## INTRODUCTION

The aim of this work is to provide a tool by which the impact of the Regional Development Incentives Act can be measured.

The work itself is not an analysis, but a presentation of primary statistics (to May 31, 1971) from which an analysis can be made. Included with the statistics are graphs, pie charts and maps. Accompanying these tables is a word of explanation regarding the pitfalls of some of the data as well as certain comments on how to use the statistics and the charts. Program Evaluation Branch would greatly appreciate any constructive criticism and comments regarding the use of the statistics and their application in your individual units. Please forward all comments to R.H. Marshall, Director of Program Evaluation.

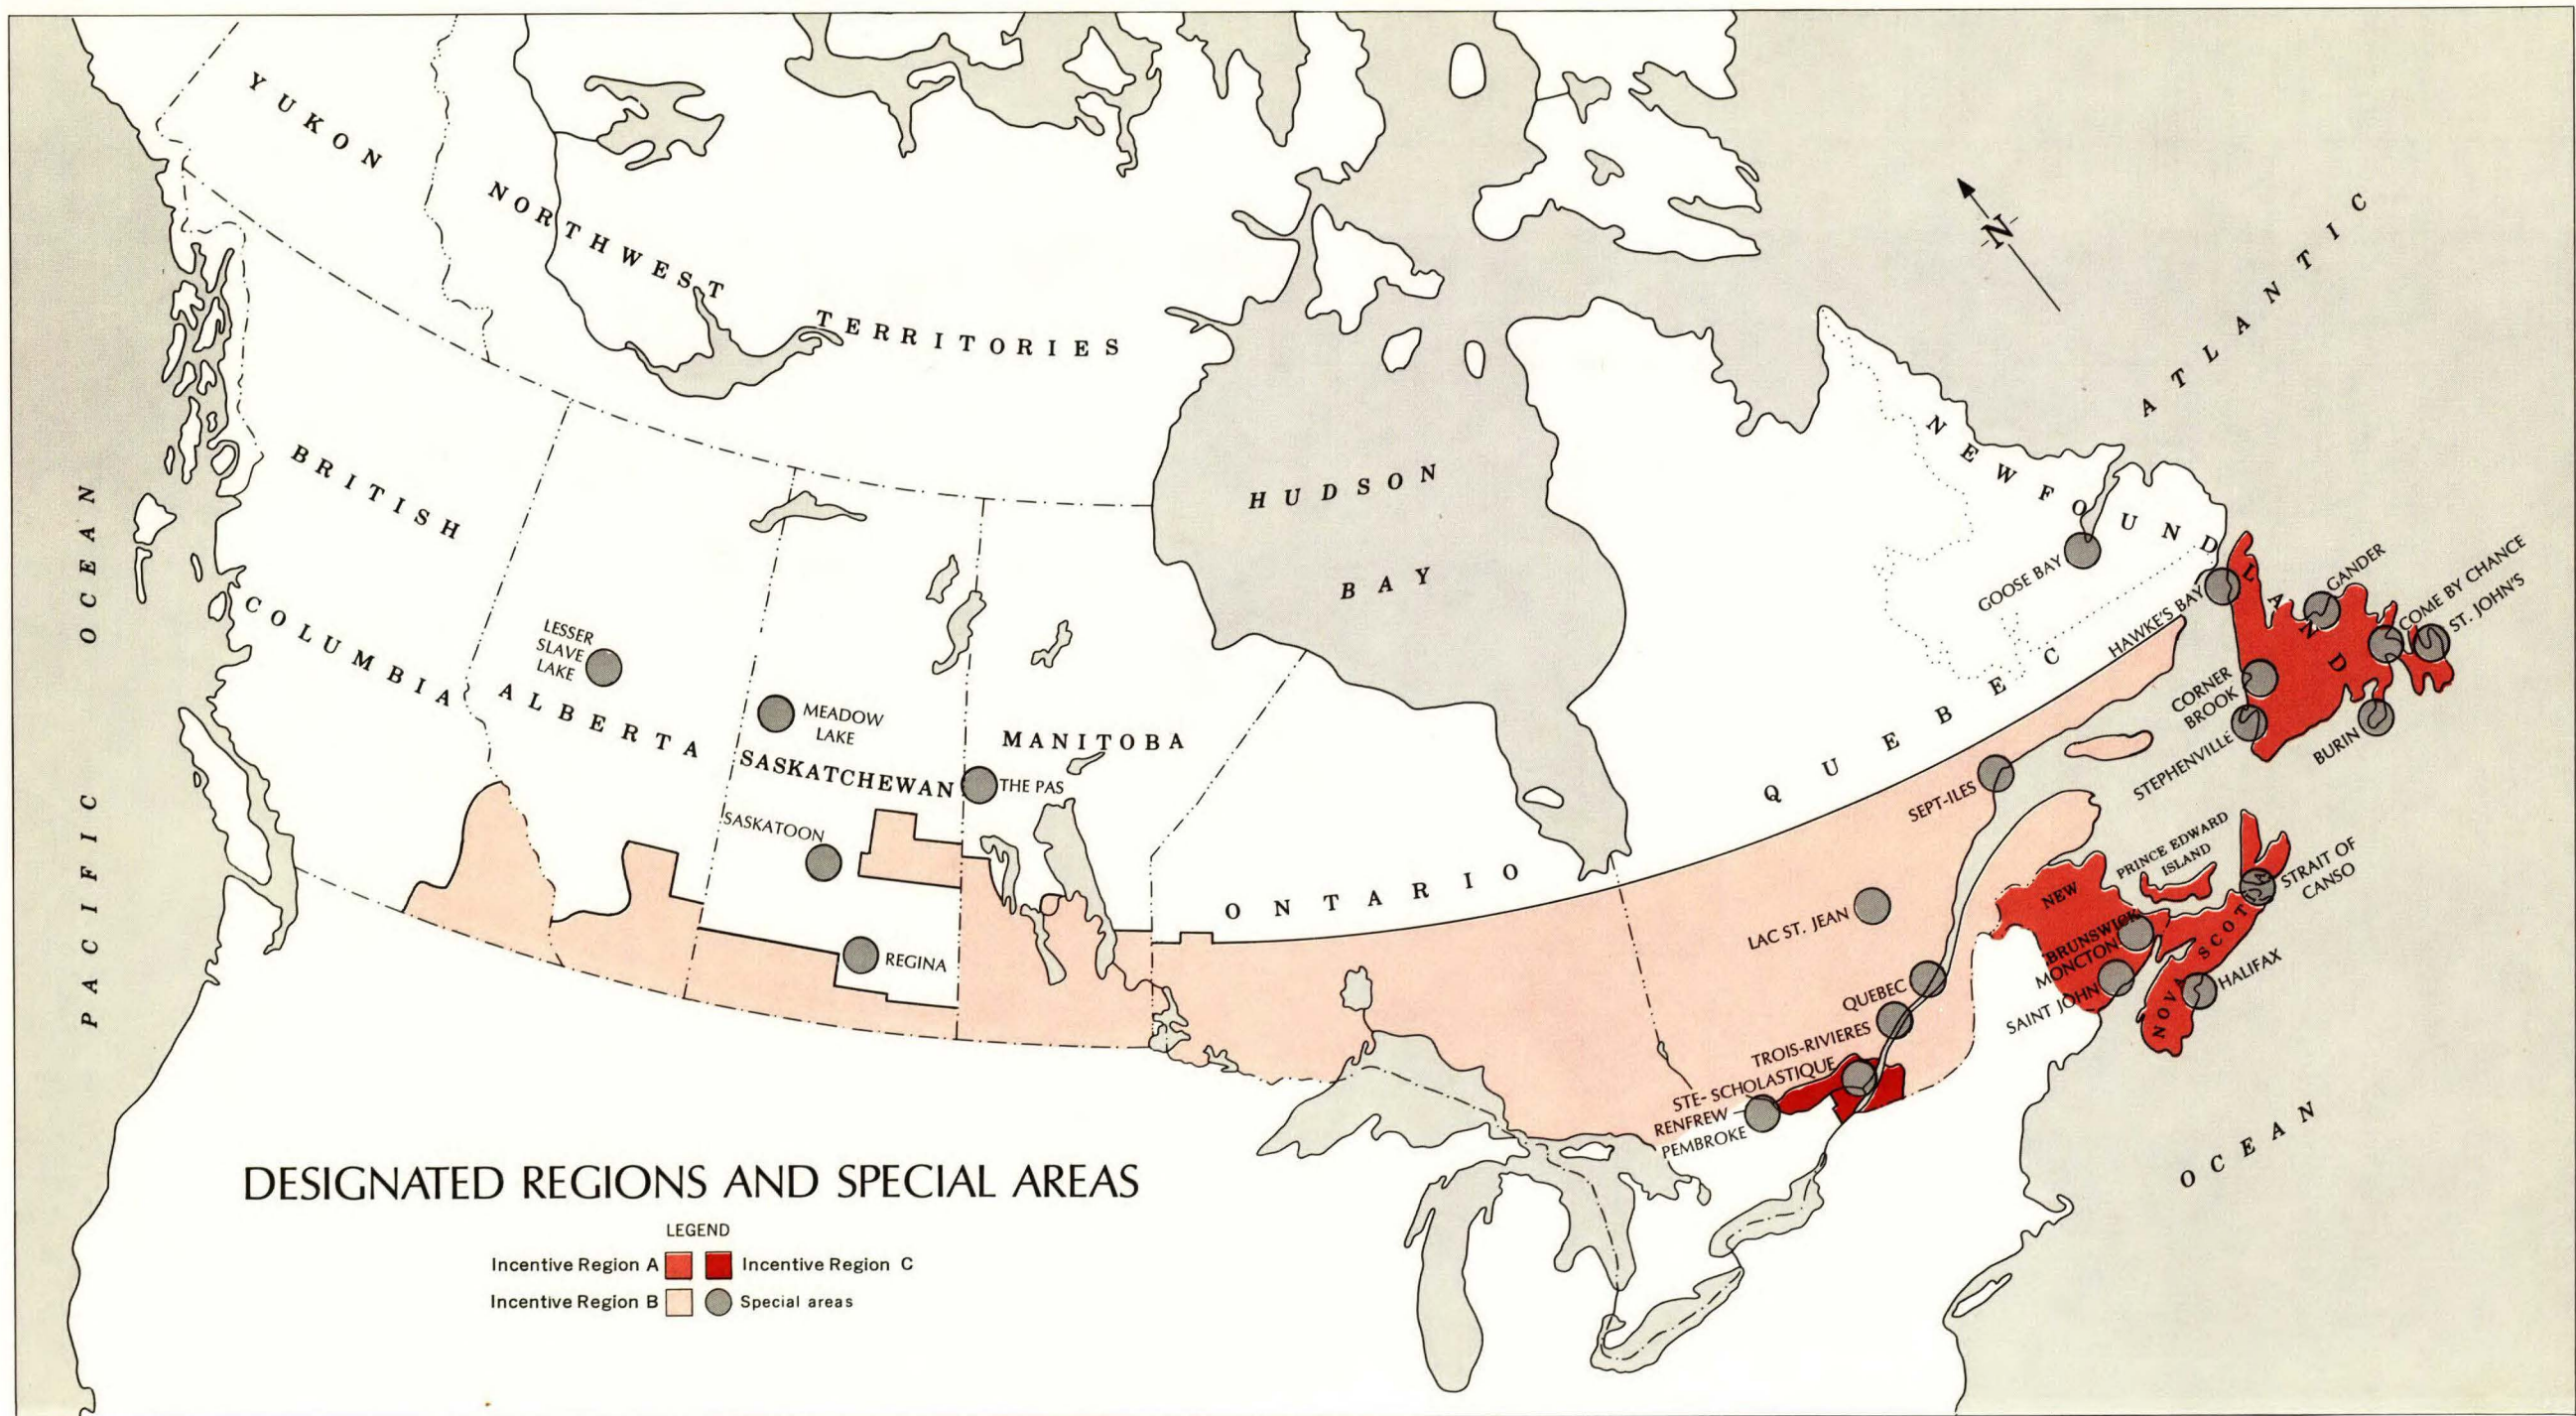

The work is divided into three complementary divisions. The first splits the country into three regions: Atlantic (Newfoundland, Prince Edward Island, Nova Scotia and New Brunswick); Central (Quebec and Ontario); and Western (Manitoba, Saskatchewan, Alberta and British Columbia).

The second division subdivides the country into smaller units: the provinces. This further breakdown of statistics also enables each province to be compared to the national values; it also shows which province receives the largest percentage of the incentives, as well as the provinces in which the cost of producing one job is above or below the national average. The data also shows why one province may be receiving the largest share, or why it should not receive it. Among the indicators that help make this decision are the unemployment and the population density of each province: should the provinces with the highest unemployment receive the largest amount of incentives?

The third division represents the situation in the provinces, because each province is divided into its Canada Manpower Centres or (C.M.C.). From this presentation, it is hoped that one will get a clearer understanding of where industries are being located and where and how the growth poles are developing.

The information is drawn from a variety of sources. Canada Manpower has provided the information on labour force and unemployment; Statistics Canada has provided the population statistics; the Incentives Branch of Regional Economic Expansion has provided the necessary economic data. The Cartographic Unit of the Department of Regional Economic Expansion produced the graphs and maps for this work.

The first map and graph of the study, at the beginning of this publication, show the area covered by the study and the general trends of the program. Although the points of the line "Capital Cost" cannot be compared with the points of line "Offer Accepted", the relative slopes of the lines can be compared to derive the trend of the program from one month to another. The slow start, and the sudden increase in slope in later months will be noticed. The effect of including Incentive Region C and an added 10% to the Atlantic region (this change occurred in January) may also be deduced.

REGIONAL ECONOMIC EXPANSION CANADA  
EXPANSION ECONOMIQUE REGIONALE CANADA

**DIVISION I**

### Introduction

The three following tables allow comparison between different regions of Canada. Table I shows that the Central Region has the highest amount of Capital Cost (51.3%) and receives a larger amount of the incentives of the total Canadian incentives (54.5%). It also produces more jobs than the other regions (58%) and, what is more important, the cost per job is only \$4,545.64, which is below the national average. On the other hand, the West has lower costs per job (\$3,748.01). The Atlantic region has the highest costs per job, yet it receives far more incentives than the Western region. A contributory cause is that in Nova Scotia (the Sydney, Glace Bay and North Sydney Canada Manpower Centre)\*, close to \$16,000,000 is received in the form of incentives, while creating only four jobs. Table I also makes very plain that creating a job in the Atlantic region is very expensive; in the West it is less costly: \$3,000 less per job. Accompanying Table I is a pie chart, representing the percentage distribution of Capital Cost, Incentives and Jobs.

Table II is self-explanatory. The Central region, having the larger population in the Designated Regions, should receive the larger share of the grants. The question is: which of the other two regions should get the second larger share? The tendency seems to be to give more importance to areas of denser population; should this be so or should the areas of lesser population be given a larger share?

---

\* Although the Sydney, Glace Bay and North Sydney Canada Manpower Centres are producing only four new jobs, it is still a fact that these centres *maintain* hundreds of jobs.

Table III is a combination of the economic data and of the demographic data. What is of importance, is the value of incentives per capita and the amount of capital cost required to produce one job.

Sources:

The information on Population was taken from the 1966 Census of Canada, "Population", Catalogue No. 92-632, Census of Canada, 1966. (Dominion Bureau of Statistics).

The information on Labour Force and Unemployment was taken from a study made by the Department of Manpower and Immigration,

"Canada Manpower Centre Area Profiles: Statistical Summary", Department of Manpower and Immigration, 1971.

Economic Data were taken from "Report on the Operation of the Regional Development Incentives Act and on 'Special Areas' Incentives", from October 1969 to May 1971, published by the Incentives Division, Department of Regional Economic Expansion.

Terms Used:

In these tables, "cost per job" refers to the total incentive offered, divided by the estimated number of jobs to be created.

In the graph on page 13, "incentives for capital" refers only to that part of the incentive offered which is applied to the capital costs. "Incentives for jobs" refers only to that part of the incentive offered which is applied to the estimated number of jobs to be created.

Examples

One company accepts 20% of capital costs of \$180,000 (or \$36,000), plus \$1,000 per job created, and provides 10 new jobs. Total incentive is \$46,000; "cost per job" is \$4,600; "incentives for capital" is \$36,000 and "incentives for jobs" is \$10,000.

Labour Force is the estimated labour force in each unit, as reported to the Department of Manpower and Immigration.

Unemployment refers to clients without jobs, the statistics provided by the Department of Manpower and Immigration.

Population in Designated Region is taken from the population statistics supplied by Canada Manpower Centre. The information comes from the Department of Manpower and Immigration.

Capital Cost ÷ Number of Jobs	\$26,449	\$21,719	\$27,812	\$23,412

**DIVISION II**

### Introduction

In this section, Canada is divided into 10 units - the Provinces. From these tables the reader can compare the effect and growth of the program in each province by measuring it against the national values, or against other provinces of similar population or of similar capital costs, etc. A large number of comparisons and cross comparisons are possible. The division into provinces is a further breakdown of the regional units shown in the earlier division. There are three tables in this division: the economic data, demographic data, and demo-economic data. Accompanying these tables are two graphs. The graph on page 12 shows estimated jobs by province, compared to that of the national total; the information is presented by the month. At the bottom of the graph, each province is indicated by a number. The graph is self-explanatory.

The graph on page 13 is more complicated. Presented are "incentives for capital" and "incentives for jobs" as a percentage of their respective Canadian totals. (See definitions on page 6.) The extreme right of the page shows the per cent distribution of each type of incentive by province, and a monthly average of the build-up by province. The individual provincial graphs show both types of incentive by month as a percentage of the Canadian total of each type.

The individual columns are to be interpreted as follows: read the colour at the top of the column as if it applied to the entire column, and read the bottom colour up to the point where it is shown.

**DIVISION III**

### Introduction

In this section, each province is taken individually and broken down by Canada Manpower Centre area. The Canada Manpower Centres are the only units that conform closely to the boundaries of the Designated Regions and Special Areas. With these divisions it was then possible to use the information gathered by the Department of Manpower and Immigration. These tables follow the same format as the preceding tables. It is important to pick out in each province where the applicants are situated and (more interesting) to decide why they are grouped around one particular area. Also of importance, but not included in this study, are the types of industry locating or expanding in the areas; are they primary, secondary or tertiary? These questions, and probably many others, will come from reading this information. It is hoped that this study contains the statistics required to answer these questions.
