Barrow

Canadian Wildlife Service Cooperative Waterfowl Banding Project Atlantic Region 1981

Introduction

The seventeenth consecutive year of cooperative banding was completed in 1981. Five bait banding stations and two airboats conducted banding operations in New Brunswick, Nova Scotia and Newfoundland - Labrador. Two new bait stations were operated at Snegamook Lake and Tinker Harbour, Labrador. Other bait banding areas were Terra Nova National Park, Newfoundland, Border Area, Nova Scotia and Bathurst, New Brunswick. The USA airboat operated in the Saint John River area near Fredericton and the CWS airboat operated various areas throughout Nova Scotia, New Brunswick and Newfoundland.

Results

A total of 3924 birds was banded in 1981 with Black Ducks, Greenwinged Teal, and Blue-winged Teal being the most important numerically.

Table 1 summarizes this year's banding results by province. The age and sex breakdown for the five bait stations and two airboats is shown in table form throughout Appendix A. The immature per adult ratio of 3.4 suggests that 1981 was a normal year for production.

Table 2 contains a cost analysis for this year's program. Over fifty percent of the funds was spent in Labrador on the two experimental stations.

DATA FILE

125.30 CWS-AR Barrow 1981

Discussion

The most ambitious endeavor for 1981 was the establishment of the Snegamook Lake bait station and the resurrection of the Tinker Harbour bait station, both in Labrador. Because of the remoteness of these areas many unforeseen difficulties were encountered. Several individuals quit or did not show up for work because it interfered with their unemployment check. Rental of faulty equipment, high support costs and few birds all contributed to a frustrating effort in Labrador. Although only 72 birds were banded at Tinker Harbour and 27 at Snegamook Lake the outlook for 1982 is encouraging.

Bait trapping at Codroy, Newfoundland was terminated this year for night-lighting in an attempt to band more birds, eliminate excessive costs and the poaching problem. While banding the resident population was successful two attempts to band migrants were unproductive because poor weather, and an expensive engine failure terminated the effort. A total of 183 ducks was banded at Cordoy in 1981.

Bait trapping at Terra Nova National Park, Newfoundland was carried out jointly by a banding student and park personnel. Low numbers of migrant waterfowl were present this year and consequently only 19 birds were banded.

Bait trapping crews at the Border Area, Nova Scotia and at Bathurst, New Brunswick experienced successful years. The quota requirement for Black Ducks (500) was achieved by the Border station when combined with the airboat totals and 323 Black Ducks were banded at Bathurst. The Bathurst station also picked up approximately 100 recaptures.

The USA airboat night-lighting near Fredericton, New Brunswick had another exceptional year banding over one thousand birds, and meeting the Black Duck guota in less than two weeks.

A total of 1404 birds was banded by the CWS airboat working over a three month period. Extensive repairs hampered the airboat's production this year.

Recommendations

Top priority and financial assistance for 1982 should be allotted to banding in Labrador. Most equipment and banding supplies are on site at Tinker Harbour. Also, more productive areas were located near the end of this year's banding and competent help is available.

The Snegamook bait station should be replaced with a dog banding effort. No birds were captured by bait trapping but twenty-seven adult male molting Black Ducks and one adult male molting Canada Goose were captured by using a dog. Two other Black Ducks were recaptured both banded in Maine, U.S.A. It is believed that two dogs with handlers could band a large number of birdsfrom that unique segment of the population and could also capture some local waterfowl.

The CWS airboat has been operating with an obsolete 35 year old engine that has finally given out. A decision whether to purchase a new or reconditioned engine and work areas on a limited basis or to acquire a new boat is required.

The USA airboat has had fantastic success the past two seasons in working an area by achieving their goal in a very short time and should be continued in 1982.

The Bathurst and Border area bait stations should be continued for quota requirements and to provide some stability to Atlantic Provinces data not likely to be attained at the other bait stations.
