## INTRODUCTION

Research into the regional and provincial industrial structures has been hampered by insufficient data. Public policies to encourage regional development, however, make it imperative that some effort be made to identify provincial areas of comparative advantage - both from the demand side as well as the supply side. But traditional comparative advantage calculations on the basis of, say, cost of labour as a percentage of value added (Kaldor, 1970) miss the essential point of demand. For it is possible that high input costs for a region may be offset by proximity to markets and/or productivity (Mera, 1973). The purpose of this paper is to develop indices of comparative advantage that allow <sup>us</sup> comprehensive view as possible. The analysis is conducted at the 3-digit level for manufacturing industries, by province.

In its simplest terms, the task is that of identifying some underlying factors that influence the changing productivity of any given industry both intra and inter-provincially. The approach followed is not that of specifying production functions for each of the industry classifications, after the tradition of the neo-classical school. Rather, we have identified a number of variables that appear to have importance and their inter-relationships in each province for each industry are observed. Following upon this analysis, interprovincial comparisons with respect to efficiency and performance are made. Finally, the paper identifies a number of performance indicators, that capture the welfare of the workers as well as the profitability of producers. These performance indicators

are used to rank provinces by industries and industries by provinces - again at the 3-digit level for the manufacturing industries.

A great deal of data and analysis is presented in this report. So much so that no attempt has been made to describe it fully in the text. Rather, the text has been abbreviated and an effort made to make the tables self-explanatory.

## PROVINCIAL STRUCTURE OF PRODUCTION

### Presentation

In the first section of this study our analysis is conducted with reference to a particular industry, namely Slaughtering and Meat Processing (Industry No. 101). Since there are 129 manufacturing industries classified at the 3-digit level,<sup>1</sup> only Industry No. 101 has been presented<sup>2</sup> in detailed form as shown in Table 1. Data on value added, employment, manufacturers' shipments, wage bills etc. have been obtained from Statistics Canada under rules of confidentiality. In most cases the time series cover the period 1961-70, but data for 1971 has been added when possible. A list of major variables is contained in Appendix 1, together with a description of the units in which the variables are expressed. (All dollar values are expressed in current dollars<sup>3</sup>).

### Methodology and Results

This section outlines the methodology followed and the results obtained. Table 1 attached gives the most detailed information and results for the one industry reported upon exhaustively here, while subsequent tables give rather less detailed results for all 129 manufacturing industries.

- 
1. See Appendix 3 for a classification of industries.
  2. Data will be available for specific industries under special request to the Economic Development Analysis Division, DREE.
  3. Absence of regional price deflators at the detailed industry level has ruled out any possibility of calculations in real terms.

### Basic Data

The basic data pertaining to the Slaughtering and Meat Processing Industry are given in the top portion of Table 1, for all variables considered to be of some importance in this study. Each variable has been defined in Appendix 1. Our definition of value added (V.A.) is different from the Census Value Added (C.V.A.) since, as explained in Appendix 2, it excludes service input costs. This should give us a more accurate measure of productivity, especially for those industries where the ratio of service input costs to Census Value Added is very high. Also, this facilitates making either interprovincial comparisons of a given industry or interindustrial comparisons within a province.

### Annual Growth Rates

The variables were regressed on time to calculate their annual growth rates ('EXP' expressed in percentage terms) in each province. The following function is used to estimate the annual growth rate:

$$X_t = \text{constant} (1 + \text{EXP})^t \quad (1)$$

where  $X_t$  = any variable.

EXP = annual growth rate.

The other symbols used in the first part of Table 1 refer to the following:

S.E. below EXP = standard error of the annual growth rate.

S.E. below CONSTANT = standard error of the constant term.

RBAR = correlation coefficient of the regression form.

S.E.R. = standard error of the regression.

Some examples may be taken to demonstrate the results more clearly. By way of illustration, the annual growth of employment rate in the slaughtering and meat industry in Newfoundland over the 1961-70 period was - 7.24 per cent; that is, employment has fallen at an annual rate of 7.24 per cent over this period. It should be noted that this annual 'growth' rate is not computed from starting and terminal year employment levels, but, rather, by regression analysis of all annual employment levels during the period 1961-70. This annual rate is statistically significant at the 5 per cent level, since the standard error of estimate is relatively low (i.e., 1.74 per cent). In Ontario the employment growth rate for the slaughtering and meat industry over the 1961-71 period was -0.15 per cent, which is not statistically significant since the standard error of estimate is relatively high. In that case, Ontario's employment growth rate should be interpreted as zero.

The growth rates for the other variables were also computed by means of regression analysis. The purpose of the first or top portion of Table 1 is to set out the historical data on the pertinent variables, and to illustrate the growth rates of each of the chosen variables. These industrial growth rates can then be compared amongst different industries and/or for the same industry amongst different provinces.

of a growing industry. The variables are defined in Appendix 1.

Most of the signs are expected to be positive except when the variables are related to the number of employees (L), the labour man-hours (L.H.) and the hourly wage-rate (H.W.). The negative entries demonstrate the possibility that growth need not be positively related to the number of employees or the wage rate but, rather, may be of the labour saving type. The correlation matrix is useful as a cross reference for helping to explain various behaviour patterns amongst industries.

#### Industrial Performance

The bottom section of Table 1 gives two equations in double-log form that give some insight into the degree of sensitivity of labour and productivity to changes in the wage rate. The first equation shows the application of Verdoon's Law<sup>1</sup> and the second equation indicates the Arrow-Chenery-Minhas-Solow version<sup>2</sup> of capital labour elasticity measurements. Both equations are statistically significant for all provinces.

The first equation relates to the interrelationship between productivity gains and employment levels. Estimates for C (the elasticity of labour displacement) are either greater or less than one. We suggest that the higher the value of C (i.e.  $C > 1$ ) the greater is the rate of labour displacement that takes place in order to achieve higher productivity. Conversely, a low value of C (i.e.  $C < 1$ )

1. J.P. Verdoon, 'Complementarity and long-range projections', *Econometrica*, 1956.

2. See on this point J.M. Katz, "Verdoon Effects, Returns to Scale, and the Elasticity of Substitution", *Oxford Economic Papers*, 1968.

indicates that productivity gains are achieved without reducing employment. Provinces for which the estimate of C is markedly greater than one are Newfoundland and P.E.I. The estimates suggest, therefore, that productivity gains in the slaughtering and meat processing industry in those provinces have been at the cost of a considerable employment loss. Ontario, on the other hand, has a C estimate approximating one, which indicates that productivity gains have not occasioned employment losses.

The second equation relates to the relationship between wage rates and productivity increases. Values for B (elasticity of productivity with respect to the wage rate) indicate the degree to which productivity gains are reflected in wage rates. When  $B > 1$  it implies that wage rate increases have failed to go along with productivity increases. Examples taken from the slaughtering and meat processing industry are Newfoundland, Nova Scotia, New Brunswick, Saskatchewan and B.C. Similarly, converse implications follow when  $B < 1$ . With  $B = 1$  the implication is that wage rate increases are commensurate with productivity increases. For industry group 101, Alberta comes very close to this latter case. Whenever  $B > 1$  it is pertinent to question whether the labour markets are behaving in a competitive manner.

## PERFORMANCE INDICATORS

This section attempts to identify, from the basic data computed in Table 1, those industries which are doing best in terms of some specific variables and growth indexes.

### Relative Performance Indicators

In addition to detailing absolute levels of wage rates, productivity, employment and value added, which reflect the viability and/or profitability of any specific industry in a given province, we have devised a method to account for different growth rates in these variables and thereby give some indication of comparative advantage. This index can be written as follows:

$$G^R = \prod_{j=1}^N (1 + b_j^R) \quad (2)$$

where R refers to the province, j refers to the selected variables and b to the annual growth rates of those variables. A separate growth index has been computed for each of the 129 industries examined.

We have chosen four important variables for the growth index of each industry in each province. These are: employment, wage rate, productivity and shipments. The first two refer to the welfare of the workers and the last two to the viability of production and perhaps to the general state of health of the industry. The following results were obtained with respect to industry No. 101, by province:

TABLE 3  
Growth Index by Province  
INDUSTRY NO. 101

Slaughtering and Meat Processing Industry

	NFLD.	P.E.I.	N.S.	N.B.	QUE.	ONT.	MAN.	SASK.	ALTA.	B.C.	CAN.
GROWTH INDEX	1.16	1.15	1.21	1.23	1.19	1.22	1.19	1.25	1.26	1.23	1.22
RANK	9	10	6	4	7	5	8	2	1	3	

From the above Table it appears that the composite growth index for the slaughtering and meat processing industry in Nova Scotia is marginally below that for New Brunswick. The reasons underlying this divergence can be ascertained from Table 1 (attached). In Table 5 it is indicated that Nova Scotia has fallen behind New Brunswick mainly because employment (L) growth in the slaughtering and meat processing industry in Nova Scotia has been almost nil whereas in New Brunswick it increased an annual compound rate of 3.6 per cent. Through the use of Table 5 other inter-provincial comparisons can be easily made.

General Performance Indicators: Relative and Absolute Levels

While the growth index as developed in the preceding analysis captures the general growth potential of an industry, it still remains partial insofar as the absolute welfare gains

or losses inter-provincially are not taken into account. In this section an attempt is made to accommodate growth in the context of some absolute levels of welfare. Two particular indicators have been used, namely, the average hourly wage rate and the average productivity in any province by a given industry. These two indicators are then separately multiplied by the individual growth index for each industry, by province, to render what is termed general performance indicators on a per-worker basis. These are calculated as follows:

$$P_{1i}^R = G_i^R \times H.W._i^R \quad (3)$$

$$P_{2i}^R = G_i^R \times PROD_i^R \quad (4)$$

where  $H.W._i^R =$  average hourly wage rate for the years 1968-1970  
in province R, industry i.

$PROD_i^R =$  average hourly productivity for the years 1968-1970  
in the province R, industry i.

The results on this basis are shown in the following table:

TABLE 4

General Performance Indicators on a  
Per Worker basis by Province  
Industry No. 101

	SLAUGHTERING MEAT PR.										
	NFLD.	P.E.I.	N.S.	N.B.	QUE.	ONT.	MAN.	SASK.	ALTA.	B.C.	CAN.
GROWTH INDEX	1.16	1.15	1.21	1.23	1.19	1.22	1.19	1.25	1.26	1.23	1.22
RANK	9	10	6	4	7	5	8	2	1	3	
HOURLY WAGE	1.67	3.29	2.07	2.61	2.70	3.07	3.22	3.24	3.26	3.25	3.02
RANK	10	1	9	8	7	6	5	4	2	3	
PRODUCTIVITY	4.95	6.59	3.83	4.73	5.61	5.85	5.04	5.76	6.43	6.38	5.80
RANK	8	1	10	9	6	4	7	5	2	3	
G X HW	1.93	3.79	2.51	3.20	3.22	3.73	3.83	4.03	4.11	3.99	3.68
RANK	10	5	9	8	7	6	4	2	1	3	
G X PROD.	5.73	7.60	4.64	5.80	6.70	7.11	5.99	7.17	8.10	7.83	7.06
RANK	9	3	10	8	6	5	7	4	1	2	
CHANGES	2	0	-1	-1	1	2	-2	-1	0	0	

It is apparent from the above table that some changes in rank are noticeable between the absolute level of one variable and its general performance indicator. This is well illustrated in the P.E.I. case where the province comes first for the wage rate and only fifth on the performance indicator side. The wage rate rank is pulled down by a slow growth index. In this context the ideal situation (highest level of welfare within the industry) is one where a high growth index is combined with a high level of wage rate.

This is the situation in the Western Provinces; Alberta has the highest rank, in terms of worker's welfare, within the Slaughtering and Meat Processing (Industry No. 101). A similar analysis relating to productivity also shows Alberta with the highest rank.

Performance has to be judged also by the hourly wage rate vis-a-vis hourly productivity. The last row on Table 4 (labelled "changes") indicates the difference between the rank in terms of wage rates and the rank in terms of hourly productivity. Assuming nothing is done to alter the relationship, a negative figure suggests the industry may be facing problems in the province concerned.

#### Negative Change in Rank

A negative change in rank for a province means that the workers are relatively overpaid in comparison with their productivity and that of other provinces. Generally speaking, in this case the ratio of surplus (profit) to value added will be declining and lower than the average for the industry. The competitive position, in short, is being eroded.

Under this condition the profit margin per unit of output will be less than the average unless the capital cost per unit of output is also lower than the average. If there is no inter-provincial difference in capital cost within the industry, then a lower ratio of surplus to value added will be a serious limitation to growth. It is possible, however, to have a situation where a negative change in rank is not

necessarily associated with a low ratio of surplus to value added. Here we consider two major possibilities in the case of a growing industry.

In the first case, the industry receives a higher price for its final product than its competitors in other provinces yet maintains the same profit level. In this case we must assume that the industry is protected by a high transportation cost structure preventing other producers from competing in its market. Therefore, the industry is faced with a definite market, provincial or local, and future growth is related to that market.

In the second case, the industry has to pay less for its supply of primary or intermediate inputs than its competitors. The industry is then in a position to sell its product at a competitive price with other producers. It will also be possible for it to capture the provincial market and compete for the national or the international markets.

#### Positive Change in Rank

The analysis in this case is similar to the previous one. Generally, a positive change in rank will be associated with a higher ratio of surplus to value added. Assuming inter-provincial differences in capital cost to be negligible, profits will be higher and a good rate of growth should prevail. If the industry pays cheaper prices for its inputs or receives higher prices for its final product, growth will be enhanced further.

A similar analysis can be derived for all industries from data computed in Table 5 and Table 1.

General Performance Indicators: Interindustrial

This section is concerned with the performance of an industry in comparison with all other industries within one province. Four variables were used together with their respective rates of growth. These are: shipments, employment, productivity and hourly wage rate as previously defined. Also included is a growth index which can be written as follows:

$$C = A(1+b) \quad (5)$$

where A refers to the absolute value (3 years average) of the selected variable and b to its annual growth rate. The industries are ranked according to their respective C values as shown in Table 6.

APPENDIX 1

LIST OF VARIABLES FOR MANUFACTURING INDUSTRIES  
BY PROVINCE

V.A.	=	Value added in current dollars (unit = \$1000)
W.B.	=	Wages and salaries bill in dollars (unit = \$1000)
S	=	Surplus = V.A. - W.B.
S/VA	=	Ratio of surplus to V.A.
L	=	Production and related workers or employees
L.H.	=	Labour Man-hours (unit = 1000 man hours)
VA/L	=	Productivity per employee
H.W.	=	Hourly wage rate
VA/LH	=	Man hour Productivity
C.V.A.	=	Census Value Added (unit = \$1000) in current \$ = Value Added + Services
SHIP	=	Shipments in current \$ (unit = \$1000)
EXP	=	Annual growth rate of the variable
C	=	Elasticity of labour displacement
B	=	Elasticity of productivity (man-hour) with respect to wage rate

APPENDIX 2Estimation of Service Input Costs per Dollar of  
Census Value Added by Provinces and Industries

Consider the following definitional identities:

$$VA_i^R = CVA_i^R - SER_i^R \dots (1)$$

$$S_i^R = VA_i^R - WB_i^R \dots (2)$$

$$SO_i^R = CVA_i^R - WB_i^R \dots (3)$$

where

VA = Value Added

CVA = Census Value Added

SER = Cost of Services

S = Surplus (Real)

SO = Surplus (Tacit)

Subscript i refers to the industry, superscript R refers to the province and superscript N refers to the nation. The problem we face is how to estimate  $SER_i^R$  such that

$$\sum_{R=1}^N SER_i^R = SER_i^N \dots (4)$$

with similar aggregation consistency requirements for the other variables. The procedure followed by us is simply this:

$$\text{Let } \alpha_i^N = SER_i^N / CVA_i^N = 1 - VA_i^N / CVA_i^N \dots (5)$$

where  $VA_i^N$  and  $CVA_i^N$  data for the year 1961 are obtained from the RDP indices and CVA values respectively from Statistics Canada. Once  $\alpha_i^N$ 's are known from (5) we apply the following hypothesis for the estimate of  $VA_i^R$  -

$$VA_i^R = CVA_i^R - (SO_i^R/SO_i^N)SER_i^N \dots (6)$$

where

$$SER_i^N = \alpha_i^N CVA_i^N \dots (7)$$

[from (5)]

Hence from (1), (3), (6) and (7) we derive

$$SER_i^R = \left( \frac{CVA_i^R - WB_i^R}{CVA_i^N - WB_i^N} \right) \alpha_i^N CVA_i^N \dots (8)$$

It follows that (6) satisfies the condition that  $\sum_{R=1}^N VA_i^R = VA_i^N$

and (8) satisfies (4). From (8) we also obtain the following:

$$\alpha_i^R = \left[ \frac{\left( \frac{SO_i^R}{CVA_i^R} \right)}{\left( \frac{SO_i^N}{CVA_i^N} \right)} \right] \alpha_i^N \dots (9)$$

where  $\alpha_i^R = SER_i^R/CVA_i^R \dots (10)$

In the formulation (9)  $\alpha_i^R$  rises (or falls) relative to  $\alpha_i^N$  as  $SO_i^R/CVA_i^R$  is greater (or lesser) than  $SO_i^N/CVA_i^N$ .

APPENDIX 3

The 1960 Standard Industrial Classification (3 digit level) has been used plus a few aggregations to make it compatible with the 1961 Input-Output Industry Classification.

1. The Clothing Industry (No. 243) includes:
  - Men's clothing industry (No.243)
  - Women's clothing factories and contractors (No.244)
  - Children's clothing factories (No.245)
  - Fur goods industry (No.246)
  - Hat and cap industry (No.247)
  - Foundation garment industry (No.248)
  - Other clothing industry (No.249)
  
2. The Printing and Publishing Industry (No. 286) includes:
  - Commercial printing (No.286)
  - Publishing only (No.288)
  - Publishing and printing (No.289)
  
3. The Boatbuilding and Repair Industry (No. 328) includes:
  - Boatbuilding and repair (No.328)
  - Miscellaneous vehicle manufacturers (No.329)
