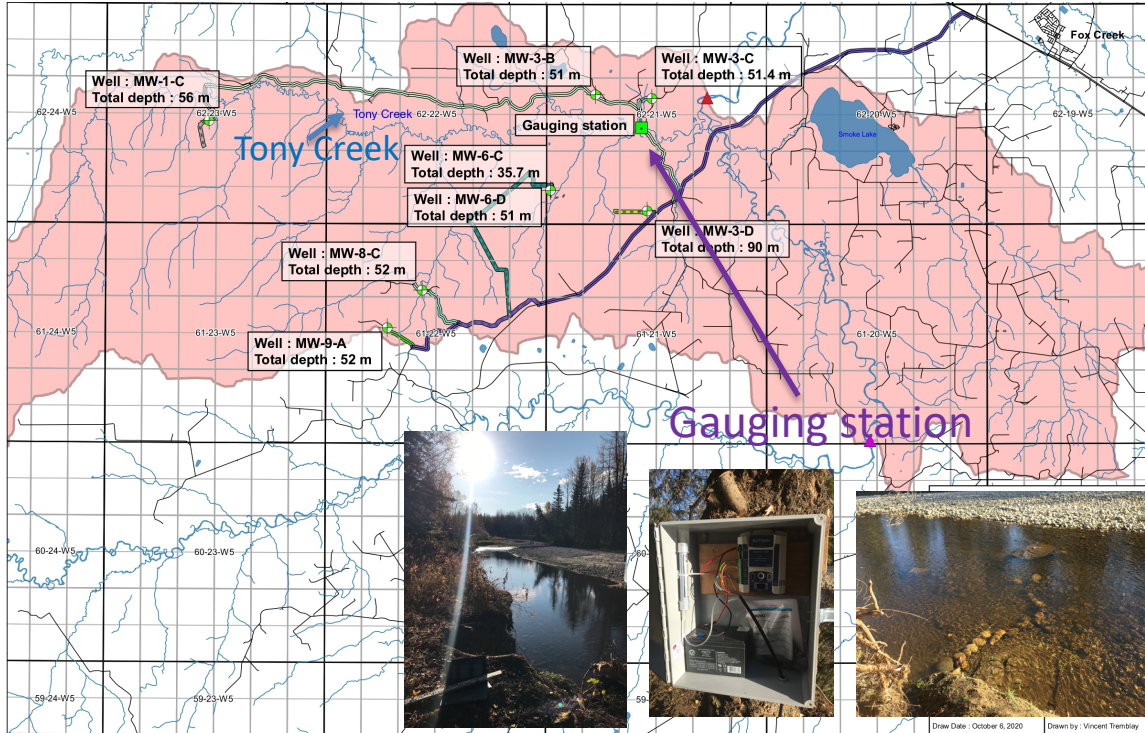

- Permeability (slug) tests in the 9 monitoring wells
- Groundwater sampling (in monitoring wells and 13 water wells from O&G operators)
- Permeability tests in unconsolidated sediments
- Download of pressure transducers

Installation of lysimeters, soil moisture sensors, rain gauges and rain collectors at 5 sites in vegetated and unvegetated (impacted) areas.

Fieldwork in 2020 and 2021

8 wells drilled on Crown land, including twin wells (MW-6) + 1 well drilled on an active O&G well pad

Borehole geophysical logging

Objectives :

- 1) identify lithological, hydrogeological, and mechanical/structural conditions in the near surface bedrock
- 2) Support the shallow aquifer characterization

Pipe and screen installation

Borehole geophysical logging

Lithological logs

- Natural gamma → stratigraphy based on changes in mineralogy
- Resistivity → stratigraphy based on changes in electrical properties

Hydrogeophysical logs

- Fluid temp/conductiv.
- Flow meters (2)
- Video camera

Structural/Geomechanical logs

- Acoustic Televiewer → identify frequency and orientation of structures
- Sonic tool → measure travel times P&S waves
- Gamma-gamma density

Logs collected:

Well	Lithologic			Hydrogeologic			Geomechanical		
	Gamma	Resist.	Fluid logs	Camera	Flowmeter		ATV	Density	Sonic
			Temp/Cond		Impeller	HPFM			
MW-1-C	✓		✓	✓		✓	✓	✓	✓
MW-3-B	✓	✓	✓	✓	✓	✓	✓	✓	✓
MW-3-C	✓	✓	✓	✓		✓	✓	✓	✓

Canada

Borehole geophysical logging

Preliminary analyses:

- Groundwater (4 – 6°C) is flowing naturally in all wells:
 - Recharge (down flow) occurring in 7 wells at rates of 0.05 to >4 L/min
 - Discharge (up flow) occurring in 1 well at rates of 0.10 to 0.2 L/min
 - Flow occurs both along fractures and through permeable sandstone
- Rock properties:
 - Gamma and resistivity logs can support/refine stratigraphic analyses from cuttings
 - Density average: 2.34 g/cm³ (2.05 – 2.63 g/cm³ ± 2 SD)
 - Velocity (Vp) average: 2300 m/s (1630 – 3000 m/s ± 2 SD)
- Structural features:
 - Bedding is ~horizontal, some high angle joints
 - Stereonet/fracture frequency analyses from borehole imagery to come
 - Borehole wall roughness influences data analyses

Geochemistry - Groundwater

Map of water types

Only 4 wells contained dissolved methane: MW-3-D (90 m) and three private wells.
All of **microbial** origin.

Geochemistry - sediments

HAWK (pyrolysis) analyses were performed on 97 samples.

- Based on their TOC (total organic carbon) content, 18 samples were selected for petrography
- TOC values range from 0.2 to 8.8 wt.% with a mean value of 0.95 ± 1.6 wt. %
- Thermal maturity varies from immature to mature
- The organic-rich layers is composed of Type III (terrestrial) kerogen.

Hydrogeological modeling

3D model (FEFLOW)

Hydraulic heads

- More heterogeneity will be integrated
 - Different scenarios will help better understand the (shallow and deeper) hydrodynamics
 - Ecohydrological model
 - Study on soil moisture and snow cover
- to come

Cumulative effects assessment (CEA)

Objectives:

1. Provide an **overview of the state of scientific knowledge on CEAs** through a literature review.
2. Learn about the **opinions, views and concerns of Indigenous communities on CEAs** and hear their recommendations on the CEA process and their involvement/participation in this process to improve the practice of CEA in general, via (virtual) focus groups.
3. Identify **hindrances faced by consultants** in the CEA process in Canada and hear their recommendations for improving the practice, via (virtual) interviews.
4. Based on the content analysis of the discussions, **make concrete and realistic recommendations** to address the difficulties and barriers currently encountered in the practice of CEAs in Canada, so that they can be conducted more effectively and respectfully.

NATURAL RESOURCES CANADA - INVENTIVE BY NATURE

Recent development for the characterisation and modeling of aquifer systems

Daniel Paradis

October 13, 2021

Natural Resources
Canada

Ressources naturelles
Canada

Canada

Current Activities

- **High-resolution aquifer characterization for the optimization of a pump-and-treat system:** Paradis, Gloaguen, Claprood
- **Hydraulic conductivity from NMR logs in sediments with elevated magnetic susceptibilities:** Crow, Paradis, Grunewald, Liang, Russell
- **Development of oscillatory hydraulic tomography:** Nefzi, Lefebvre, Paradis, Bourg
- **Coupled temperature and hydrological modelling for assessing low flow conditions:** Arzola, Paradis, Lefebvre, St-Hilaire
- **AI for real-time water resources forecasting:** Liang, Gloaguen, Paradis
- **Numerical modelling of groundwater flow and age in an Appalachian aquifer system :** Mathis, Lefebvre, Molson, Paradis

High-resolution aquifer characterization for the optimization of a pump-and-treat system

- Background:
 - Operating of a pump-and-treat system to capture contaminants in a sand-gravel-till-roc aquifer system
 - The system is costly to operate as large volumes of water are unnecessary treated
 - A better characterization of the heterogeneity could help to optimize the system
 - A GSC-INRS collaboration

Characterization Program Objectives

- Developed a modern characterization program to:
 - Quantify hydraulic properties values (incl. K_v) for each sediments (sand, gravel, silt, till, roc)
 - Identify the main contaminant pathways (if any)

GSC-INRS Testing Method

Journal of Hydrology 478 (2013) 102–118

Contents lists available at SciVerse ScienceDirect

journal homepage: www.elsevier.com/locate/jhydrol

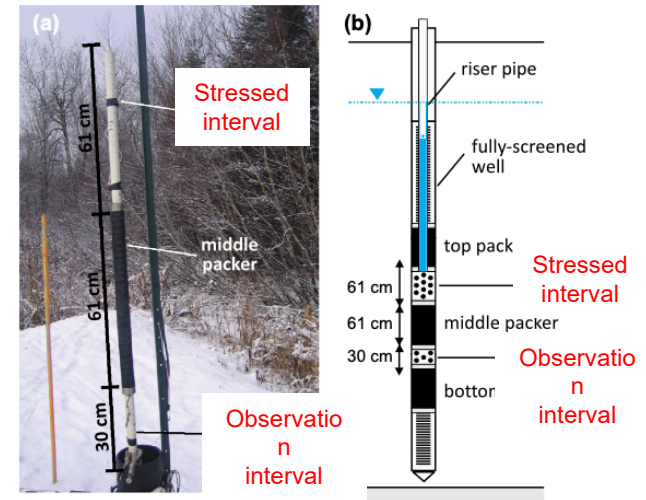

Single-well interference slug tests to assess the vertical hydraulic conductivity of unconsolidated aquifers

Daniel Paradis^{a,b,*}, René Lefebvre^b

^a Geological Survey of Canada, 490 Rue de la Couronne, Quebec City, Canada G1K 9A9

^b Institut National de la Recherche Scientifique, Centre Eau Terre Environnement (INRS-ETE), 490 Rue de la Couronne, Quebec City, Canada G1K 9A9

- Developed by the GSC-INRS to overcome the lack of field method to estimate vertical permeability

Special Well Installation in Sediments

- Adapted drilling rig to have screen in direct contact with sediments (no sand-pack; small hole-well space)
- Fully-screened well across the aquifer
- Essential for high-resolution profiling

Schéma d'aménagement de puits d'observation sans massif-filtrant dans les dépôts meubles

Testing Assembly Optimization

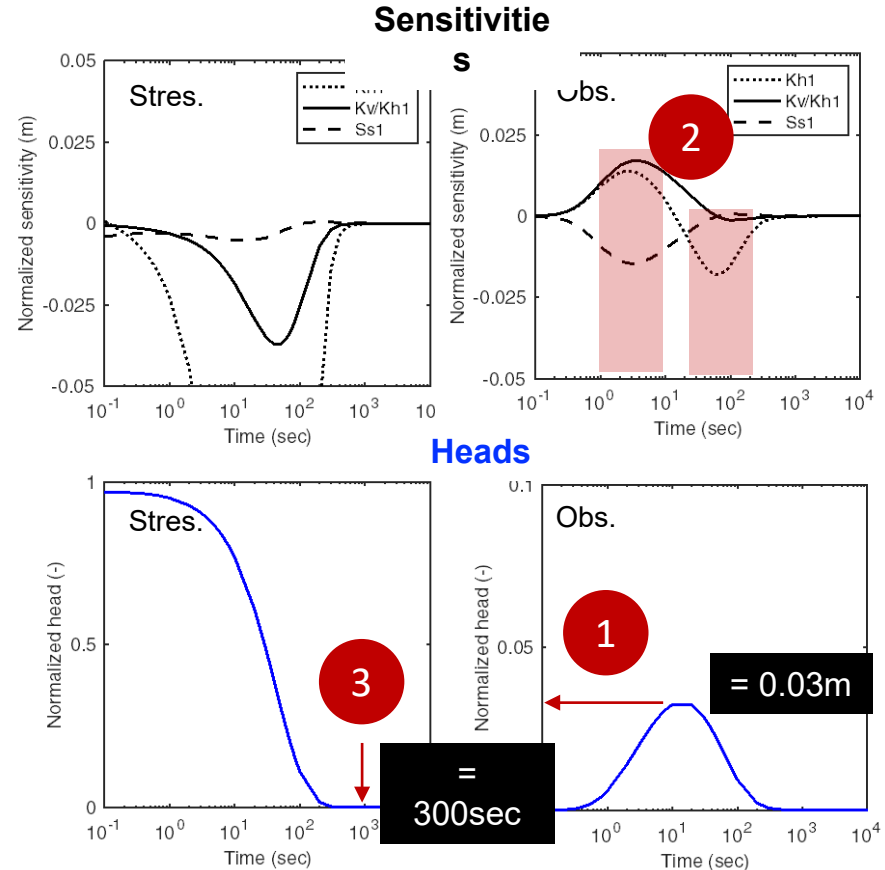

- Trade-off between test duration and quality of data
- Simulated sensitivities and heads for different sediments and testing assembly configurations

Example of Optimization

Optimization criteria:

- 1 Heads (in Obs.)
- 2 Sensitivities for each hydraulic property (in Obs.)
- 3 Duration of the test

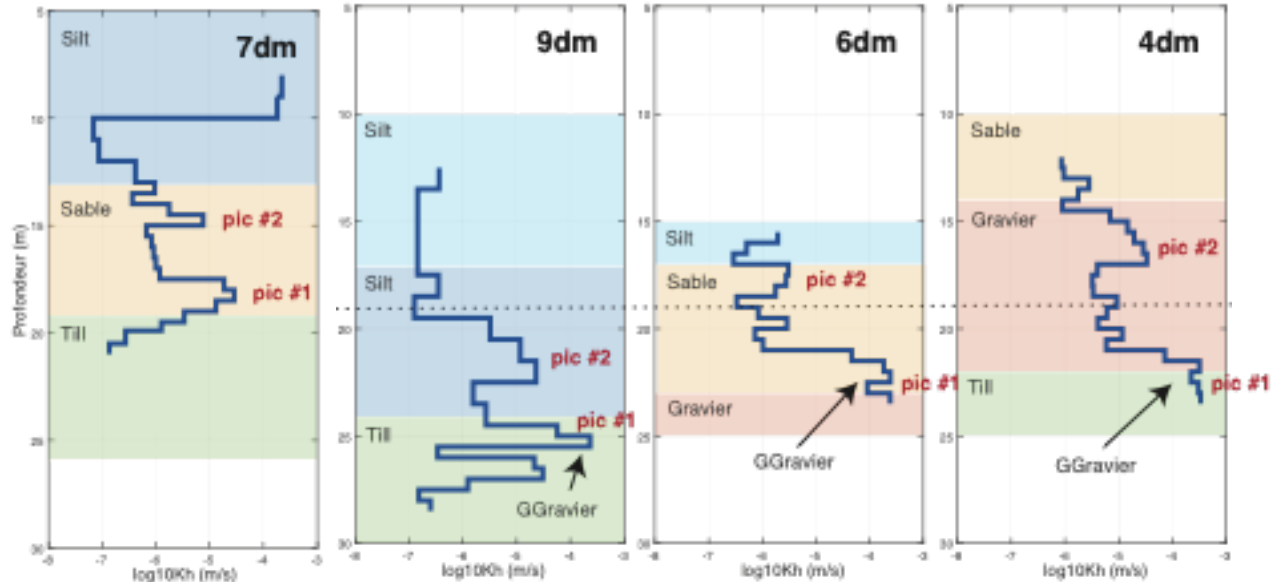

Assembly and Test Parameters

Material	Assembly				Test	
	L (m)	D (m)	rw (in)	rc (in)	Duration	H0 (m)
Silt	2.0	0.5	4	1.5	42 min	1
Sand	0.5	0.5	4	2.5	5 min	2
Gravel	0.25	0.5	4	2.5	< 1 min	4
Till	2.0	0.5	4	1	2h00	1
Fractured roc	2.0	0.5	3	1	2h45	1
Roc	5.0	0.5	3	0.5	>24h	1

Results: Contaminant Pathways

- >250 hydraulic tests @0.5-2 m vertical resolution
- Large variations in permeability (~4 orders)
- Recognition of two high-permeability pathways

Approx. separation between wells 1.5 km

Results: Hydraulic Properties Distributions

- Define the distribution of **hydraulic conductivity** and **anisotropy** values for each sediments unit (6 units)

Conclusions

- Provide new insights about the potential migration pathways of contaminants
- Quantify hydraulic property values for all sediments (incl. anisotropy)
- Will help to improve the **security** of the pump-and-treat system and to lower its **cost of operation**

Ring of Fire: Reconstructing long-term environmental records to support regional assessment

Nicolas Benoit - Nicolas.Benoit@NRCan-RNCan.gc.ca

Josué Jautzy - Josue.Jautzy@NRCan-RNCan.gc.ca

October 13th, 2021

Background

Ring of Fire (RoF) = large mineral deposits of Ni/Cu/Zn/Cr and PGM

- Located in one of the world's largest wetland system;
- Sensitive to climate change (Hadley et al., 2019) and anthropogenic stresses (Leclair et al., 2015)

Additional knowledge on environmental conditions required:

- Baseline conditions response to climate change + remote anthropogenic stresses
- Changes to groundwater flow dynamic, geochemical fate of metal(loid)s in surface storage of tailings and waste rocks over time.
- Natural presence/behavior of metal(loid)s needs to be carefully assessed

Main objective

Improve knowledge on the evolution of the wetlands baseline conditions in response to climate and anthropogenic stresses and their effects on metal(loid)s mobility.

Abstract

Canada 1 Water is a 3 year governmental multi-department–private-sector–academic collaboration to model the groundwater–surface-water of Canada coupled with historic climate and climate scenario input. To address this challenge continental Canada has been allocated to one of 6 large watershed basins of approximately two million km². The model domains are based on natural watershed boundaries and include approximately 1 million km² of the United States. In year one (2020–2021) data assembly and validation of some 20 datasets (layers) is the focus of work along with conceptual model development. To support analysis of the entire water balance the modelling framework consists of three distinct components and modelling software. Land Surface modelling with the Community Land Model will support information needed for both the regional climate modelling using the Weather Research & Forecasting model (WRF), and input to HydroGeoSphere for groundwater–surface-water modelling. The inclusion of the transboundary watersheds will provide a first time assessment of water resources in this critical international domain. Modelling is also being integrated with Remote Sensing datasets, notably the Gravity Recovery and Climate Experiment (GRACE). GRACE supports regional scale watershed analysis of total water flux. GRACE along with terrestrial time-series data will serve provide validation datasets for model results to ensure that the final project outputs are representative and reliable. The project has an active engagement and collaborative effort underway to try and maximize the long-term benefit of the framework. Much of the supporting model datasets will be published under open access licence to support broad usage and integration.

Project Objectives

- develop fully-integrated groundwater –Surface-water model(s) for Canada
- use models to evaluate the potential influence of Climate Change on water resources (large scale)
- translate model output into societal-relevant metrics

Project Symbolism / Vision

Colour and symbolism

- elements that make up the water cycle.
- **yellow and white rays:** signifies the sun and the solar energy that drives the system.
- **rays** are also an abstraction of a graduated measure to signify quantification of the water balance.
- **water droplet:** introduces water with –
 - green leaf conveying land cover and evapotranspiration,
 - pale blue fleche signifying atmospheric water.
- **dark blue lower semi-circle:** groundwater–surface-water is represented and symbolising the coupled nature of groundwater–surface-water.
- **upward form of the water droplet:** can also be imagined as symbolizing the re-entrainment of water through evaporation and evapotranspiration to the atmosphere.

**BLUEPRINT FOR A PHYSICALLY-BASED,
DIGITALLY-SIMULATED HYDROLOGIC RESPONSE MODEL.**

R. ALLAN FREEZE

Island Waters Branch, Department of Energy, Mines and Resources,
Calgary, Alberta, Canada

and

R. I. HARLAN

Forestry Branch, Department of Fisheries and Forestry, Calgary, Alberta, Canada

Abstract: In recent years hydrologists have subjected the various subcomponents of the hydrologic cycle to intensive study, designed to determine the mechanisms of flow and to arrive at physical and mathematical descriptions of the flow processes. As a consequence, meaningful results are now available in the form of numerical solutions to mathematical boundary value problems for groundwater flow, concentrated porous media flow, overland flow, and channel flow. These developments as physical solutions, together with the tremendous advances in digital computer technology, should provide the impetus for a necessary reevaluation of research in hydrologic simulation. In this sense, a blueprint for the development of physically based hydrologic response models is presented, the level of sophistication that can be achieved with presently available methodology is discussed, and areas for necessary future research are proposed.

"The ability to accurately predict behavior is a
newest type of the substance of knowledge in any
subject."

CHANNING and LINDSEY¹

Introduction

"There is a group of hydrologists who espouse the pursuit of scientific research into the basic operation of each component of the hydrologic cycle in order to gain a full understanding of their mechanisms and interactions. Although the immediate motivation of an individual researcher may not transcend the narrow confines of a set of special phenomena, it is implicit that a full systems of the hydrologic cycle may eventually be sought. This concept of a full synthesis is held to be the only rational approach to hydrology."

AMERICOLO and HAAT²

A complete physically-based synthesis of the hydrologic cycle is a concept

Toward Sustainable Management Framework

Comparison and Validation in the Great Lakes Region

- Total water storage variations for Southern Ontario were calculated by Aquanty using their software Hydrogeosphere (HGS).
- This software combines
 - The most detailed 3D geological information available
 - A dense network of groundwater wells
 - Surface water observations (e.g. streamflow)
 - Weather forcing (snow, precipitation, evapotranspiration)
- The software provides
 - Soil moisture
 - Groundwater
 - Surface Water

- NRCAN-AAFC-Aquanty
- constructing vigorous, large scale models takes time and skill
- once constructed, many questions can be addressed
- best in class, uniform quality modelling tools can support future research projects
- open Access data layers

Hydrogeology

A fully integrated groundwater–surface-water model for southern Ontario

S.K. Frey^{1*}, O. Khader¹, A. Taylor¹, A.R. Erler¹, D.R. Lapen², E.A. Sudicky¹, S.J. Berg¹, and H.A.J. Russell³

Abstract: A prototype groundwater–surface-water model for southern Ontario has been developed with HydroGeoSphere (HGS), which provides a three-dimensional (3-D), physics-based simulation of fully integrated groundwater–surface-water flow. To-date, the model has been tested for its ability to reproduce average monthly surface-water flow rates and groundwater levels, and its sensitivity to spatial and temporal resolution. Model utility has been demonstrated through an assessment of groundwater extraction influences on regional groundwater levels, which demonstrates how it could be used to address water resources and hydrologic questions.

Southern ON. model is being used by: U Waterloo, U of T, MECP, Quinte Conservation, Oak Ridges Moraine Co....

Elevation
(mASL)

100x Vertical Exaggeration

- six drainage regions for the continental domain
- regions are approximately similar in size
- physiographic characteristics taken into account for drainage region delineation
- element edge length 1000 to 5000 m
- 7 or 8 subsurface layers
- 2.5 to 4 million 3D elements

Model	2Dmesh Nodes	2Dmesh Elements	Land Area (km2)	Coast Area (km2)	Total Area (km2)	Land Proportion of Canada (%)
Arctic	244346	484146	1.72E+06	6.20E+05	2.34E+06	17%
Hudson	243689	483269	2.02E+06	3.19E+05	2.34E+06	20%
Atlantic	195899	387132	1.60E+06	2.77E+05	1.87E+06	16%

Datasets: Development and Assembly

GW–SW Model Construction

- land surface DEM and major lake bathymetry
- surface water drainage network (rank ordered)
- land cover
- soils w/hydraulic properties
- 3D Hydrostratigraphic model (surficial, bedrock)
- permafrost distribution
- subsurface hydraulic property characterization
- validation data (GW, SW, soil moisture)
 - stream flow
 - observation wells etc.

Atmospheric (Historic)

- Precipitation
- snow accumulation and melt
- potential evapotranspiration
- surface temperature

Atmospheric (Climate Projection)

- CMIP6, CORDEX

Remote Sensing

- GRACE
- soil Moisture
- surface Water

Model construction datasets will be harmonized across model domains and will support analysis at a range of spatial scales.

Modelling Framework

Land Surface Modelling
5 km resolution

Regional Climate Modelling
12.5 km resolution

GW – SW Modelling
1 to 5 km resolution

The Community Land Model Version 5: Description of New Features, Benchmarking, and Impact of Forcing Uncertainty

David M. Lawrence, Rosie A. Fisher, Charles D. Koven, Keith W. Oleson, Sean C. Swenson, Gordon Bonan, Nathan Collier, Bardan Ghimire, Leo van Kampenhou, Daniel Kennedy, ... See all authors

Decision Support Framework

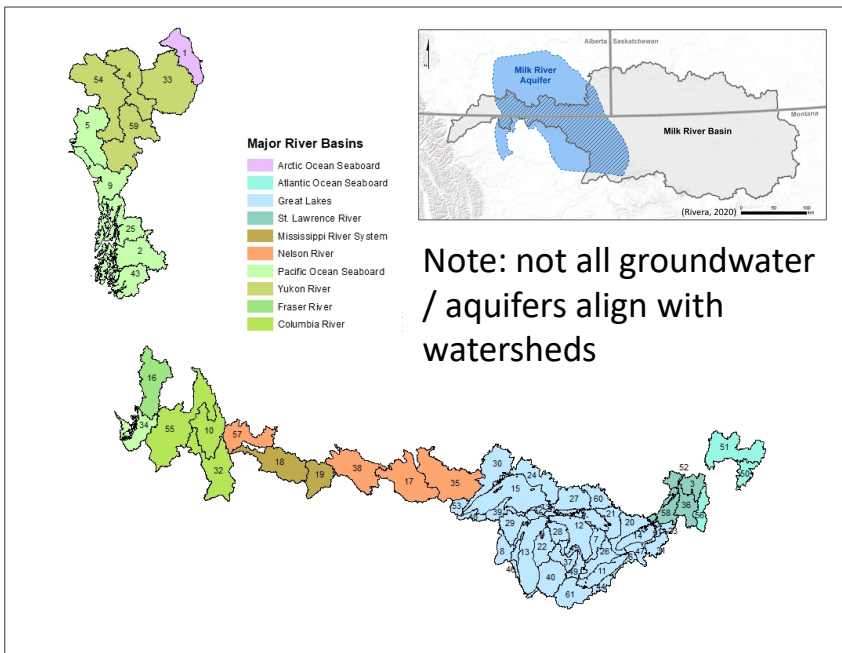

HGSRT Proof-of-concept

Groundwater Information Network

ources, 2021

Canada-USA Watersheds

- order: 4th
- number: 61
- Area: 2,350,443.30 km²
- percentage Canada / USA: 45% / 55%
- Great Lakes watersheds account for 766,000 km² of which Lakes are 244,000 km²
- aggregate information by hydrogeological regions (Sharpe et al. 2014)
- provide conceptualized bedrock and surficial aquifer types

- population: 60,000,000
 - Per watershed: min: <200. max >6 million

e.g. karst aquifers

GRACE

Gravity Recovery and Climate Experiment (GRACE)

- note change in groundwater level and snow depth from left to right image

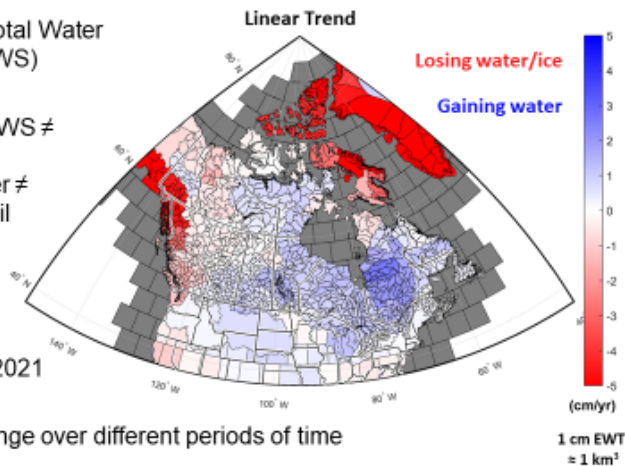

- mapping change in Mass
- 2 satellites
- track changes in spacing and elevation
- 15 year plus record
- global coverage
- watershed solution for
- large regional footprint ~100,000 km²

GRACE

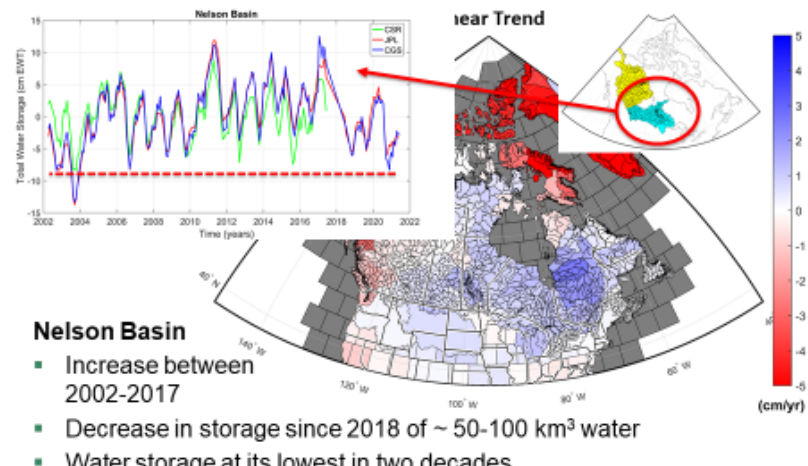

National Scale Changes: Trends

- Trends in Total Water Storage (TWS)
- Trends in TWS ≠ trends in groundwater ≠ trends in soil moisture
- Trend calculated over 2002-2021
- Trends change over different periods of time

National Scale Changes: Trends

Nelson Basin

- Increase between 2002-2017
- Decrease in storage since 2018 of ~ 50-100 km³ water
- Water storage at its lowest in two decades

GRACE comparative study underway in S-ON with regional model

Communication

- flyers – project announcement
- branding – logo
- web site – trilingual (www.Canada1Water.ca)
- newsletter – annual trimester cycle
- social Media
- science conference and meeting presentations, publications
- GSC Data release open file, open access
 - e.g., S-ON model [Frey et al. \(2019\)](#), Great Lakes model datasets [Xu et al. \(2021\)](#)

Engagement

- National Dialogue on Groundwater (NDGW)
- One-on-one contacts with provinces
- Connecting with individual researchers
- Outreach to NGO organizations, Conservation Authorities, etc.
- First Nations engagement via GEM, CFS, etc.,

“Canada 1 Water represents a truly 21st century advancement in integrated climate-surface-groundwater modelling capabilities to assess water resource vulnerabilities across the Canadian landscape. Not only within Canada, but it lays out a science-based roadmap for scientific communities and government agencies around the globe.”
