

HIV in Canada: 2023 Surveillance Highlights

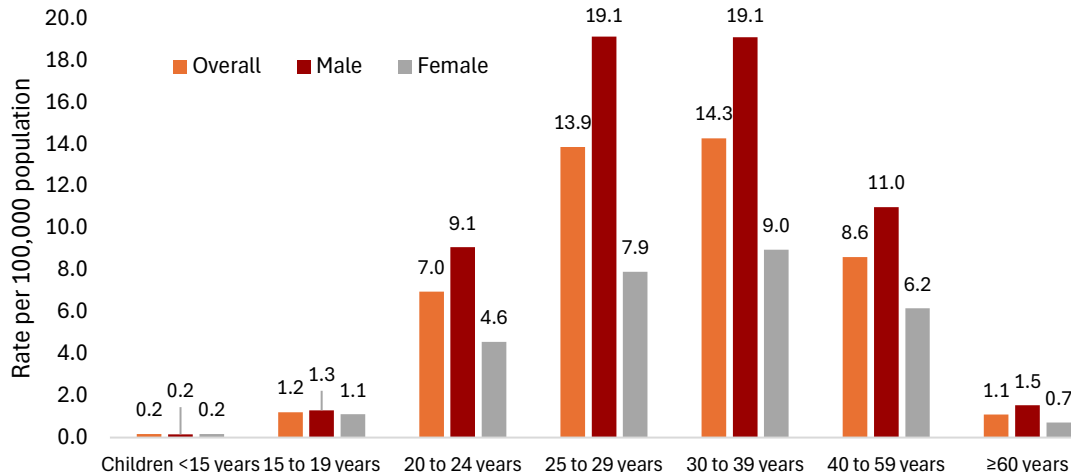

National rate per 100,000 population: **6.1**

2,434 new diagnosed cases of HIV in 2023

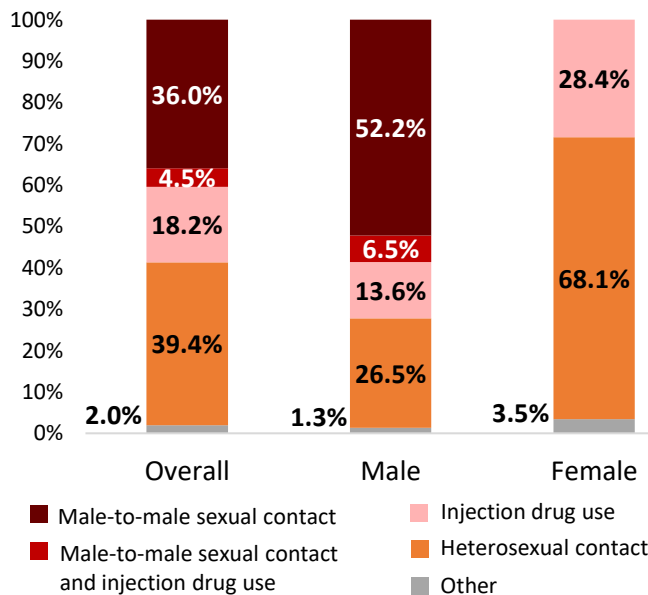

35.2% increase since 2022

Rates per 100,000 population of new HIV diagnoses, by age group and sex

Proportion of new HIV diagnoses in adults, by mutually exclusive exposure category and sex

247 infants born to people living with HIV

97.1% of pregnant people living with HIV received perinatal antiretroviral therapy (ART)

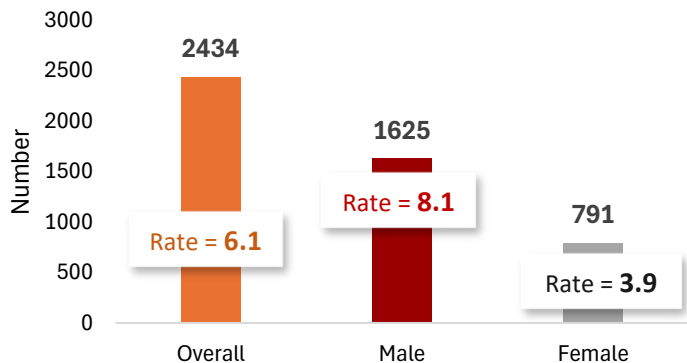

5 infants were born with HIV transmitted perinatally

- **3** were born to pregnant people living with HIV who **did not receive any ART**
- **2** were born to people who received **some or partial ART**

Based on sentinel surveillance representing 95% of infants who were exposed to HIV.

Data for 2023 excludes cases that have been previously diagnosed outside of Canada (e.g., prior to immigration) or in another province/territory, when known. Data presented do not account for age and sex rate variations between provinces and territories. If discrepancies exist between data summarized and provincial or territorial reports, the most recent provincial or territorial report should be utilized.
TR: Territories, AT: Atlantic provinces

Number and rate (per 100,000 population) of new HIV diagnoses, by sex
