General Introduction

In this appendix, results of low flow analysis for the Eastern Region are presented. This is one of the five administrative regions the province is divided into. The number of stations, with 5 or more years of recorded data, located in this region is 131 and that includes active, discontinued, regulated and non-regulated stations (see Figure C-1). For developing flow duration curves, 123 stations were used, while the rest (i.e. 02HD024, 02HK010, 02KA009, 02KC002, 02KF002, 02KF003, 02LA008, and 02LB033) were excluded due to less than 5 years of continuous daily flow data and missing values (see Table C-1). The period of record flow duration curves are termed annual flow duration curves and those corresponding to each of the 12 months are termed monthly flow duration curves in order to be consistent with previous analyses completed in 1990 by Cumming Cockburn Limited. The flows equalled or exceeded zero to 100% of the time, derived from annual and monthly flow duration curves, are listed in this appendix. Extreme value analyses were conducted separately for 1-, 3-, 7-, 15-, and 30-day duration annual low flow values. For this analysis, 105 stations were used and the rest were excluded due to less than 10 years of flow records. Those stations where less than 5 non-zero low flow values were available over 10 or more years of the record were also excluded. Detailed procedures for these analyses are described in the main report.

This appendix consists of eight different sections, which are explained below. In these sections, self-explanatory section captions are used and therefore table and figure numbers are not associated with all tables and figures.

C1: This section contains results of data screening procedures, concerning independence, trend and general randomness. In tables, the identifier NOT (SIG) means the test statistic was not significant (was significant) at the given significance level.

C2: This section contains results of extreme value analysis corresponding to 11 selected return periods, i.e. 1.005, 1.010, 1.111, 1.250, 2, 5, 10, 20, 50, 100, and 200 years. A separate table is included for each of the five considered low flow durations, i.e. 1-, 3-, 7-, 15-, and 30-day. In these tables, the most suitable distribution fitting procedure for the Gumbel III distribution (i.e. MAX-maximum likelihood, SOD-smallest observed drought and MOM-method of moments) or the method of moments for the three-parameter lognormal distribution (LN3), basic statistical characteristics (i.e. MEAN, SD-standard deviation, SKEW-coefficient of skewness, and CV-coefficient of variation) are also listed. In addition, the record length (REC) and the minimum value (MIN) of each low flow sample are also listed. For samples containing very small and/or zero flows, it was very likely to have negative return values for longer return periods (e.g. 100 or 200 years). These cases are shown using NA (i.e. not applicable), rather inserting zeros as was done in the previous report by Cumming Cockburn Limited.

C3: This section contains extreme value plots for those stations where at least 10 years of continuous flow data was available. In these plots, negative return values for certain cases are not shown.

C4: This section contains results of extreme value analysis corresponding to 11 selected return periods, i.e. 1.005, 1.010, 1.111, 1.250, 2, 5, 10, 20, 50, 100 and, 200 years, for 7-day duration low flows for each month of the year. Rest of the information is the same as in Section C2.

C5: This section contains extreme value plots for 7-day duration low flows for each month of the year. Rest of the information is the same as in Section C3.

C6: This section contains flow magnitudes that were equaled or exceeded zero to 100% of the time over the period of record for annual and monthly flow duration curves at 1% (PER) intervals. The period of record largest value is shown against 0 while the smallest value is shown against 100.

C7: This section contains annual flow duration curves for stations where at least 5 years of continuous data was available; see Table C-1 for the list of stations.

C8: This section contains monthly flow duration curves for stations where at least 5 years of continuous data was available; see Table C-1 for the list of stations.

Figure C-1: Available HYDAT gauging stations for the Eastern Region of Ontario.

Table C-1: The list of stations, with at least five years of continuous daily flow data, considered for the Eastern Region of Ontario. A stands for Active; D for Discontinued; R for Regulated; and N for non-regulated. DA means ‘drainage area’ and PORU means ‘period of record used’.
