

**ESTIMATES OF ECONOMIC ACTIVITY IN REGIONS
OF THE CANADIAN GREAT LAKES BASIN
FOR THE PERIOD 1972 - 2020**

- Series A, Volume I -

**Prepared for Social Sciences Division
Ontario Region**

December 1974

By

C. A. Sonnen and P. M. Jacobson

PREFACE

The Estimates of Economic Activities were prepared by Mr. C. Sonnen and Mr. P. Jacobson of INFORMETRICA Limited in Ottawa to provide a solid economic base for the International Joint Commission Reference Studies of Pollution of the Upper Great Lakes and Pollution from Land Use Activities. In particular, the estimates will be used in the Wasteloading Forecasting and Policy Simulation Model for Lakes Superior and Huron and in the Land Use Forecast and Policy Simulation Model for the entire Great Lakes Basin.

Extensive efforts and costs have gone into the preparation of the CANDIDE "Canadian Disaggregated Interdepartmental Econometric" model which was used for the production of these estimates, but no attempt had been made previously to project so far into the future. Various critical assumptions regarding social and policy parameters had to be made in order to make quantitative detailed estimates possible.

The "Series A" Estimates are based on a set of assumptions compatible with a continued trend in the development of the Service Industry. Volume I, presented here, contains estimates for the Upper Lakes Regions. Volume II contains estimates for the Lower Lakes Regions. The "Series B" Estimates will be based on an alternative set of assumptions.

It is imperative that any use of the Estimates should be based on a clear understanding of these principal assumptions and the consequences of departing from these assumptions.

With this in mind, the document will provide a highly useful reference and benchmark of economic activity for many planning applications in the Great Lakes Basin.

Introduction

This report provides a preliminary estimate of economic activity in the Great Lakes drainage regions (see Map 1) from the present through the year 2020. Figures for real domestic product (excluding housing but including 31 other industrial categories) provide the projected measures of such activity. These projections are intended to serve as reference, or benchmark, measures of economic output which, as the project continues, will be modified to reflect such things as pollution abatement activities in each of the regions and Canada as a whole.

Methodology

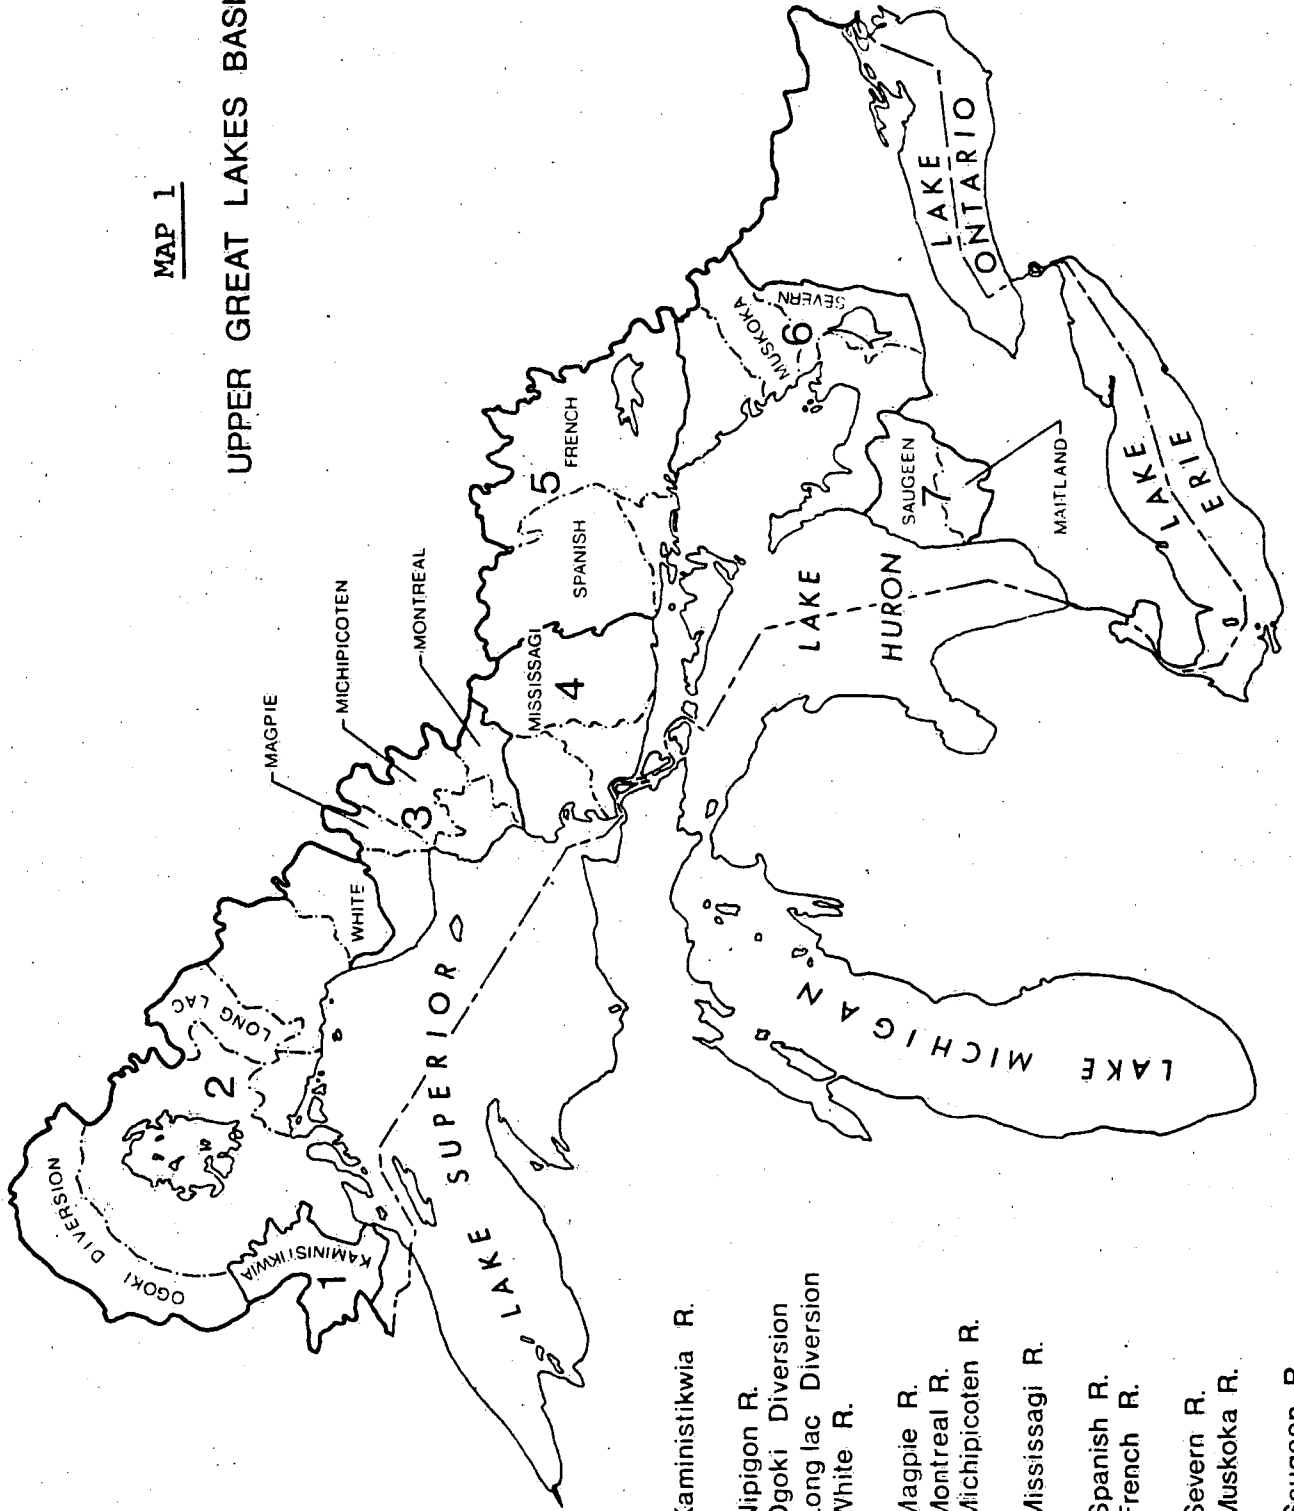

Well-articulated models of regional economic activity in Canada are not available. To derive regional measures, therefore, the project model uses a forecast of national economic activity which is then distributed to the regions of concern. The distribution mechanism used to derive the figures presented in this report is primitive in that the share of each region in the output of each industry in 1971 remains the same throughout the projection period. For example, 5.6% of the output of Primary Metals manufacturers occurred in Region IV (see Map on Page 2) in 1971; thus, the same 5.6% of Canadian Primary Metals manufacturing was distributed in 2020 to Region IV.

An econometric model (a variant of CANDIDE Model 1.1) of the Canadian economy has been used to derive the forecasted national aggregates. As compared to projections based on the simple extrapolation of previous trends of individual measures of economic activity, use of this analytical tool for forecasting offers a number of advantages. Perhaps the most important is the ability to project activity on the basis of a consistent economic theory as well as a consistent accounting framework. It should be recognized that CANDIDE is itself a systems view of economic behaviour (which is sensitive to sociological and other assumptions), and in its use, it has been possible to exercise key judgements (or priors) that the model then "translates" into such measures of economic activity as industrial output. Thus, in the course of developing this set of benchmarks, it was assumed that governments in the next half century will continue to view full employment with moderate price increases as a key policy objective.

Further, use of this model has enabled a projection of economic activity on the basis of demand as well as

supply considerations. The impact of demographic assumptions may help to illustrate the point. At least, with respect to major trends, it is judged with considerable confidence that fertility rates, which have declined steadily over the last two decades, will continue to decline over the next 15 years and will then level off at what is considered, by usual standards, a low rate.

This has obvious implications for the supply side of the economy in that, over time, the labour force can be expected to grow much more slowly than has been the case recently. Consequently, the potential for maintaining the rates of economic growth that have prevailed in the recent past (and are available in the near future) will be reduced. This key demographic assumption also affects demand in that the mix of commodities and services needed to fulfill private consumption requirements will vary with the growth of population as a whole as well as with the changing age structure of the population. Moreover, given the slowing growth of population, investment in housing can be expected to grow more slowly than has been the case in the last decade. This, in turn, implies a different pattern in the growth and mix of industrial output than if recent rapid population growth were simply extrapolated.

Finally, it should be noted that CANDIDE is an extremely large system of equations that incorporates means of projecting industrial output in considerable detail. Consequently, it has been unnecessary to link projections of industrial output to such aggregate measures of economic activity as Gross National Product through any independent mechanism.

Having noted these advantages, a number of cautions are emphasized. These projections are conditional on the assumptions made (and on those that implicitly are in the model). Obviously, there are an infinite number of forecasts since options available in so long a period as 50 years are innumerable. Thus, the tabulated projections should be thought of as the middle points of a band of projections about which some confidence is held. That band widens over time. Finally, it should be noted that these projections are in no sense meant to represent targets to which public policy should be directed.

Major Assumptions of the Forecast

It is broadly assumed that the trends of the past generation continue in the sense that no radical transformations in the world order are presumed. This, therefore, precludes such political or social events as a major war, radical political change in a major industrialized country in the west, a collapse of the international trading and financial institutions under which relations currently are administered, or a critical and sustained shortage of one or more resources basic to industrialization.

Canadian population growth is determined by births, deaths, and immigration. Births (in the CANDIDE model) are in turn determined as the product of a general fertility ratio and the number of women of child-bearing age. It is assumed that the fertility ratio continues to decline until 1985 when it levels off at a ratio which approximates that of the provinces with currently low fertility rates. Immigration is maintained such that net immigration amounts to 100,000 through 1985; thereafter, this source of population grows annually by about 1.5% through 2000 and then the annual growth accelerates to 3.0% in 2001-2010 and to 5.0% in 2011-2020. As a consequence, the following patterns in demographic variables that are key to the economy emerge:

SELECTED DEMOGRAPHIC GROWTH RATES

(Average Annual Rates of Growth)

<u>Population</u>	<u>Source Population of:</u>			
	<u>Total Labour Force</u>	<u>Primary Labour Force</u>	<u>Secondary Labour Force</u>	
1974-1980	1.21	2.13	2.61	1.37
1981-1990	1.13	1.23	2.57	0.74
1991-2000	1.03	1.04	1.19	0.98
2001-2010	0.88	1.00	0.21	1.31
2010-2020	0.83	0.96	0.20	1.23
1974-2020	1.00	1.22	1.27	1.20

The echo effects of the "post war" baby boom have provided an important source of growth to the economy in the last decade by supplying a rapidly growing labour force and by providing important additions to demand. This effect will continue through the 1970's, but with less and less positive effect. By the 1990's, however, this will not be a central source of growth and, barring radical changes in productivity, the potential for economic growth should be significantly reduced from its present 5.0% per year to about 4.0%.

It is assumed that economic growth in the United States and in the OECD countries is maintained at close to potential. Further, it is assumed that high rates of interest, caused by pressures on world capital markets, will continue through the 1970's, but will decline thereafter. As a consequence of these and other assumptions, measures of foreign trade (exports and imports) will constitute steadily declining shares of Gross National Expenditure. That is, the Canadian economy will become increasingly closed.

Exports, as a share of Gross National Expenditure, will decline less rapidly than imports. This is attributable to the view that prices for Canadian exports will grow more rapidly than those for imports and, to a lesser extent, that the volume of exports will grow at a slightly more rapid rate. This basic set of assumptions can be rationalized as representing an international setting in which the scarcity of basic resources (as opposed to manufactured goods) persists and is less mitigated by investment. Canada benefits (as an exporter of resources) both in its terms of trade and from the volume of exports.

Although it is assumed that the marginal propensity to consume public goods (education, public health services, etc.) is higher than for private consumption, it is thought that no major new public sector programs that would substitute for private consumption will be inaugurated. As a consequence, government current expenditures can be expected to slowly account for an increasing share of national expenditures, but no major shift (as has occurred in the last decade) is anticipated. Governments are assumed to maintain the current tax system and, for the most part, tax rates are projected at their current levels.

Summary of Results

Over such a long period as that under review in this study, the growth of economic output is a function of the growth in the labour force, increases in productivity per worker, and the ability of policy makers to keep the economy continuously operating at or near "potential" with acceptable price increases. It is assumed that governments will operate the economy at close to the potential, accepting, in the long term, an average annual increase of about 4.1% in prices as measured by the implicit deflator of Gross National Product. This rate is somewhat higher than has been experienced in the post-World War II period and reflects the general assumption of a continued world scarcity of basic resources.

Growth of the supply of labour is related to the growth of the population eligible to work and the willingness of that group to participate in the labour force. The past generation has seen a steady decline in the average hours worked per week. It is anticipated that this will continue, the average falling from a present 36 hours per week to about 27 in 2020. On the other hand, there has been a clear tendency for people to participate (in the albeit reduced work week) in the past. This is attributable primarily to the increased rate of women's participation. It is expected that this trend will also continue; the participation rate of women under the age of 35 is projected, for example, to rise from a present 45% to almost 80% in 2020. Over all, it is projected that the participation rate will rise from its current 58% to almost 65% in 2020.

The labour force, consequently, can be expected to grow at an average annual rate of about 1.5% in 1974-2020. This, and a growth in output per labourer averaging about 2.7% annually, yields an expected average annual growth of 4.2% of the Gross National Product. (in constant dollar terms). The pattern over time is interesting. The potential for rapid growth is almost certainly to deteriorate over time as the growth of the labour force slows. Thus, in 1974-1990, the economy can potentially grow at an average rate of about 4.8%; from 1991 through 2020, however, the potential is restricted by the slow growth of the labour force to about 3.8%. This pattern is illustrated in the figures below.

SELECTED INDICATORS*

(Average Annual Rates of Growth)

	<u>Gross National Product</u>			<u>Real Disposable Income Per Capita</u>	<u>Labour Force</u>	<u>Labour Productivity</u>
	<u>Constant Dollars</u>	<u>Current Dollars</u>	<u>Implicit Deflator</u>			
1974-1980	5.5	10.8	5.1	5.0	2.9	2.3
1981-1990	4.4	7.9	3.4	3.0	1.8	2.5
1991-2000	3.5	7.2	3.7	2.0	1.1	2.6
2001-2010	3.8	7.9	3.9	2.5	1.0	2.6
2011-2020	4.2	9.1	4.7	2.9	1.0	3.0
1974-2020	4.2	8.5	4.1	3.0	1.5	2.7

* A more comprehensive selection of basic indicators is provided as Appendix A.

To support the rapid growth of government services, it is assumed that taxes are such that disposable personal income per capita will grow slightly less rapidly than Gross National Product. Nevertheless, this indicator of economic well being will continue to increase at an average annual rate of 3.0% in 1974-2020. This rate is only slightly less than that which was maintained in the 1960's. In terms of 1961 prices, per capita disposable income will rise from \$4,950 in 1974 to \$9,410 in 2020.

The relative growth of various components of Gross National Expenditure can be discerned from figures below.

COMPOSITION OF GROSS NATIONAL EXPENDITURE IN CURRENT DOLLARS

(Averages for Periods Indicated)

(In Percent)*

	<u>1960</u>	<u>1970</u>	<u>1980</u>	<u>2000</u>	<u>2020</u>
Consumer Expenditure	66.4	58.6	55.0	44.0	34.0
Durables	8.4	8.0	9.6	6.6	4.6
Semidurables	9.3	7.8	7.5	5.2	3.4
Nondurables	23.5	19.0	16.3	12.9	9.7
Services	25.2	23.9	21.7	19.3	16.4
Government Current Expenditure	13.8	19.2	22.7	33.1	38.4
Gross Fixed Capital Formation	22.1	21.2	22.9	21.3	22.9
Government	4.1	3.7	3.3	2.9	2.7
Business	18.0	17.5	19.6	18.4	20.3
Residential Construction	4.7	4.8	3.9	1.9	1.2
Non-residential Construction	6.8	6.4	7.7	8.7	10.6
Machinery and Equipment	6.6	7.0	8.0	7.8	8.6
Inventory Change	1.1	0.2	0.9	0.4	0.5
Exports	18.3	24.7	22.1	19.9	15.8
Imports	21.1	23.7	23.6	18.7	11.8

* May not sum to 100.0% because of rounding.

As was noted earlier, the consumption of public goods and services (as measured by government current expenditures) is projected to provide an increasing share of total expenditures at the expense of private consumption. Under conditions of a slowly growing population, this is a reasonable projection if the economy is to operate at its full potential. Among private consumption items, expenditures for services and durable goods can be expected to grow most rapidly as has been the case in the past decade.

Demand generated for investment is projected to provide 21%-22% of total expenditures, of which the private sector is expected to provide a greater amount. The one significant contrast between the future and the experience of recent years is in the projection for residential construction which is projected to grow slowly and to

decline as a proportion of total expenditures. This, of course, is attributable to the pattern of population growth. The formation of new households, which has grown rapidly in the past decade, can be expected to increase at slower rates in the future. Domestic savings should be sufficient to finance investment throughout most of the period. Business and government can be expected to provide increasing shares of total savings, particularly after the mid-1980's. Until that time, low dependency ratios (the number of persons not in the labour force to those employed) should cause personal savings to rise rapidly.

As can be discerned from the tabulation below, land-based economic activities would continue their past decline as a share of total industrial output. In combination, the contribution of agriculture, forestry, and fishery, to total output is projected to decline from 4.8% of the total in 1970 to about 3.8% in 2020. In contrast, the contribution of secondary industries (including mining, manufacturing, construction, and transportation and utilities) is projected to increase from 51.3% in 1970 to 61.2% in 2020. The services industries contributed 44.1% in 1970; this is projected to fall to 34.9% in 2020.

COMPOSITION OF REAL DOMESTIC PRODUCT BY INDUSTRY

(In Percent)*

	<u>1960</u>	<u>1970</u>	<u>1980</u>	<u>2000</u>	<u>2020</u>
Agriculture	5.2	3.6	3.1	3.0	2.9
Forestry	1.3	1.0	1.1	1.0	0.9
Fisheries	0.2	0.2	0.1	0.1	0.05
Mining	4.6	5.0	5.0	5.6	6.7
Manufacturing	24.9	26.9	28.3	29.6	33.4
Construction	6.0	5.6	5.4	4.8	4.5
Transportation and Utilities	12.2	13.8	15.2	16.4	16.6
Trade	12.8	12.6	13.3	12.9	12.6
Finance	7.6	7.1	6.7	6.1	5.6
Services	14.2	15.5	14.5	14.3	12.0
Housing	4.1	3.3	2.5	1.8	1.1
Public Administration	7.1	5.6	4.9	4.4	3.6

* May not sum to 100.0% because of rounding.

Employment in the land-based industries is projected to decline as a share of total employment because of the relatively slow growth of output in these industries. In 1970, these sectors accounted for 7.7% of the total; by 2020, they should account for only about 2.0%. In 1970, secondary sectors provided employment to about 39.1% of those employed. By 2020, this share is projected to fall to about 24.1% despite the relatively rapid growth of output in these sectors. The services sectors accounted for 53.3% of total employment in 1970; that share is projected to increase to 74.0% in 2020.

This difference in the trends of output and employment for the secondary and services sectors illustrates a central reality about Canada's economic prospects. Barring radical changes in consumer behaviour or in technology, growth at full potential can only be reasonably achieved by concentrating labour and other factor inputs in those sectors where productivity is high.

COMPOSITION OF LABOUR FORCE BY INDUSTRY

(In Percent)*

	<u>1960</u>	<u>1970</u>	<u>1980</u>	<u>2000</u>	<u>2020</u>
Agriculture	11.4	6.5	3.7	2.0	1.3

* May not sum to 100.0% because of rounding.

Notes on the Regional Distribution of the National Forecast

Appendix B provides a detailed listing of industrial outputs (as measured by Real Domestic Product in 1961 dollars) for each year in the period 1972-2020 for each of the Great Lakes regions under review. As noted, these projections are based on the percentage contribution of each region to the output of each industry as was available from the 1971 Census of Population.* That distribution matrix has been kept constant for the forecast period.

For those wishing to convert the details of Appendix B to index numbers, the following is provided:

* This distribution has, however, been adjusted to reflect other sources of information as, for example, the Census of Manufactures.

REAL DOMESTIC PRODUCT BY MAJOR INDUSTRIAL GROUP
