CONCENTRATION IN THE MANUFACTURING INDUSTRIES OF CANADA Office of the
By Canada Berecter of 2mustigation and Resouch Combines Investigation Clot)

Published Under the Authority of the Honourable Ron Basford Minister of Consumer and Corporate Affairs

# DEPARTMENT OF CONSUMER AND CORPORATE AFFAIRS 

Combines Investigation Act

Ottawa, March 31, 1971.

#### Abstract

The Honourable Ron Basford, P.C., M.P., Minister of Consumer and Corporate Affairs, Ottawa.

Sir:
I have the honour to transmit to you the text of a report entitled: "Concentration in the Manufacturing Industries of Canada".

Special tabulations essential to the study were prepared by the Manufacturing and Primary Industries Division, Dominion Bureau of Statistics, Ottawa, whose assistance is gratefully acknowledged. Professor Gideon Rosenbluth of the University of British Columbia made helpful comments upon a draft outline of the report.

The report was prepared in the Research Branch by Mr. R. S. Khemani under the direction of Mr. J. William Morrow and with the assistance of other members of the staff.

Yours very truly,

D. H. W. Henry

Director of Investigation and Research
Combines Investigation Act

## INTRODUCTION

This Report contains the results of a statistical inquiry into levels of concentration in Canadian manufacturing industries. It is intended to be of immediate assistance in the formulation and evaluation of industrial and commercial policies, especially those relating to competition. In addition, the appendices have been designed partly to provide the considerable detail often required by academic economists who wish to explore the causes and effects of existing levels of concentration.

Basically, measures of concentration of economic activity involve the ranking by size of the relevant economic units, such as companies or factories, in order to find out to what extent the activity is concentrated in the hands of the few largest units. One of the earliest and most renowned of such measures was by A.A. Berle and G.C. Means, ${ }^{1}$ who reported on the position that had been occupied by the largest two hundred corporations in the United States some forty years ago. Not long afterwards, the Royal Commission on Price Spreads ${ }^{2}$ found that the hundred largest companies in Canada had some 65 per cent of the total capital of all companies. Concentration measures of that kind provide a general indication of the degree to which private economic power is concentrated. When first published they caused considerable concern because they were sharply at variance with the stereotypes of a competitive economy which were then prevalent in the minds of economists as well as members of the public at large.

Those early measures of concentration helped to underline the need for a vast amount of empirical research to supplement the work of economic theorists. There has now evolved, especially in the United States, the field of economics known as industrial organization, whose purpose is to analyse the structure and organization of economic activity and their effects upon the performance of the economy. Moreover, with easy access to electronic computers, the capability of analysing data has increased rapidly.

The present Report, while containing some broad measures of concentration in Canada's business sector as a whole, focuses mainly upon the details of concentration in each of 159 separate manufacturing industries for the year 1965. For each manufacturing industry treated, measures of concentration are presented on two distinct bases. One base is the manufacturing establishment, which approximates the technological unit of production. The other base is the manufacturing enterprise which is defined as all manufacturing establishments in an industry under common control. For example, in a given industry, the Report shows what percentage of total industry shipments were accounted for by the four largest establishments and by the four largest enterprises. The two figures will be the same if each of the four largest enterprises operated only one establishment in that industry; otherwise, enterprise concentration will be higher than

[^0]establishment concentration. Detailed results shown in the appendices have been aggregated and summarized in various ways in the text.

The only comprehensive statistics of concentration in Canadian manufacturing industries previously available were for the year 1948, found in the classic study of Gideon Rosenbluth published in 1957 under the auspices of the National Bureau of Economic Research. ${ }^{3}$ Concentration statistics for United States manufacturing industries were first published before World War II. They are now published on a regular basis and have proven to be an extremely productive tool for policy makers and students of industrial organization.

A virtue of having concentration data at the level of individual industries is that each industry tends to be associated with a particular market or group of markets. Whereas general measures of the kind introduced by Berle and Means provide an indication of the overall distribution of private economic power, concentration data on an industry-by-industry basis provide an indication of competitive conditions in the many separate markets within the economy of a country. Where an industry consists of a number of firms such that no single one or single small group can exert a dominant influence on pricing, then the structural basis for a reasonably competitive market mechanism exists. On the other hand, where a small group of firms, such as the largest four or the largest eight in the industry, account for a dominant share of output, then the possibility of serious restrictions on the competitive process must be taken into account. Of course, no single structural test is conclusive in this regard. In particular instances such factors as foreign trade, the existence of substitude products from other industries, and the relations among the dominant firms would have to be considered as well. Nevertheless, concentration measures do provide an extremely useful indicator of the degree of competition in the economy.

Research into the causes and effects of high concentration can be done by using statistics of industry concentration in conjunction with other data. The importance of internal company growth relative to external growth by mergers as contributors to concentration can be explored. Studies have been done in the United States and elsewhere on the relation of concentration to profit levels, price-cost margins, advertising expenditures and other factors. ${ }^{4}$ It is hoped that the present report will stimulate research into he causes and effects of concentration in Canadian manufacturing industries.

[^1]
## SUMMARY OF FINDINGS

## General Levels of Concentration

The business life of Canada in 1965 was shared by nearly 170,000 active corporations in addition to many thousands of farmers and individual small business proprietors. Thousands of corporations each with assets valued at less than $\$ 5$ million accounted for the greater part of corporate economic activity in agriculture, personal and business services, wholesale and retail trade and construction.

On the other hand, relatively small numbers of large corporations play a highly strategic role in the business life of Canada. In 1965 the 174 largest corporations had 50 per cent of total corporate assets. Ninety-four largest non-financial corporations had 38 per cent of the assets of all non-financial corporations. Seventeen corporations in the utilities sector, most of them under some form of public control, had 72.7 per cent of the assets in that sector. Sixteen mining corporations accounted for 37.2 per cent of the assets in that sector. Eighty banks, insurance companies and other financial corporations had 61.7 per cent of the assets in that sector, and the fifty largest manufacturing corporations had 40 per cent of the assets in that sector.

Special tabulations were made to show the sizes of the largest $4,8,12,20,50$ and 100 manufacturing enterprises in 1965. The largest four operated 117 manufacturing establishments in 29 industries and accounted for over 5 per cent of all manufacturing shipments. The largest hundred operated 1,263 establishments in 114 industries and accounted for 42 per cent of total manufacturing shipments. There were 453 enterprises which operated establishments in two or more industries. They operated 2,530 establishments and accounted for about half of the total manufacturing shipments. The remainder was accounted for by nearly 30,000 enterprises each of which operated in only one industry.

## Levels of Enterprise Concentration in Individual Manufacturing Industries

Details of concentration in 159 manufacturing industries accounting for about 94 per cent of total value added by manufacturing were obtained. The remaining industries were rejected because of the heterogeneity of their products. Of the 159 industries for which data were obtained, five were excluded from the analytical tables, again because of product heterogeneity. The remaining 154 industries, which were subjected to careful analysis, accounted for about 88 per cent of total value added by manufacturing.

Levels of concentration were measured in several different ways, each method having particular advantages. Industries were first examined in terms of the number of largest enterprises in each which accounted for 80 per cent of the industry's shipments. Sixty manufacturing industries accounting for 37 per cent of total manufacturing shipments in the sample were found to be highly concentrated in that eight or fewer enterprises accounted for 80 per cent of shipments. At the other extreme, 57 industries accounting for 42 per cent of shipments in the sample had fairly low or low concentration
in that over twenty enterprises in each industry were required to account for 80 per cent of shipments. When employment was substituted for shipments, it was found that levels of concentration, while still high, were appreciably lower than when measured by shipments.

Concentration was also measured in terms of the percentage of shipments in each industry accounted for by the largest 4, 8, 12, 20 and 50 enterprises. A total of 39 industries accounting for 30 per cent of the total shipments in the sample were characterized as highly concentrated oligopolies in that the largest four enterprises in each industry accounted for 75 per cent or more of shipments. Another 38 industries accounting for 19 per cent of the shipments in the sample were moderately concentrated oligopolies in that the largest four enterprises in each accounted for between 50 and 75 per cent of industry shipments.

## Levels of Establishment and Enterprise Concentration

Whereas the enterprise is the level at which major economic decisions are made, the establishment approximates to the technical unit of production.

The manufacturing industries in the sample were found to be less concentrated in terms of establishments than in terms of enterprises. Establishment concentration was high in 38 industries accounting for 22 per cent of the total shipments in the sample in that fewer than eight establishments in each accounted for 80 per cent of shipments. In comparison, sixty industries accounting for 37 per cent of the shipments in the sample had high enterprise concentration. A clear relation was found to exist between levels of industry concentration and the divergence between enterprise and establishment concentration. The higher the level of concentration the greater was the divergence between enterprise and establishment concentration.

An analysis was made of the characteristics of the largest enterprises in each industry. Leading enterprises and their establishments were both found to vary in size directly with the level of concentration in their industries. Moreover, the difference in absolute size between leading enterprises and leading establishments was greater in the highly concentrated industries. However, it was found that in relative rather than absolute terms, the difference between the sizes of leading enterprises and leading establishments did not vary with the levels of industry concentration. Thus, leading enterprises tend each to have more than one establishment regardless of the level of concentration of their industry. A further analysis indicated that the large enterprises tended to have the large establishments.

Finally, an analysis was made of the extent to which enterprises with different size rankings in their respective industries tend to be multi-establishment operations. It was found that the tendency towards multi-establishment operation was greatest among the four largest enterprises in each industry, followed by the top eight. Enterprises which ranked twelfth or smaller were nearly always single-establishment operations.

In summary, there is a close relationship in Canada between high concentration and the fact that the largest enterprises in most industries tend to have two or more establishments each.

## Regional Concentration

Up to this point in the Report, no allowance was made for the fact that some industries consist of establishments serving a local or regional rather than a national market. Enterprises in such industries are usually faced with a smaller number of actual competitors than statistics on a national basis would indicate. It was found that 34 industries accounting for 36 per cent of total shipments in the sample had marked regional characteristics. Some measures of concentration on a regional basis were obtained for the 34 industries, but problems of confidentiality were such that reasonably comprehensive regional data could only be obtained for 18 of them. It was found that levels of concentration in the 18 industries, as shown by the regional data, were much higher than had been indicated by the national data. Using a weighted average of the regional data for each of the 18 industries, the largest four enterprises in seven of them accounted for 50 per cent or more of the shipments of their respective industries. Using the national concentration measures, only two of the same 18 industries showed as high levels of concentration.

## Trends in Concentration

Canadian statistical evidence respecting historical trends in levels of industrial concentration is scanty. Such evidence as there is indicates that in 1965 the general level of concentration in manufacturing industries was higher than in 1948 or in 1958. Taking the non-financial corporate sector as a whole, concentration appears to have declined somewhat between 1958 and 1965.

Comparisons at the level of individual manufacturing industries were made of concentration measures for 1948 by Gideon Rosenbluth and those for 1965 in the present Report. The statistics of only forty industries were found to be comparable. The levels of enterprise concentration in that sample had increased significantly between 1948 and 1965. In the former year, industries in which 12 or fewer enterprises accounted for 80 per cent of industry shipments made up 32.4 per cent of the sample by value added; in 1965 such industries made up 41.2 per cent of the sample. When looked at in terms of manufacturing establishment, no clear trend in levels of concentration was evident.

The assets of the 54 largest manufacturing corporations in 1958 were compared with those of the fifty largest corporations in 1965 . The former had 38 per cent of the total assets of all manufacturing corporations in 1958, whereas the latter had 40.1 per cent of the assets of all manufacturing corporations in 1965.

However, taking all non-financial corporations, the largest 94 in 1958 had 40.6 per cent of the assets of all non-financial corporations, whereas the largest 94 in 1965 had 37.6 per cent. The indicated decline in concentration appears to have been related to the growth of sectors of low concentration such as services and to the decline of the position of the railways relative to that of other utilities.

## Comparison of Levels of Concentration in Manufacturing in Canada and the United States

Comparisons with studies done in the United States showed that levels of concentration in Canadian manufacturing industries were considerably higher than those
in the United States. The fifty largest United States manufacturing companies accounted for 25 per cent of value added by manufacture in 1963, whereas the fifty largest manufacturing enterprises in Canada accounted for 36 per cent of value added by manufacture in 1965. The figures for the hundred largest were 33 per cent of value added in the United States and 46 per cent of value added in Canada.

At the level of individual manufacturing industries, it was found that Canadian industry classifications tended to be considerably broader than those of the United States. In many cases two or more United States industries had to be combined for purposes of comparison with one Canadian industry. Altogether, 116 industries or groups of industries were compared. On the Canadian side, 123 manufacturing industries were included and on the American side 231 industries were included. They accounted for 68 per cent of total United States manufacturing shipments and 77 per cent of total Canadian manufacturing shipments. The results showed that Canadian manufacturing industries in 1965 were much more concentrated than their United States counterparts in 1963. Of the 116 industry groupings in the sample, 98 were significantly more highly concentrated in Canada than in the United States.

Finally, tests were made to determine the differences in indicated levels of concentration resulting from the use of the Canadian and United States systems of industry classification. Levels of concentration in 231 United States manufacturing industries were compared with levels of concentration in the same industries when combined into 116 industry groups comparable to the Canadian industry classifications. When concentration in each of 231 American industries was measured separately, 11 of them accounting for 15.17 per cent of the shipments in the sample were in the highly concentrated range. When the same industries were combined into 116 industry groups comparable to Canadian classifications, only 3 of the groups emerged in the highly concentrated range.

Thus, it appears that the level of manufacturing concentration in Canada would be far higher than as shown in this Report if the American system of industry classification could have been used. It is, however, beyond the scope of this Report to decide which classification provides the best basis for a concentration study. The Canadian classifications clearly err in the direction of being too broad and of leading to understatements of concentration. However, some critics have contended that the American classifications err in the other direction.

## CHAPTER I

## INDUSTRIAL CONCENTRATION: CONCEPTS AND MEASUREMENT

## The Concept of the Industry

Industrial concentration, connotes a measure of the extent to which a small number of firms account for a large proportion of an industry's output. ${ }^{1}$ Such measures are designed to indicate the degree to which the structure of an industry can be characterized as competitive.

Economic theory and actual experience suggest that the level of concentration is an important determinant of market behaviour. Other things being equal, the smaller the number of leading firms which account for a large proportion of an industry's output, the more likely it is for monopolistic practices to prevail. In highly concentrated industries, firms have considerable latitude and discretionary power in making decisions regarding price, output and other related matters. They have this power because the presence of only a few rivals enables them to act inter-dependently. On the other hand, when industry concentration is low, the existence of many rival firms forces each to behave independently, and firms have less discretionary power over prices, output and related factors. In the latter case, market forces rather than individual firms determine the levels of prices and output.

The rationale of industry concentration ratios was expressed by Joe S. Bain in the following terms:
"If we wish to view concentration as a structural determinant of competition, it is the degree of concentration within each group of competing firms which will presumably be the strategic influence, and we naturally inquire about the degree of concentration within individual industries." ${ }^{2}$ (emphasis by Joe $S$. Bain).

One of the practical difficulties of obtaining satisfactory industry concentration ratios is in classifying industries so that each approximates a group of competing firms. In a sense, all sellers compete with one another for the buyer's dollar. However, competition in the more direct and relevant sense occurs when firms offer to a common group of buyers products which are close substitutes for one another. Products are close substitutes when a change in selling price of one significantly affects the demand for the others. ${ }^{3}$

[^2]Ideally, industries should be classified to conform with the foregoing concepts of conditions of supply and demand. On the supply side, the firms should offer similar products to a common market. On the demand side, the similarity of the products should relate to their substitutability in use. It is, of course, impossible in practice to classify actual industries in such an ideal way. The various products produced by the different firms in an industry may not all be close substitutes, or similar products may be produced in different industries. Furthermore, the geographic demarcation of markets may vary even within a single industry.

In developing concentration measures, dependence must be placed largely upon the industry or product classifications already established in official statistics. In Canada the Dominion Bureau of Statistics collects data on an industry basis. The concentration figures in this Report are therefore based on industry rather than product statistics. The industry as defined in the Canadian Standard Industrial Classification Manual "is composed of establishments engaged in the same or a similar line of economic activity". ${ }^{4}$ The line of economic activity is defined in terms of the commodities produced, and the criteria include end use or chief component materials of the commodities. ${ }^{5}$

## Choice of Industries

The source of statistics for this Report was the 1965 Census of Manufactures of the Dominion Bureau of Statistics. The various manufacturing industries as defined by D.B.S. could be used unchanged; two or more industries could be combined; individual industries could be sub-divided, or particular industries could simply be rejected as unsatisfactory for measuring concentration.

In deciding upon which industries to reject, a compromise had to be made between the desirability of having a comprehensive study and the need to avoid publication of concentration ratios which would be seriously misleading. In a few cases industries were combined or sub-divided in order to bring them into closer conformity with the concepts of the industry mentioned earlier. The scope for subdividing industries was, however, seriously restricted by the fact the resultant classifications had to consist of enough producers to avoid disclosure of statistics pertaining to individual enterprises or establishments. In most cases it was found best either to use or reject industries as already defined.

The most common reason for rejecting an industry was that it consisted of two or more separate groups of firms each serving a distinct market. However, such an industry was only rejected if the classified products were very heterogeneous and it was believed that the statistics would be seriously misleading. For example, an industry was not rejected when the value of one product was much greater than that of the other, or where the leading firms produced both products.

[^3]After the process of screening, combining and subdividing of industries, concentration data were obtained for 159 industries as defined for purposes of the present study. ${ }^{7}$ The value added ${ }^{8}$ by those industries was equivalent to about 94 per cent of the total value added by all manufacturing industries in 1965. Concentration data of all those industries are contained in the detailed tables in Appendix A.

In addition, two ratios have been calculated for each industry which are designed to assist in evaluating the suitability of the industry as a base for measuring concentration. ${ }^{9}$ These are the Primary Product Specialization Index and the Coverage Index.

The Primary Product Specialization Index (PPSI) measures the extent to which plants classified in an industry specialize in making products regarded as primary to that industry. Value of shipments of products primary to the industry are expressed as a ratio of the total value of shipments of all products by the industry. ${ }^{10}$ For example, if poultry products are the only products primary to the Poultry Processing Industry, then the PPSI will express the total value of poultry products shipped by the industry as a percentage of the total value of products of all kinds shipped by the industry.

The Coverage Index (C I) measures the extent to which shipments of products primary to an industry are made by plants classified in that industry. It is the value of shipments of products primary to that industry as a ratio of total shipments of those products by all industries. For example, the Coverage Index of the Poultry Processing Industry would be less than one hundred to the extent that poultry products were also shipped by other industries.

It was found for the most part that the existing D.B.S. industry classifications yielded quite high Primary Product Specialization Indexes and Coverage Indexes.

## Units of Economic Activity

Statistics are presented on the basis of the manufacturing establishment as defined by D.B.S. and on the basis of the manufacturing enterprise as defined for purposes of the present study. The D.B.S. defines an establishment as:
"The smallest unit which is a separate operating entity capable of reporting the following principal statistics:

Materials and supplies used
Goods purchased for resale as such
Fuel and power consumed
Number of employees and salaries and wages

[^4]
## Manhours worked and paid Inventories <br> Shipments or sales"11

The establishment is the " best approximation to the technological unit of production in manufacturing for which statistics are available.

An enterprise, for purposes of measuring concentration in individual manufacturing industries in this Report, is defined as all manufacturing establishments in a single manufacturing industry which are under common control. Most manufacturing enterprises each consist of only one establishment, such as one sawmill or one dairy. However, the definition allows for even the large conglomerate enterprise which controls numbers of plants in several industries. Under the definition, all the establishments in Industry A under control of Conglomerate $X$ would be defined as one enterprise in Industry A. All the establishments in Industry B under control of Conglomerate $X$ would be one enterprise in Industry B , and so on. Any holdings of the conglomerate other than manufacturing establishments are excluded from the definition of an enterprise and from the statistics. The methods used in combining establishments into enterprises are described in Appendix C. The enterprise, as herein defined, is intended to approximate the economic decision-making unit with regard to prices and related matters.

## Measures of Concentration

Given the industry classifications and the units of activity, whether establishments or enterprises, there remain the questions of what units to use as measures of economic activity or size and how to present the resultant statistics in order to indicate levels of concentration.

Value of assets, numbers employed, value of shipments and value added have been the most frequently used indicators of economic activity for measuring concentration. All have their merits and all present certain problems, both conceptual and technical. ${ }^{12}$ For purposes of the present Report, statistics of assets were not available at the industry level but those of value of shipments, value added and employment were. Value of shipments was chosen as the principal measure because it provides a good approximation of the concept of a market. ${ }^{13}$ However, measures of concentration in terms of employment and of value added are also presented in the study.

[^5]Having decided upon the units of measurement, the next question was how they could best be used to portray levels of concentration. Basically, what is required is to portray the size distribution of the firms in an industry in a manner best suited to assessing the degree to which the industry is structurally competitive. Moreover, in dealing with a large number of industries, the measure should be simple, and of a kind to permit inter-industry comparisons and facilitate comparisons with similar industries in other countries. Also, the measure must be such as to preserve the confidentiality of individual firms. Economists agree that there is no single measure which meets all the requirements ideally. ${ }^{14}$ In the present Report, the measures adopted are:

Inverse Indexes, showing the numbers of enterprises or establishments required to account for 80 per cent of the value of factory shipments or employment respectively in each industry.

Industry Concentration Ratios, showing the percentage of the value of factory shipments accounted for by the largest $4,8,12,16,20$ and 50 enterprises or establishments in each industry.

Herfindahl Indexes, based upon employment, value of factory shipments and value added respectively.

The number of firms accounting for 80 per cent of employment was the principal measure used in the study by Gideon Rosenbluth ${ }^{15}$ of concentration in Canadian manufacturing industries in 1948. The desirability of facilitating comparisons with earlier years is a sufficient reason for presenting those measures in the present Report. A virtue of the measure is that it allows for inter-industry comparisons by focusing attention on a large proportion of an industry's economic activity.

Concentration ratios have been widely used in the United States and have been found to be extremely useful. Moreover, international comparisons are facilitated by using the same measure in Canada. The measure has the virtue of providing the maximum of detail with respect to the largest firms in each industry. By and large, the state of competition is determined by the size distribution of the largest firms in an industry. The principal difficulty presented by the measure is in attempting to compare levels of concentration in different industries. For example, it is not uncommon for the first four firms in Industry $A$ to have a larger share of their market than the first four firms of Industry B have of their market, but for the reverse to be the case for the largest eight firms in the two industries. In such instances there is no entirely objective way of deciding which of the two industries should be described as the more highly concentrated.

[^6]In dealing with the foregoing problem it is often helpful to know how much divergence in size there is among the enterprises and among establishments within a size group. The level of concentration tends to vary directly with the divergence within size groups. The present Report presents measures of standard deviation ${ }^{16}$ and coefficient of variation ${ }^{17}$ for each size group of enterprises. The first reflects absolute size differences and the second reflects relative size differences within the size groups.

The Herfindahl Index is the sum of the squares of each firm size expressed as a ratio or percentage of total industry size. The index varies up to a maximum value of one hundred which signifies monopoly. By a single index it takes account both of the number of firms in an industry and of their relative sizes. As such it is particularly useful for ranking industries according to levels of concentration.

16 Formulat $S=\sqrt{\frac{\sum_{i=1}^{n}\left(x_{i}-x\right)^{2}}{n}}$
${ }^{17}$ Formula. $V=\frac{S}{\mathrm{x}}$
where $x_{1}$ is the value of factory shipments of the ith to $n t h$ firm and $x$ is the mean.

This can be expressed as a ratio or in terms of a percentage.

## CHAPTER II

## CONCENTRATION LEVELS IN CANADIAN MANUFACTURING INDUSTRIES, 1965

## General Measures of Concentration of Economic Power

The concentration of economic power is closely associated with the corporate form of business organization. For various economic, technical and legal reasons which are well known, ${ }^{1}$ large business undertakings are nearly always incorporated. The corporate form of business organization has been extended to nearly all sectors of the economy. Table II-1 contains selected statistics of corporations by asset size groups and by economic sectors for the year 1965.

There were nearly 170,000 active corporations in Canada of which approximately 167,000 each had assets valued at less than $\$ 5$ million. Thousands of these relatively small corporations accounted for the greater part of corporate economic activity in agriculture, services, whosesale and retail trade and construction. Some of those economic activities, notably farming and services, are carried out to a considerable extent by individual proprietors, professional persons or tradesmen operating independently. The individual proprietor also plays a continuing although declining role in trade and construction. Though concentration of corporate activity in wholesale and retail trade as a whole is low, there are some large corporate retail chains, department stores and wholesalers.

In the spheres of manufacturing, mining, utilities and finance, the corporate form of business organization is virtually universal. Moreover, corporations each with assets greater than $\$ 5$ million account for the greater part of activity in those sectors. With regard to utilities, many of the large corporations are publicly owned or under some degree of public control. It is in finance, manufacturing and mining that the greatest concentrations of private economic power occur. A total of fifty corporations, each with assets of $\$ 100$ million and over accounted for 40 per cent of total assets in manufacturing; 16 such corporations accounted for 37 per cent of total assets in mining; and in the financial sector eighty such corporations accounted for 62 per cent of total assets.

While manufacturing is not the only sector of the economy where high concentration occurs, the need for additional information about it is particularly acute. There already exists a considerable amount of information about the structure of the financial sector ${ }^{2}$ and of mining ${ }^{3}$. The manufacturing sector in Canada is large and important and it is desirable to add to the knowledge of its structure. In 1965, manufacturing activity accounted for approximately 25 per cent of gross domestic product at factor cost, 25 per cent of employment, and 28 per cent wages and salaries.

## General Measures of Concentration in Manufacturing

Most of the special tabulations of enterprises obtained for the present Report were based upon the definition of an enterprise as consisting of all establishments under common control in a single manufacturing industry. In addition, however, it proved possible to obtain tabulations in which the manufacturing enterprise is defined as consisting of all establishments under common control in all manufacturing industries. Data based upon the latter concept are presented in Tables II-2 and II-3.

TABLE II-2

## SELECTED STATISTICS OF THE LARGEST CANADIAN MANUFACTURING ENTERPRISES, 1965

Table II-2 provides measures of the size of the largest manufacturing enterprises without reference to the particular market or markets in which they operate. The fifty largest enterprises accounted for over a third of the total value added by all manufacturing industries. The table also shows the significance of multi-establishment ownership as a factor in the general level of concentration in Canadian manufacturing industries. The four largest enterprises together controlled a total of 117 manufacturing establishments in 29 industries, and the largest hundred enterprises controlled 1,263 manufacturing establishments.

Table II-3 provides further evidence that bigness in manufacturing is also associated with conglomerate enterprises which operate in more than one industry. For example, there were 31 manufacturing enterprises each of which had establishments in six or more industries. These enterprises accounted for approximately 17 per cent of total value of factory shipments of all manufacturing industries in 1965. At the other extreme, there were over 30,000 enterprises which accounted for about half the total value of factory shipments in manufacturing and operated for the most part in one industry with one establishment.

TABLE II-3
MANUFACTURING ENTERPRISES, BY NUMBERS OF INDUSTRIES IN WHICH EACH HAD ESTABLISHMENTS, 1965

| Enterprises Having <br> Establishments in | Number of <br> Enterprises | Number of <br> Establishments | Value of Factory <br> Shipments <br> $\left(\${ }^{\prime} 000\right)$ |

## Concentration by Individual Manufacturing Industries

Detailed statistics pertaining to concentration in 159 individual manufacturing industries were obtained and are presented in Appendix A. Five of them have been excluded from the summary tables in the present and succeeding chapters because of their heterogeneous product composition. ${ }^{4}$ The 154 manufacturing industries which are included in the summary tables which follow accounted for 88 per cent of total value added by all manufacturing industries in 1965.

[^8]
## The Inverse Indexes

For purposes of exposition and summarization, 154 manufacturing industries have been classified by the following value ranges of the inverse indexes:

| Number of Enterprises <br> Accounting for $80 \%$ of <br> Factory Shipments <br> or Employment |  |
| :--- | :--- | | Description of |
| :---: |
| Level of |
| Concentration ${ }^{5}$ |

As with other measures of concentration, the inverse indexes leave considerable scope for interpretation in the light of factors which affect competitive conditions in an industry. There is no question that an index of four or fewer indicates a very high degree of concentration nor that an index of fifty or over indicates a low degree of concentration. However, in intermediate ranges of the index the actual levels of concentration depend to an important degree upon the size distribution of the largest firms which together account for 80 per cent of shipments or production. For example, an industry with an inverse index of 15 is much more highly concentrated if one of the 15 firms is dominant in size than if all 15 firms are of similar size.

| Total | 154 | 100.00 | 30.42 | 100.00 | 13.12 | 100.00 | 1,336,972 | 100.00 |

(a) Number of largest enterprises accounting for 80 per cent of factory shipments in each industry. Source: Tables A-1, A-2 (Appendix)

[^9]Table II-4 and Chart II-1 summarize levels of concentration in 154 individual manufacturing industries as measured by the number of enterprises required to account for 80 per cent of the total factory shipments of an industry. Sixty industries accounting for a third of total value added by the sample were highly or very highly concentrated in that eight or fewer enterprises accounted for 80 per cent of shipments in each industry. Of those sixty industries, 31 industries accounting for 23 per cent of the value added of the sample were very highly concentrated in that four or fewer enterprises accounted for 80 per cent of shipments in each industry.

Table II- 5 summarizes concentration levels by major industry groups, and indicates what proportion of each group was included in the sample of 154 industries. Concentration data were obtained for industries accounting for between 80 and 100 per cent of each of 16 of the 20 major groups. The coverage of the other four groups varied from only 14 per cent of the Furniture and Fixture group and 35 per cent of the Metal Fabricating group to 73 per cent of the Primary Metal group.

The prevalence of highly concentrated industries does vary from one major industry group to another, but no clear pattern on that basis appears to emerge. Most of the large industry groups contain industries with a wide range of concentration levels. That applies, for example, to such major groups as Food and Beverages, Textiles, Clothing, Wood Industries and Paper and Allied Industries. In some other instances major industry groups consist of only a few industries, as in the case of the Printing, Publishing and Allied Industry group. That group has been classified into just two industries, both of which have low concentration levels. Similarly, there are just two industries in the Tobacco Products group, both of which are highly concentrated. ${ }^{6}$

Inverse indexes in terms of the number of enterprises required to account for 80 per cent of employment in each industry are summarized in Table II-6 and Chart II-2. They reveal concentration levels which, while high, are lower than the levels indicated on the basis of shipments. The differences are particularly marked in the areas of very high and low concentration. In terms of employment, 24 industries which accounted for 12 per cent of employment were very highly concentrated; in terms of shipments, 31 industries which accounted for 26 per cent of shipments were very highly concentrated. The extent of the divergence of the two inverse measures of concentration is further analysed in Appendix D.

## Industry Concentration Ratios

The top four enterprise concentration ratios for 154 manufacturing industries are summarized in Table II-7 and Chart II-3 below. As with the treatment of the inverse indexes, the question of how to interpret the findings in the case of industry concentration ratios arises. Any interpretation must take account of the fact that there are factors other than the number and size distributions of domestic producers which influence competitiveness within markets. Professor Bain, after making these and other

reservations, expressed the following view with respect to the interpretation of concentration ratios in the United States:
"The Census fourfold classification ( 75 to 100 per cent by four, 50 to 75 per cent by four, and so forth) is probably better than a dichotomy. It permits us, in the four classes, to recognize in a rough and ready fashion 'highly concentrated oligopoly', 'moderately concentrated oligopoly', 'slightly concentrated (or low-grade) oligopoly', and 'atomism', though perhaps the lines between classes are not drawn at just the best places." ${ }^{7}$

The same approach is adopted herein. It should be noted, however, that in applying it to Canadian data a somewhat higher degree of market concentration becomes acceptable. This is primarily due to the smaller size of markets in Canada relative to those in the United States.

According to the foregoing criteria, 39 Canadian manufacturing industries accounting for 30 per cent of the total value of factory shipments in the sample were highly concentrated oligopolies in that the largest four enterprises in each accounted for 75 per cent or more of shipments in 1965. Another 38 industries accounting for 19 per cent of the shipments in the sample were moderately concentrated oligopolies. The remaining 77 industries accounting for 50 per cent of shipments were either only slightly concentrated or structurally competitive.

Source: Table A-1, A-2 (Appendix)

Table II-8, which may be compared with Table II-5, provides a breakdown of the top four enterprise concentration ratios into major industry groups. The patterns of industry concentration as portrayed in the two tables are very similar.

## Herfindahl Index

The inverse indexes and the concentration ratios discussed in preceding sections serve to focus attention upon the position of the largest enterprises. The Herfindahl index reflects the size distribution of all the enterprises in an industry, thus taking account of the periphery of smaller enterprises which often exist along with the leaders. A practical advantage of the Herfindahl index is that, as a summary index, it effectively conceals the data of individual enterprises. As a result, problems of data suppression in the interest of confidentiality are largely removed.

The foregoing features of the Herfindahl index made it particularly useful for the ranking of industries by levels of concentration. Table A-12 in Appendix A shows the ranks of 154 Canadian manufacturing industries by the Herfindahl indexes based upon value of factory shipments, value added and employment. The fifty industries with the highest Herfindahl indexes among those surveyed are listed in Table II-9. A number of highly concentrated industries were excluded from the survey because of heterogeneous product composition. For example, processors of aluminum, nickle, copper and zinc are among those excluded.

## CHAPTER III

## LEVELS OF ESTABLISHMENT AND ENTERPRISE CONCENTRATION

## Differences in Enterprise and Establishment Concentration

The foregoing findings relate to concentration in terms of enterprises. The enterprise as mentioned earlier, consists of all establishments in a single manufacturing industry under common control. Data pertaining to concentration in terms of manufacturing establishments were also obtained. The levels of establishment concentration and the relationships between enterprise and establishment concentration are described below.

In manufacturing, the basic technical unit of production is the establishment. To that extent concentration levels in terms of establishments tend to reflect the degrees of concentration which are made necessary by the existing technical organization of production processes. Details of establishment concentration levels are presented in Table A-3 in Appendix A. Some of the principal results are summarized in Table III-1 and Chart III-1 below.

## TABLE III-1

NUMBER OF LARGEST ESTABLISHMENTS ACCOUNTING FOR 80 PER CENT OF FACTORY SHIPMENTS IN 154 MANUFACTURING INDUSTRIES, 1965

| Inverse Index ${ }^{(a)}$ | Industries |  | Industry Value of Factory Shipments |  | Industry Value Added |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number | Percent of Total | \$ Bil. | Percent of Total | \$ Bil. | Percent of Total |
| Up to 4 | 11 | 7.14 | 2.83 | 9.29 | . 96 | 7.36 |
| Over 4 to 8 | 27 | 17.53 | - 3.81 | 12.53 | 1.79 | 13.64 |
| Over 8 to 20 | 44 | 28.58 | 6.16 | 20.53 | 2.57 | 19.55 |
| Over 20 to 50 | 40 | 25.97 | 7.89 | 25.93 | 3.81 | 29.06 |
| Over 50 | 32 | 20.78 | 9.73 | 32.02 | 3.99 | 30.39 |
| TOTALS | 154 | 100.00 | 30.42 | 100.00 | 13.12 | 100.00 |

(a) Number of largest establishments accounting for 80 per cent of factory shipments in each industry.

Source: Tables A-3, A-4 (Appendix)
Within the 154 manufacturing industries analysed, there were 38 industries accounting for 22 per cent of total value of factory shipments in which eight or fewer establishments accounted for 80 per cent of factory shipments in 1965. In that sense, slightly more than one-fifth of Canadian manufacturing industries are highly concentrated in terms of establishments. However, establishment concentration levels were considerably

## CHART III-1

NUMBER OF LARGEST ESTABLISHMENTS ACCOUNTING FOR 80 PER CENT OF FACTORY SHIPMENTS IN 154 MANUFACTURING INDUSTRIES, 1965

Source: Table A-3 (Appendix) and Table III-1
lower than the enterprise concentration levels as shown in Table II-4 in Chapter I. Thus, in terms of enterprises, 37 per cent of total value of factory shipments in the sample was in industries where eight or fewer enterprises accounted for 80 per cent of factory
shipments. Whereas, 38 industries are considered highly concentrated in terms of establishments, sixty industries are considered highly concentrated in terms of enterprises.

Table III-2 herein serves to establish even more clearly the substantial divergence between enterprise and establishment concentration. The first part of the table shows the divergence in terms of numbers of industries, whereas the second part shows it in terms of industry value of factory shipments. The relative differences (Column 5) indicate that the divergence between enterprise and establishment concentration is greatest in industries of high concentration. The divergence in terms of number of industries varies from a high of approximately 64 per cent for the highly concentrated industries to a low of approximately 5 per cent for the industries with low concentration.

Source: Tables A-1 to A-4 (Appendix)

The divergence between enterprise and establishment concentration levels implies a considerable disparity between enterprise and establishment sizes. High levels of concentration are clearly associated with multi-establishment ownership. As an enterprise consists of establishments under common control, there is a direct relationship between the size of enterprises and size of establishments.

## Leading Enterprises and Their Establishments

Table III-3 compares the average value of factory shipments of the top four enterprises and of all the establishments controlled by the top four enterprises, arranged by concentration quartiles. It indicates that both the leading enterprises and their establishments vary in size directly with the degree of industry concentration. The average sizes of leading enterprises and establishments in the industries of the top concentration quartile are over eight times those of their counterparts in the industries of the lowest concentration quartile. Moreover, as would be expected, the average difference in size between leading enterprises and establishments is greater in the highly concentrated industries. However, the relative difference in average size (Column 4) between leading enterprises and their establishments is of the same general order in the industries in different concentration quartiles. Indeed, the relative difference is lowest in the industries of highest concentration. This shows that leading firms in industries tend to be multi-establishment regardless of the level of industry concentration. Moreover, the difference between the average size of leading enterprises and of their establishments is considerable in each concentration quartile, ranging from 49 per cent to 68 per cent. A further analysis indicates that the large establishments in most Canadian manufacturing industries are controlled by the large enterprises. A simple correlation between the average size of the establishments in the top 12 enterprises and the average size of a similar number of largest establishments gives a correlation coefficient of .9776 .

## Concentration Levels and Multi-Establishment Operations

The foregoing analysis has established that the difference between enterprise and establishment concentration is large. The tendency of leading enterprises in industries of all concentration levels to control more than one establishment is an important factor determining the size of leading enterprises. Moreover, it has been found that large enterprises tend to have large establishments. Gideon Rosenbluth ${ }^{1}$ found that 64 per cent of the variation in concentration among industries in 1948 could be ascribed to variations in average firm size. As there exists a direct relationship between enterprise and establishment sizes, an analysis of multi-establishment operations is of some importance.

Multi-establishment operations by enterprises can arise for a variety of reasons. The most important among these reasons is probably the existence of diminishing returns to scale which may stem from numerous factors. A firm may locate its plants in different

[^15]market areas. It may establish new plants to permit greater specialization or it may acquire additional plants through mergers.

In this section we attempt to analyse two basic propositions:
(i) Are multi-establishment operations a phenomena of highly concentrated industries or
(ii) Are all large enterprises multi-establishment operations regardless of industry concentration level?

TABLE III-3

| Up to $24 \%$ | 7,172.68 | 3,213.67 | 3,959.01 | 55.19 |

Source: Tables A-1, A-3 (Appendix)
Some light was shed upon these questions in Tables III-2 and III-3 above. Although the divergence between enterprise and establishment concentration shown in Table III-2 indicates the existence of multi-establishment operations, the table does not indicate whether the highly concentrated industries in terms of enterprises are the same industries as those that are highly concentrated in terms of establishments. Moreover, Table III-3 indicates that the divergence between the average sizes of leading enterprises and of their establishments is not necessarily related to concentration and it does not indicate whether or not there are more establishments per enterprise in highly concentrated industries. Furthermore, there exists considerable disparity in absolute enterprise sizes among industries in different concentration quartiles. It is, therefore, important to know if this absolute size disparity results from a higher degree of multi-establishment operations.

Table III-4 below shows the divergence between total numbers of enterprises and of establishments in the same groups of industries, classified by the top four enterprise concentration quartiles. It establishes the different degrees by which enterprise concentration is characterized by the presence of multi-establishment operations. The multi-establishment enterprises are most prevalent in the quartile of highest concentration and least prevalent in the quartile of lowest concentration. For instance, the relative difference (Column 7) indicates that there are approximately 36 per cent more establishments than enterprises in industries where the top four enterprise concentration

Source: Table A-1 (Appendix)
ratio is 75 to 100 per cent of total industry shipments. On the other hand, when the top four enterprise concentration ratio is between zero to 24 per cent, there are only 2.31 per cent more establishments than enterprises.

Table 1II-5 establishes that the leading enterprises in all industries are to a degree multi-establishment operations regardless of the enterprise concentration level. Within the top four enterprises there are from 1.94 establishment to 3.30 establishments per enterprise. In the case of the top eight enterprises this range of establishments per enterprise is smaller. On the other hand, the enterprises from the 12 th onwards consist, in most instances, of single-establishment enterprises. The relative difference (Columns 8 and 9) indicate that there is greater multi-establishment operations in the largest four enterprises than in the largest eight enterprises as compared with the remaining enterprises in these industries. The difference in multi-establishment operations between the top four and top eight enterprises is, however, less marked (Column 7).

Thus, in conclusion it can be stated that:
(a) Enterprise concentration levels are considerably higher than establishment concentration levels in Canadian manufacturing industries.
(b) The average enterprise and establishment size is to a marked degree greater in more concentrated industries than in less concentrated industries.
(c) The size disparity among the top four enterprises in different industries and in different concentration levels results not only from large absolute size of enterprises and their establishments, but also from multiestablishment operations.
(d) Although multi-establishment enterprises are more prevalent in concentrated industries, all leading enterprises in most industries are to an extent multi-establishment enterprises.

## CHAPTER IV

## INDUSTRIES WITH REGIONAL MARKETS

In the preceding analysis, no allowance was made for the fact that some manufacturing industries consist of establishments each of which serves a local or regional rather than a national market. Product and market characteristics such as perishability, high weight-value ratio, widely distributed sources of raw materials, and the need for close seller-buyer liaison all favour segmentation of national markets. Moreover, the proportion of industries with segmented markets is especially high in geographically large countries such as Canada.

The presence of such industries in the sample of 154 industries treated in this Report leads to an understatement of prevailing national levels of concentration. The reason is that all the enterprises in an industry with regional markets are not actually in competition with one another. For example, consider an industry consisting of twenty enterprises half of which are in the East and half of which are in the West. If there is no trade between the East and West then there exist two regional markets each containing ten competitors. Consequently, statistics on a national basis will understate the degree of actual market concentration that exists. In such instances it is desirable to know the level of concentration in each of the two markets.

An effort has been made to assess the effects of market segmentation upon levels of concentration. Industries with marked regional characteristics were identified and statistics of concentration were obtained for them by Provinces or by groups of Provinces. The regional measures of concentration were then compared with the national measures for the same industries.

In selecting the industries with regional markets, account was taken of the pattern of distribution of establishments and of the apparent reasons therefor. A prime requirement was that an industry have establishments distributed in a manner consistent with the existence of two or more market areas within the country. Some regional industries such as cement manufacturing have market areas often extending into several Provinces. Others such as commercial printing serve smaller areas. Difficulties were experienced with some industries such as fish processing and fruit and vegetable canning, where availability of materials was an important locational factor.

It proved impossible to obtain statistics covering regions corresponding with any precision to the actual regional market boundaries of particular industries. For the most part, statistics were only available by Provinces or by groups of Provinces. Nevertheless, such data provide a general indication of the effects of market segmentation.

Altogether, 34 industries were characterized as regional, and regional concentration measures for them are presented in Appendix A. However, data suppressions in the interest of confidentiality proved to be a serious problem, and only 18 of the 34 regional industries were selected for further analysis.

(a) Regional ratios weighted by percentage of total value of factory shipments accounted for by each region,

Source: Tables A-5, A-7 (Appendix)

For the 18 selected regional industries, comparisons have been made between their levels of concentration as measured nationally and the weighted average of their levels of concentration as measured regionally. Each regional ratio was weighted by the value of factory shipments in that region as a percentage of the industry's total national value of factory shipments. ${ }^{1}$ The detailed results are presented in Table IV-1.

| Up to 12.5 | 5 | 2,951.05 | 54.09 | 1 | 896.24 | 16.43 |

[^17][^18]In almost all cases, the regionally weighted national concentration ratios are considerably greater than the corresponding unweighted national concentration ratios. To that extent the concentration levels in regional industries are understated by the unweighted national concentration ratios. The divergence between the regional and national ratios tends to be greater at the establishment than at the enterprise level. This is probably a reflection of the fact that large enterprises often have plants in several regions.

The comparison of weighted and unweighted concentration ratios is summarized in Table IV-2. In the case of enterprises there were only two industries where the unweighted top four enterprise concentration ratio was between $50-62.5$ per cent of value of factory shipments. The weighted concentration ratio on the other hand, indicates seven industries accounting for 40 per cent more value of factory shipments. There is a parallel tendency in the case of establishments as well.

In conclusion it can be stated that the unweighted national concentration ratios considerably understate the true levels of concentration prevailing in manufacturing industries with regional characteristics.

## CHAPTER V

## HISTORICAL COMPARISONS AND CONCENTRATION TRENDS IN CANADA

The paucity of earlier studies of concentration in Canada makes it difficult to discern what the trends have been. Changes over time in industry definitions, classification systems, and types of statistics available all add to the difficulties of comparing the data in the present Report with those in earlier studies. In order to establish the past levels of concentration in Canada, further research would have to be undertaken, but some limited comparisons can be made.

## Changes in Over-all Concentration

The Royal Commission on Price Spreads, which reported in 1935, dealt at some length with the position occupied by large corporations. It found that the total assets less depreciation of the hundred largest non-financial companies in 1933 had been as follows:

TABLE V-1
NET ASSETS OF 100 LARGEST NON-FINANCIAL COMPANIES BY SIZE CLASSES, 1933

| Class Size of Companies <br> by Net Assets | Total Net Assets |
| :---: | :---: |
| (million of dollars) | (thousands of dollars) |
| 100 and up | $5,093,580$ |
| $75.0-99.9$ | 77,016 |
| $50.0-74.9$ | 512,398 |
| $45.0-49.9$ | 186,010 |
| $40.0-44.9$ | 40,186 |
| $35.0-39.9$ | 233,343 |
| $30.0-34.9$ | 132,001 |
| $25.0-29.9$ | 190,546 |
| $20.0-24.9$ | 296,768 |
| $15.0-19.9$ | 206,242 |
| $10.0-14.9$ | 264,532 |
| $8.0-9.9$ | 101,762 |
| Total | $7,324,384$ |

Source: Royal Commission on Price Spreads, Report, Ottaw, (1935).
It can be estimated from information in the report ${ }^{1}$ that the assets of the two major railways, one of them owned by the Crown, stood at about $\$ 3.7$ billion, or just over half the total. It can also be estimated that in 1929, a more representative year than 1933, the total assets of the hundred largest companies were about $\$ 8.3$ billion.

[^19]By way of comparison the total assets less depreciation of the hundred largest non-financial corporations in 1958 were valued at $\$ 18.2$ billion an increase of approximately 219 per cent over 1929. It is not an extremely large increase in view of the increases in prices and production which occurred during the span of 29 years. The increase would have been greater but for the extremely large place occupied by the railways in the Canadian corporate universe of 1929 . Unfortunately, the ratio of the assets of the hundred largest corporations to total corporate assets in 1929 is not available.

The relative position occupied by the 94 largest non-financial corporations in 1958 can, however, be compared with that of 1965. Table V-2 shows that those of 1958 accounted for 40.6 per cent of total net assets of all non-financial corporations, whereas the largest ones in 1965 accounted for only 37.6 per cent. This suggests that overall concentration levels have declined. It is largely due to the decline in relative importance of the two railways in Canada vis-a-vis the other large corporations and to the increasing size and importance of sectors such as Wholesale and Retail Trade and Services. In 1958 the 16 largest corporations in the Utilities and Transportation sector accounted for 94.0 per cent of the total net assets in that sector, whereas in 1965 the 17 largest corporations in that sector accounted for only 72.7 per cent of total net assets. In the case of Wholesale and Retail Trade there was an increase of approximately 70 per cent in total net assets of the sector and in Services the increase was 161 per cent. In manufacturing the 54 largest corporations accounted for 38.0 per cent of total net assets in that sector in

TABLE V- 2

## NET ASSETS OF THE 94 LARGEST NON-FINANCIAL CORPORATIONS 1958 and 1965

| Sector | 1958 |  |  |  | 1965 |  |  |  |

1958. In 1965, the fifty largest corporations in manufacturing accounted for 40.1 per cent of total net assets, indicating some increase of overall concentration in manufacturing. ${ }^{2}$

## Changes in Individual Industry Concentration

Some comparisons can be made between the statistics by Gideon Rosenbluth of concentration in individual manufacturing industries in 1948 and the statistics for 1965, although even these comparisons present difficulties. By the latter year industries were more narrowly defined with a resultant increase in the total number of industries. Moreover, there have been significant changes in the definition of a manufacturing establishment and of employment. Also, the criteria used by Rosenbluth in excluding industries from his sample were not the same as those used in excluding industries from the sample of industries in this Report.

Both the samples of industries are large. The 96 industries used by Rosenbluth accounted for 76 per cent of value added by manufacture in $1948,{ }^{3}$ while the sample of 154 industries used in this Report accounted for 88 per cent in 1965. The findings respecting numbers of firms (1948) and enterprises (1965) required to account for 80 per cent of employment are summarized in Table V-3.

The proportion of industries in the respective samples with very high concentration was lower in 1965 than in 1948. However, the sample applies to industries with very low concentration. A larger proportion of industries were in the intermediate ranges of concentration in 1965 than in 1948. In view of the differences in the content of the two samples and of the various changes in statistical methods which occurred in the period, no distinct trend in concentration can be discerned from the table, either with regard to enterprises or establishments. The apparent changes in concentration are not pronounced enough to permit any conclusions. It may well be that further study and the use of additional techniques would produce more conclusive results.

Although, the samples of industries in 1948 and 1965 are different, it has been found that forty of the industries used by Rosenbluth are directly comparable with forty of the industries used herein in the sense that there have been virtually no changes in their definitions. They accounted for 28 per cent of the total value added by manufacture in 1965. They are listed in Table V-4 along with their concentration indexes for 1948 and 1965, and the results are summarized in Table V-5.

There was clearty an increase in enterprise concentration in the sample of forty industries, whereas the increases in establishment concentration appear to have been approximately offset by decreases. Thus, the percentage of total value added by industries with enterprise concentration indexes up to 12 increased from 32.4 per cent to

1965 data derived from Appendix A, Tables A $1, A 3$.
41.2 per cent, while that of industries with concentration indexes above 24 declined slightly. Of the forty industries in the sample, enterprise concentration rose in 26 cases.

At the establishment level, there was a sharp decline in the percentage of value added by industries with concentration indexes under six, although there was a slight increase in the range between 6 and 12 . There was also a sharp decline in the value added by industries with concentration indexes above one hundred. of the forty industries in the sample, establishment concentration increased in 21 cases.

## CHAPTER VI

## COMPARISON OF LEVELS OF CONCENTRATION IN manufacturing in canada and the united states

Comparisons of the structure of Canadian and United States manufacturing industries are of particular interest for Canada. The technology, standards of living, consumption patterns, skills and education in the two countries are broadly similar and closely interrelated. There are also many differences between the two countries, some of which affect industrial structure. For instance, with a physical size comparable to that of the United States, Canada's population and gross national product are only a fraction as large. Moreover, foreign trade plays a greater relative role in the Canadian economy than in that of the United States. Some Canadian manufacturing industries, such as those producing lumber and newsprint, serve world markets and are large by most standards. There are others which cater mainly to the domestic market and are small and unspecialized in comparison with their counterparts in the United States.

The methods of measuring concentration in manufacturing in the United States are sufficiently similar to those used in Canada to permit some meaningful comparisons. Aside from product, concentration statistics, the Federal Trade Commission and Bureau of the Census in the United States also compile aggregate and industry concentration ratios. Hence, comparisons of levels of concentration in Canada and the United States can be made on the basis of the overall manufacturing sector and individual manufacturing industries.

In 1963, the largest fifty manufacturing companies ${ }^{1}$ in the United States accounted for 25 per cent of total value added by manufacture. The largest hundred manufacturing companies accounted for 33 per cent. ${ }^{2}$ Statistics for the same year pertaining to Canada are not available. However, Table II-3 in Chapter II of the present study shows that in 1965 the largest fifty enterprises in Canada accounted for 36 per cent of total value added and the largest hundred enterprises accounted for 46 per cent. Concentration in manufacturing as a whole would appear to be considerably higher in Canada than in the United States.

A substantial number of individual Canadian manufacturing industries have counterparts in the United States with which direct comparison can be made. The methods and results of these comparisons are described below.

[^22]
## Selection of Industries

A list of comparable Canadian and United States industries was prepared by reference to the Standard Industrial Classification Manual of the two countries. ${ }^{3}$ The U.S. classification of manufacturing industries is far more detailed and has almost three times the number of classes. However, there are some Canadian industries which can be compared directly with American industries. There are other instances where two or more industries in one country, when combined, are comparable with one industry in the other country.

The two classification systems were compared at the four-digit level. Where product comparability between Canadian and U.S. industries, a measured by value of shipments, equalled or exceeded 90 per cent, the industries were considered comparable. ${ }^{4}$ In all other cases, the industries were rejected as being non-comparable and excluded from the industry count. This process yielded 116 industries or groups of industries in each country which were comparable. The 116 Canadian industries or groups consisted of 123 Canadian industries as defined for purposes of this Report. The 116 United States industries or groups consisted of 231 four-digit industry classes. Thus, a good deal of grouping of United States industries was required to make them comparable with Canadian industries. Only about one half of the Canadian industries in this study had United States counterparts without the necessity of grouping.

## Method of Comparison

When one Canadian industry was directly comparable with one U. S. industry, the various concentration ratios of the two industries could be compared directly. When two or more industries were combined, new concentration ratios had to be estimated using the concentration ratios of the separate industries as a base. Since the actual shipments of individual producers are kept confidential in both countries, the precise changes in leadership among them as broader industry groups are formed are generally unknown. If, however, certain assumptions are made about how the combining of two industries affects the ranking of the largest producers, then the possible maximum and minimum concentration ratios can be established. ${ }^{5}$

A maximum concentration ratio for a combined industry can be found by making the assumption that the same producers are the largest in each of the constituent industry classes. For example, if the shipments of the largest four producers in each industry class are summed and expressed as a percentage of the total shipments of the combined industry, the result is the maximum possible four-firm concentration ratio.

[^23]A minimum value of the concentration ratio can be computed by making two assumptions:
(i) The largest four, eight, etc. producers in each constituent industry class of a combined industry produce only the products assigned to that class.
(ii) If value of shipments of the largest four, eight, etc. producers in one constituent industry class is larger than that of the largest four, eight, etc. producers of any of the other constituent industry classes, then each of the four, eight, etc. producers in the first set is larger than any producer in the other set. ${ }^{6}$

The minimum concentration ratio is then obtained by expressing the value of shipments of the set of four, eight, etc. producers with the largest total value of shipments among the industry classes as a percentage of the total value of shipments of the combined industry.

In comparing the concentration of a Canadian industry with a combined United States industry, the maximum value of the United States concentration ratio was used. ${ }^{7}$

## Levels of Concentration in Canada and the United States

Table A-13 in the appendix presents details of actual and estimated industry concentration ratios for 116 Canadian and United States industries. Comparisons of 1965 Canadian data are made with United States data for 1963 and 1966 because United States data for 1965 are not available. The effects of these year differences on concentration levels in the two countries are believed to be minimal; the differences between the U.S. concentration ratios of 1963 and 1966 were relatively small. The 116 Canadian manufacturing industries accounted for 77 per cent of the total value of factory shipments and 70 per cent of the total value added of the manufacturing sector in 1965. The 116 United States manufacturing industries accounted for 68 per cent of the total value of shipments and 62 per cent of the total value added of the manufacturing sector in 1963.

Comparisons of the top four firms, and in some instances the top eight, concentration ratios were made. It revealed that, of the 116 Canadian industries, 98 were significantly more concentrated than their U. S. counterparts. Of the remaining 18 industries, many might also have been judged by some measures to be more concentrated in Canada. They are listed separately in Table A-14 along with their Canadian and United States concentration ratios. Canadian manufacturing industries are, therefore, to a marked degree more highly concentrated than those in the United States, even on the basis of estimated maximum concentration figures for the U. S. which, as noted above, have been calculated on the basis of extreme assumptions.

[^24]A similar conclusion was reached by Professor Gideon Rosenbluth using statistics pertaining to $1948 .^{8}$ In a sample of 56 comparable industries, Professor Rosenbluth found that fifty Canadian industries were more highly concentrated. After excluding industries with regional markets and those associated with high imports or exports, he found that 30 of 34 comparable industries were more highly concentrated in Canada. These proportions are high enough to establish clearly a definite tendency towards higher concentration in Canada.

The results of the comparisons in the present study are further summarized in Table VI-1. It reveals that 24 industries in Canada had less than four enterprises accounting for 80 per cent of industry value of factory shipments. These 24 grouped industries accounted for 32.49 per cent of total value of factory shipments among the comparable industries. On the other hand, there were only three industries in the U.S. sample where less than four companies accounted for 80 per cent of industry value of shipments. These three industries accounted for 13.60 per cent of the total value of shipments in the number of industries being compared. Similar disparity in the concentration levels between the two countries are also revealed where more than four enterprises or companies are required to account for 80 per cent of industry value of shipments.

## Statistical Effects of the Grouping of United States Industry Classes

The combination of 231 United States four-digit industry classes into 116 new industries in order to make them comparable with the more broadly defined Canadian industries has been described above. It is, however, of interest to compare the levels of concentration in the 231 separate United States industry classes with the levels of concentration in the same industries after they were grouped into 116 industries.

The combination of several United States industry classes into industry groups has a tendency of making the combined industry over-inclusive. Over-inclusive product or industry coverage has the effect of understating concentration levels. The changes in levels of concentration at the industry class and group level are reflected in Table VI-2.

Table VI-2 indicates that on the industry class basis there were 11 United States industries where up to four companies accounted for 80 per cent of industry value of shipments. These 11 industries accounted for 15.17 per cent of total value of shipments in the industry classes surveyed. When concentration levels are based on industry groups, however, there are only three industry groups where the top four companies account for 80 per cent of value of shipments. These three industry groups account for 13.60 per cent of total value of shipments among all the industry groups surveyed. United States concentration ratios were, therefore, significantly lowered by the grouping of industry classes.

Note: See text for a description of how the list of industries was compiled.
(a) The concept of the company as used in United States studies of concentration is similar to that of the enterprise as used in this Report
(b) Either actual concentration ratios or maximum estimates were used.

| Over 20 to 50 | 31 | 26.72 | 45,127,8 | +15.77 | 22,418.7 | 18.72 | 57 | 24.68 | 44,671.9 | 15.61 | 21,983.9 | 18.35 |
| Over 50 | 59 | 50.86 | 137,227.5 | 47.94 | 59,293.6 | 49.51 | 105 | 45.45 | 126,370.0 | 44.14 | 54,784.0 | 45.75 |
| Total | 116 | 100.00 | 286,247.0 | 100.00 | 119,753.5 | 100.00 | 231 | 100.00 | 286,247.0 | 100.00 | 119,753.5 | 100.00 |

[^26]In Canada the 116 industry groups consist of only 123 individual industries as defined for the purpose of this Report, and concentration levels were probably not significantly affected by those changes.

The conclusion to be drawn from the foregoing is that the levels of concentration in Canadian manufacturing industries as found in this Report are very much lower than if they had been based upon the United States industry classes. It is beyond the scope of this Report to settle the issue as to which classification system, had they both been available for Canada, would have produced the most valid results.

It is clear that the Canadian system errs in the direction of too broad industry classifications. Indeed, some Canadian industries are so broadly classified that they had to be excluded from the present study. On the other hand, the United States classifications may well err in the other direction. Kaysen and Turner, for example, did reach that conclusion. ${ }^{9}$ For purposes of their survey of market structures they combined 440 four-digit census manufacturing classes into 191 markets.

## APPENDIX B

## MANUFACTURING INDUSTRIES INCLUDED AND EXCLUDED FROM THE REPORT

## Industries for Which Concentration Ratios Were Obtained

The industries for which concentration measures have been obtained are in nearly all cases defined in terms of the Standard Industrial Classification Manual as published by the Deminion Bareau of Statistics. ${ }^{1}$ For most of them there exists a 1965 D.B.S. Census of Manufactures bulletin with exactly the same coverage. In a few instances, industries in more than such bulletin have been combined, and in others an industry in a single bulletin has been sub-divided.

In the following motes a short description of each industry treated in this Report is presented. Where the industry descriptions are in quotation marks they have been taken directly from the Stamdard Industrial Classification Manual, unless otherwise indicated. The relevant Standard Industrial Classification (S.I.C.) numbers are cited as well as the catalogue numbers of the appropriate D.B.S. 1965 Census of Manufactures bulletins. Further details of the nature of each industry can be obtained by reference to those sources.

SIC 1010 Sloughtering and Meat Processors
(Cant. Na 32-221)
This industry includes:
SIC 1011 Slaughtering and Meat Packing Plants
SIC 1012 Sausage and Sausage Case Manufacturers
SIC 1013 Animal Oils and Fats Plants
Slaughtering asd Meat Processors are:
"Establishments primarily engaged in'operating abattoirs, meat packing plants, or in manufacturing prepased meats and meat specialities from purchased carcasses. Important products of establishments classified in this industry are fresh meats, cured and smoked meats, fresh and cured sausages, canned meats, and animal oils and fats."

SIC 1030 Poultry Processors
(Cat. No. 32-227)
"Establishments primarily eagaged in killing, dressing, packing or canning poultry."

[^28]The following two Dominion Bureau of Statistics industries have been combined:
SIC 1050 Dairy Factories (Cat. No. 32-209);
SIC 1070 Process Cheese Manufacturers (Cat. No. 32-210).

## Dairy Factories are:

"Establishments primarily engaged in manufacturing natural cheese of all kinds; creamery butter; both butter and cheese; condensed, canned or powdered milk; ice cream, frozen desserts such as sherbets and ices, and ice cream mix; pasteurized and bottled fresh milk. Establishments that pasteurize and bottle milk are included in this industry whether or not they sell the milk at retail."

## Process Cheese Manufacturers are:

"Establishments primarily engaged in manufacturing process cheese, cheese pastes and spreads."

SIC 1110 Fish Products Industry
(Cat. No. 32-216)
The D.B.S. industry bulletin defines this industry as comprising those:
". . . . establishments whose principal activity is the canning, salting, pickling or drying of fish and shellfish as well as those producing fish meal and oil, seal oil, whale oil and meal and seaweed products."

## SIC 1120 Fruit and Vegetable Canners and Preservers

(Cat. No. 32-218)
"Establishments primarily engaged in manufacturing canned and dried fruits and vegetables, fruit and vegetable juices, soups, preserves, jams and jellies, pickles, cider and sauces. Included also are establishments primarily engaged in quick-freezing of fruits and vegetables and processing in $\mathrm{SO}_{2}$."

## SIC 1230 Feed Manufacturers

(Cat. No. 32-214)
"Establishments primarily engaged in the production of poultry, turkey, hog, cattle, fur-bearing animal, dog and cat feeds."

SIC 1240 Flour Mills
(Cat. No. 32-215)
"Establishments primarily engaged in milling flour from grain."

SIC 1250 Breakfast Cereal Mamufacturers
(Cat. No. 32-204)
"Establishments primarily engaged in manufacturing prepared breakfast foods such as: com, wheat, and bran flakes; rolled oats; and other cereals either pre-cooked or to be cooked."

## SIC 1280 Biscuit Manufacturers

(Cat. No. 32-202)
"Establishments primarily engaged in manufacturing biscuits, crackers, pretzels and similar 'dry' bakery products including ice cream cones."

SIC 1290 Bakeries
(Cat. No. 32-203)
"Establishments primarily engaged in manufacturing bread, cakes, pastries and similar 'perishable' bakery products."

SIC 1310 Confectionery Manufacturers
(Cat. No. 32-213)
"Establishments primarily engaged in manufacturing candies, chocolates, cocoa products, chewing gum and other confectionery such as salted nuts and popcom."

## SIC 1330 Sugar Refineries

(Cat. No. 32-222)
"Establishments primarily engaged in manufacturing cane sugar, beet sugar, sugar syrups, molasses and beet-pulp."

SIC 1350 Vegetable Oil Mills
(Cat. No. 32-223)
"Establishments primarily engaged in manufacturing vegetable oils and their by-products, such as linseed, soybean and cocoanut oil, oilcake meal and linseed meal."

SIC 1391 Macaroni Manufacturers.
(Cat. No. 32-219)
This industry is comprised of establishments primarily engaged in manufacturing dry macaroni, spaghetti, noodles, vermicelli and kindred products.

## SIC 1392 Miscellaneous Food Marnufacturers

(Cat. No. 32-224)
"Establishments primarily engaged in manufacturing baking powder, flavouring extracts and syrups, malt, milled rice, self-rising and blended flours, . . . . . . . .
starch and its products, jelly powders, yeast, prepared cocoanut, powdered eggs, frozen eggs, 'health foods', peanut butter and other food specialties not elsewhere classified. Establishments primarily engaged in roasting coffee, blending tea or grinding and packaging spices are classified in this industry," . . . . . . . . . . . .

SIC 1410 Soft Drink Manufacturers
(Cat. No. 32-208)
"Establishments primarily engaged in manufacturing non-alcoholic beverages and carbonated mineral waters or concentrates and syrups for the manufacture of carbonated beverages."

SIC 1430 Distilleries
(Cat. No. 32-206)
"Establishments primarily engaged in producing alcoholic beverages such as whisky, brandy, rum and gin. This industry includes establishments primarily engaged in manufacturing ethyl alcohol whether or not the alcohol is ultimately used to make potable spirits."

SIC 1450 Breweries
(Cat. No. 32-205)
"Establishments primarily engaged in manufacturing ale, beer, porter, stout and other malt liquors."

SIC 1470 Wineries
(Cat. No. 32-207)
"Establishments primarily engaged in producing wines."
SIC 1510 Leaf Tobacco Processing
(Cat. No. 32-225)
"Establishments primarily engaged in final grading, re-drying and packing tobacco leaf in hogsheads. These establishments customarily store the dried tobacco in the hogsheads for a period of time which may be several years, i.e. aging the tobacco. In most cases the hogsheads of tobacco are shipped direct to the tobacco products factory". . . . . . . .

SIC 1530 Tobacco Products Manufacturers
(Cat. No. 32-225)
"Establishments primarily engaged in manufacturing cigarettes, cigars, tobacco and snuff."

## SIC 1610 Rubber Footwear Manufacturers

(Cat. No. 33-206)
"Establishments primarily engaged in manufacturing all-rubber footwear having fabric uppers and rubber soles."

SIC 1630 Rubber Tire and Tube Manufacturers
(Cat. No. 33-206)
"Establishments primarily engaged in manufacturing rubber tires and tubes for automobiles, trucks, aircraft, tractors, and other machinery and implements."

## SIC 1690 Other Rubber Industries

(Cat. No. 33-206)
"Establishments primarily engaged in manufacturing rubber goods, such as rubberized fabrics, mechanical rubber goods, rubber flooring and rubber sundries."

SIC 1720 Leather Tanneries
(Cat. No. 33-202)
"Establishments primarily engaged in tanning, currying and finishing leather of all types, such as sole and belt leather, bookbinders' leather; glove, hamess, bag, strap and upholstery leather."

## SIC 1740 Shoe Factories

(Cat. No. 33-203)
"Establishments primarily engaged in manufacturing boots, shoes, slippers, mocassins and similar foot wear by cutting and sewing material."

## SVC 1792 Boot and Shoe Finding Manufacturers

(Cat. No. 33-203)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in manufacturing boot and shoe cut stock and findings of leather or of other materials."

## SIC 1799 Miscellaneous Leather Products Manufacturers

(Cat. No. 33-205)
"Establishments primarily engaged in manufacturing leather products and similar articles not elsewhere classified, such as huggage, handbags, 'small leather goods'. ... . Establishments primarily engaged in manufacturing harness or saddlery, and leather belting are included."
"Establishments primarily engaged in spinning, twisting, winding or spooling cotton yarn and in weaving fabrics wholly or mainly of cotton such as duck, sheetings, prints, towellings, bedspread fabrics, table damask, drapery and upholstery fabrics."

SIC 1950 Wool Yarn Mills and Wool Cloth Mills
(Cat. No. 34-209)
This industry includes:
SIC 1930 Wool Yarn Mills
SIC 1970 Wool Cloth Mills
Wool Yarn Mills are:
"Establishments primarily engaged in spinning and winding woollen yarn for sale as such."

Wool Cloth Mills are:
"Establishments primarily engaged in weaving woollen and worsted fabrics such as suitings, coatings, dress goods and flannel; blankets and blanketings; and other woollen fabrics. Included in this industry are establishments primarily engaged in weaving paper-makers' felt of all materials."

## SIC 2010 Total Synthetic Textile Mills

(Cat. No. 34-208)
"Establishments primarily engaged in manufacturing yarns, threads and broad woven goods of synthetic textile fibres, including glass fibres. This industry includes establishments primarily engaged in manufacturing yams, threads and broad woven goods of natural silk. It also includes establishments engaged in extrusion of synthetic textile filaments."

For the present Report, the industry has been divided into the following two industries:
2010-1 Manufacturers of Filament, Staple Fibre and Tow 2010-2 Synthetic Textile Spinners, Weavers and Throwers.

## SIC 2110 Fibre Preparing Mills

(Cat. No. 34-219)
"Establishments primarily engaged in preparing fibres for spinning (except synthetic fibres) and in manufacturing batting, padding, wadding, upholstery filling or in processing waste and recovered fibres and flock. Included are establishments primarily engaged in wool scouring and carbonizing and combing and converting top."
"Establishments primarily engaged in spinning, twisting and manufacturing sewing threat or crochet, darning, hand-knitting and embroidery threads for sale as such."

SIC 2130 Cordage and Twine Industry
(Cat. No. 34203)
"Establishments primarily engaged in manufacturing rope, cable, cordage, net, twine, and related goods from hemp, jute, cotton, paper, flax and other fibres."

SIC 2140 Narrow Fabric Mills
(Cat. No. 34-207)
"Establishments primarily engaged in manufacturing narrow fabrics, such as woven tapes, ribbons and bindings, elastic cord, lacing, elastic and non-elastic webbing."

## SIC 2150 Pressed and Punched Felt Mills

(Cat. No. 34-210)
"Establishments primarily engaged in manufacturing pressed felt of any fibre by means of heating, moisture and pressure; and those making punched felt for rugs, cushions and other products from hair, jute, wool or other fibres by the needle loom process."

SIC 2160 Carpet, Mat and Rug Industry
(Cat. No. 34221)
"Establishments primarily engaged in manufacturing carpets and rugs of wool, cotton, or synthetic materials; jute and cocoa fibre mats and matting; and rag carpets and rugs."

SIC 2180 Textile Dyeing and Finishing Plants
(Cat. No. 34-206)
"Establishments primarily engaged in custom dyeing and finishing of woollen and worsted goods, cotton and linen goods, silk and synthetic goods. This industry also includes establishments primarily engaged in cloth sponging and miscellaneous special finishing of textiles on a custom basis."

## SIC 2190 Linoleum and Coated Fabrics Industry

(Cat. No. 34210)
"Establishments primarily ongaged in manufacturing oilcloth, linoleum, other hard surface floor coverings, leatherette and other coated fabrics including water repellent fabrics except rubberized."
(Cat. No. 34-202)
"Establishments primarily engaged in manufacturing awnings, tents, sails, tarpaulins, canopies and bags made from canvas fabric."

## SIC 2230 Cotton and Jute Bag Industry

(Cat. No. 34-204)
"Establishments primarily engaged in manufacturing bags made from cotton, jute, burlap and other textile fabrics except canvas."

SIC 2291 Automobile Fabric Accessory Manufacturers
(Cat. No. 34-210)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in manufacturing automobile upholstery materials and body linings."

SIC 2292 Embroidery, Pleating and Hemstitching Manufacturers
(Cat. No. 34-210)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in manufacturing trimmings and Schiffli machine embroideries."

SIC 2310 Hosiery Mills
(Cat. No. 34-215)
"Establishments primarily engaged in knitting, dyeing or finishing fullfashioned or seamless hosiery."

SIC 2390 Other Knitting Mills
(Cat. No. 34-215)
"Establishments primarily engaged in manufacturing knit outerwear, underwear, gloves and other knit articles except hosiery."

SIC 2431 Total Men's Clothing Industry
(Cat. No. 34-216)
"Establishments primarily engaged in manufacturing suits, coats, trousers, overcoats, shirts, underwear, work clothing, sheep-lined coats, sportswear and men's furnishings and leather clothing."

For this Report, the industry has been divided into the following indastries:
SIC 2431-1 Men's Suits and Overcoats
SIC 2431-2 Men's Trousers
SIC 2431-3 Men's Windbreakers and Work Pants
SIC 2431-4 Men's Overalls and Work Shirts
SIC 2431-5 Men's Fine Shirts
SIC 2431-6 Men's Other Clothing
SIC 2431-7 Men's Neckwear

SIC 2432 Men's Clothing Contractors
(Cat. No. 34-216)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments manufacturing men's clothing on a "contract' basis, i.e., not on their own account."

SIC 2441 Total Women's Clothing Factories
(Cat. No. 34-217)
"Establishments primarily engaged in manufacturing suits, coats, dresses, skirts, blouses, household apparel, sportswear, underwear, lingerie and neckwear."
For this Report, the industry has been divided into the following industries:
SIC 2441-1 Women's Coats and Suits
SIC 2441-2 Women's Dresses
SIC 2441-3 Women's Skirts and Blouses
SIC 2441-4 Women's Other Outerwear
SIC 2441-5 Women's Lingerie

SIC 2442 Wamen's Clothing Contractors
(Cat. No. 34-217)
Comprises those custom establishments engaged in the manufacturing of women's clothing articles not on their own account.

SIC 2450 Children's Clothing Industry
(Cat. No. 34-217)
"Establishments primarily engaged in manufacturing children's and infants' dresses, coats, snow suits and other outerwear."

## SIC 2460 Fup Goods Industry

(Cat. No. 34-213)
"Establishments primarily engaged in manufacturing fur coats, other fur garments, accessories and trimmings."

SIC 2470 Total Hat and Cap Industry
(Cat. No. 34-214)
"Establishments primarily engaged in manufacturing hats of straw, cloth, fur felt and wool felt; hat and cap materials and millinery."

For this Report, the industry has been divided into the following industries:
SIC 2470-1 Caps
SIC 2470-2 Men's Hats
SIC 2470-3 Women's and Children's Hats
SIC 2470-4 Hat and Cap Makers' Materials.
SIC 2480 Foundation Garment Industry
(Cat. No. 34-212)
"Establishments primarily engaged in manufacturing corsets, girdles, brassiers and other foundation garments."

SIC 2511 Shingle Mills
(Cat. No. 35-204)
Comprises establishments whose major activity is shingle manufacture.

## SIC 2513 Sawmills and Planing Mills

(Cat. No. 35-204)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in sawing and planing lumber and those producing ties, spoolwood, lath and other mill products such as cooperage stock and box shooks from round wood are included in the Sawmills and Planing Mill Industry."

SIC 2520 Veneer and Plywood Mills
(Cat. No. 35-206)
"Establishments primarily engaged in producing plywood or veneer."
SIC 2541 Sash, Door and Other Millwork Plants
(Cat. No. 35-205)
"Establishments primarily engaged in manufacturing mill products such as dressed lumber, sash, doors, window and door frames, interior woodwork, moulding and hardwood flooring. Included are establishments primarily engaged in dressing purchased lumber and in custom dressing. This industry also includes establishments primarily engaged in manufacturing pre-cut or pre-fabricated wooden buildings or panels for buildings or in manufacturing laminated rafters, roof trusses and beams."

## SIC 2542 Hardwood Flooring Industry

(Cat. No. 35-203)
The D.B.S. industry bulletin defines this industry as comprising those:
". . . . establishments primarily engaged in the manufacture of birch, maple, oak and other hardwood flooring."

## SIC 2560 Wooden Box Factories

(Cat. No. 35-209)
"Establishments primarily engaged in manufacturing wooden boxes, crates, fruit and vegetable baskets. This industry includes establishments making box shook from sawn lumber."

SIC 2580 Coffin and Casket Industry
(Cat. No. 35-210)
"Establishments primarily engaged in the manufacture of coffins, caskets and other morticians' supplies."

SIC 2610 Household Furniture Industry
(Cat. No. 35-211)
"Establishments primarily engaged in manufacturing household fumiture of all kinds and of all materials. This industry also includes upholstery, cabinet making and furniture repairing shops."

## SIC 2640 Office Furniture Industry

(Cat. No. 35-212)
"Establishments primarily engaged in manufacturing office furniture such as desks, chairs, tables, filing cabinets of all kinds and of all materials."

## SIC 2660 Miscellaneous Furniture Industry

(Cat. No. 35-213)
"Establishments primarily engaged in manufacturing store furniture and fixtures, public building and professional furniture and fixtures of all kinds and of all materials. This industry also includes establishments primarily engaged in manufacturing mattresses and springs."

## SIC 2680 Electric Lamp and Shade Industry

(Cat. No. 35-214)
"Establishments primarily engaged in manufacturing electric table and floor lamps and shades of all types and of all materials."

SIC 2710 Total Pulp and Paper Mills
(Cat. No. 36-204)
"This industry includes pulp mills producing chemical or mechanical woodpulp; and combined pulp and paper mills and paper mills manufacturing newsprint, book and writing papers, kraft paper, paperboard or building and insulation board. Barking mills engaged in producing barked or rossed pulpwood are included in this industry."

For this Report, the industry has been divided into the following industries:
SIC 2710-2 Newsprint Mills
SIC 2710-1 Other Pulp and Paper Mills

## SIC 2720 Asphalt Roofing Manufacturers

(Cat. No. 36-205)
"Establishments primarily engaged in manufacturing asphalt saturated shingles and sidings, roofing felts and sheathings, smooth-surfaced and mineral-surfaced roll roofings."

SIC 2731 Manufacturers of Folding Cartons and Set-up Boxes
(Cat. No. 36-214)
The D.B.S. industry bulletin defines this industry as comprising those:
".... . establishments primarily engaged in manufacturing folding or set-up paper or paperboard boxes, fibre containers and paperboard containers not elsewhere classified."

## SIC 2732 Manufacturers of Cornugated Boxes

(Cat. No. 36-213)
The D.B.S. industry bulletin defines this industry as comprising those:
". . . . . establishments primarily engaged in manufacturing corrugated paper boxes and wrappers, corrugated double face sheets and single face rolls or sheets."

SIC 2733 Paper and Plastic Bag Manufacturers
(Cat. No. 36-207)
The D.B.S. industry bulletin defines this industry as comprising those:
". . . . . establishments engaged primarily in the manufacture of paper bags, as well as of bags made of cellulose or other plastic films and of metal foil."

SIC 2740 Miscellaneous Paper Converters
(Cat. No. 36-206)
"Establishments primarily engaged in coating, treating, cutting and otherwise converting paper and paperboard. Many of these establishments also use synthetic
materials and metal foil to produce articles similar to those manufactured of paper and paperboard."

## SIC 2850 Commercial Printing, Publishing Only, Printing and Publishing

(Cat. No. 36-203)
This industry includes:
SIC 2860 Commercial Printing
SIC 2880 Publishing Only
SIC 2890 Printing and Publishing.
The Commercial Printing Industry comprises:
"Establishments primarily engaged in commercial or job printing including lithographing, blankbook making and bookbinding. This industry includes general printing shops as well as shops specializing in printing newspapers and periodicals for others. Silk screen printers are included."

The Publishing Only Industry comprises:
"Establishments primarily engaged in publishing only and which do no printing or are not engaged in some other principal activity. ..... The term 'publishing' as applied in this industry includes publishing of books, newspapers, periodicals, almanacs, maps, guides, calendars and similar products."
The Printing and Publishing Industry comprises:
'Establishments primarily engaged in publishing and printing newspapers, magazines, periodicals, books, almanacs, maps, guides, and the like."

## SIC 2870 Platemaking, Typesetting and Trade Bindery Plants

(Cat. No. 36-203)
The D.B.S. industry bulletin defines this industry as comprising:
"Establishments (trade shops) primarily engaged in providing specialized services to the printing and publishing trades, advertising agencies or others:"....

## SIC 2910 Iron and Steel Mills

(Cat. No. 41-203)
"Four main types of establishments are classified in this industry: (1) Establishments primarily engaged in manufacturing pig iron and ferro-alloys. (2) Steel works primarily engaged in manufacturing ingots, steel castings and in continuous casting of steel. (3) Rolling mills primarily engaged in hot and cold rolling of steel into primary shapes. (4) Coke ovens operated in connection with blast furnaces. In some cases the blast furnace, steel mill, rolling mill and coke oven or some combination of two or more of them are carried on as one integrated operation and the manufacturing processes may be carried on beyond the rolling mill stage."

SIC 2920 Steel Pipe and Tube Mills
(Cat. No. 41-220)
"Establishments primarily engaged in manufacturing welded and seemless steel pipe and tubing."

## SIC 2940 Iron Foundries

(Cat. No. 41-226)
"Establishments primarily engaged in manufacturing iron castings, including cast iron pipe and fittings."

SIC 2960 Aluminum Rolling, Casting and Extruding
(Cat. No. 41-204)
"Establishments primarily engaged in manufacturing aluminum shapes such as bars, rods, plates, sheets and castings."

SIC 2970 Copper and Alloy Rolling, Casting and Extruding (Cat. No. 41-224)
"Establishments primarily engaged in manufacturing copper and copper alloy shapes such as bars, rods, plates, sheets and castings."

SIC 2980 Metal Rolling, Casting and Extruding, ne.s.
(Cat. No. 41-215)
"Establishments primarily engaged in manufacturing non-ferrous metals such as zinc, tin, lead, nickel and titanium and their alloys in shapes such as bars, rods, plates, sheets and castings."

## SIC 3010 Boiler and Plate Works

(Cat. No, 41-223)
"Establishments primarily engaged in the manufacture of heating and power boilers except cast iron sectional heating boilers, storage tanks, pressure tanks, smoke-stacks, plate work and similar boiler-shop products. Some establishments in this industry engage both in the fabrication of the product and its installation."

SIC 3020 Fabricated Structural Metal Industry
(Cat. No. 41-207)
"Establishments primarily engaged in fabrication of heavy steel parts and sìmilar parts of other metals and alloys for structural purposes."
"Establishments primarily engaged in manufacturing ornamental metal work, stairs and staircases, fire escapes, grilles, railings, metal sash, doors and frames and metal. partitions. Establishments included in this industry may install the products of their own manufacture but they are primarily engaged in fabrication."

SIC 3040 Total Metal Stamping, Pressing and Coating Industry (Cat. No. 41-227)
"Establishments primarily engaged in manufacturing sheet metal products such as metal stampings for automobiles and for purposes such as bottle caps, heel caps, metal lath and metal boxes. Also included are establishments primarily engaged in manufacturing pressed metal products such as kitchen utensils, hospital and similar utensils and containers. This industry also includes establishments primarily engaged in coating metal and metal products, such as vitreous enamelware, galvanizing and electro-plating" . . . . . . .

This industry has been divided into the following industries:
SIC 3040-1 Manufacturers of Metal Food Cans
SIC 3040-2 Other Metal Stamping, Pressing and Coating.

## SIC 3050 Wire and Wire Products Manufacturers

(Cat. No. 41-216)
"Establishments primarily engaged in drawing wire from rods and in manufacturing nails, spikes, staples, bolts, nuts, rivets, screws, washers, wire fencing, screening, wire cloth, barbed wire, tire chains, uninsulated wire rope and cable, kitchen wire goods and other wire products."

## SIC 3060 Hardware, Tool and Cutlery Manufacturers

(Cat. No. 41-208)
"Establishments primarily engaged in manufacturing edge and hand tools, cutlery and hardware. Important products of this industry are axes; chisels; dies and other metal-working tools; hammers, shovels, hoes, rakes, files, saws, builders' hardware, marine hardware, non-electric razors and blades, table and kitchen cutlery and a miscellaneous group of products usually known under the term 'hardware' and not elseware classified. This industry also includes establishments primarily engaged in manufacturing bits, drills and other cutting tools for machines or for power-driven hand tools."
"Establishments primarily engaged in manufacturing commercial cooking equipment and major heating apparatus such as furnaces, oil burners, gas burners, steam and hot water heating apparatus and heating equipment, not elsewhere classified. Establishments primarily engaged in manufacturing cast iron sectional heating boilers and convection or cast iron radiators are included in this industry."

## SIC 3080 Machine Shops

(Cat. No. 42-207)
"Machine shops primarily engaged in producing machine parts and equipment, other than complete machines, for the trade. This industry includes machine shops providing custom and repair services."

SIC 3110 Agricultural Implement Industry
(Cat. No. 42-202)
"Establishments primarily engaged in manufacturing agricultural implements such as plows, threshing machines, binders, fertilizing machinery, milking machines, and mowing machines. The industry also includes establishments primarily engaged in manufacturing tractors."

SIC 3150 Miscellaneous Machinery and Equipment Manufacturers
(Cat. No. 42-214)
"Establishments primarily engaged in manufacturing machinery and equipment designed particularly for use in construction and mining operations including earth moving machinery and equipment, and earth and rock boring and drilling equipment. Establishments primarily engaged in manufacturing other specialindustry machinery except agricultural machinery, including such products as textile machinery, pulp and paper machinery, printing machinery, and foodprocessing machinery; establishments primarily engaged in manufacturing machinery and equipment not designed for use in any particular industry or classified elsewhere, including such products as marine engines, general-purpose engines, pumping equipment, equipment for the transmission of mechanical power, conveyor systems, elevators and lifting and hoisting machinery. Establishments primarily engaged in manufacturing industrial tractors for handling materials in industrial plants, depots and docks are included here. Included also are establishments primarily engaged in manufacturing woodworking machinery and in manufacturing machine tools which are power-driven machines employing a cutting tool for work on metal."
"Establishments primarily engaged in manufacturing electric and non-electric commercial refrigerating equipment such as display cases, counters, and frozen food storage cabinets; and refrigeration units for installation in custom or built-in refrigeration facilities."

## SIC 3180 Office and Store Machinery Manufacturers

(Cat. No. 42-216)
"Establishment primarily engaged in manufacturing office and store machinery such as typewriters, cash registers, coin-operated vending machines, mechanical computing machines, and scales and balances."

SIC 3210 Aircraft and Parts Manufacturers
(Cat. No. 32-203)
"Establishments primarily engaged in manufacturing aeroplanes, gliders, balloons and aircraft parts, such as engines, propellers and pontoons. Aircraft repair is included in this industry."

## SIC 3230 Motor Vehicle Manufacturers

(Cat. No. 42-209)
"Establishments primarily engaged in manufacturing or assembling complete motor vehicles such as passenger automobiles, commercial cars and buses, trucks, and special purpose motor vehicles such as ambulances and taxicabs."

SIC 3240 Truck Body and Trailer Manufacturers
(Cat. No. 42-217)
"Establishments primarily engaged in manufacturing truck and bus bodies but not manufacturing complete trucks or buses. Included are establishments primarily engaged in manufacturing truck trailers and tractor-type bus trailers, as well as those primarily engaged in manufacturing trailers for attachment to passenger cars."

SIC 3250 Motor Vehicle Parts and Accessories Manufacturers
(Cat. No. 42-210)
"Establishments primarily engaged in manufacturing motor vehicle parts (except truck and bus bodies) and accessories for use on motor vehicles, such as engines, brakes, clutches, axles, gears, transmissions, wheels, frames, radiators, springs, automobile hardware, heaters, horns, and mirrors."
"Establishments primarily engaged in building and rebuilding locomotives of any type or gauge and railroad cars (including frames and parts) for freight and passenger service. This industry includes establishments of railway companies primarily engaged in manufacturing or repairing locomotives and cars."

SIC 3270 Shipbuilding and Repair
(Cat. No. 42-206)
"Establishments primarily engaged in building and repairing all types of ships of more than 5 tons displacement."

## SIC 3280 Boatbuilding and Repair

(Cat. No. 42-205)
"Establishments primarily engaged in building and repairing all types of boats. This industry, for the most part, handles the smaller type of craft, such as motorboats, sailboats, rowboats, lifeboats and canoes."

SIC 3290 Miscellaneous Vehicle Manufacturers
(Cat. No. 42-212)
"Establishments primarily engaged in manufacturing transportation equipment not elsewhere classified such as animal-drawn vehicles including sleighs, as well as parts for any vehicles included."

SIC 3310 Manufacturers of Small Electrical Appliances
(Cat. No. 43-203)
"Establishments primarily engaged in manufacturing small electrical appliances such as vacuum cleaners, fans, toasters, irons and water heaters."

SIC 3320 Manufacturers of Major Appliances (electric and non-electric)
(Cat. No. 43-204)
"Establishments primarily engaged in manufacturing household type appliances and machines such as stoves; refrigerators, home and farm freezers; window type air conditioning units; laundry equipment and sewing machines."

SIC 3340 Manufacturers of Household Radio and Television Receivers
(Cat. No. 43-205)
"Establishments primarily engaged in manufacturing radio and television receiving sets. The industry also includes establishments primarily engaged in manufacturing record playing, tape playing and recording equipment and parts."
(Cat. No. 43-206)
"Establishments primarily engaged in manufacturing radio and television transmitters, radar equipment, closed circuit television equipment, and electronic navigational aids; public address apparatus, and the related parts and equipment. Included are establishments primarily engaged in manufacturing telephone and telegraph equipment and parts. This industry includes establishments primarily engaged in manufacturing electronic control panels and similar devices."

## SIC 3360 Manufacturers of Electrical Industrial Equipment

(Cat. No. 43-207)
"Establishments primarily engaged in manufacturing electric motors, generators and other electric power equipment for use in the generation, transmission and utilization of electric energy."

## SIC 3370 Battery Manufacturers

(Cat. No. 43-208)
"Establishments primarily engaged in manufacturing storage and primary batteries including wet and dry batteries."

SIC 3380 Manufacturers of Electrical Wire and Cable
(Cat. No. 43-209)
"Establishments primarily engaged in manufacturing electric wire and cable both insulated or armoured and non-insulated."

SIC 3390 Manufacturers of Miscellaneous Electrical Products
(Cat. No. 43-210)
"Establishments primarily engaged in manufacturing electrical products not elsewhere classified, such as electric signalling apparatus; electric lighting fixtures; electric light bulbs and tubes (light sources) of all kinds such as incandescent filament lamps, vapor and fluorescent lamps, photoflash and photoflood lamps; wiring devices; panelboards (distribution, lighting and residential types); low voltage switchboards; carbon or graphite electrodes; conduit and fittings. This industry also includes establishments primarily engaged in manufacturing electronic computers and data processors."

## SIC 3410 Cement Marnufacturers

(Cat. No. 44-204)
"Establishments primarily engaged in manufacturing hydraulic cement, including Portland, natural masonry and puzzolan cements."

SIC 3475 Concrete Products Manufacturers and Ready-Mix Concrete Manufacturers
This industry includes:
SIC 3470 Concrete products Manufacturers (Cat. No. 44-205)
SIC 3480 Ready-Mix Concrete Manufacturers (Cat. No. 44-211)
Concrete Products Manufacturers are:
"Establishments primarily engaged in manufacturing concrete products such as building blocks, brick, sewer pipe, tanks, poles, septic tanks. Establishments primarily engaged in Manufacturing sand-lime brick and blocks are included."

Ready-Mix Concrete Manufacturers are:
"Establishments primarily engaged in mixing and delivering ready-mix concrete."

SIC 3511 Clay Products Manufacturers (From Domestic Clays)
(Cat. No. 44-215)
The D.B.S. industry bulletin defines this industry as comprising:
".....establishments primarily engaged in the manufacture of clay brick, roofing, floor and wall tile, sewer pipe and other structural products from domestic clays."

SIC 3512 Clay Products Manufacturers (From Imported Clays)
(Cat. No. 44-216)
The D.B.S. industry bulletin defines this industry as comprising:
". . . . establishments primarily engaged in the manufacture of clay products such as pottery, chinaware, porcelain insulators and other products from imported clays."

SIC 3530 Stone Products Manufacturers
(Cat. No. 44-213)
"Establishments primarily engaged in cutting, shaping and finishing stone for building and other purposes. Important products of this industry include monuments and tombstones, dimension stone for buildings, slate blackboards and stone furniture."

SIC 3550 Asbestos Products Manufacturers
(Cat. No. 44-203)
"Establishments primarily engaged in manufacturing asbestos textiles, packings, brake linings, gaskets, asbestos building materials and other commodities composed wholly or chiefly of asbestos."

SIC 3561 Glass Manufacturers
(Cat. No. 44-207)
This industry is comprised of establishments primarily engaged in manufacturing pressed, blown and drawn glass, including bottles, sealers, artistic glass and window glass.

## SIC 3562 Glass Products Manufacturers

(Cat. No. 44-207)
This industry is comprised of establishments primarily engaged in manufacturing mirrors, edge plate, leaded glass, cut glass, decorated glassware, insulating multi-pane window units and hermetically sealed windows.

SIC 3570 Abrasives Manufacturers
(Cat. No. 44-202)
"Establishments primarily engaged in manufacturing abrasive grinding wheels of emery, carborundum and other natural or artificial materials; abrasive sticks, stones, bricks, paper and cloths and buffing and polishing wheels. This industry includes the manufacture of primary abrassive materials such as fused alumina and silicon carbide."

## SIC 3650 Petroleum Refineries

(Cat. No. 45-205)
"Establishments primarily engaged in refining crude petroleum and in producing gasoline, fuel oils, lubricating oils, illuminating oils and other petroleum products. The industry also includes establishments primarily engaged in blending lubricating oils and greases which they have purchased."

## SIC 3690 Other Petroleum and Coal Products Industries

(Cat. No. 45-207)
"Establishments primarily engaged in manufacturing petroleum and coal products not elsewhere classified, such as fuel briquettes, road emulsions and roofing compounds. This industry also includes coking plants operated as separate establishments and not as a subsidiary activity in Iron and Steel or Chemical Plants."

## SIC 3710 Explosives and Ammunition Manufacturers

(Cat. No. 46-218)
"Establishments primarily engaged in manufacturing explosives; ammunitions including mines, bombs and depth charges; safety and detonating fuses; fireworks of aul kinds; flares and railroad fuses."

SIC 3720 Marufacturers of Mixed Fertilizers
(Cat. No. 46-220)
"Establishments primarily engaged in manufacturing superphosphates and mixed fertilizers."
"Establishments primarily engaged in manufaturing synthetic resins in such forms as powders, granules, flakes, liquids or simple sheets. This indsutry includes establishments primarily engaged in manufacturing transparent cellulose film or film from synthetic resin."

## SIC 3740 Total Manufacturers of Pharmaceuticals and Medicines

(Cat. No. 46-209)
"Establishments primarily engaged in manufacturing drugs and medicines. This industry includes manufacturers of patent and proprietary medicines; veterinary medecines; vitamin products; cod liver oil; and biological products, such as antitoxins, bacterins, serums, vaccines; as well as establishments primarily engaged in manufacturing antibiotics. Establishments primarily engaged in grinding drugs and herbs are also includes."

For this Report, the industry has been divided into the following two industries:
SIC 3740-1 Manufacturers of Ethical Drugs
SIC 3740-2 Other Pharmaceuticals and Medicines.
SIC 3750 Paint and Varnish Manufacturers
(Cat. No. 46-210)
"Establishments primarily engaged in manufacturing paints, varnishes, lacquers, enamels and shellac. This industry also includes establishments primarily engaged in manufacturing products such as putty, filler, oil stain, and thinner."

## SIC 3760 Manufacturers of Soap and Cleaning Compounds

(Cat. No. 46-214)
"Establishments primarily engaged in manufacturing soap in any form synthetic detergents, cleansers, washing powders and cleaning preparations including scouring powders and hand cleansers. This industry includes establishments primarily engaged in manufacturing household laundry bleaches and bluing."

## SIC 3770 Manufacturers of Toilet Preparations

(Cat. No. 46-215)
"Establishments primarily engaged in manufacturing perfumes, comestics, lotions, hair dressings, toothpaste and other toilet preparations."

## SIC 3780 Manufacturers of Industrial Chemicals

(Cat. No. 46-219)
"Establishments primarily engaged in manufacturing basic industrial inorganic chemicals such as acids, alkalis, salts, compressed gases and other inorganic
compounds or in manufacturing industrial organic chemicals by chemical processes. This industry includes establishments primarily engaged in manufacturing dry colours, pigments, white leads, lead oxides, iron oxides and titanium oxide and in manufacturing dyes. Included also are establishhments primarily engaged in manufacturing synthetic rubber and those primarily engaged in manufacturing compressed organic gases."

## SIC 3791 Manufacturers of Printing Inks

(Cat. No. 46-216)
This industry is comprised of establishments primarily engaged in manufacturing printers' inks for newspaper, letterpress, lithographing; printers' rollers and writing inks.

SIC 3811 Instrument and Related Products Manufacturers
(Cat. No. 47-206)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in manufacturing mechanical measuring and controlling instruments (except clocks and watches); dental, medical and surgical instruments and equipment; optical instruments and lenses; and photographic equipment and supplies."

## SIC 3812 Clock and Watch Manufacturers

(Cat. No. 47-206)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in manufacturing of clocks and watches, including materials and parts for the same. It includes establishments whose primary activity is the assembling of clocks and watches from purchased movements and from watch cases of both their own and other manufacture."

## SIC 3814 Ophthalmic Goods Manufacturers

(Cat. No. 47-206)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in grinding ophthalmic lenses and the manufacturing of other ophthalmic goods such as complete spectacles, sunglasses, etc."

## SIC 3815 Dental Laboratories

(Cat. No. 47-206)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in making dentures, bridges, inlays and other dental restorations."

SIC 3830 Broom, Brush and Mop Industry
(Cat. No. 47-201)
"Establishments primarily engaged in manufacturing household, industrial and street-sweeping brooms; household, paint and tooth brushes; floor, dust and dish mops."

SIC 3850 Plastic Fabricators, n.e.s.
(Cat. No. 47-208)
"Establishments primarily engaged in moulding, extruding and fabricating special plastic parts for automobiles, radios, toys, and other articles for the trade. Included also are establishments primarily engaged in making plastic articles which cannot be classified conveniently elsewhere, including synthetic sausage casings and plastic and fibreglass awnings."

SIC 3931 Sporting Goods Industry
(Cat. No. 47-204)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in manufacturing sporting and athletic goods, such as bicycles, fishing tackle, golf and tennis equipment; baseball, football and boxing equipment, skates and equipment for other sports."

SIC 3932 Toys and Games Industry
(Cat. No. 47-204)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in manufacturing toys of all kinds such as tricycles, dolls, wagons, sleighs and games."

SIC 3950 Fur Dressing and Dyeing Industry
(Cat. No. 47-205)
"Establishments primarily engaged in scraping, currying, tanning, bleaching and dyeing pelts."

SIC 3970 Signs and Displays Industry
(Cat. No. 47-209)
"Establishments primarily engaged in manufacturing signs and displays including electric signs and neon signs."

## SIC 3981 Button, Buckle and Fastener Industry

(Cat. No. 47-202)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in manufacturing buttons, buckles and fasteners."

SIC 3986 Musical Instrument and Sound Recording Industry
(Cat. No. 47-203)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in manufacturing pianos, organs, stringed instruments, wind instruments and percussion instruments; recording and duplicating, or in duplicating only such articles as records, tapes, wires and other media for recording vocal or instrumental performances."

## SIC 3988 Typewriter Supplies Manufacturers

(Cat. No. 47-207)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in manufacturing carbon paper, stencil paper, inked ribbons and other typewriter supplies."

## SIC 3989 Fountain Pen and Pencil Manufacturers

(Cat. No. 47-207)
The D.B.S. industry bulletin defines this industry as comprising those:
"Establishments primarily engaged in manufacturing fountain pens and parts; ball-point pens; lead and mechanical pencils; and crayons."

## SIC 9990 Leather Glove Factories, Fabric Glove Manufacturers

The industry includes:
SIC 1750 Leather Glove Factories (Cat. No. 33-204)
SIC 2499 Fabric Glove Manufacturers (Cat. No. 34-218)
Leather Glove Factories are:
"Establishments primarily engaged in manufacturing gloves and mittens of leather."
Fabric Glove Manufacturers are:
"Establishments primarily engaged in manafacturing fabric gloves."

## LIST OF MANUFACTURING INDUSTRIES EXCLUDED FROM THIS REPORT

## APPENDIX C

## NOTES ON STATISTICAL METHODS

## The Linking of Establishments Into Enterprises

The process of linking establishments into enterprises involved a number of stages. The Dominion Bureau of Statistics already had the means of linking together all the establishments of a single company in an industry. What remained to be done was to link together establishments in an industry which, while having different corporate names, were in fact under common control. Basically, what was required was knowledge about intercorporate connections.

Two sources of information about intercorporate connections were used. The first was the confidential files maintained by the Merger and Monopoly Branch of the Office of the Director of Investigation and Research, Combines Investigation Act, Ottawa. This source is built upon the basis of acknowledged control rather than upon any fixed percentage of ownership of one company by another.

The second source which was used was the non-confidential part of the returns filed by corporations in 1965 under the Corporations and Labour Unions Returns Act. ${ }^{1}$ Most corporations with annual gross revenue exceeding $\$ 500,000$, or with assets exceeding $\$ 250,000$ must report under the Act. Exceptions include crown corporations and corporations operating under the authority of such Government of Canada Statutes as the Canadian and British Insurance Act, the Trust Companies Act, the Loans Companies Act, the Small Loans Act, the Radio Act and the Railway Act. Each is required, among other things, to report the name of each corporation holding 10 per cent or more of its total issued shares of any class and the number of shares of each class so held. On the basis of this kind of information, the Dominion Bureau of Statistics has arranged reporting corporations with intercorporate links into complexes. Each complex starts with a holding corporation in which no other reporting corporation owns over 10 per cent of the voting shares.

For purposes of the present study, the complexes were found to have the disadvantage that they are based upon ownership links as low as 10 per cent of voting stock. No means were available for determining which cases of minority ownership involved control and which did not. In the circumstances, it was decided to reorganize all complexes containing any minority ownership links. The corporations in the new complexes were all related by ownership links of more than 50 per cent of voting stock.

The information on intercorporate links obtained from the two sources was transferred to a D.B.S. companies list by means of a code in order to permit processing of data based upon the enterprise. In adding the code to the companies list, priority was

[^29]accorded to information on file in the Merger and Monopoly Branch because it was based upon intercorporate control rather than majority ownership. Information on majority ownership linkages from C.A.L.U.R.A. was used only where no information from the first source was available. As it turned out, more linkages were obtained from the latter source than from the former. However, the former source included most of the large corporations, and probably accounted for more than half the total in terms of value of factory shipments.

## Primary Product Specialization and Coverage Index

The "primary product specialization index" (PPSI) measures the extent to which plants classified in an industry specialize in making products regarded as primary to the industry; that is, value of shipments of primary products by the industry is expressed as a ratio of the total shipments of all products by the industry (excluding miscellaneous receipts, such as receipts for contract and commission work on materials owned by others, scrap and salable refuse, repair, etc.).

The "coverage index" (CI) measures the extent to which all shipments of products primary to an industry are made by plants classified in the industry, as distinguished from secondary producers elsewhere; that is, value of shipments of the primary products by the industry is expressed as a ratio of the total shipments of those products by all industries.

Two problems had to be overcome in compiling the two indexes. The first was that of compiling lists of products which were primary to each industry. The second was in obtaining the needed values of shipments.

The Dominion Bureau of Statistics does not publish lists of products which it treats as primary to each industry. For many industries such lists can be approximated by resorting to the bulletins of the Annual Census of Manufactures ${ }^{2}$ and the Standard Commodity Classification Manual. ${ }^{3}$ In addition, valuable assistance was received from the Integration and Development Staffs of the Dominion Bureau of Statistics.

Many of the required product statistics were obtained from the annual industry bulletins and from the 1965 D.B.S. report on Products Shipped by Canadian Manufacturers. ${ }^{4}$ In some instances where the data were note available it was possible to deduce from published sources that the values involved were relatively small. In a number of cases where the values involved were greater than 5 per cent of an industry's shipments, the assistance of the Manufacturing and Primary Industries Branch of D.B.S.

[^30]was obtained. Often by means of product grouping they were able to provide the needed data without breach of confidence.

## Estimation of Concentration Indexes

The data for the present study were supplied by the Dominion Bureau of Statistics and had to conform with the Statistics Act. As a consequence, statistics of shipments, value added and employment pertaining to groups of establishments and enterprises were withheld whenever their publication would have breached confidentiality of individual returns. To cite an example, if value added of the largest seven establishments of an industry had already been published elsewhere, the value added of the largest eight establishments had to be withheld. In many such instances, estimates of the missing data were made and they are believed to be reasonably accurate. The various techniques of interpolation which were used are described below.

## Value of Factory Shipments

Statistics of factory shipments as pertaining to establishments were interpolated by the method used by Gideon Rosenbluth. ${ }^{5}$

Statistics of factory shipments as pertaining to enterprises posed a greater problem due to lack of previously published data based upon enterprises. As the number of enterprises in an industry is frequently smaller than the number of establishments, the industry bulletins published by the Dominion Bureau of Statistics could not be used. The parabolic curve method was used to interpolate values for suppressed enterprises between the top four and twenty. This type of interpolation assumes that the data can be fairly well described by a polynomial.

The following example will illustrate the method. ${ }^{6}$

## Example:

To estimate the value of shipments for the eight largest enterprises given:

| No. of largest enterprises | 4 | 8 | 12 | 16 |
| :--- | ---: | ---: | ---: | ---: |
| Deviation of No. of largest <br> enterprises from 8 | -4 | 0 | 4 | 8 |
| Deviation divided by $4=x$ | -1 | 0 | 1 | 2 |
| Value of shipments $=y(\$ 000)$ | 96148 |  | 128730 | 138079 |

[^31]Let the ' $x$ " variable be the "Deviation divided by 4 " and the ' $y$ ' variable be the value of 'Shipments'.
Substituting these values of $x$ and $y$ into the general second order polynomial

| $y$ | $=a+b x+c x^{2}$ |  |
| ---: | :--- | ---: |
| one obtains 96148 | $=a-b+c$ |  |
| $y$ | $=a$ | i |
| 128730 | $=a+b+c$ |  |
| 138079 | $=a+2 b+4 c$ |  |

Treating equations i, iii, iv as a system of simultaneous equations and solving for 'a' one finds

$$
a=114753
$$

however

$$
y o=a
$$

Thus the eight largest enterprises contribute $\$ 114,753,000$.
To test the method, 26 industries were chosen at random. The values of manufacturing shipments for the $4,8,12,16$ and 20 largest enterprises were known. It was assumed that a figure was suppressed and the parabolic curve method was used to calculate the values. The difference between the actual value and the calculated value was below 4 per cent in all cases and below 3 per cent in most cases. The bias of the estimated values tended to be upward. It was found that a second order polynomial generated the best estimate for the eight largest enterprises and a third order polynomial gave the best estimate for the 12 largest enterprises. Since all interpolation methods are highly sensitive to the interval between the known points, no interpolations were performed involving the values of the fifty largest enterprises.

## Value Added and Employment

The method used by Rosenbluth ${ }^{7}$ can only be used to interpolate estimates pertaining to shipments, value added and employment of establishments if the respective class intervals in which the establishments fall into are also shipments, value added or employment. It is not possible for example, to calculate the value added or employment figures if the establishment size and their class intervals are measured in shipment units.

[^32]The 'difference method'8 was used to estimate the value added or employment of the top four or eight etc. establishments (ranked by shipments). The method can be used to interpolate middle figures in a series with even or uneven class intervals, or figures in the last of a series of chain intervals. In this study the method was applied to uneven class intervals.

The following example will illustrate the method.

Divided Difference Table

| $x$ | $y$ | First <br> Difference | Second <br> Difference | Third <br> Difference |
| :---: | :---: | :---: | :---: | :---: |
| $x_{0}$ | $y_{0}$ | $D_{1}^{1}=\frac{y_{1}-y_{0}}{x_{1}-x_{0}}$ |  |  |
| $x_{1}$ | $y_{1}$ | $D_{2}^{1}=\frac{y_{2}-y_{1}}{x_{2}-x_{1}}$ | $D_{1}=\frac{D_{2}^{1}-D_{1}^{1}}{x_{2}-x_{0}}$ |  |
| $x_{2}$ | $y_{2}$ | $D_{3}$ | $D_{3}^{1}=\frac{D_{3}-y_{2}-D_{2}^{1}}{x_{3}-x_{2}}$ | $D_{1}^{3}=\frac{D_{2}^{2}-D_{1}^{2}}{x_{1}-x_{0}}$ |

Where $x_{0} \ldots \ldots x_{3}$ are the number of establishments for which we have data and $y_{0} \ldots \ldots . y_{3}$ is the data eg. value added or employment, the resulting 'differences' are then substituted in the formula:

$$
\begin{aligned}
y x= & y_{0}+\left(x-x_{0}\right) D_{1}^{1}+\left(x-x_{0}\right)\left(x-x_{1}\right) D_{1}^{2}+ \\
& \left(x-x_{0}\right)\left(x-x_{1}\right)\left(x-x_{2}\right) D_{1}^{3}
\end{aligned}
$$

Where $y x$ is the desired figure to be interpolated eg. value added or employment and $x$ is the number of establishments eg . the top four or eight etc.

In the numerical example given below, an estimate of the top 16 establishments is made.

| $\mathbf{x}$ | $y$ |
| ---: | ---: |
| 4 | 34991 |
| 8 | 59540 |
| 12 | 78569 |
| 17 | 98070 |

[^33]Compiling the difference table and substituting in Newton's formula we obtain:

$$
\begin{aligned}
\mathrm{yx}= & 34991+(16-4) 6137.25+(16-4)(16-8) \\
& (-172.50)+(16-4)(16-8)(16-12) 5.94 \\
= & 34991+59368 \\
= & 94359
\end{aligned}
$$

To test the method a random sample of 26 industries was selected and various value added and employment figures were assumed to have been suppressed. In the case of value added figures the actual and interpolated figures deviated an average of 2.7 per cent. In the case of employment figures, the average error was slightly higher at 3.7 per cent. In most instances the estimates were biased upwards. ${ }^{9}$

The above method could not be used to estimate value added or employment as pertaining to enterprises because no previously published data were available to minimize the inaccuracies. Consequently, as with values of shipments by enterprises, the parabolic curve method was used to estimate enterprise value added and employment. The 80 percent index for employment pertaining to establishments was estimated using the Rosenbluth method.

## Weighted Concentration Ratios

In this Report, the weighted average of the top four (enterprise or establishment) regional concentration ratios were computed to assess the extent of regional segmentation

[^34]of markets. Each region's top four enterprise or establishment concentration ratio was weighted by the share of that region's value of factory shipments expressed as a ratio of the national value of factory shipments for that industry. The formula for the weighted average used in this study is:
$$
\bar{X}=\frac{W_{1} X_{1}+W_{2} X_{2}+\ldots \ldots \ldots+W_{K} X_{K}}{W_{1}+W_{2}+\ldots \ldots+W_{K}}
$$
where $W_{1} \ldots W_{K}=$ (Dollar value of factory shipments of all enterprises or establishments in a given industry in region 1 to K ) divided by (national dollar value of factory shipments for that industry).
and $\quad X_{1} \ldots X_{K}=$ (Dollar shipments of the top four enterprises or establishments in a given industry in region 1 to K ) divided by (national dollar value of factory shipments for that industry).

## APPENDIX D

## A BRIEF NOTE ON MEASURES OF INDUSTRY CONCENTRATION

There are several types of measures of industry concentration some of which have been presented in this Report. Moreover, no single measure can be considered to be the best in all respects and there is a considerable amount of economic literature on the subject. Some of the issues pertaining to the concentration measures presented in this Report are examined below.

In economic theory, the type of competition prevailing in an industry is determined to a considerable extent by the size distribution of firms and the absolute number of firms in that industry. For instance, competition in an industry consisting of firms of similar size will be different than in an industry consisting of one or two dominant firms and a periphery of small firms. Indexes of industry concentration as a structural determinant of competition are based on those concepts. As stated earlier in this Report, a concentration index measures the extent to which a smiall number of firms account for a large proportion of an industry's economic activity. However, concentration indexes such as the inverse measure and the concentration ratio do not take into account the total number of firms in an industry and their relative size distribution. For example, in the 80 per cent index we exclude the number of firms that account for the remaining 20 per cent of an industry's economic activity. We also exclude a certain number of firms from the focus of our attention using the industry concentration ratio. In addition, the distribution of individual firm sizes is not indicated in the inverse measure or the concentration ratio due to aggregation.

A particular problem encountered by economists pertaining to the choice of a concentration index and the aggregate nature of the concentration ratio is illustrated in Table D-1.

Examining the concentration ratios for the top four enterprises, S.I.C. 1470 is less concentrated than S.I.C. 3180. If, however, we examine the concentration ratios for the top eight enterprises, S.I.C. 1470 is more concentrated than S.I.C. 3180 . This poses a question; which of the two industries is more highly concentrated?

The concentration ratio can be more accurately interpreted if it is considered along with the coefficient of variation, which measures the relative size dispersion of individual enterprises within a size class. The coefficient of variation in Table D-2 indicates that enterprise size dispersion is greater in S.I.C. 3180 than in S.I.C. 1470. It also indicates that this dispersion is greatest in the top four interprises in S.I.C. 3180; being more than twice the dispersion in the top four enterprises in S.I.C. 1470. Much of the same applies to the top eight enterprises. This leads to the conclusion that S.I.C. 3180 is more concentrated that S.I.C. 1470.

The coefficient of variation will to some degree also indicate whether the industry is dominated by relatively few large enterprises among many enterprises or by few

Source: Table A-g (Appendix A)
enterprises among a small number of enterprises. In the case of the above example, though S.I.C. 3180 has a greater number of enterprises than S.I.C. 1470, it is more concentrated than the latter. Analysing the coefficient of variation for single groups of large enterprises in S.I.C. 3180, we note that the relative dispersion is found to be greatest in the top four enterprises and tends to be less marked in the other groups. On the other hand, in S.I.C. 1470 the coefficient of variation for the first four and the next four enterprises are nearly equal and the relative difference of the coefficient of variation of the top four and top eight enterprises is less marked. This signifies that S.I.C. 1470 consists of more than four large enterprises of similar size groups. The interested reader can examine the average value of factory shipments in Table A-10 for these two industries. It will be noted that the proportional difference in the averages is greatest in S.I.C. 3180.

The Herfindahl index is an example of a concentration measure which takes into account not only the dispersion of relative firm sizes, but also the total number of firms in an industry. If for example, the Herfindahl index is examined in Table D-1, we arrive at the same conclusion as given above, namely S.I.C. 3180 is more concentrated than $1470^{1}$. Though S.I.C. 3180 has a greater number of enterprises than S.I.C. 1470, the Herfindahl index for the former industry indicates that the relative dispersion between the larger and smaller enterprises is considerably greater than for the latter industry.

The advantage of the Herfindahl index in the above analysis is that in a single number it enables us to define the concentration level and relative patterns of enterprise size distribution. However, unlike the concentration ratio and the coefficient of variation, the Herfindahl index does not specify the market share of large enterprises in the industry. In addition, the Herfindahl index is aggregative and does not indicate in which particular group of firms the greatest dispersion in relative firm sizes exists. Furthermore, if two industries have the same Herfindahl indexes, one would be led to expect the same levels of concentration and relative dispersion of firm sizes.

For example, S.I.C. 1792 and 3310 do have the same Herfindahl index for shipments, (Table D-3). On the other hand, the coefficient of variation of the top eight enterprises in S.I.C. 3310 indicates a greater enterprise size dispersion as compared with S.I.C. 1792. In general terms, this would indicate that in S.I.C. 3310, a few enterprises within the top eight are more dominant. In S.I.C. 1060 and $2431-3$ the difference in number of enterprises is very great. The former industry has 1,165 enterprises whereas S.I.C. $2431-3$ has only 115 . In so for as concentration index reflects structural determinants of competition, these two industries are very different. Yet, this is not evident from the Herfindahl index alone.

[^35]TABLED-3
COEFFICIENTS OF VARIATION OF VALUE OF FACTORY SHIPMENTS CUMULATIVELY AND BY GROUPS OF LARGE ENTERPRISES IN SELECTED CANADIAN MANUFACTURING INDUSTRIES, 1965

Source: Table A-9 (Appendix A)

Professor Gideon Rosenbluth ranked industries using three concentration indexes: ${ }^{2}$
(1) Percentage of employment accounted for by the leading three firms
(2) Number of firms required to account for 80 per cent of employment, and
(3) Herfindahl's summary index for employment

Statistical analysis showed that the ordering of industries by concentration level is largely independent of the particular index employed. The Spearman rank correlation coefficient comparing indexes (1) and (2) was .981 ; the coefficient comparing index (1) and (3) was .980 , and the coefficient comparing indexes (2) and (3) was .979.

A similar analysis of the various enterprise concentration indexes used in this study has been made, viz:
(1) top four concentration ratio
(2) 80 per cent shipments index
(3) 80 per cent employment index
(4) Herfindahl index (employment)
(5) Herfindahl index (shipments) and
(6) Herfindahl index (value added)

TABLE D-4
SPEARMAN RANK CORRELATION COEFFICIENT BETWE EN SELECTED MEASURES OF CONCENTRATION, CANADIAN MANUFACTURING INDUSTRIES, 1985

|  | 1 | 2 | 3 | 4 | 5 | 6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Index | Top 4 Concentration Ratio (Ship.) | $\begin{gathered} 80 \% \\ \text { (Ship.) } \end{gathered}$ | $\begin{gathered} 80 \% \\ \text { (Empl.) } \end{gathered}$ | Herfindahl Index (Empl.) | Herfindahl Index (Ship.) | Herfindahl Index (V.A.) |
| 1 Top 4 Concentration Ratio (Ship.) | - ${ }^{-}$ | . 8273 | . 9254 | . 9345 | . 9684 | . 9809 |
| $280 \%$ (Ship.) | . 8273 | - | . 9828 | . 9206 | . 8963 | . 8962 |
| $380 \%$ (Empl.) | . 9254 | . 9828 | - | . 9563 | . 9271 | . 9312 |
| 4 Herfindahl Index (Empl.) | . 9345 | . 9206 | . 9563 | 76 | . 9769 | . 9786 |
| 5 Herfindahl Index (Ship.) | . 9684 | . 8963 | . 9271 | . 9769 | - | . 9888 |
| 6 Herfindahl Index (Value Added) | . 9809 | . 8962 | . 9312 | . 9786 | . 9888 | - |

This statistical analysis covered various sets of observations for the six different concentration indexes. As certain concentration indexes were withheld to avoid disclosure of individual enterprise statistics, the analysis could not be extended to cover all of the 159 manufacturing industries surveyed. The analysis indicates that the choice of an index of concentration does not significantly alter the overall ranking of the

[^36]concentration levels. However, it is suspected that these results may not apply to the groups of industries in different concentration levels. Such analysis could not be extended due to the large number of concentration indexes withheld to avoid individual enterprise disclosure.

It must be noted that the above rank correlation coefficients are applicable to the overall ranking of different concentration indexes even though different measures e.g. shipments, value added and employment were used. These coefficients do not discribe the close correlation between shipments, employment and value added. A simple correlation coefficient computed between 80 per cent shipments and 80 per cent employment index yield $\mathrm{r}=.9561$. The correlation coefficient between Herfindahl index (shipments) and Herfindahl index (employment) is .9596 and between Herfindahl index (value added) and Herfindahl index (shipments) is 9839 . The correlation coefficient between Herfindahl index (employment) and Herfindahl index (value added) is .9618 .

[^34]:    ${ }^{9}$ It must be noted that the "difference method" of interpolation in this case assumes a linear relationship to exist between the number of establishments and their share of an industry's economic activity. This is an unrealistic assumption as far as concentration statistics can be described. However, the accuracy of this method, as well as most other methods of interpolation, increases if there are a greater number of observations with intervals of small absolute magnitude.

[^35]:    ${ }^{1}$ This is partly due to the fact that there exists a relationship between the Herfindahl index and the coefficient of variation.
    $H=\begin{gathered}c+1 \\ n\end{gathered}$ where $c=$ squared coefficient of variation and $n=$ total number of firms in the industry.
