**NORMAL VALUES OF TEMPERATURE, PRECIPITATION,
STATION AND SEA LEVEL PRESSURE, VAPOUR PRESSURE
& SUNSHINE AT CANADIAN CLIMAT STATIONS**

This report replaces CDS #9-77 "Normal Values of Temperature, Precipitation, Station and Sea Level Pressure, Vapour Pressure and Sunshine at Canadian CLIMAT Stations" issued December 15, 1977.

The index gives the latitude, longitude and elevation of each Canadian CLIMAT station along with their international index number. The period of record is given in each table. Wherever possible the standard thirty year period from 1951 to 1980 was used, but if this was not available then the best available period was used and any deviation from this period is so noted in the tables. There is a code figure in each table indicating how each set of values was obtained.

Temperature — Values of temperature are in degrees Celsius and were obtained by averaging the mean daily maximum and mean daily minimum temperatures.

Precipitation — Monthly precipitation amounts are in millimeters. These data were obtained from precipitation values measured four times daily at 00, 06, 12 and 18 GMT. The precipitation amounts were obtained by adding together the total rainfall and the water equivalent of the total snowfall. Since 1960 many of the stations have been equipped with snow gauges in order to obtain the actual water content. Prior to this period, the water content was taken as 1/10 of the measured snowfall.

The limits for the five frequency groups of precipitation (quintiles) are in millimeters. The first value shown in the first quintile is the lowest precipitation value reported in the thirty year period 1951 to 1980, and the last value in the last quintile shows the greatest precipitation reported for the month.

Station and Sea Level Pressure — Values of station and sea level pressures are in kilopascals. One kilopascal equals ten millibars. These values have been prepared either from hourly abstracts, means of the four synoptic values at 00, 06, 12 and 18 GMT, or a combination of both for the available years of record during the period 1953-1980.

Vapour Pressure — Values of vapour pressure are in kilopascals. These values have been prepared either from hourly abstracts, means of the four synoptic values at 00, 06, 12 and 18 GMT, or a combination of both for the available years of record during the period 1953-1980.

Sunshine — Values of daily bright sunshine are in hours. These values have been prepared from available data during the period 1951-1980. Observations were made with the Campbell-Stokes sunshine recorder in which the sun's rays are focused on a suitable card by means of glass sphere burning a track along the path of the sun's image.

**NORMALES DE LA TEMPÉRATURE, DES PRÉCIPITATIONS,
DE LA PRESSION À LA STATION ET DE LA PRESSION
RÉDUITE AU NIVEAU MOYEN DE LA MER, DE LA TENSION
DE VAPEUR D'EAU ET DE L'INSOLATION, AUX STATIONS
CLIMAT CANADIENNES**

Le présent document remplace la circulaire CDS n° 9-77 "Normal Values of Temperature, Precipitation, Station and Sea Level Pressure, Vapour Pressure and Sunshine at Canadian CLIMAT Stations" publiée le 15 décembre 1977.

L'index des stations climatologiques canadiennes donne la latitude, la longitude, l'altitude et l'indicatif numérique international de chaque station. La période de relevés figure dans chaque tableau. On a utilisé soit la période standard de 30 ans, de 1951 à 1980, soit à défaut, la plus longue période de relevés possible. Le code qui figure dans chaque tableau indique comment on a obtenu les valeurs.

Température — Les valeurs de la température sont exprimées en degrés Celsius. On les a obtenues en faisant la moyenne de la température maximale quotidienne moyenne mensuelle et de la température minimale quotidienne moyenne mensuelle.

Précipitations — Les hauteurs mensuelles de précipitations sont exprimées en millimètres. On a obtenu ces données à partir des relevés effectués quatre fois par jour à 00, 06, 12 et 18 TMG. Ces valeurs correspondent à la somme de la hauteur totale de pluie et de la valeur totale de l'équivalent en eau de la neige. Depuis 1960, un grand nombre de stations ont été équipées de nivomètres qui permettent d'obtenir directement l'équivalent en eau, alors qu'avant cette date on calculait l'équivalent en eau en multipliant la hauteur de neige mesurée par 0,1.

Les extrêmes des cinq groupes de fréquences des précipitations (quintiles) sont exprimées en millimètres. L'extrême inférieure du premier quintile correspond à la plus faible hauteur de précipitations relevée entre 1951 et 1980, tandis que la dernière valeur, soit l'extrême supérieur du dernier quintile, correspond à la plus grande hauteur de précipitations relevée pour le mois.

Pression à la station et pression réduite au niveau moyen de la mer — Les valeurs de la pression à la station et de la pression au niveau de la mer sont exprimées en kilopascals. Un kilopascal est égal à dix millibars. On a obtenu ces valeurs à partir de la moyenne des relevés horaires ou de la moyenne des quatre valeurs synoptiques relevées à 00, 06, 12 et 18 TMG, ou encore d'une combinaison des deux, pour les années de relevés disponibles entre 1953 et 1980.

Tension de vapeur d'eau — Les valeurs de la tension de vapeur d'eau sont exprimées en kilopascals. On a obtenu ces valeurs à partir de la moyenne des relevés horaires ou de la moyenne des quatre valeurs synoptiques relevées à 00, 06, 12 et 18 TMG, ou encore d'une combinaison des deux, pour les années de relevés disponibles entre 1953 et 1980.

Insolation — Les valeurs de l'insolation effective quotidienne sont exprimées en heures. On a obtenu ces valeurs à partir des données de la période de 1951 à 1980. Les observations ont été effectuées à l'aide de l'héliographe Campbell-Stokes qui, grâce à une sphère de verre, concentre les rayons du soleil pour brûler une carte appropriée; la trace correspond à la trajectoire du soleil.

INDEX OF CANADIAN CLIMAT STATIONS
