Summary

The Canadian Food Inspection Agency (CFIA) is dedicated to safeguarding food, animals and plants, which enhances the health and well-being of Canada's people, environment and economy. The National Chemical Residue Monitoring Program (NCRMP) is an annual Canadian Food Inspection Agency (CFIA) regulatory surveillance program which verifies compliance in foods to Canadian standards and guidelines for chemical residues and contaminants. The data collected from the NCRMP along with other surveillance activities enables the CFIA to identify trends that may warrant additional control strategies to maintain or improve compliance.

The NCRMP is one of several valuable surveillance tools that the CFIA employs to help maintain the very high compliance observed year after year. The NCRMP is carried out in accordance with Codex Alimentarius principles and guidelines and is an important part of the CFIA food safety framework that monitors Canadian food for potential chemical hazards. This program provides data to support the Canadian food production system and the integrity of Canada's chemical residue control system. These systems are equivalent to those of our main trading partners like the United States and the European Union.

In the 2014/15 fiscal year (April 1, 2014 to March 31, 2015), an initiative known as the Food Safety Oversight (FSO) Program was introduced to complement the NCRMP and to increase CFIA's oversight in the non-meat food sectors. By the 2015/16 fiscal year (April 1, 2015 to March 31, 2016) the CFIA increased the sampling and testing of fresh fruit and vegetables. Some of these additional FSO program samples were collected at federally registered establishments/importers by inspectors in the same manner as the NCRMP samples. The majority of the FSO samples, however, were collected at retail by contracted samplers. Sampling of foods at both federally registered establishments and at retail offers additional information on the levels of residues and contaminants present in foods in the Canadian market place.

The CFIA communicates non-compliant results from surveillance activities like the NCRMP and the FSO Program to farmers, growers/producers, importers, and retailers to identify areas of concern and to promote the safe use of agricultural chemicals and practices. This ongoing effort ensures that safe and healthy food is continuously available to Canadians.

This report summarizes testing results from both the NCRMP and the FSO Program in food samples collected between April 1, 2015 and March 31, 2016 (hereafter referred to as 2015/16). Over 125000 tests for residues of veterinary drugs, pesticides, metals, and contaminants were performed on more than 14000 NCRMP and FSO monitoring samples and generated millions of results, which are summarized in Annex B of this report. Test results from samples taken as part of the NCRMP and FSO Program showed that the overwhelming majority of food on the market meets Canadian standards for food safety. The overall compliance rate was determined to be 95.7% which is consistent with past years.

What is the National Chemical Residue Monitoring Program?

Since 1978 a national program to monitor foods for chemical residues, now known as the National Chemical Residue Monitoring Program (NCRMP), has been in place to ensure that strategies for reducing health risks as they relate to chemical residue and contaminant exposure in food are implemented proactively.

While the CFIA verifies food safety in different ways, the NCRMP is central to maintaining the safety of the food supply with respect to chemical residues and contaminants. The NCRMP is a valuable surveillance tool built on Codex Alimentarius principles^{1,2} that allows the CFIA to monitor Canadian food products. The data collected is used to assess health risks by identifying all non-compliances which helps the CFIA refine any follow up activity like directed or compliance sampling, or additional testing, and inspection activities. This allows the CFIA to take proactive measures to improve food safety and helps industry comply with Canadian food safety requirements and standards.

What is the Food Safety Oversight Program?

In 2014, the Government of Canada introduced an initiative known as the Food Safety Oversight (FSO) Program to complement existing surveillance programs like the NCRMP by providing additional sampling and testing of commodities to specifically increase oversight on fresh fruit and vegetables, fish and seafood and manufactured products. Since fish and seafood and manufactured food products are currently outside the scope of the NCRMP, these results will be highlighted in a different report by the CFIA.

Why does the CFIA conduct the annual NCRMP and FSO Programs?

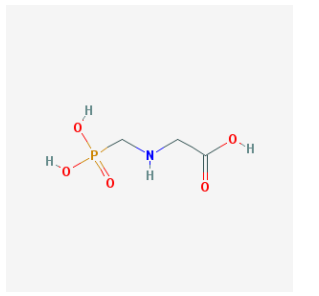

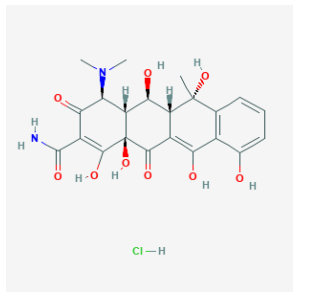

The CFIA is responsible for monitoring the safety of inter-provincially traded and imported food products, as well as domestically produced food destined for export. Imported products must meet the same regulatory requirements as domestic products. The NCRMP and FSO Program provide information on chemical residues and contaminants in foods to ensure that national standards and guidelines are respected by industry. Results are evaluated by the CFIA and any potential health risks from chemical residues present in foods are assessed by Health Canada. The CFIA determines appropriate follow up actions for all chemical residue results exceeding Canadian standards and guidelines. These combined efforts demonstrate that industry is supplying food according to Canadian standards. In addition, the NCRMP provides data that supports the international recognition of a safe and healthy Canadian food supply and market access.

What causes chemical residues in food?

Pesticides and other agricultural chemicals are used in conventional agricultural production systems. These chemicals help protect crops from damage by pests, increase yields and expand the geographical location in which crops can be grown. Pesticides must be applied according to label instructions and good agricultural practices, and the resulting residues in food must not exceed established Canadian limits. Food-producing animals may also be exposed to pesticides and other agricultural chemicals. For example, pesticide residues may be present in livestock feed and water, insecticides may be applied directly to animals for the control of ticks or flies, and fumigants may be used to control pests in stored grains and animal houses. While pesticides help protect our food supply, small amounts of pesticide residues may stay in or on our food after it is applied. Some pesticides 'break down' over time, meaning very little residue is left by the time we consume the food when they are used properly³.

Food-producing animals may be treated with veterinary drugs. Some drugs are administered to individual animals to treat specific disease conditions, while other drugs are administered to groups of animals, usually through medicated feed or water, for the prevention or treatment of disease or for the purpose of growth promotion. Responsible use of veterinary drugs according to a veterinarian's prescription or label directions should not result in residues that exceed established Canadian limits.

What causes chemical contamination of food?

Chemical contamination of food products may result from direct or indirect use of (or exposure to) contaminated soil, water, or air, from natural toxins, from industrial pollution, from food processing, or from contact with food packaging materials. These chemicals generally occur in foods at very low levels, but regardless should be monitored to ensure they do not exceed levels deemed safe for human health.

Metals and elements (for example iron and mercury) occur in food naturally, or may result from the use of pesticides or other agricultural chemicals, from environmental contamination, or from processing.

What are the Canadian limits for residues and contaminants in food?

Maximum Residue Limits (MRLs) for Pesticides

Pesticide MRLs are established by Health Canada's Pest Management Regulatory Agency (PMRA) and appear in Health Canada's *MRL Database* <http://pr-rp.hc-sc.gc.ca/mrl-lrm/index-eng.php>. Pesticide MRLs apply to the specified raw agricultural commodity as well as to any processed food product that contains the commodity unless otherwise specified. According to section B.15.002 of the *Food and Drug Regulations* (FDR), when no specific MRL exists for a residue in a pesticide in a food commodity, residues of a pesticide or other agricultural chemical must not exceed 0.1 parts per million (ppm).

Maximum Residue Limits (MRLs) for Veterinary Drugs

Veterinary drug MRLs are set by Health Canada's Veterinary Drugs Directorate (VDD) and appear in Health Canada's *List of Maximum Residue Limits (MRLs) for Veterinary Drugs in Foods* <https://www.canada.ca/en/health-canada/services/drugs-health-products/veterinary-drugs/maximum-residue-limits-mrls/list-maximum-residue-limits-mrls-veterinary-drugs-foods.html>. In the absence of an MRL or proposed MRL for a veterinary drug, the CFIA deems any food product containing a residue at or above the limit of quantitation (LOQ) for the analytical method to be non-compliant.

A list of banned drugs in animal-derived foods is specified in section B.01.048 of the *FDR*. All detected results of banned drug residues in animal-derived foods are considered non-compliant.

Regulatory Maximum Levels (MLs) for Contaminants

Contaminants and other adulterating substances in foods have regulatory maximum levels. These appear on Health Canada's *List of Contaminants and Other Adulterating Substances in Foods* https://www.canada.ca/en/health-canada/services/food-nutrition/food-safety/chemical-contaminants/contaminants-adulterating-substances-foods.html#fn_t1b1 and *List of Maximum Levels for Various Chemical Contaminants in Foods* <https://www.canada.ca/en/health-canada/services/food-nutrition/food-safety/chemical-contaminants/maximum-levels-chemical-contaminants-foods.html>.

What was sampled?

The NCRMP and FSO Program generated compliance information on seven basic food commodity groups regularly consumed by Canadians. Table 1 lists some examples of products tested by commodity group. The food commodity groups included both imported and domestic products (Figures 3 and 4). The majority of sampling was conducted in raw meat and fresh fruit and vegetables. These food commodity groups represented the majority of the raw agricultural commodities available on the Canadian market.

How were foods chosen for testing?

The CFIA’s sampling activities were carried out in accordance with internationally accepted principles and guidelines^{1,2}. The NCRMP and FSO Program are designed to provide a statistical estimate of the compliance rate of the food production system. If no non-compliances are detected in a sample size of about 300, one can assume with high confidence that the compliance rate for that food is greater than 99%².

Samples selected were unbiased, random, and collected throughout the fiscal year. The number of samples collected for the NCRMP was determined by taking into consideration past compliance data, the volume of food produced, import transaction information, consumption information, and changes in import or production locations and practices. Year-to-year variation in the number and the location of individual sample types collected can fluctuate considerably.

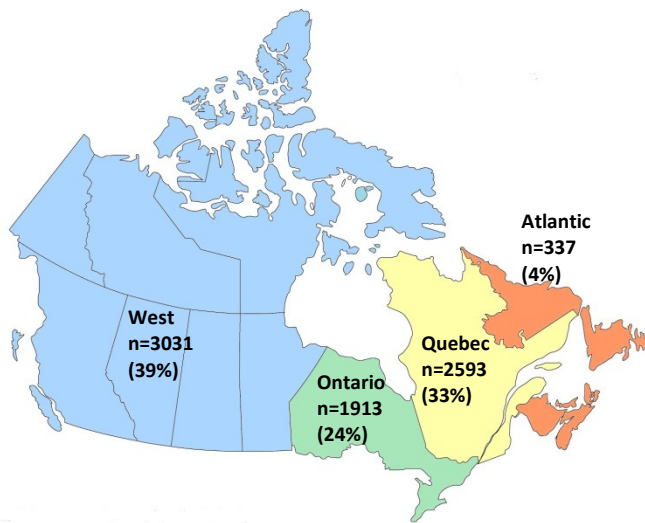

FSO Program samples were selected from identifying the fresh fruit and vegetable products, seeds, peanuts and tree nuts that historically have limited CFIA-generated chemical residue data available.

All food samples were collected using a pre-defined sampling schedule based on an internationally accepted approach^{1,2}. All food samples must be of an adequate size to represent the product.

Where did the NCRMP sampling occur?

Following a sampling schedule, CFIA inspectors collected samples of individual lots of domestically-produced and imported foods. Domestic samples were collected as close as possible to the point of production in the distribution system (e.g., slaughter establishments, fruit and vegetable packing facilities, etc.). Imported samples were collected at the point of entry into the Canadian market. Figure 5 illustrates the distribution of where domestically-produced, inter-provincially traded food samples for the NCRMP were collected in Canada. The top 10 countries from which NCRMP import samples originated are presented in Table 2.

Figure 5: Number of domestic NCRMP samples collected by operational area in 2015/16

There were 7874 domestic samples collected with the highest percentage, 39%, originating from the Western Area. Only a small amount, 4%, originated from the Atlantic with the remainder collected from Quebec and Ontario at 33% and 24% respectively. The number of samples collected approximates the amount of food available within each operational area.

Imported product samples originated from a total of 67 countries. Of the 6156 imported NCRMP samples collected the majority, 63%, originated from the USA and Mexico. The number of samples collected by country of origin generally represented the availability of those products on the Canadian market. There were nine imported samples collected with unknown country of origin.

Where did the FSO Program sampling occur?

Following a sampling schedule, CFIA inspectors and contracted third party samplers collected samples of individual lots of imported and domestically-produced fresh fruits and vegetables, nuts and seeds. Most samples were collected at retail locations across Canada. Tables 3 and 4 illustrate the breakdown of FSO samples by country of origin and by retail area, respectively.

How did the CFIA test the food samples?

Testing for the NCRMP and FSO Program was performed at ISO/IEC 17025 accredited laboratories, including CFIA and private laboratories under contract with the Government of Canada⁷. Methods used by the laboratories included both single-residue and multi-residue methods. The 2015/16 fiscal year marked the beginning of a new suite of CFIA analytical methodology, resulting in an increase in the scope of testing, and increases in analytical sensitivity. This means that the CFIA is now capable of detecting more residues and contaminants than ever before, and at lower levels in most foods.

What tests were performed?

A total of 125 160 tests for chemical residues and contaminants were carried out in 2015/16 on 14279 NCRMP and FSO Program food samples. Figures 6 through 9 illustrate the breakdown of testing by chemical class performed by CFIA and contracted laboratories on a test basis. Table 5 provides examples of the chemicals and chemical groups by chemistry class.

How were the results assessed?

The CFIA assessed all test results against Canadian regulations⁸ and limits (MRLs and MLs) or, in certain cases where no Canadian limits exist, guidance levels set by Health Canada. Specifically:

- Each residue or contaminant detected that is below or at the Canadian limit or guidance level was considered **compliant**.
- Each residue or contaminant detected that is above the Canadian limit or guidance level was considered **non-compliant**. For veterinary drug residues with no MRLs, results exceeding the method limit of quantification are also considered **non-compliant**.
- Each banned drug residue detected at any level is considered **non-compliant**.
- In the absence of Canadian limits or guidance levels, results were recorded but not assessed. The collected data (i.e., PAHs data, certain metals, etc.) are provided to Health Canada for potential standard setting, assessing risk, and/or other risk management purposes.

For each food commodity group listed in Table 1 an annual **compliance rate** was calculated, which was the percentage of samples that are compliant compared to the total number of samples. Note that if a sample was found to have multiple non-compliances, it was considered ‘non-compliant’ only once in this report.

What enforcement/follow-up actions were taken?

All non-compliant sample results were evaluated to determine the appropriate follow-up action. Follow-up actions vary according to the magnitude of the health risk, with the objective of preventing any repeat occurrence or further distribution of items remaining in the marketplace. These actions may have included notification of the producer or importer, notification of the foreign competent authority, follow-up inspections, further directed sampling, or recall of products if Health Canada determined that the product posed an unacceptable health risk to consumers or certain segments of the population.

What did the CFIA find?

Data collected from the 2015/16 NCRMP and FSO Program fiscal year is summarized in Annexes B1-B6. The following is a summary of the compliance result outcomes for the samples collected.

The compliance rate is one measure that the CFIA uses to assess the safety of the food supply and gauge the effectiveness of food safety controls in the food production system. Figure 10 indicates that in the 2015/16 fiscal year 95.7% of the foods sampled and tested were compliant with Canadian regulations⁸, limits, and guidelines. This overall result is comparable to the compliance rates observed in previous sampling years. Most food commodity groups had overall compliance rates exceeding 95%. Imported dairy was the only food commodity group that had appreciably lower compliance than 95%.

Figure 10: Overall 2015/16 compliance rate by NCRMP and FSO Program food commodity group

Lower compliance in imported dairy products

The data indicated that imported dairy products had the lowest compliance rate (82.6%) of all food commodity groups (mostly due to veterinary drug residues). It should be noted that the product types of domestic and imported dairy products sampled were very different. All of the domestic samples tested were raw milk, whereas all imported dairy products tested were cheese. Although the preference is to monitor the raw agricultural commodity, Canada does not import raw milk and therefore secondary products such as cheese must be sampled instead. There are MRLs established for some veterinary drugs in milk, but none are established for residues in secondary products derived from milk. In the absence of MRLs in cheese, drug residues detected at or above the analytical method limit of quantitation (LOQ) are assessed as non-compliant. However, the results do not necessarily represent a risk to human health.

There were 33 samples non-compliant as a result of thiouracil residues which represented 92% of the non-compliant samples of imported cheese. Thiouracil has been used in the past to increase weight gain in animals prior to slaughter. These veterinary drugs are no longer permitted for use in food-producing animals in Canada and there are no established MRLs. Findings of thiouracil residues in ruminant liver have been attributed to dietary consumption of 50 sulphur-rich Brassica species, rather than use of veterinary drugs⁹. Brassica are a genus of plants that include many vegetable crops that form the diet of both humans (broccoli, kale, etc.) and animals (canola)¹⁰. It is possible that the presence of thiouracil detected in imported cheese was due to dairy cattle fed diets containing brassicas such as canola. Thiouracil may be secreted in the milk and subsequently detected in secondary products such as cheese. Health Canada has indicated that the levels detected in imported cheese were not expected to result in a risk to human health¹¹.

Lower compliance in domestic eggs

A lower compliance rate (91.6%) was observed in domestic eggs. Many of the positive and non-compliant results in domestic and imported eggs were from residues of nicarbazin and ionophore drugs. These drugs are used to treat enteric parasites in broiler chickens, but they are not approved for administration to laying hens in Canada, and therefore no MRLs are established in eggs.

Low level residues of nicarbazin and ionophore drugs may occur in eggs when laying hen feed is contaminated by carry-over from a previous batch of broiler chicken feed during feed mixing and preparation, rather than deliberate drug use. The low levels of nicarbazin and ionophore residues detected in eggs were assessed by Health Canada and were considered unlikely to pose a human health concern¹². In 2012, Health Canada established guidance that enabled the CFIA to establish action levels (for follow-up) for residues of ionophores and nicarbazin in eggs. The action levels are established at a level that is protective of both human and animal health while still being low enough to detect deliberate drug use. The CFIA does not take enforcement or follow-up action on residues detected below the established action levels. All but five (or 90%) nicarbazin and ionophore results in eggs tested in 2015-2016 were below the established action levels.

Higher numbers of non-compliant samples in domestic meat

Although the compliance rates for domestic and imported meat are high (95.8% and 98.7%, respectively), more non-compliant samples (mostly from veterinary drug residues) in domestic samples (n=206) were observed vs imported samples (n=20). This difference can be attributed to the differences between the types of domestic and imported samples tested. Canadian meat samples tested under the NCRMP are collected exclusively at slaughter facilities across the country. The samples consisted of unprocessed raw meat, and included muscle, fat, kidney or liver. Imported meat samples consisted mostly of muscle, both cooked and uncooked, and in some cases were processed (i.e., sausage, ready-to-eat products, nuggets, etc.). A greater number (and level) of residues are not unexpected in domestic meat samples because drug residues often occur or accumulate at higher levels in liver, fat, and kidney, or may persist for longer periods of time. Meat samples that are further processed and/or precooked tend to have less of these same residues.

The compliance rates for the major and minor domestic meat species and production/market classes are presented in Tables 6 and 7, respectively. Most major domestic meat species and their production/market classes (i.e., for bovine – beef, veal, cow) exceeded 95% compliance for veterinary drug residues, pesticide residues, and contaminants. Minor meat species had (generally) lower compliance (mostly from veterinary drug residues). In Canada, most minor species and mutton/lamb do not have many established MRLs for veterinary drug residues. As a result, when residues of veterinary drugs are detected in minor species' meat products, mainly from extra-label drug use (i.e., the administration of a drug to a species or to treat a condition that does not appear on the product label), they are considered non-compliant with Canadian regulations⁸. Residue levels detected in minor species were typically lower than the MRLs established for the same drug in other major meat species, and therefore these products are not expected to result in a risk to human health.

Lower compliance in imported fresh fruit and vegetables (NCRMP)

In 2015/16 the overall compliance rate for imported fresh fruit and vegetables (FFVs) collected in the NCRMP was lower than in previous years at 93.2%. This result also coincided with the introduction and implementation of new CFIA pesticide testing methods, which increased the scope of testing and the sensitivity of the applied methodology. In other words, more residues of pesticides, and at much lower levels, were detectable in 2015/16 in comparison to previous testing years.

More non-compliant results (mostly from pesticide residues) in imported FFVs samples (n=247) collected in the NCRMP were observed vs domestic FFVs samples (n=13). This difference can be attributed to the lower number (and type) of pesticides registered for use in Canada in comparison to the total number (and type) registered and used in the countries from which the non-compliant samples originated. Many of the pesticides detected from foreign countries, including the United States and Mexico, are not registered in Canada. This is because many of the FFVs that are grown in more southern climates are not grown in Canada, and/or because Canada does not have the same pest pressures as those countries and therefore do not require their use.

For detected pesticide residues with no established MRLs such as those used in other countries but not registered in Canada, the general MRL of 0.1 ppm is used to assess compliance. For many of the pesticide results detected in imported FFVs samples the levels exceeded the general MRL which meant that the results were non-compliant with Canadian regulations. Although the compliance rate was generally higher in domestic FFVs, as is illustrated in some examples provided in Tables 8 and 9 below, the results are not necessarily an indication that imported FFVs are unsafe to consume.

Similar lower compliance observed in the FSO Program Imported FFVs samples

Similar non-compliant results (resulting from pesticide residues) were observed in imported FFVs samples collected under the FSO Program. There were 19 non-compliant samples (90.2% compliance) in imported FFVs and 3 non-compliant samples (94.4% compliance) in domestic FFVs. Imported spinach had the lowest compliant rate of 67% (n=15). All of the nuts and seeds samples were 100% compliant.

What do the NCRMP and FSO Program results mean?

The overall combined NCRMP and FSO Program compliance rate in the 2015/16 fiscal year of 95.7% was consistent with those seen in previous years. Similar overall compliance rates were observed for domestic and imported products, with the exception of a few food commodity groups, where the type of products being tested (e.g., raw milk vs cheese, raw meat vs cooked meat) was likely responsible for the observed differences.

The results obtained through the NCRMP and FSO Program enabled the CFIA to take appropriate follow-up actions on non-compliant food samples, to identify trends in the prevalence of chemical residues and contaminants in the Canadian food supply, and to further optimize the Agency's surveillance activities and other control measures to minimize potential health risks to Canadians. The NCRMP data were routinely provided to Health Canada and used in health risk assessments of various chemical residues and contaminants in food. These data were also shared with Canada's major trading partners, including the United States and the European Union.
