

Δ⁹THC

Δ⁹THC > Δ⁸THC > Δ⁷THC > Δ⁶THC > Δ⁵THC > Δ⁴THC > Δ³THC > Δ²THC > Δ¹THC. Δ⁹THC is the most abundant and active form of THC. It is responsible for the psychoactive effects of cannabis. Δ⁹THC is converted to Δ⁹-THC-COOH in the liver, which is then excreted in the urine. Δ⁹THC is also converted to Δ⁹-THC-OH in the liver, which is then excreted in the urine.

Δ⁹THC is converted to Δ⁹-THC-COOH in the liver, which is then excreted in the urine. Δ⁹THC is also converted to Δ⁹-THC-OH in the liver, which is then excreted in the urine.

- Δ⁹THC is converted to Δ⁹-THC-COOH in the liver, which is then excreted in the urine.
- Δ⁹THC is also converted to Δ⁹-THC-OH in the liver, which is then excreted in the urine.

Δ⁹THC is converted to Δ⁹-THC-COOH in the liver, which is then excreted in the urine. Δ⁹THC is also converted to Δ⁹-THC-OH in the liver, which is then excreted in the urine.

Δ⁹THC is converted to Δ⁹-THC-COOH in the liver, which is then excreted in the urine. Δ⁹THC is also converted to Δ⁹-THC-OH in the liver, which is then excreted in the urine.

- Δ⁹THC is converted to Δ⁹-THC-COOH in the liver, which is then excreted in the urine.
- Δ⁹THC is also converted to Δ⁹-THC-OH in the liver, which is then excreted in the urine.

Δ⁹THC is converted to Δ⁹-THC-COOH in the liver, which is then excreted in the urine. Δ⁹THC is also converted to Δ⁹-THC-OH in the liver, which is then excreted in the urine.

Δ⁹THC is converted to Δ⁹-THC-COOH in the liver, which is then excreted in the urine. Δ⁹THC is also converted to Δ⁹-THC-OH in the liver, which is then excreted in the urine.

THC

THC is converted to THC-COOH in the liver, which is then excreted in the urine. THC is also converted to THC-OH in the liver, which is then excreted in the urine.

THC is converted to THC-COOH in the liver, which is then excreted in the urine. THC is also converted to THC-OH in the liver, which is then excreted in the urine.
