Screening recommendations for

chlamydia and gonorrhea during pregnancy in Canada, 2023

An update from the National Advisory Committee on Sexually Transmitted and Blood-Borne Infections (NAC-STBBI)

Screen all asymptomatic pregnant women/pregnant individuals (PWPI) for Chlamydia trachomatis (CT) and Neisseria gonorrhoeae (NG)

SCREEN DURING PREGNANCY

During the first trimester or at the first antenatal visit AND again in the third trimester*

* Conditional recommendation; low certainty evidence

SCREEN AT THE TIME OF LABOUR

In any of the following situations*:

- No prenatal screening has occurred (no valid results available at the time of labour)
- Third trimester screening has not occurred
- A positive test result was obtained for CT or NG during pregnancy without appropriate follow-up, including treatment and a test-of-cure

* Conditional recommendation; low certainty evidence

CT and NG cases are increasing

33%

increase in overall **chlamydia** rates from 2010 to 2019

increase in overall 182% Increase in overall gonorrhea rates from 2010 to 2019

Untreated CT and NG in pregnancy can cause adverse pregnancy outcomes (e.g., pre-term birth) and serious illness in neonates (e.g., ophthalmia neonatorum, neonatal pneumonia)

Routine screening can help identify CT and NG to protect the health of **PWPI** and their neonates
